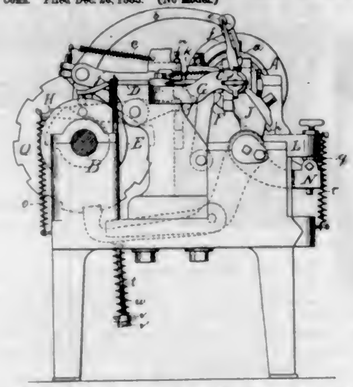
298,843. NUT. SAMUEL GISSINGER, Pittsburg, assignor to John H. Noble, Hulton, Pa. Filed Aug. 3, 1883. Renewed Apr. 14, 1884. (No model.)

Brief.—The cavity passes to or across and beyond the bolt-hole, and is filled with fibrous packing—*e. g.*, cotton waste or asbestus.

Claim.—A nut having a cavity communicating or intersecting the bolt-hole, in combination with fibrous packing capable of being drawn between the threads of the nut and the bolt, substantially as and for the purpose specified.

298,844. BOTTOM FOR BOOTS OR SHOES. CONRAD F. GLANVILLE, San Francisco, Cal., assignor of one-half to William H. Yee, same place. Filed Mar. 1, 1884. (No model.)



Claim.—1. In a boot, and in combination with an outer and an inner sole, a rim or flange of rubber interposed between their edges, so as to form an inclosed central air-space between the soles, substantially as herein described.

2. In a boot or shoe, an outer and an inner sole, with an edge-interposed rim or flange of rubber, forming an inclosed air-space between the soles, in combination with a spring or springs acting between the soles within this space, substantially as herein described.

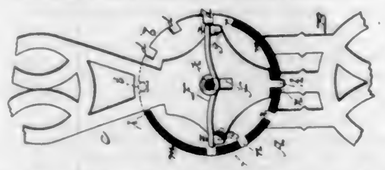
3. In a boot, and in combination with an outer and an inner sole, a rim or flange of rubber interposed between their edges, so as to form an inclosed central air-space between the soles, said rim having its front or sides extended up to protect the upper, substantially as herein described.

298,845. SCREW-CUTTING MACHINE. CHARLES GLOVER, Hartford, Conn. Filed Dec. 26, 1883. (No model.)

Claim.—1. The combination of the pendent finger *f*, the plunger *g*, and their operating mechanism, substantially as described, and for the purpose specified.

2. The combination of a holding-chuck, gripping-fingers for bringing a screw-blank in front of said chuck, the pendent finger, and the reciprocating plunger for acting upon said finger, the finger in turn acting upon the end of the screw-blank, substantially as described, and for the purpose specified.

3. The combination of the slide C, having the adjustable plunger mounted therein, the collar A, made adjustable longitudinally upon said slide, and reciprocating mechanism acting upon said collar to operate it and the slide, substantially as described, and for the purpose specified.

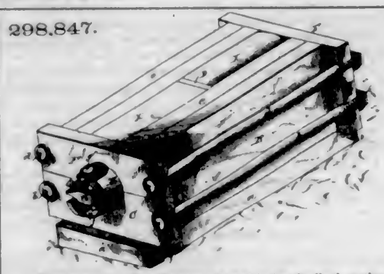


4. The combination of the sliding block G, having the beveled face *l'*, the back rest, F, having the beveled face *l*, and mechanism for reciprocating the slide, substantially as described, and for the purpose specified.

5. The combination of the sliding block G, having the beveled face *l'*, the back rest, F, having the beveled face *l*, mechanism for reciprocating said block G, and an adjustable stop to limit the extent of the upward movement of said block, substantially as described, and for the purpose specified.

6. The combination of the oscillating tool-holder, its driving-lever, driving-cam, the jointed arm P, attached to said driving-lever, and the spring *u*, substantially as described, and for the purpose specified.

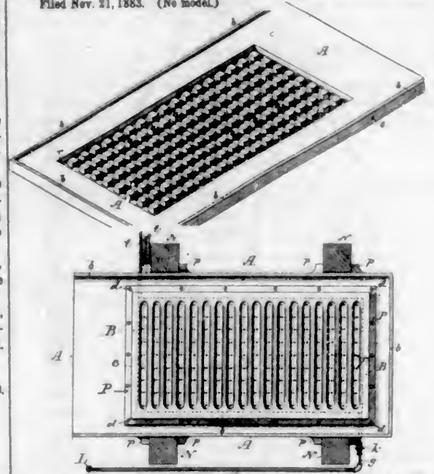
7. The combination of the oscillating tool-holder, its driving-lever, driving-cam, the relief-spring *u*, and mechanism for adjusting the pressure of the spring, substantially as described, and for the purpose specified.



298,846. CANOPY-STANDARD. GEORGE H. GRAHAM and JULIUS D. LLOYD, Oriskany, N. Y. Filed Mar. 17, 1884. (No model.)

Claim.—1. A canopy-standard provided with a central slot to receive a transverse pin and bearings to receive a spring, and provided with projections to engage notches in the stationary portion, whereby said standard is locked automatically in position.

2. In a canopy-standard, the adjustable arm provided with the central slot and side lugs and locking pins or lugs, in combination with the centrally-perforated head, of the stationary arm having notches, and the cap-plate provided with the central pin, the flange having notches and cut away to form a passage for the adjustable arm, substantially as described.



298,847. TILE-MOLD. JAMES GRANT, Goshen, Ind. Filed Mar. 18, 1884. (No model.)

Claim.—1. A collapsible core formed in longitudinal sections and provided with notches at its ends, in combination with a longitudinal strip located between said sections to form a key, and screw-threaded pins seated in the notches of the sections and provided with tightening-nuts and pivoted latches, whereby the sections of the core are drawn together against the key and the latter held in position between the same, substantially as and for the purpose set forth.

2. The combination, with a collapsible core formed in longitudinal sections and provided with a key held between them by a pin and latch, of a mold-frame consisting of a suitable base or platform provided with removable side and end sections, said end sections being divided longitudinally, and each half having at its ends notches or grooves and clamping-rods seated therein, and provided with nuts engaging the screw-threaded ends thereof to securely hold both the side and end sections together and to the base or platform, substantially as and for the purpose specified.

298,848. OIL-PRESS MAT. CHARLES S. HAMILTON, Milwaukee, Wis. Filed Nov. 21, 1883. (No model.)

Claim.—1. The combination, in an oil-press mat, of a metallic plate, A, so excavated on its upper face as to leave at uniform distances from each other, supporting-columns—as *a a*—and of a thin plate, P, secured to said plate A over the excavated portion thereof, thereby forming between the two plates a steam-tight chamber for the reception and circulation of a heating medium, substantially as and for the purposes set forth.

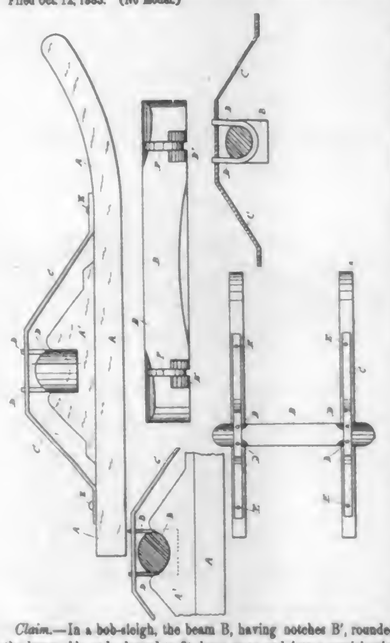
2. The combination of the plates A and P, inclosing between them a heating-chamber with supporting-columns for resisting pressure, substantially as and for the purposes set forth.

3. The combination, with the perforated plate B, having drainage-grooves, of the partition-plate P and excavated plate A, substantially as and for the purposes set forth.

4. The combination, with an oil-press mat, when the same is provided with a heating-chamber, of a flexible hose, as *l*, connecting said chamber with the heat-reservoir, whereby heat is continuously admitted to the mat without interference with its vertical movement, substantially as and for the purposes set forth.

5. The method of heating oil-press mats, consisting in passing the heating medium from its supply-reservoir to the plates to be heated

through a flexible conduit, and permitting said heating medium to enter and escape at diagonally-opposite corners of the heating-chambers in said mats, substantially as and for the purposes set forth.



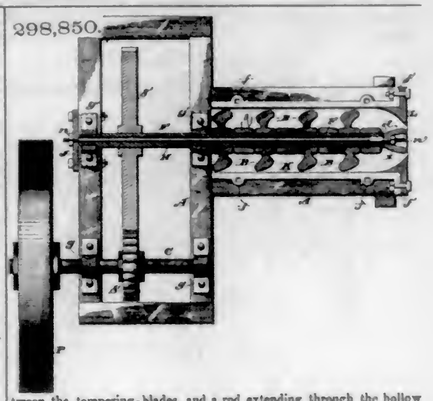
6. The combination, in an oil-press mat, of the plate A, having a plane lower surface, upon which are raised strips *m m*, to prevent the spreading of the meal form beyond proper limits when the same is under pressure, and the cap-plate B, having a corrugated upper face, whereby a meal cake is produced, having one plane and one corrugated face, substantially as and for the purposes set forth.

7. The combination, in an oil-press mat, of the removable perforated cap-plate B, provided on its under face with the drainage-grooves, and the plate A, provided with a heating-chamber formed in its upper face, together with a thin plane partition-plate, P, inserted between said plates A and B, substantially as and for the purposes set forth.

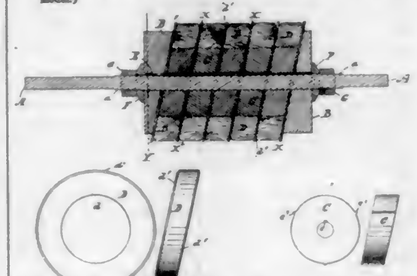
8. The combination, in an oil-press mat provided with a heating-chamber, of the inlet-pipe *g*, provided with cock *k*, the supply-pipe L, located near the opposite end of the press, and the flexible hose *l*, connecting said pipe *g* and pipe L, substantially as and for the purposes set forth.

9. In an oil-press mat, a perforated cap-plate, B, having a corrugated upper face and drainage-grooves cut into its lower face, substantially as and for the purposes set forth.

298,849. BOB-SLEIGH. EDWIN A. HARDING, Harbor Springs, Mich. Filed Oct. 12, 1883. (No model.)



Claim.—In a bob-sleigh, the beam B, having notches B', rounded on the lower side and adapted to fit down upon and into a semicircular recess on top of the blocks A', secured to the upper sides of the runners A, said beam having grooves F, rounded at the bottom, thereby permitting it to oscillate upon the yokes D and block A', in combination with runners A, provided with braces C, as shown and described.



298,850. TILE-MACHINE. FRANCIS M. HARRIS, MAXWELL G. HARRIS, MILO J. HARRIS, and MARCUS L. HARRIS, Covington, Ind., assignors of one-fifth to John N. Spining, same place. Filed Nov. 8, 1883. (No model.)

Claim.—In a tile-machine, the combination, with a frame for supporting the driving-gear, and a cylinder secured to one side of the frame and provided at its outer end with a die, of a hollow rotary shaft journaled in the side pieces of the supporting-frame, and having a gear-wheel secured thereto between said side pieces, said hollow shaft extending into the cylinder and nearly to the outer end thereof, tempering-blades formed with hubs or sleeves encircling the hollow shaft, and spacing-sleeves between the tempering-blades, and a rod extending through the hollow shaft and secured at one end to the machine-frame, the opposite end of the rod having an enlarged bearing for supporting the outer end of the hollow shaft, and a die removably secured to the outer and projecting end of said rod, substantially as set forth.

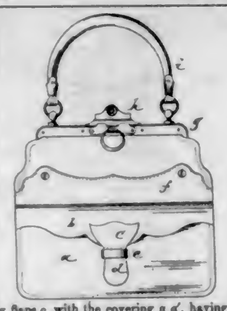
298,850.

298,851. MACHINE FOR CONVERTING WOOD INTO FIBER. JOSEPH H. HAYDEN and JONATHAN R. SLEEPER, Bristol, N. H., assignors of one-third to Cyral R. Aldrich, Boston, Mass. Filed Mar. 30, 1884. (No model.)

Claim.—1. The herein-described means for converting wood into fiber, consisting of a series of three or more circular saws, separated by wooden collars, provided in their center with holes bored on an angle with the parallel sides thereof, and all mounted upon an arbor and securely clamped thereon by suitable end collars and nuts threaded to said arbor, hung in suitable bearings, and driven by means of a pulley and belt, substantially in the manner and operating as and for the purpose set forth.

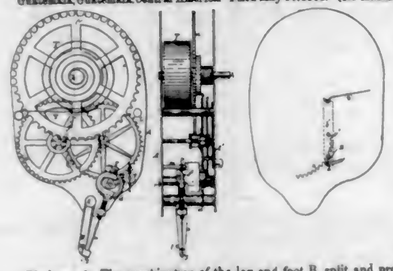
2. The herein-described means for converting wood into fiber, consisting of a series of three or more circular saws, separated by collars composed of wood and metal, provided in their center with holes bored on an angle with the parallel sides thereof, and all mounted upon an arbor and securely clamped thereon by suitable end collars and nuts threaded to said arbor, hung in suitable bearings, and driven by means of a pulley and belt, substantially in the manner and operating as and for the purpose set forth.

3. The combination, with the saw-arbor A, of a series of saws, X, mounted thereon and held on an angle by the metal and wooden separator-collars C D, (the collar D having chamfered corners *d'*,) the end collars, B F, the spline E, fitting key-seats in said arbor A, collars B C, and saws X, and suitable nuts, G, all constructed and operating substantially as and for the purpose set forth.



298,852. SATCHEL. DAVID HEIDELBERGER, Chicago, Ill. Filed Jan. 14, 1884. (No model.)

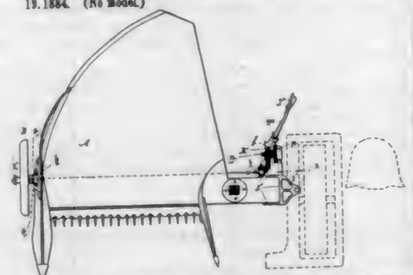
Claim.—1. In a satchel or traveling-bag, the exterior or covering *a a'*, provided with projecting flaps *n*, substantially as and for the purpose specified.



2. The interior or lining formed of side pieces, *k*, bottom piece, *l*, and end pieces or gussets provided with flaps *o*, substantially as and for the purposes specified.

3. The combination of the interior pocket formed of the lining *k*, gussets *j*, having flaps *o*, with the covering *a a'*, having flaps *n*, and the stiffening-piece *m*, all constructed and attached substantially as specified.

298,852.



298,853. STENCIL OR PERFORATING PEN. JOHN C. HILL, New Guatemala, Guatemala, Central America. Filed May 16, 1883. (No model.)

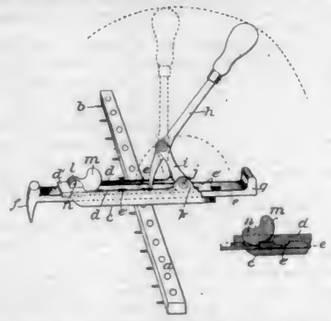
Claim.—1. The combination of the leg and foot B, split and provided with the screw *l*, securely attached to the pin *k*, with fixed rests in the sides A A', and needle *n*, needle-bar *i*, and the mechanism described for operating the same, to provide a smooth rest for the mechanism, relieve the hand from supporting the weight, and facilitate the making of perfect letters, as shown, and for the purposes specified.

2. The brake *b'*, pinned to the side A', provided with a mortise on the upper end to receive the bent end of the spring *c'*, and having a thumb-piece extending out through the slot *v*, and an arm, *z*, to engage the cogs of the wheel *c* and stop the machinery and the needle, in combination with the wheel *c*, needle-bar *i*, needle *n*, and the mechanism operating the same, as shown, and for the purposes specified.

298,854. HARVESTER. HENRY A. HOWE, Albion, N. Y. Filed Mar. 19, 1884. (No model.)

Claim.—1. In a harvester, in combination with the main frame and platform thereof, the bracket L, provided with ribs *s'* and the extension *s''*, substantially as and for the purpose described.

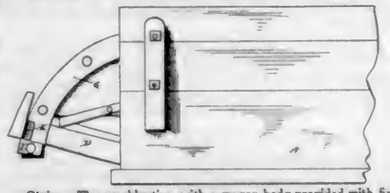
2. The combination, in a harvester provided with means for adjusting the platform, of the bracket L, consisting of the plate *s*, ribs *s'*, and ears I, cast in one piece, and constructed to support the mechanism whereby said adjustment is accomplished, substantially as described.



3. The combination, in a harvester provided with means for adjusting the platform, of the bracket L, consisting of the plate *s*, ribs *s'*, and ears I, cast in one piece, and provided with the standard *o*, secured to the base-plate *s*, and having cast integral therewith the rack *p* and pin *n*, all constructed, arranged, and operating substantially as described.

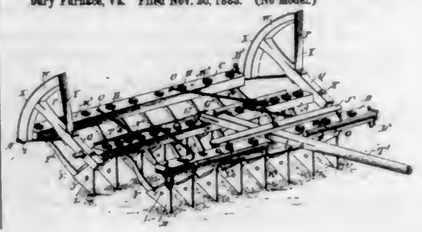
4. In a harvester provided with means for adjusting the platform, in combination with the shoe C, having cast integral therewith the guides *a a* and stop *a'*, the plate *b*, having cast integral therewith the axle *d'* and stop *d''*, whereby the relative movement of the plate and guides is limited, substantially as described.

298,855. SUPPOSITORY FOR CATARRH. FREDERICK HERMAN HUBBARD, Brooklyn, N. Y., assignor to himself and Henry M. Pierson, same place. Filed Jan. 25, 1884. (No specimens.)



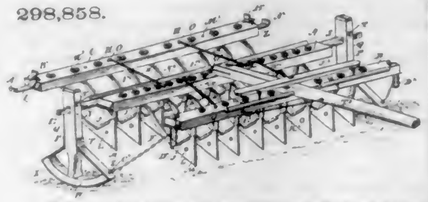
Claim.—The suppository composed of iodoform, geranium, carbolic acid, gum, and a fatty vehicle, substantially as set forth.

298,856. CARPET-STRETCHER. FREDERICK J. HUBBARD, Chicago, Ill. Filed Nov. 22, 1883. (No model.)



Claim.—In a carpet-stretcher, the combination of the draw-bar *a*, having curved teeth *b* inserted therein, the case *c*, pivoted to said bar, the flanges *d*, the recessed bar *e*, provided with spur *f* and projection *g*, the hand-lever *h*, with yoke *i*, pivoted to standards, as described, and the drop-pawl *m*, secured as specified, all these parts arranged and operated substantially as described.

298,857. END-GATE FOR WAGONS. GEORGE WASHINGTON HURD, Meadville, Mo. Filed Feb. 12, 1884. (No model.)



Claim.—The combination, with a wagon-body provided with fixed standards *a a* and slotted removable standards B, secured to the wagon-box between the standards *a a*, of the tail-board D, pivoted at its lower edge to the lower ends of the standards B, and provided with flanged arms K at its top edge, and the curved guides G, hinged to the staples H of the standards B, and provided at their lower ends with lugs L, substantially as specified.

298,858. HARROW AND CULTIVATOR. GEORGE H. JOHNSON, Salisbury Furnace, Va. Filed Nov. 20, 1883. (No model.)

298,858.

Claim.—1. In a harrow, the combination, with the parallel center and front and rear beams, of the curved or angular tooth-carrying standards, pivotally connecting the said center beam with the front and rear beams, whereby the said front and rear beams may be adjusted so as to regulate the position of the standards in relation to the center beam, and hooked rods connecting the center beam adjustably with both the front and rear beams, as set forth.

2. In a harrow, the combination of the center beam, the parallel front and rear beams, the standards connecting said front and rear beams with the center beam, and equipped with triangular teeth, a tongue hinged to the center beam, and means for connecting the said tongue with either the front or the rear beam, substantially as set forth.

3. The combination of the center beam, the front and rear beams, the standards connecting the said front and rear beams with the center beam and having the triangular teeth, the tongue hinged to the center beam, and diagonal braces connected adjustably to the said tongue and having clevises, whereby they may be connected to either the front or the rear beam, substantially as set forth.

4. In a harrow of the class described, the herein-described tooth-carrying standard, consisting of a curved or angular beam, having flattened and perforated ends to receive the connecting-bolts, and terminating at its lower end in a plate having an overhanging flange and a transverse opening, and an equilateral triangular tooth secured to the said standard by a transverse bolt, the upper edge of said tooth fitting under the overhanging flange, substantially as set forth.

5. The combination of the center beam, the front and rear beams, the tooth-carrying standards connecting said front and rear beams with the center beam by means of vertical connecting-bolts, a shaft or axle journaled to the rear side of the center beam, and a vertically-perforated beam hinged upon the said shaft or axle, and adapted to receive the connecting-bolts of the front ends of the rear standards, substantially as set forth.

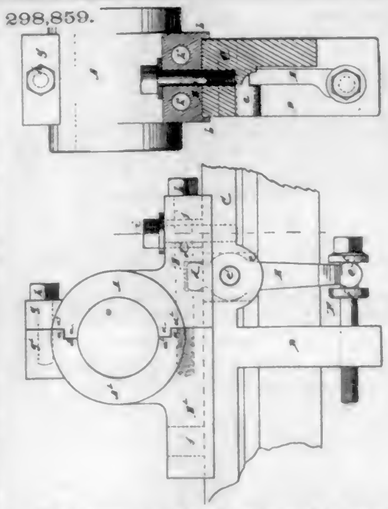
6. The combination of the center beam, the front and rear beams, the tooth-carrying standards pivotally connecting the said front and rear beams with the center beam, supporting-latches hinged upon the ends of the rear beam, a shaft or axle journaled to the rear side of the center beam, and rotary runners secured upon the ends of the said shaft or axle, substantially as set forth.

7. In a harrow constructed substantially as described, the herein-described rotary runner, consisting of an arm, a segmental felly secured to the end of the same, and a strap or tire secured to the said felly, and having its ends bent up and secured to the said arm at some distance from the felly, which is thereby braced and secured, substantially as set forth.

8. The combination of the shaft or axle having notched ends, the runners constructed substantially as described, and having notched sleeves or boxes, and the transverse securing-bolts engaging the notches in the said sleeves or boxes and in the ends of the shaft or axle, substantially as set forth.

9. The combination of the center beam, the front and rear beams, the tooth-carrying standards connecting the said front and rear beams with the center beam, the shaft or axle journaled to the rear side of the center beam, the rotary runners mounted upon the said axle and having loops or eyes at their front ends, and chains secured to the ends of the front beam, and capable of being connected detachably with the runners, substantially as set forth.

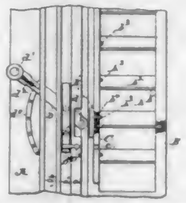
298,859. JOURNAL-BOX. CONRAD KAHLER, Chicago, Ill. Filed Mar. 1, 1884. (No model.)



Claim.—1. A journal-box consisting of two half-boxes divided vertically, to enable wear to be taken up and prevent horizontal play, substantially as specified.

2. A journal-box consisting of two half-boxes, each having a lip or projection and a cut-away portion, *a'*, having a base, and means for connecting the half-boxes together, substantially as specified.

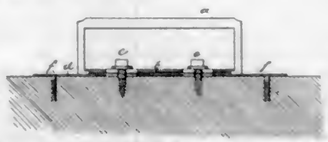
3. The half-boxes A A', each having a lip, *a*, and cut-away portion *a'*, base B B', and ears *g g'*, in combination with the bolts *h* and *k*, substantially as and for the purpose specified.



4. The half-boxes A A', constructed as described, base B B', ears *g g'*, and bolts *h k*, in combination with the guide-rail C and bolts *j*, substantially as and for the purposes specified.

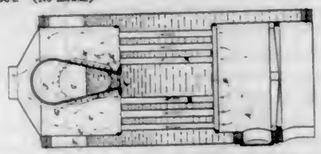
298,859.

5. The half-boxes A A', base B B', and guide-rail C, in combination with the pendant D, lever E, and adjusting-bolt F, substantially as and for the purpose specified.



298,860. BLIND-SLAT OPERATOR. WILLIAM H. KEENAN, Auburn, Ind. Filed Sept. 18, 1883. (Model.)

Claim.—1. In a blind-slat operator, the combination, with the shutter having pivoted slats and movable bar arranged alongside the shutter and connected with the slats, as described, of the lever pivoted to the window-framing, and having its outer end connected with the movable bar and its inner end engaging a suitable rack, whereby the slats may be held at any desired angle, substantially as described, and for the purposes specified.



2. The blind-slat-operating device, substantially as described and shown, composed of the pivoted slats having extensions beyond their pivots, the vertically-movable bar provided on its inner edge with a slot, as described, crank-rods connecting the slats and movable bar, the pivoted lever provided with depending strap or bar having a stud projected into the slot in the movable bar, the rack, and a suitable detent secured to the lever and engaging the rack, all as and for the purposes specified.

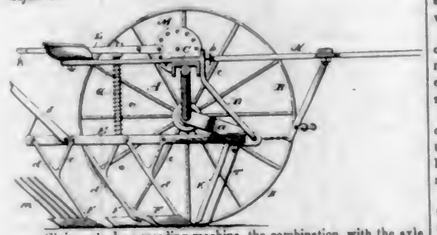
298,861. LOCK-STRIKE. JACOB WILLIAM KOHN, Newark, N. J. Filed Nov. 30, 1883. (No model.)

Claim.—In combination, the plate *b*, having vertical slots to receive the screws *c*, and the keeper or strike *a*, adapted to work horizontally upon said plate and vertically with said plate without changing the position of the screws, substantially as set forth and shown.

298,862. STEAM-BOILER. HOSEA K. KRIEBEL, West Point, Pa., assignor of one-half to Frederick Light, Jr., same place. Filed Jan. 19, 1884. (No model.)

Claim.—1. A steam-boiler provided with a steam-dome located in its upper or combustion chamber, the said dome consisting of an inverted-pear-shaped center part, from which the steam is directly carried from the boiler, and two large egg-shaped tubular extensions extending from said pear-shaped center opening therein, and also through the inner walls of the combustion-chamber, to which they are secured, the said parts opening through the floor of said chamber between rows of tubes, thereby forming a rigid staying system for the boiler and allowing free circulation of the steam and water, substantially as and for the purpose specified.

2. In a steam-boiler, a cast-metal steam-dome located in the upper box, said dome opening through the inner walls and floor of said box into the steam and water spaces of the boiler, said dome extending across the said combustion chamber or box of the boiler, and secured to the walls thereof, and located between the outlets of two rows of tubes, substantially as and for the purpose specified.



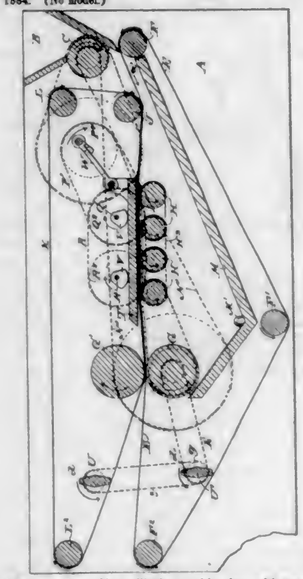
3. A cast-metal dome for steam-boilers, consisting of parts H H, J, and I, the parts H being for the circulation of both water and steam, and are secured to the inner walls or shell of the boiler, substantially as and for the purpose specified.

4. A cast-metal dome for steam-boilers, consisting of egg-shaped water and steam flues H H, dome J, and water-circulating flue I, the dome part J having steam-exit K, substantially as and for the purpose specified.

5. The upper combustion-chamber of a boiler, provided with a solid cast-metal steam-dome having branching tubular arms below and on its sides, the said integral cast dome being riveted to the bottom and sides of said combustion-chamber to form a circulatory system for the steam and water, and rigidly stay the boiler at this part, substantially as and for the purpose specified.

298,863. WEEDING-MACHINE. JOSEPH B. LADD, North Topeka, Kans. Filed June 22, 1883. (No model.)

Brief.—The plates carrying the levers and racks are swiveled so as to turn with the lateral movements of the drag-bars. The levers form handles with which to elevate the drag-bars. Spring to hold down to work. The yoke that carries the drag-bars and the draft is vertically the adjustable.



Claim.—1. In a weeding-machine, the combination, with the axle and a bail-piece, adjustably secured to the frame so as to be raised or lowered, and arms journaled at one end on the axle and secured at their outer ends to the bail, of drag-bars pivotally secured at their forward ends to the bail, and levers for raising and lowering said drag-bars, substantially as set forth.

2. The combination, with the vertically-adjustable bail and vertically and laterally adjustable drag-bars secured at their forward ends to the bail, of a lifting-lever pivoted to a laterally-adjustable plate or support pivoted to the main frame, substantially as set forth.

3. The combination, with the vertically-adjustable bail and vertically and laterally adjustable drag-bars, of a lifting-lever pivoted to a laterally-adjustable plate or support, a segment secured to said plate or support, and a holding-lever pivoted to the lifting-lever and adapted to engage said segment, substantially as set forth.

4. The combination, with the drag-bars E, lifting-lever K, rod G, and spring *e*, of the pivoted plate I, having a segment, M, secured thereto, and lever L, pivoted to lever K, and adapted to engage the segment M, substantially as set forth.

298,864. CIDER-MILL. ALPHEUS D. LAIR, Mexico, Ind. Filed Mar. 19, 1884. (No model.)

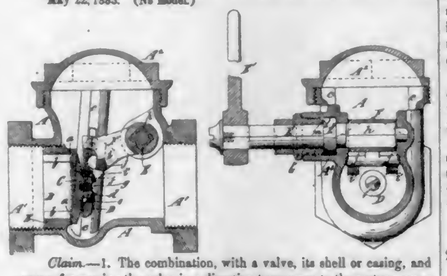
Claim.—1. In a cider-mill, the combination, with two endless fabric aprons or bands, of a series of presser-rollers, and of a reciprocating presser-plate held above the rollers, the endless bands or aprons passing between the rollers and the presser-plate, substantially as herein shown and described.

2. In a cider-mill, the combination, with two endless bands or aprons passing over rollers, of a series of rollers arranged below one band, and a presser-plate arranged above the other band, so that the adjoining parts of the two bands pass between the presser-plate and the rollers, substantially as herein shown and described.

3. In a cider-mill, the combination, with two endless bands or aprons passing over rollers, of a series of rollers arranged below one band, and a presser-plate arranged above the other band, so that the adjoining parts of the two bands pass between the presser-plate and the rollers, and of shafts carrying arms for pressing the presser-plate in the direction toward the rollers, substantially as herein shown and described.

4. In a cider-mill, the combination, with two endless bands or aprons, of rollers over which they pass, presser-rollers held under one band, a reciprocating presser-plate held above the other band, and cams or their equivalents for pressing it in the direction toward the rollers below it, substantially as herein shown and described.

5. In a cider-mill, the combination, with two endless fabric aprons or bands, of rollers over which the bands pass, a series of rollers arranged under one band, a reciprocating presser-plate arranged above the other band or apron and over the rollers, and of two presser-rollers, G and G', substantially as herein shown and described.



6. In a cider-mill, the combination, with two endless fabric bands or aprons, of a presser for pressing the pomace between the said bands, and of beaters for striking the bands after they have pressed the juice from the pomace, substantially as herein shown and described.

7. In a cider-mill, the combination, with two endless fabric bands or aprons, of rollers over which the bands pass, the shafts U and U', provided with wings *d*, and gearing or belting for revolving the said shafts to cause the wings to strike the said bands or aprons, substantially as herein shown and described.

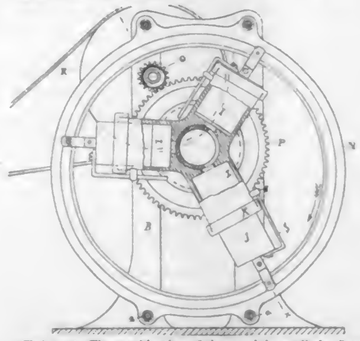
8. In a cider-mill, the combination, with the grinding apparatus and two endless fabric bands or aprons passing over rollers, of the reciprocating presser-plate T, the connecting-rod W, connecting the said presser-plate with the crank-shaft, the rollers H, arranged below the presser-plate, and of the presser-rollers G and G', substantially as herein shown and described.

9. In a cider-mill, the combination, with a hopper, B, grinding-roller C, and the endless bands or aprons K and E, passed over rollers, of a reciprocating presser-plate, T, the rollers H below the presser-plate, the shafts R and Q, carrying cams V, for pressing the presser-plate downward, the presser-rollers G and G', the beater-shafts U and U', and of means for operating all the said rollers and parts from the shaft of the grinding-roller C, substantially as herein shown and described.

298,865. VALVE. JOHN S. LENG, West New Brighton, N. Y. Filed May 22, 1883. (No model.)

Claim.—1. The combination, with a valve, its shell or casing, and means for moving the valve in a direction transverse to the water way or passage, of an adjustable and removable seat screwed into one of the pipe sockets or openings of the shell or casing to a position inward of the outer end of the socket or opening, so as to leave on the outer side of said seat a screw-threaded portion of the socket or opening, for the reception of a pipe, substantially as herein described.

2. The combination of a valve shell or casing, a carriage sliding therein in a direction transverse to the water way or passage, a valve attached to the carriage, but capable of adjusting itself in all directions independently of the carriage, and an adjustable and removable valve-seat screwed into one of the pipe sockets or openings in the shell or casing to a position inward of the outer end of said socket or opening, so as to leave on the outer side of said seat a screw-threaded portion of the socket or opening, for the reception of a pipe, substantially as herein described.



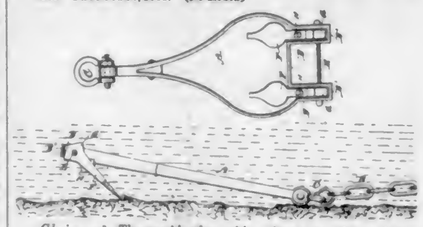
3. The combination, with the stuffing-box, of the valve-operating rock-shaft provided with a collar fitting in said box, and the outer side of which forms a valve-seat, and an externally-screw-threaded plug or gland screwed into the box, and having a valve-like face which bears upon and forms a tight joint with said collar to prevent leakage between the shaft and the plug or gland, the said collar being held between the rigid surfaces formed by the bottom of the stuffing-box and the inner end of said plug or gland, substantially as herein described.

4. The combination of the stuffing-box A^2, the shaft E, provided with a collar, E^2, in the outer side of which is a grooved seat, *l*, and the externally-screw-threaded plug or gland G, having a valve-like projection, *m*, which enters and forms a tight joint with said groove, the said collar being held by the rigid surfaces formed by the bottom of the stuffing-box and the inner end of said plug or gland, substantially as herein described.

5. The combination of the valve C, having a rounded back and a projection, *d*, the carriage D, having the hole *e* beveled in the back, and the washer *f* and screw *g*, substantially as herein described.

6. The combination of the valve C, carriage D, provided with the arms *i*, the lever F, fitting between said arms, and provided with horns *j*, projecting from opposite sides and engaging with the arms *i i*, and also provided with the portion *k*, bearing on the top of the carriage at a point between the arms *i i* and the rock-shaft E, substantially as herein described.

298,866. ROTARY PUMP. GEORGE LENHARD, Detroit, Mich. Filed June 27, 1883. (No model.)

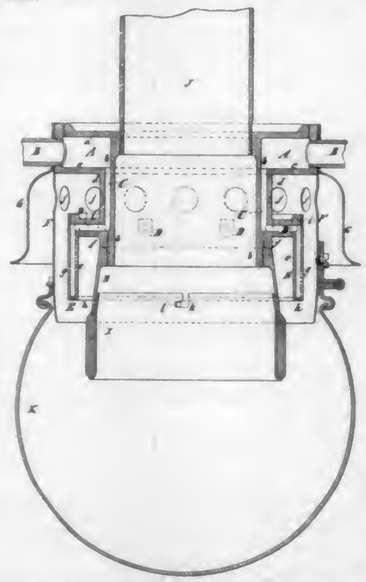


Claim.—1. The combination of the revolving cylinder I, piston J, grooved track N, and rod *c*, provided with an offset, *c'*, and a friction-roller traveling in the grooved track, whereby the pressure is exerted in a straight line, substantially as described.

2. In a combined rotary pump and motor provided with reciprocating pistons J, and track N, having a grooved channel, O, the combination of the piston-rods detachably connected to said pistons J, and having a pin extending at right angles thereto, and carrying an anti-friction roller, *b*, constructed to enter said channel O, all combined, arranged, and operating as specified.

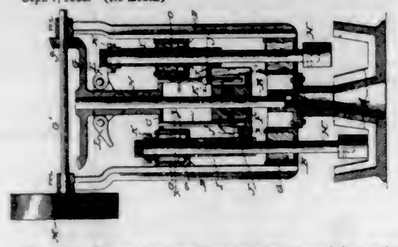
3. In a rotary pump, the combination, with the cylinder I, piston J, and suitable means for reciprocating said piston, of the guide S, working in an eye in the projection *s*, whereby the piston J is guided in its movement, substantially as described.

4. In a combined rotary pump and motor provided with reciprocating pistons, as J, the rigid track N, having a channel, O, and the piston-rods *c*, each having an offset, *c'*, and carrying a friction-roller adapted to travel in said channel, and constructed to be detachably connected with said pistons, substantially as and for the purpose specified.



298,867. ANCHOR. WILLIAM LEWIS, St. John, New Brunswick, Canada. Filed Oct. 30, 1883. (No model.)

Claim.—1. The combination, with a frame or yoke, A, having pockets B, of the rod E, the flukes F, mounted loosely on the same, and having the pivoted ends beveled, substantially as herein shown and described.



2. The combination, with the frame or yoke A, having pockets B, of the rod E, the flukes F, mounted loosely on the rod E, and having the pivoted ends beveled, and of the projections H on the flukes, substantially as herein shown and described.

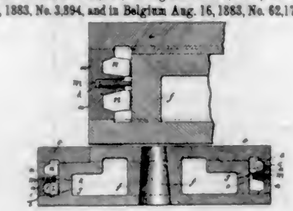
298,868. GAS-BURNER. ANDREW B. LIPSEY, West Hoboken, N. J., assignor to William Bell, New York, N. Y. Filed July 2, 1883. (No model.)

Claim.—The combination, with a downwardly-extending annular burner-tip or a circular series of burner-tips, of an annular gas-chamber, an annular gas-passage leading from the annular gas-chamber, arms extending laterally from the annular gas-passage to the burner tip or tips, and a central flue extending through the space encircled by the burner tip or tips and through the annular gas-chamber, and serving to carry away the products of combustion, substantially as specified.

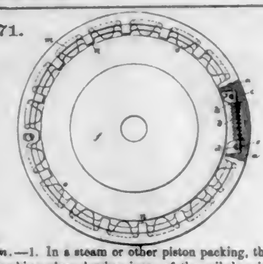
298,869. STAMP-MILL. GEORGE SHAW LONG, Petrolia, Pa. Filed Sept. 7, 1883. (No model.)

Claim.—1. The combination of a vertical shaft, a revolving vertical cam consisting of a central sleeve having laterally-projecting flanges at its lower end provided with triangular wings, forming an annular space between them and the sleeve, each wing having an inclined and a vertical edge, stamps corresponding in number with the number of the cam-wings, vertical ways or sleeves I, having laterally-projecting lugs provided with two anti-friction rollers each, and vertical rods corresponding in number and position with the stamps pendent from the frame, projecting with their lower ends into the annular spaces in the cam, and forming guides upon which the inner anti-friction rollers upon the lugs travel, as and for the purpose shown and set forth.

2. The combination, in a stamp-mill, of an annular trough, a frame composed of a circular bed or base piece having a central vertical box or bearing, a top plate or casting having a central upright sleeve and upright side pieces, square guide boxes or bearings O, vertical guide-rods *w*, drive-shaft G', bevel-pinion *g*, cam-shaft E, cam F, constructed as described, bevel-wheel G, stamps H, sleeves I, provided with projecting lugs J, and friction-rollers J' and *i*, ratchets K, and pawls L, adapted to engage said ratchets on the upstroke of the stamps, all constructed and arranged as and for the purpose shown and set forth.



298,870. PAPER-BAG RACK. WILLIAM MACK, Indianapolis, Ind. Filed Mar. 6, 1884. (No model.)



Claim.—1. A paper-bag rack consisting of a base-board, *a*, back-board *b*, circular side boards, *d d'*, quarter-circular boards *c* and *c'*, with door A, shelves $a\,a'\,a^2\,a^3\,a^4\,a^5\,a^6\,a^7$, all combined and arranged as specified, substantially in the manner and for the purpose set forth.

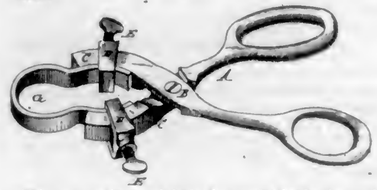
2. A quadrantal or fan-shaped paper-bag rack, the base-board of which is rectangular, the back-board being wedge-shaped, the sides formed of quadricircular boards fastened at the top to the back-board and at the front to the base-board, the space thus inclosed being provided with shelves, forming tapering receptacles for paper bags, substantially in the manner and for the purpose set forth.

298,871. PISTON-PACKING. ALEXANDER MACLAINE, Belfast, County of Antrim, Ireland. Filed Jan. 3, 1884. (No model.) Patented in France Feb. 24, 1883, No. 153,913; in England June 6, 1883, No. 2,802, and Aug. 11, 1883, No. 3,394, and in Belgium Aug. 16, 1883, No. 62,173.

298,871.

Claim.—1. In a steam or other piston packing, the combination, with the packing-rings having jaws, of the coiled springs, supporting bars or tubes, and means for securing the same in the jaws, whereby the springs may be introduced and secured in place without straining the rings, as set forth.

2. The combination, with the packing-rings having flanges, of the wave-springs K K, whereby the springs are held in place by the flanges, as set forth.



3. The combination, with the double expansion piston packing rings having a series of ribs, blocks, or projections, of the gun-lock or other springs bearing upon the body of the piston and extending between the projections, as and for the purpose set forth.

4. In a piston-packing, the double expansion packing rings provided with a series of ribs, blocks, snugs, or other projections on the inner side of the rings, approaching the body of the piston and adapted to prevent the rings being forced inwardly too far, as set forth.

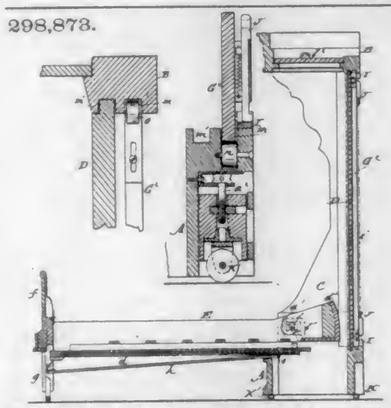
5. The combination, with the expansion-rings, of the flat wave-like springs between the adjacent sides of the rings, the ends of which are provided with feet or stops, as set forth.

6. An expansion-packing consisting of flanged rings, wave-like springs secured between the flanges, lugs or stops upon the inside of the rings, and coiled springs and means for securing the same in the jaws of the rings, as set forth.

298,872. BOTTLE-CAPPER. CATHARINE MAY, Cleveland, Ohio, assignor to Walter L. Judd, Brooklyn, N. Y. Filed June 30, 1883. (No model.)

Claim.—1. An improved device for capping bottles, jars, and the like, the same consisting, essentially, of a pair of handles pivoted together, scissors-like, and having forwardly-extending jaws, and a loop or flexible strap having its ends connected adjustably with the said jaws, substantially as set forth.

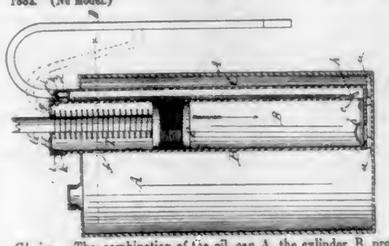
2. The combination of a pair of handles pivoted together, scissors-like, having forwardly-extending jaws provided with binding-screws and clamps for fastening a flexible strap to the aforesaid forwardly-projecting jaws, with a flexible strap having its ends connected adjustably with the said jaws by means of the said clamps, so as to form a tightening-loop, substantially as set forth.



298,873. WARDROBE-BED. WILLIAM H. MCCLURE, New York, N. Y., assignor to James L. Plimpton, same place. Filed Apr. 23, 1883. (Model.)

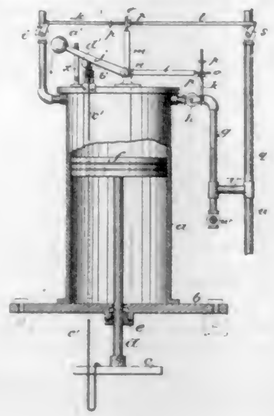
Claim.—1. In a cabinet-bedstead, the combination, with the fixed head or stationary part and its sides, provided in their lower portions with the recesses and toothed frames, of the rolling fulcrum-plates, provided with teeth and tongues, as described, and the folding bed-bottom having its sides provided with oblique slots, said fulcrum-plates engaging the toothed frames, and their tongues engaging the oblique slots, substantially as and for the purpose set forth.

2. In a cabinet-bedstead, the combination, with the base and entablature, of the sliding sides composed of hinged-together sections provided with rolls, and adapted to move or slide in grooves in the entablature and base, substantially as shown and described, and for the purpose set forth.



3. In a cabinet-bedstead, the combination of the entablature and base provided with stops having double-inclined surfaces and central notches, of the sliding sides composed of hinged-together sections pro-

298,873.

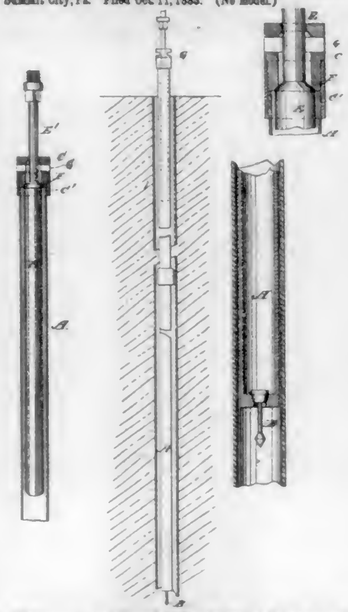


vided with rolls, and adapted to move in grooves in the entablature and base, and the spring-bolts having operating-cords, substantially as shown and described, and for the purpose set forth.

298,874. OIL-CAN. JAY C. MERRELL, Geneseo, N. Y. Filed Dec. 21, 1882. (No model.)

Claim.—The combination of the oil-can A, the cylinder B, provided with a valve in its bottom and discharge-holes near its top, the side tube, C, communicating with the cylinder by a port, the flexible tube D, attached to the top of the side tube, C, the plunger E, resting in the cylinder, the spring I, resting around the rod G and pressing on the plunger, and the cover H, provided with the hole *g*, for the insertion of the end of the flexible tube, as shown and described, and for the purpose specified.

298,875. PRESSURE-FEEDER FOR PULP-GRINDERS. EDWARD F. MILLARD, Marinette, Wis. Filed Oct. 22, 1883. (No model.)

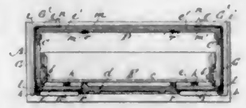


Claim.—1. In a water or steam pressure feed apparatus for pulp-grinders, the cylinder provided with means for raising or returning the piston by suction on the exhaust side, and the piston-rod having a bearing only, without packing, in the box *a*, secured within a tubular boss on the under side of the support *b*, below the cylinder, substantially as described.

2. In a steam-pressure feed apparatus for pulp-grinders, the exhaust-pipe *g*, provided with a steam-jet pipe, *q*, for producing suction on the exhaust side of the piston, for raising or returning the same, substantially as described.

3. The lever-arms *l m*, connected to the valve-rods *k*, between stop-nuts *p*, allowing play of the arms for starting the valves with a blow, substantially as described.

298,876. BAILER FOR CLEANING OIL-WELLS. JAMES S. MOODY, Summit City, Pa. Filed Oct. 11, 1883. (No model.)

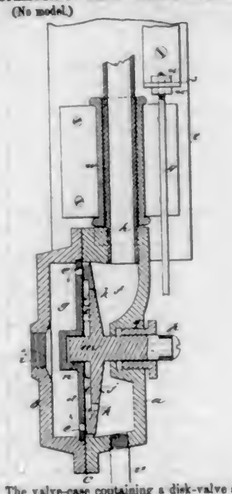


Claim.—1. An oil-well bailer having at its upper end a valve closing upwardly against its seat, and provided with a stem connected with the drill-line, whereby a sand-line is rendered unnecessary, the gas is allowed to escape, and the bailer may be entirely filled before it is drawn out of the well, as described.

2. In combination with the top of an oil-well bailer, a tubular neck, C, having a conical valve-seat at its bottom, from thence a straight bore nearly to the top, and there drawn in to fit a valve-stem, as shown and described.

3. An oil-well bailer having a valve-seat, a drop-valve, and a drill-line stem or connection, combined with a detachable screw-collar, C', as shown and described.

298,877. WARDROBE-BEDSTEAD. JOHN MORAN, Brooklyn, assignor to James L. Plimpton, New York, N. Y. Filed Apr. 24, 1883. (Model.)



Claim.—1. The folding and sliding sides constructed of an intermediate section, G, provided with a front projecting face-strip, *k*, a front section, G', hinged to said section G, within or under cover of the face-strip *k*, and the back section, G², hinged to or near the opposite edge of the intermediate section, in combination with the stationary or head part of a cabinet-bedstead, the movable part, and a bed-bottom hinged to said head part, substantially as described.

2. In combination with the base A and entablature B, having grooves *m m'*, the stationary back piece, D, fixed sides C, the folding and sliding sides G G' G², the stops *n o*, and the hinged bed-bottom E, provided with a central panel-piece, *d*, substantially as specified.

3. The combination, with the base A, having ways *m m'* and stop *o*, the entablature B, having stop *o*, the fixed sides C C, and the panel *d*, having strips *r*, of folding and sliding sides formed of the sections G G' G², the front and back sections hinged to the opposite edges of the central section, and the back section provided with stops *n n*, as shown and described, whereby openings *s'* will be formed for ventilation of the bedclothes, as set forth.

298,878. STEAM-TRAP. ROBERT B. MORSE, Naugatuck, Conn. Filed Dec. 14, 1883. (No model.)

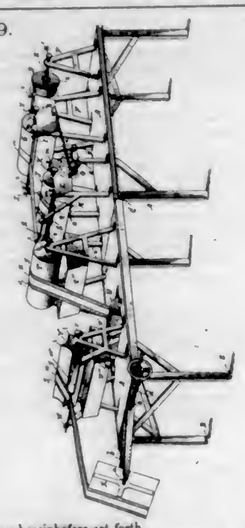
Claim.—1. The valve-case containing a disk-valve attached to the end of the steam-pipe A, and said valve having a crank-arm, *p*, outside of the case, connected to a fixed support, and causing the valve to turn for opening and closing the ports by the shifting of the case by the expansion and contraction of the pipe, substantially as described.

2. The valve-case consisting of two parts, *a b*, and having a circular valve-seat, *d*, and containing the disk-valve *j* centered in said valve-seat and in the stuffing-box, and connected by a crank-shaft or equivalent connection to a fixed support, said valve-case having chamber *f* connected to the steam-pipe A, and also having chamber *g* with a waste-pipe connection, *i*, substantially as described.

3. The improved steam-trap consisting of case *a b*, containing a disk-valve, *j*, attached to the end of the steam-pipe A, said valve having a stem, *m*, extending out through the valve-case at right angles to the pipe A, and said stem having a crank-arm also extending at right angles to the steam-pipe, and connected to a fixed object, substantially as described.

298,879. BOX COVERING AND TRIMMING MACHINE. GORDON MUNRO, Troy, N. Y., assignor, by mesne assignments, to the American Box Machine Company, of New York. Filed Mar. 13, 1883. (No model.)

Claim.—1. The described method of covering boxes, consisting in simultaneously winding upon the box a plurality of strips with their pasted sides all facing one way, and with the strips overlapping, all substantially as described.



2. An apparatus for applying simultaneously a plurality of strips to a box, consisting of a rotatable box-support, reels for the strips, pasting mechanism, and guiding mechanism for the several strips, whereby they are caused to overlap, and a suitable supporting-frame, all substantially as described, whereby the strips are pasted, overlapped, and wound upon the box, as set forth.

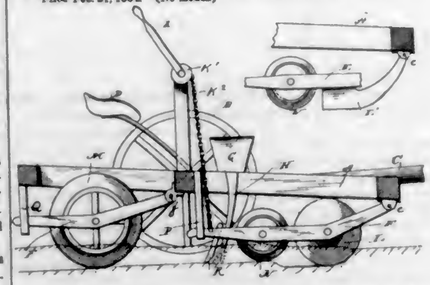
3. An apparatus for applying simultaneously a plurality of strips to a box, consisting of a suitable supporting-frame, a rotatable box-support, reels for the strips, pasting mechanism, and laterally-adjustable guiding mechanism for the several strips, all substantially as described.

4. An apparatus for applying strips to a box, consisting of a suitable supporting-frame, a laterally adjustable and rotatable box-support, reels for the strips, pasting mechanism, and guiding mechanism, all substantially as described.

5. The combination of the pasting mechanism, the tempering-rollers, and the laterally-adjustable rotary box-support, substantially as and

298,879.

for the purpose hereinbefore set forth.



6. The trimming and covering strip reels, placed one above the other and laterally adjustable with reference to one another, for the purpose of regulating the overlapping of the strips, in combination with the pasting mechanism and the tempering-rollers, substantially as and for the purposes hereinbefore set forth.

7. The combination of the pasting mechanism, the tempering-rollers, the trimming and covering strip reels placed one above the other and laterally adjustable with reference to one another, and the laterally-adjustable rotary box-support, substantially as and for the purposes hereinbefore set forth.

8. In a box-covering machine, a tempering or supporting roller for the pasted strip, fluted or ribbed for the purpose of reducing the surface with which the pasted side of the strip makes contact, substantially as hereinbefore set forth.

9. The method herein described of producing the compound covering and trimming strip from a plurality of strips in the roll, consisting in feeding the covering and trimming strips continuously along, and doring their movement first automatically applying to one side or face of each strip paste, then bringing the several strips together, with their pasted faces all on the same side, and in such position that they shall overlap one another, and finally uniting them together in this position, thus producing a compound covering and trimming strip composed of a plurality of overlapping strips, and coated on one side or face only with adhesive substance, all substantially as hereinbefore set forth.

298,880. SEED-PLANTER. JOHN RANKIN NEWTON, Carthage, Ill. Filed Feb. 21, 1884. (No model.)

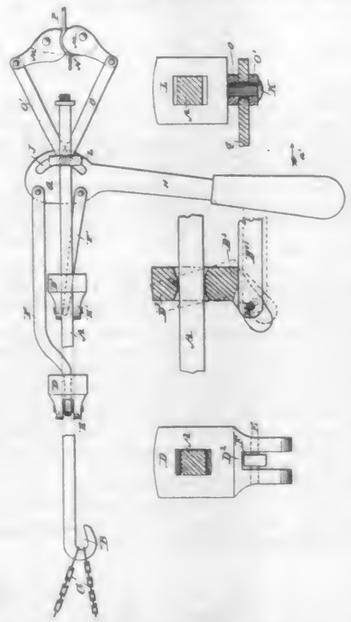
Claim.—1. The combination of a furrow-opener, a seed-bed roller, a seed-dropper, and a cover-roller, arranged in series.

2. The combination of a rolling-cutter, furrow-opener, a seed-bed roller, a seed-dropper, and a cover-roller, arranged in series, as set forth.

3. The combination of a seed-bed roller provided with a face having a large portion approximately flat, a seed-dropper, and a cover-roller, arranged in series.

4. The combination of a furrow-opener, a seed-bed roller, a seed-dropper, a coverer, and a cover-roller, arranged in series.

5. A seed-planter provided with a number of series of furrow-openers, seed-bed rollers, seed-coverers, and cover-rollers, each series arranged for separate self-adjusting vertical motion while held true in place laterally.



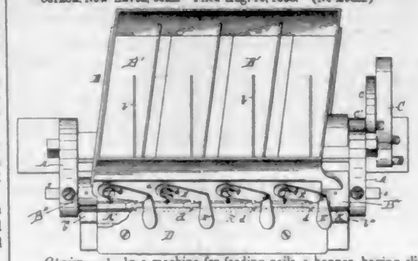
6. A grain-planter having carrying-wheels and provided with gangs of several frames bearing floating rollers, arranged in series of two—one before the other—so that both rollers are capable of rising or falling together, and to produce rolled beds above and below the seed.

7. A grain-planter having a gang of several frames held at each end from lateral motion, and bearing floating rollers arranged to run upon the covered rows while held from lateral movement, and provided with beveled sides to produce rolled ridges between the rows.

8. A grain-planter having a gang of several frames held at each end from lateral motion, and bearing separately floating rollers arranged to run one on each row, and provided with beveled sides to produce rolled ridges between the rows.

9. A grain-planter having a gang of several separate frames bearing floating rollers with beveled sides located before the seed-droppers, and arranged to form approximately level seed-beds with rolled inclined sides.

298,881. WIRE-STRETCHER. CHARLES STEPHEN OLDER and LEANDER LOWELL DEERING, Independence, Iowa. Filed May 7, 1883. (No model.)



Claim.—1. In a wire-stretcher, the combination, with the gripping device and the gravity-clutches, the latter being arranged on a bar, of the lever connected to said gripping device and clutches, and a looped bolt forming the pivot of the lever, and with its loop adapted to receive the bar upon which the gravity-clutches are arranged, substantially as and for the purpose set forth.

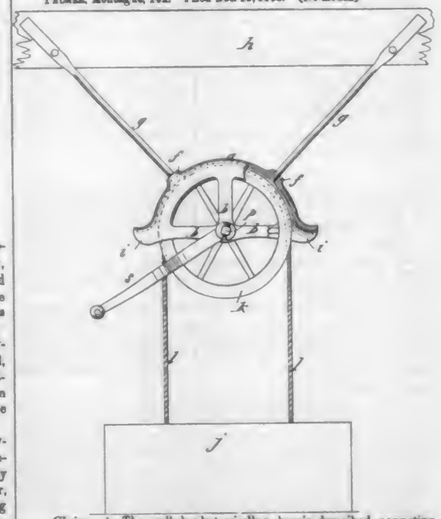
2. In a wire-stretcher, the combination, with the bar A, of the gravity-clutches having the top and bottom edges of their apertures convexed, the connecting-rods, the lever, and the gripping device, the bolt connecting the lever and the connecting-rods of the gripping device having an eye or loop through which the bar passes, substantially as and for the purpose set forth.

3. In a wire-stretcher, the combination, with the bar A, of the gravity-clutches having the top and bottom surfaces of their apertures convexed, which clutches are provided with downwardly and backwardly projecting arms, the connecting-rods, the gripping device, and the lever, the bolt connecting the lever and the connecting-rods of the gripping device having an eye or loop through which the bar A passes, substantially as and for the purpose set forth.

298,882. NAIL-FEEDER FOR NAILING-MACHINES. HENRY P. OSTRUM, New Haven, Conn. Filed Aug. 10, 1883. (No model.)

Claim.—1. In a machine for feeding nails, a hopper having slits for feeding the nails cut at an oblique angle to the walls of the hopper, as set forth.

2. In a nail-feeder, the combination, with the tilting nail-feeding hopper, of a receiving-plate, and means, substantially as described, for bringing the hopper and plate together when the hopper is tilted forward and separating them when the hopper is tilted back, and a throw-off rod for removing the nails from the receiving-plate when the hopper is tilted back, as set forth.

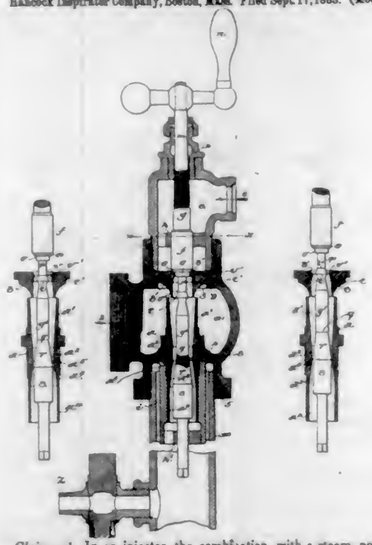


3. In a nail-feeder, the gate E, pivoted to the tilting hopper and operated thereby, and provided with the wing E', adapted to bear upon the receiving-plate, substantially as set forth.

4. In a nail-feeder, the combination of the tilting hopper having slits in its bottom for guiding the nails, and provided with projecting tongue or tongues b^*, with a receiving-plate and a swinging support therefor, and spring or springs D^2, substantially as set forth, whereby the plate is drawn toward the hopper when the latter is tilted up and forced away from it when the hopper is tilted back.

5. In a nail-feeder, the combination, with the tilting feeding-hopper D, provided with slits *b*, and the receiving-plate D, and means for operating them, of the gates E, provided with the wings E', by means of which the gates are raised when the hopper is tilted up, and pins e^*, which bear upon a nail or two in the mouth of each slit *b* when the hopper is tilted back and holds them in readiness for delivery.

6. The combination of the feeding-hopper B, having the teats b', and the slits *b*, cut into the bottom of the hopper and through the teats b', with the receiving-plate D, provided with the shoes D^3, cut away on one side, into which open side of the shoes the teats b' project, whereby the nails are guided directly into the shoes, substantially as set forth.



298,883. WELL-BUCKET WINDLASS. WILLIAM WASHINGTON PALMER, Montague, Tex. Filed Dec. 18, 1883. (No model.)

Claim.—1. The well-bucket windlass herein described, consisting of the pulley supporting-frame *a b*, screw-threaded rods *g g*, shaft *d*, a pulley mounted on the shaft within the pulley-frame and held to revolve with the said shaft, and a suitable crank on said shaft, substantially as set forth.

2. The combination of the pulley and its supporting-frame, with the shaft *d*, formed with a key, *m*, groove *q*, collar *o*, and squared portion *p*, the wire ring *t*, and a suitable crank, substantially as set forth.

298,884. INJECTOR. WILLIAM B. PARK, Taunton, assignor to the Hancock Inspirator Company, Boston, Mass. Filed Sept. 17, 1883. (Model.)

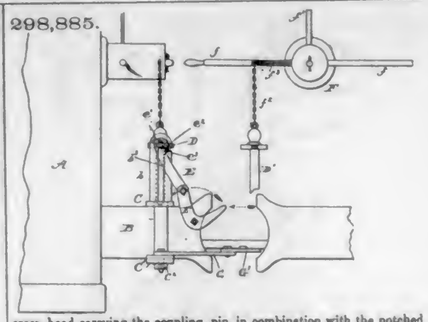
Claim.—1. In an injector, the combination, with a steam-nozzle, combining-tube, and delivery-tube, of a controlling-spindle movable longitudinally within such nozzle and tubes, and having a contour relative to the interior surfaces of such nozzle and tubes, as described, whereby when the spindle is moved the area of the throat at the junction of the combining and delivery tubes is decreased in proportion as the area for the inlet of steam at the nozzle is increased, and vice versa, substantially as and for the purpose described.

2. In an injector, the combination, with a steam-nozzle, combining-tube, and delivery-tube, and a controlling-spindle movable longitudinally within such nozzle and tubes, of an overflow-cock located between the discharge end of the delivery-tube and the check-valve in the pipe leading to the boiler, substantially as described.

3. In an injector, the combination, with a steam-nozzle, combining-tube, and delivery-tube, of a controlling-spindle movable longitudinally within such nozzle and tubes, and a guide, A', therefor, located at or near the lower end of the said spindle, whereby the latter is maintained in accurate concentric position within the injector, substantially as described.

4. In an injector, the combination, with a steam-nozzle, combining-tube, and delivery-tube, of a controlling-spindle of larger diameter near its ends than between said ends, made in two portions and fastened together within the injector, substantially as and for the purpose described.

5. In an injector, in combination with the steam-nozzle having an expanding bore, *v' t'*, a combining-tube, and the delivery-tube d^3, the controlling-spindle movable within said nozzle and tube, having the tapering enlargements *v*, *t*, and *r*, whereby the spindle may be adjusted to increase or decrease the quantity of water forced, substantially as shown and described.



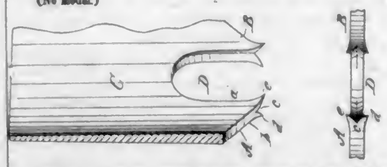
298,885. CAR-COUPLING. THOMAS PEACOCK, Auburn, and THEODORE WALLER, Scipio, N. Y. Filed Oct. 19, 1883. (No model.)

Claim.—1. The combination, with the draw-head, of the jointed arm or toggle-link, connected at one end through a sliding cross-head with the coupling-pin, and provided at its opposite end with a forward projection for adapting the arms to be tripped by an opposing draw-head, substantially as described.

2. The draw-head provided with the guideways for supporting the cross-head, in combination with the jointed arm or toggle-links for holding the cross-head, and with it the coupling-pin, in an elevated or suspended position, substantially as and for the purpose set forth.

3. The draw-head provided with the guideways for supporting the

298,885.



cross-head carrying the coupling-pin, in combination with the notched arm for engaging the pin or stud formed upon the standard for locking or holding the cross-head, and with it the coupling-pin, in its elevated position, substantially as and for the purpose set forth.

4. The cross-head carrying the coupling-pin mounted in the upright guideways, in combination with the windlass or chain wheel, provided with operating-arms for raising the cross-head, and with it the coupling-pin, into its elevated or suspended position, substantially as and for the purpose described.

5. The draw-head provided with the slotted standard, the sliding cross-head mounted thereon, and the toggle-link, in combination with the windlass or chain wheel for raising said cross-head and extending the toggle-link, substantially as and for the purpose set forth.

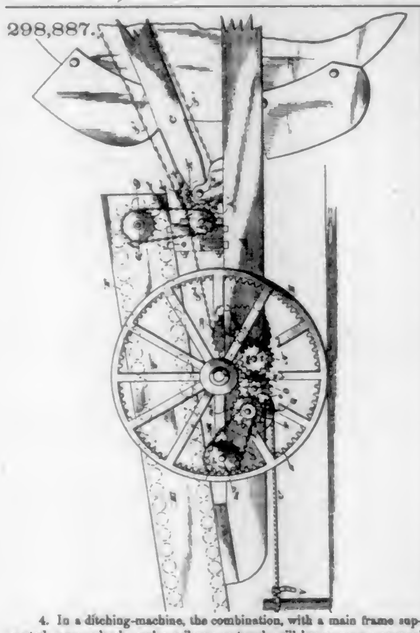
6. The combination, with the draw-head, of the pivoted jointed link-holders, arranged and operating substantially as and for the purpose set forth.

298,886. SAW. WALTER PEAK, Peakville, N. Y. Filed Apr. 2, 1884. (No model.)

Claim.—1. A saw-tooth substantially vertical upon its forward edge, having its back edge inclined at an angle of forty-five degrees, more or less, to the forward edge, having a groove formed in the said forward edge, and having the points formed by the back edge of the tooth and the V groove reversely swaged outwardly, substantially as shown and described.

2. A saw-tooth made integral with a saw-blade, having a groove formed in its forward edge, and two cutting-points swaged outwardly and oblique to each other and to the plane of the saw-blade, both points being in the same plane at right angles to the plane of the saw-blade, substantially as shown and described.

298,887. DITCHING-MACHINE. FAWCETT PLUMB, Streator, Ill. Filed Feb. 1, 1884. (No model.)



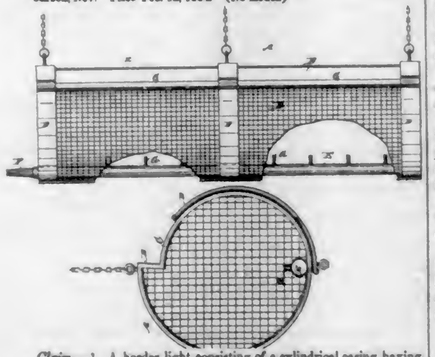
Brief.—On the wheeled frame of a ditching-wheel is mounted a tread-mill horse-power driving the ditcher-wheel and propelling the machine through gearing engaging the riding-wheel rim and a drum winding a propelling-rope.

Claim.—1. In a ditching-machine, the combination, with an excavator, of a railway or tread-mill horse-power combined with the supporting-frame of the excavator, and mechanism for transmitting motion from the horse-power to the excavator and propelling-wheel of the machine.

2. In a ditching-machine, the combination, with a rotary excavator, of a railway or tread-mill horse-power, combined with the supporting-frame of the excavator, and mechanism for transmitting the motion of the horse-power to the excavator and propelling-wheel, substantially as set forth.

3. In a ditching-machine, the combination, with a main frame supported upon wheels, and a railway or tread-mill horse-power secured upon the main frame, of a driving mechanism constructed to engage one of the supporting-wheels, and mechanism constructed to transmit the motion of the horse-power to the driving mechanism, substantially as set forth.

298,887.

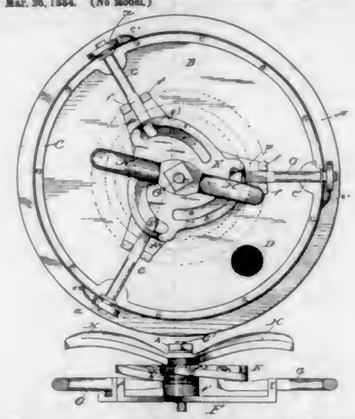


4. In a ditching-machine, the combination, with a main frame supported upon wheels, and a railway or tread-mill horse-power secured upon the main frame, of a toothed rim attached to one of the supporting-wheels, and mechanism constructed to transmit the motion of the horse-power to the toothed rim, substantially as set forth.

5. In a ditching-machine, the combination, with a main frame supported upon wheels, and a railway or tread-mill horse-power secured upon the main frame, of a drum and cable, and mechanism constructed and arranged to transmit the motion of the horse-power to the drum and cable, substantially as set forth.

6. In a ditching-machine, the combination, with a main frame supported upon wheels, and a railway or tread-mill horse-power secured upon the main frame, of a supporting-wheel provided with teeth, a drum constructed to wind a cable, and mechanism constructed to transmit the motion of the horse-power to the wheel and drum simultaneously, substantially as set forth.

298,888. BORDER-LIGHT FOR THEATERS. JOHN T. PRESDON, Carson, Nev. Filed Feb. 12, 1884. (No model.)



Claim.—1. A border-light consisting of a cylindrical casing having a wire-netting part, and provided in its top with a longitudinal offset which is open, substantially as herein shown and described.

2. In a border-light, a cylindrical casing having a wire-netting front and an open offset in its top, in front of which offset a reflector is secured to the inner surface of the casing, substantially as herein shown and described.

3. In a border-light, the combination, with a cylindrical casing having an offset in its top, of a reflector held on the inner surface of the casing in front of the offset, and of a hinged door or section, D, made of wire-netting, in front of the mirror, substantially as herein shown and described.

298,889. CHURN-COVER. JOHN G. PRITCHARD, Poultney, Vt. Filed Mar. 26, 1884. (No model.)

Claim.—1. In a cover for churns, barrels, and other vessels, the combination, with radial locking-arms, of a compound cam adapted to reciprocate the same vertically and radially, substantially as specified.

2. In a cover of the class described, a compound cam having vertical cam-grooves the boundary walls or rims of which are inclined, whereby said walls or rims effect a vertical and radial movement of the locking-arms, substantially as specified.

3. In combination with a cam having vertical cam-grooves a wall of each of which is inclined, as described, a radial locking-arm the inner end of which is constructed to pass through the vertical cam-grooves, and to embrace or partly inclose the inclined wall of said groove, substantially as specified.

4. In combination with a compound cam, a radial locking-arm having an inner end constructed to project into a cam-groove, and to embrace or partly embrace a wall of said groove, a cover constructed to form a fulcrum, and a head-ring provided with ears, substantially as shown and described.

5. The combination, with a head-ring having a series of closed ears, of a cover provided with locking-arms, and a compound cam constructed and operating, as described, to reciprocate the outer end of the locking-arms into and upwardly against the openings in said ears, substantially as specified.

6. The combination of the head-ring A, the cover B, provided with fulcrums c', and base F, having lugs f and hub f', compound cam E, having the cam-grooves e, bounded by an inclined rim, e', of locking-arms G, having projections g^3, and means for operating the cam, substantially as shown and described.

7. The combination of the base having the hub f', cover B, the cam E, handle H, bolt G', and washers f^2, and head-ring A, having ears a and locking-arms G, substantially as and for the purpose set forth.

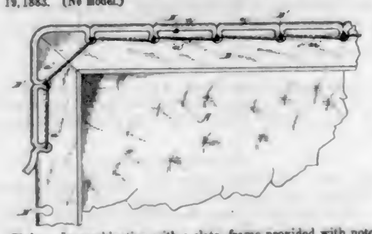
8. In combination with a compound cam, a radial locking-arm having an inner end constructed to project into a cam-groove, and to embrace or partly embrace an inclined wall of said groove, a cover constructed to form a fulcrum, and a head-ring provided with ears, substantially as specified.

9. The combination of the cam E, the arm G, the base F, the washers f^2, handle H, and nut h, substantially as and for the purpose specified.

10. The combination of the base-plate F, having the lugs f, the locking-arms G, having the portions g' adapted to pass between said lugs, and the portions g^3 g^3 at its inner end, with a cam having vertical slots or grooves the outer walls or rims of which are inclined, substantially as shown and described.

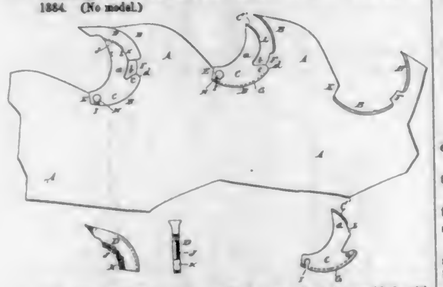
298,890. INCUBATOR. JAMES RANKIN, South Easton, Mass. Filed July 6, 1883. (No model.)

Claim.—1. In an incubator, the combination, with the heating-tank c, having float-well t, the float s in said well, provided with the stem s', and the heating-lamps k, of the lever p, pivoted in a support on the upper part of the case and resting upon the stem of the float, the tubular regulators l, fitted to the wick-tubes of the lamp, and the connecting-rods m n o, substantially as herein shown and described.



298,890.

2. In an incubator, the combination, with the heating-tank c, having float-well t, and the incubating-chamber having ventilating-tubes v, of the lever p, having its free end connected to a flame-regulator and provided with the arm y, the float s in said well, the valves u in the ventilating-tubes, and the rod w, journaled in the ventilating-tubes and provided with the crank x, substantially as herein shown and described.

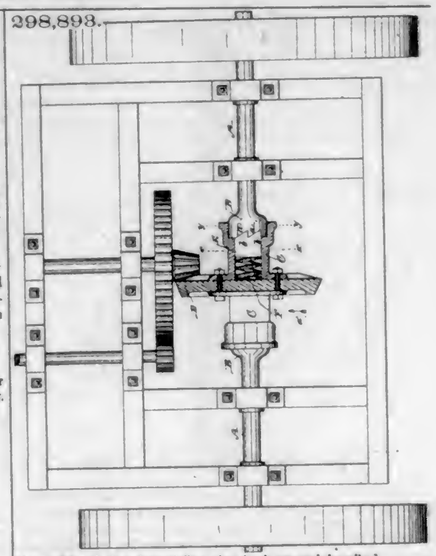


3. In an incubator, the combination, with the heating-tank c, having float-well t, the incubating-chamber having ventilating-tubes v, and the lamps k, of the flame-regulators l, the connecting-rods m n o, the lever p, provided with the arm y, the float s, and the rod w, journaled in the ventilating-tubes, substantially as herein shown and described.

298,891. NOISELESS SLATE. JOSEPH RIDER, Chicago, Ill., assignor to Augustus Warner and John H. Beers, both of same place. Filed Nov. 19, 1883. (No model.)

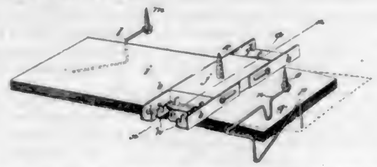
Claim.—In combination with a slate-frame provided with notches or recesses, the strip a, conforming to the indented edge of said frame, and the binding-cord a', drawn directly from notch to notch, substantially as and for the purpose set forth.

298,892. INSERTIBLE SAW-TOOTH. WILLIAM B. RIDDON, Trenton, N. J., assignor to the American Saw Company, same place. Filed Feb. 18, 1884. (No model.)



Claim.—The combination, with the saw-plate A, provided with the recess B, having the shoulder E, projection F, and recess d, of the bit-holding spring C, provided with the tongue a, having the rounded edge C' and flattened part L, the slit I and the toe c, and secured in the said recess between the shoulder and projection, with its toe in the recess of the said projection, by rivet H, and the bit D, provided with the groove J and the flattened part K, substantially as herein shown and described, whereby the bit-holding spring will be firmly held in the recess of the blade and the bit held in place by the said spring, thereby permitting the bit to be inserted and removed without removing the spring, as set forth.

298,893. MEANS FOR TRANSMITTING MOTION. WALTER A. ROLLINS, Wyattville, County of Surrey, England. Filed Mar. 7, 1884. (No model.)



Claim.—1. In a device for transmitting motion, the combination, with a shaft having ratchet-teeth on its end, of a tubular bar, into which the end of the shaft projects on the other part of the machinery, and a spring-pressed block in said tubular bar, having ratchet-teeth engaging those of the shaft, substantially as herein shown and described.

298,893.

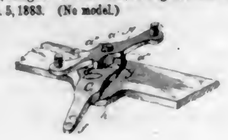
2. In a device for transmitting motion, the combination, with the shaft A, provided with the enlargement B, having ratchet-teeth a, of the wheel D, provided with the hollow boss C, the sliding block E, provided with ratchet-teeth b, and the spring F, substantially as herein shown and described.

298,894. BAG-HOLDER. HERBERT R. ROYSTON, Chicago, Ill. Filed Oct. 18, 1883. (No model.)

Claim.—1. The improved bag-holder constructed of a base, a, and elastic band e, in combination, substantially as described.

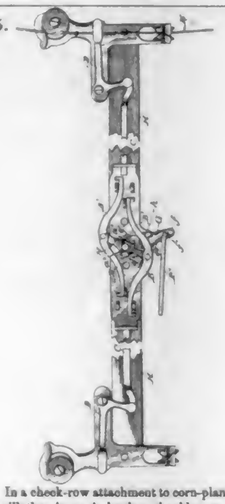
2. The combination of base a, having flanges b and slots c' f, with the elastic band e and connecting-pins d, substantially as described.

3. The combination of the base a, having flanges b, slots c' f, and the series of notches h, with the elastic band e and fastening-pins d, substantially as described.



4. The combination of the base a, having flanges b and slots c' f, and being made in two sections, with the connecting-block j, elastic band e, and the fastening-pins d, substantially as described.

5. The combination of the bag-supporting arm l, with the bag-holder, consisting of base a and the elastic band e, constructed and arranged as described.



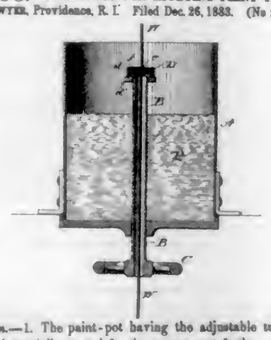
6. The end stop, p, in combination with the bag-holder, consisting of base a and elastic band e, substantially as described.

7. The combination of the end stop, p, and the top presser, q, with the bag-holder, consisting of the base a and elastic band e, substantially as described.

298,895. CORN-PLANTER CHECK-ROWER. WILLIAM B. RIDDLE, Decatur, Ill., assignor to Chambers, Bering Quinlan Company, same place. Filed Oct. 5, 1883. (No model.)

298,895.

Claim.—1. In a check-row attachment to corn-planters, in combination with the oscillating lever A, having shoulders *a a''*, the auxiliary lever G, having limbs *g g'*, adapted to receive motion alternately from the shoulders *a*, and to act alternately on the shoulders *a''* as stops, and to transmit motion through suitable mechanism to the planter seed-slides, substantially as and for the purpose specified.



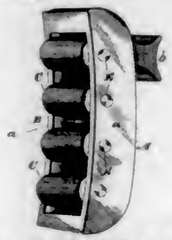
2. In combination with the rocking lever A, which receives motion indirectly from the forked levers D, and has lateral shoulders *a''*, the lever G, arranged between the lever A and mechanism connected with the planter seed-slides, and provided with limbs *g g'*, adapted to receive motion from the lever A, and to act alternately on the shoulders *a''* as stops, substantially as and for the purpose specified.

3. In combination with the tappet-wire E, forked lever D, push-bars C and B B', and rocking lever A, the auxiliary lever G, adapted to receive motion from the lever A, and its arms *g g'*, to act alternately on the shoulders *a a''* as stops, substantially as and for the purpose specified.

4. In combination with the forked lever D, push-bars C and B B', and rocking lever A, having shoulders *a a''*, the auxiliary lever G, having limbs *g g'*, adapted to coact with the shoulders *a a''*, substantially as and for the purpose specified.

5. In combination with the push-bars C and B B' and rocking lever A, the auxiliary lever G, provided with stops, and adapted to receive motion from and to the motion of the lever A, and to impart movement to the planter seed-slides, substantially as and for the purpose specified.

298,896. APPARATUS FOR APPLYING PAINT TO WIRE. WM. H. SAWYER, Providence, R. I. Filed Dec. 26, 1883. (No model.)

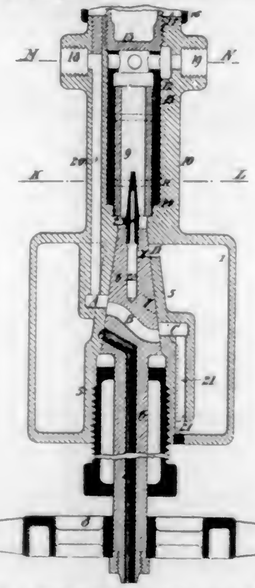


Claim.—1. The paint-pot having the adjustable tube through its bottom, substantially as and for the purpose set forth.

2. The combination, with the pot having a screw-threaded aperture in its bottom, of the correspondingly-threaded tube fitted through said aperture, substantially as described.

3. The combination, with the pot and the adjustable tube through its bottom, of the removable and replaceable head for the tube, substantially as described.

4. The combination, with the pot adapted to hold a paint or coloring-liquid, and the adjustable tube projecting into said pot and forming a wire-passage, of the two-part head attached to the inner end of the tube, and arranged to receive between its two parts a packing to hug the wire and prevent escape of liquid into the tube, substantially as described.

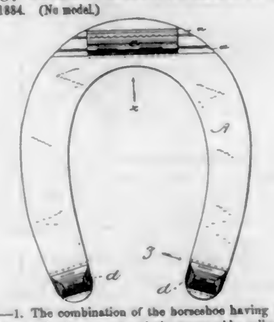


298,897. BRAKE-SHOE. GEORGE N. SCHEIB, Evansville, Ind. Filed Feb. 23, 1884. (No model.)

Claim.—1. The combination, with the body or shoe having a recessed front face, of a series of friction-rollers set into said recessed face, and adapted to simultaneously bear against the wheel, and the axles or arbors E, the opposite ends of which are secured in the side walls of the shoe, substantially as set forth.

2. The combination, with the body or shoe having a series of cavities formed in the front face thereof, of a friction-roller for each cavity, and an axle for holding the roller within its cavity, the ends of the said axles being secured in the side walls of the shoe, substantially as set forth.

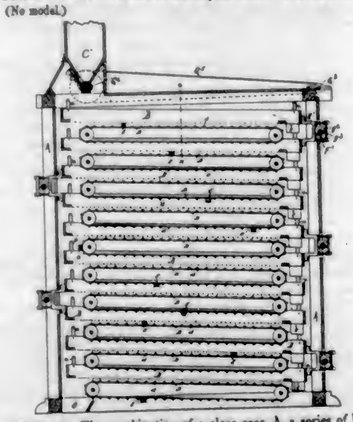
298,898. SIGHT-FEED LUBRICATOR. WILLIAM A. G. SCHONHEYDER, Shepherds Bush, County of Middlesex, assignor of one-half to Harry Olrick, London, England. Filed Jan. 30, 1884. (No model.) Patented in England Sept. 5, 1883, No. 4,275.



Claim.—1. A sight-feed lubricator consisting of a reservoir provided with condense-water inlet, and having a cock-casing and cock provided with index and pointer, the said cock being formed with a water-outlet and with an outlet for the oil, to a glass sight-tube communicating with the reservoir, and with the oil feed-pipe to the engine, the cock and casing being formed with ports and passages for putting the oil in the reservoir in communication with the oil-outlet, for putting the water in the reservoir in communication with the water-outlet or with the condense-water inlet, and for closing the cock toward the interior of the reservoir, means being also provided for letting air into the reservoir and for charging it with oil, substantially as and for the purposes set forth.

2. In a sight-feed lubricator, the reservoir 1, with cock-casing 5 and cock-plug 6, provided with index and pointer, and having water-outlet 24 and outlet 22 23 for the oil, which enters a glass sight-tube, 9, arranged in a neck continuation, 10, of the reservoir 1, and communicating with the oil-feed outlet 19 to the engine, the said neck continuation 10 being provided with condense-water inlet 18 and passage 20, the cock 6 and casing 5 being formed with ports and passages A B C, for admitting condense water to the reservoir-ports D and E for discharging the oil from the reservoir to the sight-tube 9 and outlet 19, passage F, for admitting water from the passage A into the glass sight-tube to clean it, and the passage G, for discharging the water from the reservoir into the water-outlet 24, the reservoir being provided with screw-stopper 2, for letting air into the reservoir and for charging it with oil, substantially as described.

3. In lubricators, the stopper 2 with spindle continuation, having enlarged screwed end 3, in combination with a correspondingly-screwed lug, 4, in the lubricator, substantially as and for the purposes set forth.

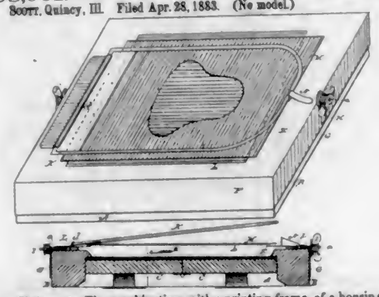


298,899. HORSESHOE. HOWARD B. SCHUREMAN, Newark, N. J. Filed Feb. 12, 1884. (No model.)

Claim.—1. The combination of the horseshoe having the parallel and oppositely-inclined grooves, and the removable calks having the ridges reciprocally inclined and parallel, substantially as set forth and shown.

2. The horseshoe having oppositely-inclined grooves therein, and having calks with oppositely-projecting ridges secured to said shoe, substantially as herein set forth and shown.

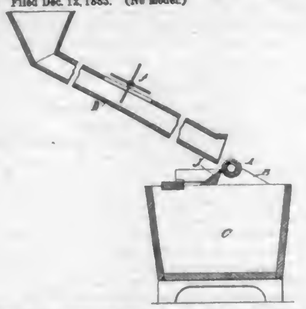
298,900. MACHINE FOR GRADING AND PURIFYING MIDDLINGS. JOH. MARTIN SCHUTZ, Minneapolis, Minn. Filed Sept. 10, 1883. (No model.)



Claim.—1. The combination of a close case, A, a series of bolting-screens, B B, suspended in the case, and increasing in fineness from the uppermost to the lowermost, means for agitating the screens, and endless belts D D under the several screens, and provided with slots *d d* and brushes E E, substantially as specified.

2. The combination of a purifying-case, H', divided by partitions H^2 H^3 into compartments, separate fans M' M', connected with different compartments of the case, ratchet-faced plates K' K' in the several compartments, and means for agitating the said frames, for the purpose specified.

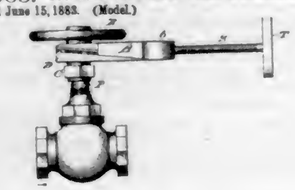
3. The combination of a series of shaking-screens successively increasing in fineness from the uppermost to the lowermost, means for conveying the screenings from one screen to another, separate means for conveying the tailings of the several screens, separate purifying-chambers ratchet-surfaced shaking-frames in the respective purifying-chambers, and a series of fans communicating separately with the purifying-chambers, substantially as herein specified.



298,901. PRINTING AND VIGNETTING FRAME. OLIVER PERRY SCOTT, Quincy, Ill. Filed Apr. 28, 1883. (No model.)

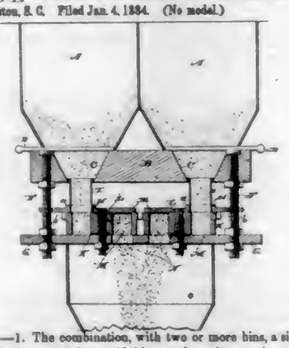
Claim.—1. The combination, with a printing-frame, of a housing or vignetting attachment fitting over said frame, and adapted to be vertically adjusted thereon, having the central opening and the skeleton frame, the said wire frame being attached to the housing and operating to hold the paper, substantially as described.

2. In combination with a printing-frame, a vignetting attachment consisting of a housing fitting over said frame, and provided with a central opening, slotted sides, and thumb-screws for the adjustment of the attachment, the skeleton frame for holding the paper in place, and the spring or springs beneath the said vignetting attachment, to force it upward from the frame, substantially as described.



298,902. MACHINE FOR MAKING GREEN-SAND CORES. JAMES SOULL, Jersey City, N. J., assignor to himself and Samuel Vance, same place. Filed Dec. 12, 1883. (No model.)

Claim.—1. The combination, in a core-forming machine, of a support for a revolving mandrel, a guide-tube, and a wheel revolving with its blades projecting into said tube, to project green sand through said tube directly upon the mandrel, substantially as specified.



2. The combination of the mandrel, guide-tube, and means for projecting the sand through the tube against the mandrel, substantially as described.

298,903. STUFFING-BOX JACK. ALLEN R. SEAMAN, Astoria, N. Y. Filed June 15, 1883. (Model.)

Claim.—The combination, in a stuffing-box jack, of two blocks or forks, A D, having inclined or wedge-shaped surfaces where the one rests upon the other, lip-pieces, and grooves to connect the one fork or block with the other, and a screw passing through the head piece or yoke of one of the forks and acting upon the head piece or yoke of the other fork, substantially as set forth.

298,904. MACHINE FOR MIXING GRAIN. JOHN L. SHEPPARD, Charleston, S. C. Filed Jan. 4, 1884. (No model.)

Claim.—1. The combination, with two or more bins, a single commingling-bin located below said bins, and an intervening plate constructed to allow of the passage of grain from the bins through the plate and into the commingling-bin, of wheels or rotary carriers situated over said plate, and constructed and arranged to convey the grain from the exit-opening of the bins and discharge it into the commingling-bin, substantially as set forth.

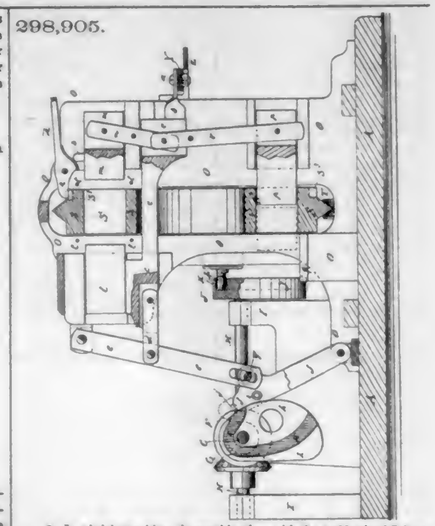
2. The combination, with two or more bins, a single commingling-bin located below said bins, and an intervening plate constructed to allow of the passage of the grain from the bins through the plate and into the commingling-bin, of wheels or rotary carriers constructed with a series of receptacles arranged to register with the discharge-openings of the upper bins and the openings in the intervening plate, substantially as set forth.

3. The combination, with two or more bins, the bottoms of which are provided with openings, of plates provided with openings registering with those of the bins, two or more wheels located under said plates and provided with openings, and a plate under said wheel provided with central openings through which the grain falls, substantially as set forth.

4. The combination, with two or more bins, provided at their bottoms with openings, of plates E, located below the bins and also provided with openings, a plate located below said plates E and provided with openings, and wheels meshing with each other and provided with openings adapted to simultaneously discharge the grain through the openings in said latter plate, substantially as set forth.

5. The combination, with two or more bins provided with openings at their bottoms, of plates E, plate G, wheels pivoted to the plate G and provided with grooves K′, and with openings adapted, when revolved, to simultaneously discharge the grain through the plate G, tubes connecting the bins with openings in the plates E, and slides to cut off the supply of grain from the bins, substantially as set forth.

6. In a machine for mixing grain, &c., the combination, with two or more bins and two or more discharging-wheels situated below said bins, of a commingling-bin provided with the shelves R and T and the shelves S, all of the above parts combined as described.



7. The combination, with two or more bins, of a lower common bin provided with inclined shelves or mixers, and intermediate mechanism for discharging said grain from the upper bins in desired proportions into and from the said lower bin, substantially as set forth.

298,905. BRICK-MACHINE. WILLIAM STEWART SMITH, Dayton, Ohio. Filed Nov. 26, 1883. (No model.)

Claim.—1. A brick-machine constructed substantially as herein shown and described, and consisting of a wheel provided with mold-openings, a cam-driven pawl for revolving the mold-wheel intermittently, and a series of plungers entering the mold-openings from opposite sides of the wheel, and worked by cam-driven levers connected by a bar passing through a central opening in the wheel, whereby the mold-openings will be filled with clay, the clay pressed into bricks, and the pressed bricks discharged from the wheel automatically, as set forth.

2. In a brick-machine, the wheel S, made, substantially as herein shown and described, with mold-openings S′, and provided with recesses S′ S′ upon the side parts of its rim, to receive the operating-pawl R and the locking-latch *r*, and having the middle part of its rim V-shaped to engage grooved supporting-rollers F, as set forth.

298,905.

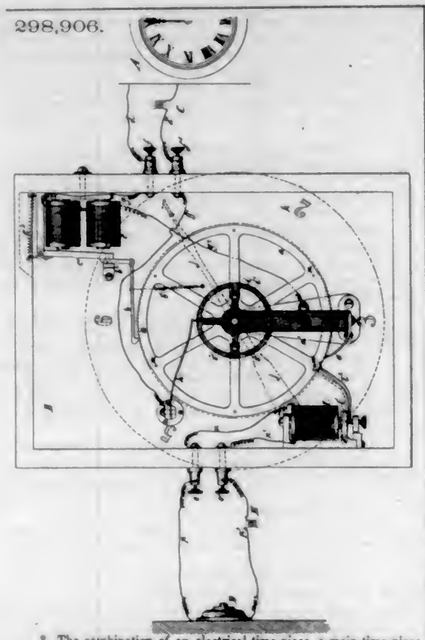
3. In a brick-machine, the combination, with the mold-wheel S, having rim-recesses S′, of the cam J K and its driving mechanism, the sliding plate M, having pin L and bolt Q, and the pawl R, substantially as herein shown and described, whereby the said wheel will be revolved with an intermittent movement by the continuous revolution of the driving mechanism, as set forth.

4. In a brick-machine, the combination, with the mold-wheel S, of the cam *h k* and its driving mechanism, the levers *f e n*, connected to the sliding bar *c*, and the plungers *l m*, substantially as herein shown and described, whereby the said plungers will be moved forward and back intermittently by the continued revolution of the driving mechanism, as set forth.

5. In a brick-machine, the combination, with the feed-hopper V, the mold-wheel S, and the sliding bar *c*, the levers *e f*, the cam *h k*, and its driving mechanism, of the plunger W, the lever Y, and the fulcrum-bar Z, substantially as herein shown and described, whereby the feed-plunger will be operated from the mechanism that operates the pressing-plungers, as set forth.

6. In a brick-machine, the combination, with the mold-wheel S, the sliding bar *c*, connected to the levers *e f*, the cam *h k*, and its driving mechanism, of the lever *e* and the plunger *p*, substantially as herein shown and described, whereby the discharge-plunger will be operated from the mechanism that operates the pressing-plungers, as set forth.

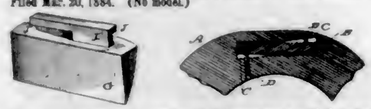
7. In a brick-machine, the combination, with the mold-wheel S, having rim-recesses S′, and the plunger *m*, having pin *s*, of the latch *r*, substantially as herein shown and described, whereby the said mold-wheel will be locked in position and released automatically, as set forth.



8. In a brick-machine, the combination, with the mold-wheel S, the pressing-plungers *l m*, and the frame O, of the guide-rods *t*, the scrapers *u*, the rods *v w*, the lever-pawl and spring *x y*, the trip-rod *z*, and the arm, cord, and weight 3 2 1, substantially as herein shown and described, whereby adhering clay will be scraped automatically from the faces of the said mold-wheel and plungers, as set forth.

298,906. WATCHMAN'S ELECTRIC TIME-DETECTOR. CHRISTIAN G. SPENGLER, Hoboken, N. J., assignor to the Electric Patrol Indicator Company, of New York. Filed Sept. 1, 1883. (No model.)

Claim.—1. The combination of an electrical time-piece, a main time-piece controlling the operation of the electrical time-piece, means for breaking at desired periods the electric circuit which extends between the electrical time-piece and the main time-piece, and mechanism adapted to be operated from a distant point for the purpose of re-establishing the electric circuit which extends between the electrical time-piece and the main time-piece, substantially as specified.



2. The combination of an electrical time-piece, a main time-piece controlling the operation of the electrical time-piece, the contact-piece *h* and wheel *i*, provided with pieces of insulating material, *i′*, for breaking the electric circuit which extends between the electrical time-piece and the main time-piece, and mechanism adapted to be operated from a distant point for the purpose of shifting the wheel *i* to remove one of its pieces of insulating mateial beyond the reach of the contact-piece *h*, substantially as specified.

298,906.

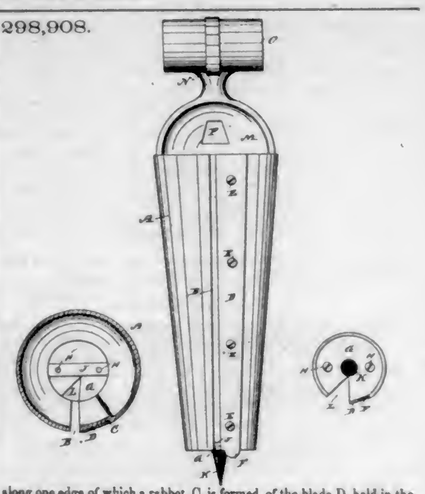
3. The combination of an electrical time-piece, a main time-piece controlling the operation of the electrical time-piece, means for breaking at desired periods the electric circuit which extends between the electrical time-piece and the main time-piece, and electro-magnetic mechanism adapted to be operated from a distant point for the purpose of re-establishing the electric circuit which extends from the electrical time-piece to the main time-piece, substantially as specified.

298,907. HORSESHOE. GEORGE E. SPRINKLE, South Whitley, Ind. Filed Mar. 20, 1884. (No model.)

Claim.—1. The combination, with a horseshoe provided at the toe and heel points with diagonal recesses having wedge-shaped extensions, of the calks provided with shanks having corresponding wedge-shaped extensions, substantially as herein described, and for the purpose shown and specified.

2. The combination of a horseshoe having diagonal recesses at the toe and heel points, provided with wedge-shaped extensions, and having screw-holes registering with the unextended portions of said recesses, the calks having shanks provided with wedge-shaped extensions, and suitable binding or fastening screws, substantially as set forth.

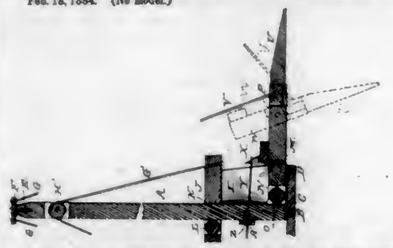
3. The herein-described calks for horseshoes, constructed with shanks the upper ends of which are provided with oppositely-extending wedge-shaped lugs or extensions, substantially as and for the purpose shown and specified.



298,908. BUNG-BORER. GUSTAV A. STANGER, Chester, Conn. Filed Feb. 8, 1884. (No model.)

Claim.—1. A bung-borer consisting of a tapering casting provided with a longitudinal slot, at one edge of which the cutting-blade is held, and with a bottom plate having an aperture, one edge of which is a cutting-edge, substantially as described.

2. The combination, with the tapering casting A, having a longitudinal slot, B, of the blade D, held on one edge of the slot B, and provided at its lower end with a sharp-edged projection, F, the bottom plate, G, having an aperture, one edge of which is a cutting-edge, and of the gimlet-pointed screw K, projecting downward from the middle of the plate G, substantially as herein shown and described.



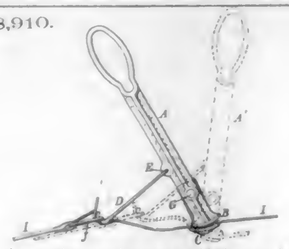
3. The combination, with the tapering casting A, having a slot, B, along one edge of which a rabbet, C, is formed, of the blade D, held in the rabbet, the bottom plate, G, having an aperture, L, and the gimlet-pointed screw K on the bottom of the plate G, substantially as herein shown and described.

298,908.

4. The combination, with the tapering casting A, having a rounded part, M, and a ring or loop, N, and a longitudinal slot, B, of the blade D, held at one edge of the slot, the bottom plate, G, having an aperture, L, and of the gimlet-pointed screw K, substantially as herein shown and described.

298,909. HAY-STACKER. JOHN J. STEPHENSON, Canton, Mo. Filed Feb. 18, 1884. (No model.)

Claim.—1. The combination of the upright post, the sliding casing, pulleys journaled upon one side of the casing, the cross-bar having trunnions, the rectangular carrier pivoted on said trunnions and having horizontal teeth and upright teeth, means for raising the carrier-frame, a spring-catch engaging the rear side of the carrier, a rope for disengaging the said catch, a weight, and a cord connecting the weight and carrier and passing over the pulleys upon the side of the sliding casing, as and for the purpose shown and set forth.

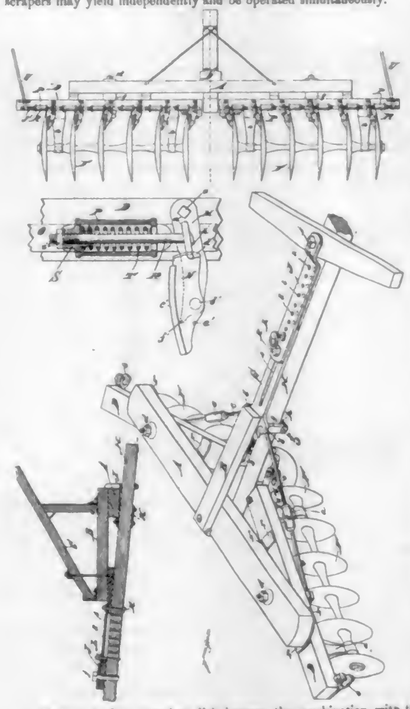


2. The herein-described hay-stacker, consisting of the upright pivoted pole having the guy-ropes, the sliding casing having the anti-friction rollers and formed with the cross-piece upon the forward end of its bottom piece, the carrier-frame pivoted upon the trunnions upon the ends of the cross-piece and having the horizontal and upright teeth, the spring-catch, the pulleys upon the side of the casing, the weighted rope, the hoisting-rope, and the capstan, all constructed and arranged as and for the purpose shown and set forth.

298,910. BELT-STRETCHER. JOHN W. I. STEVENSON, Rochester, N. Y., assignor to himself and James F. Gordon, same place. Filed July 12, 1883. (No model.)

Claim.—1. The combination, with the lever A, provided with clamping-jaw B and pivoted clamping-jaw C, of the hooks D D′, arranged to engage with the cross-bar of a buckle near its ends, substantially as and for the purposes set forth.

2. The combination, with the lever A, provided with clamping-jaw B and pivoted clamping-jaw C, of the hooks D D′, formed from one piece of metal, inserted through an opening in the lever and bent into



298,910.

suitable shape, and arranged to engage with the cross-bar of a buckle near its ends, substantially as and for the purposes set forth.

298,911. WHEEL-HARROW. E. FOWLER STODDARD, Dayton, Ohio. Filed Sept. 6, 1883. (Model.)

Brief.—Disk-gangs pivoted to main frame and connected with sliding tongue, so that their angle to line of draft will be changed by the forward and back movement of the tongue. Pivoted arm carrying a pivoted scraper which is adapted to adjust itself to surface of disk, said arm having a spring-connection with a reciprocating bar, whereby the scrapers may yield independently and be operated simultaneously.

Claim.—1. In a wheel or disk harrow, the combination, with the main frame and the wheel-gangs independently pivoted thereto, of the pole or tongue with connecting mechanism, whereby the sliding of said pole or tongue backward or forward carries the wheel-gangs and shifts their relative position from a straight line to any angle desired, or vice versa.

2. In a wheel or disk harrow, the combination, with the main frame and the wheel-gangs independently pivoted thereto, of the backwardly and forwardly sliding pole or tongue extending back between the adjacent ends of the gang-beams, and united thereto by adjustable connections, whereby the sliding of the pole in one direction will cause the wheel-gangs to be shifted from a straight line to a forward angle, or from a rearward angle to a straight line, and vice versa, as desired.

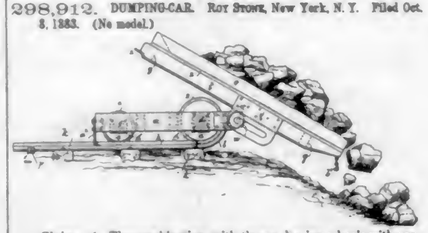
3. In a wheel or disk harrow having a main frame with independently-pivoted wheel-gangs, the tongue or pole working through fixed guides secured to the main frame and adjustably connected to the adjacent ends of the gang-beams, and provided with a series of perforations, in combination with a slotted plate or coupling secured to the main frame, a superimposed perforated plate, and a removable coupling-pin adapted to pass through said perforations and the slot in the coupling-plate, whereby the forward adjustment or play of the pole can be regulated at will to shift the wheel-gangs by the driver from his seat on the machine, as set forth.

4. In a wheel or disk harrow having a sliding pole or tongue for adjusting the wheel-gangs simultaneously from a straight to an angling position, or vice versa, the combination, with said pole of a stop for limiting the backward play of said pole, substantially as described.

5. In a disk-harrow having a sliding pole or tongue for adjusting the wheel-gangs simultaneously from a straight to an angling position, or vice versa, the main frame of the machine consisting, essentially, of the draft-beam A, cross-beam B, and brace-rods C, extending from the forward end of the beam B to the pivotal axes of the gang-beams, substantially as described.

6. In a wheel or disk harrow, the combination, with one or more series or gangs of harrow-disks, of a corresponding series of simultaneously-operated self-adjusting spring-scrapers, substantially as described.

7. In a wheel or disk harrow, the combination, with the rotating disk or disks, of a scraper-blade for each disk pivoted at a point between the axis and periphery of said disk, whereby said blade can adjust itself to the surface of the disk at all points of its scraping-surface from one end to the other.



8. In a wheel or disk harrow, the combination, with a series of rotating harrow-disks, of a series of pivoted rocking arms carrying self-adjusting scrapers, which said arms are connected to and operated by a bar or rod, so as to be vibrated simultaneously through the medium of a lever or equivalent device.

9. In a wheel or disk harrow, the combination, with a series of rotating harrow-disks, of a series of scrapers adjustably united to a reciprocating bar by spring-connections.

10. In a wheel or disk harrow, the combination, with a series of rotating harrow-disks, of a series of pivoted arms carrying pivoted self-adjusting scrapers, and united to a reciprocating bar by spring-connections.

11. In a wheel or disk harrow, the combination, with a series of rotating harrow-disks, of a series of pivoted arms carrying pivoted self-adjusting scrapers, and united to a reciprocating bar by an adjustable spring-connection.

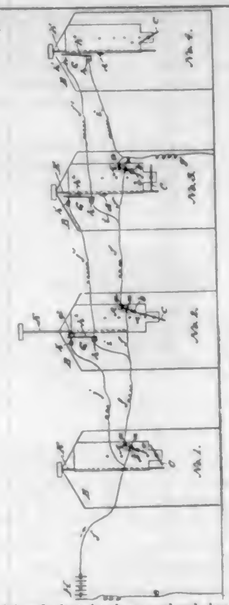
298,912. DUMPING-CAR. ROY STONE, New York, N. Y. Filed Oct. 8, 1883. (No model.)

Claim.—1. The combination, with the car having wheels with central flanges, of the main track A, the extensible rails *l*, having stops at the ends, and the cross-ties for the same, substantially as set forth.

2. The combination, with the frame *a b*, and wheels *c c*, of the car-body *t q o*, the slotted guide-plates *t'*, the axle *v*, and the rollers *w w*, substantially as set forth.

3. The frame *a b* and wheels *c c*, having central flanges to the treads thereof, in combination with the body *t q*, and lodges or box *o*, the guide-plates *t'*, and the rollers *w w*, substantially as set forth.

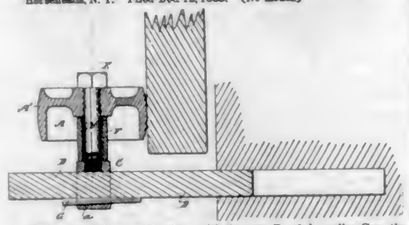
4. The combination, with the car-track having wheels with central flanges, of the sliding body resting upon the track, the main track A, the extensible rails *l*, having stops at the ends, and the cross-ties for the same, substantially as set forth.



298,913. ELECTRIC BLOCK-SIGNAL FOR RAILWAYS. STEPHEN JAMES SWAYZE and JOHN CLARENCE LANE, Sag Harbor, N. Y. Filed Nov. 13, 1883. (No model.)

Brief.—As train passes station it mechanically sets a signal, thereby also closing a shunt-circuit around a locking-magnet at previous station, allowing signal thereat to fall to "safety."

Claim.—1. The signal-board E, adapted to be automatically elevated by the passage of a train, the clutching and retarding mechanism D, and the fan C, or its equivalent, in combination with the magnets *a*, lever *b*, spring *c*, and switch G, connected as described, and adapted to be opened and closed by the signal-board E, substantially as specified.

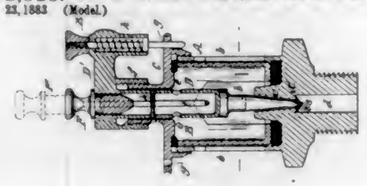


2. In a signaling system, the switches G, connected to the main wire

298,913.

f by wires *f'* and *i*, and adapted to be opened and closed by the signal-board E, in combination with the magnets *a* and the locking mechanism, whereby the setting of one signal will release the other, substantially as described.

298,914. STAY-ROLLER FOR SLIDING DOORS. LE GRAND TERRY, Horseheads, N. Y. Filed Dec. 12, 1883. (No model.)

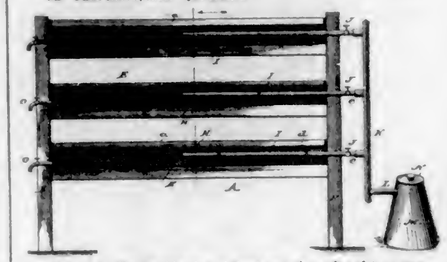


Claim.—1. The combination, with the arm D, of the collar C on the same, which collar is provided with a groove, *a*, the key G, the spindle B, removably secured to said collar, and the roller A, mounted on the spindle, substantially as herein shown and described.

2. The combination, with the arm D, of the collar C on the same, the spindle B, screwed in the collar C, the sleeve F, surrounding the spindle, and the roller A, mounted on the spindle, substantially as herein shown and described.

3. The combination, with an arm, of a collar mounted adjustably on the same, and provided with a key for locking it in place, a spindle on the collar, and a roller mounted on the spindle, substantially as herein shown and described.

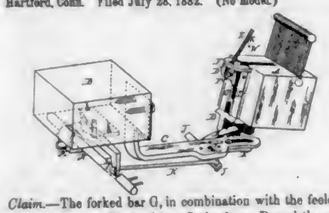
298,915. OIL-CUP. WILLIAM H. THOMAS, Santa Ana, Cal. Filed Oct. 23, 1883. (Model.)



Claim.—1. In adjustable self-feeding oil-cups, the combination, with a hollow adjustable feeder or feeding-plug closed at its lower end, of a filling plug or stopper arranged to close the upper or mouth end of said feeder and stop devices within the feeder, arranged to admit of the raising of the filling-plug to charge the cup, but preventing its detachment from the cup, substantially as specified.

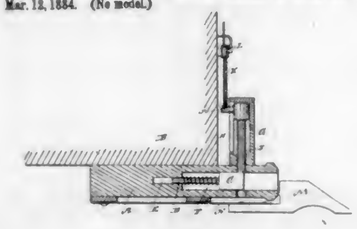
2. The filling-plug F, with its attached shackle *i*, in combination with the hollow feeder D, and its pin or stop *k*, substantially as and for the purpose specified.

3. The conical raising and lowering feeder D, having a series of longitudinal cuts or grooves, *s*, down and around its conical or pointed end, in combination with the seat *c* and lower portion of the cup, having a discharge-hole, *d*, and a countersunk recess, *d'*, outside of and around the base of said seat, essentially as and for the purpose herein set forth.



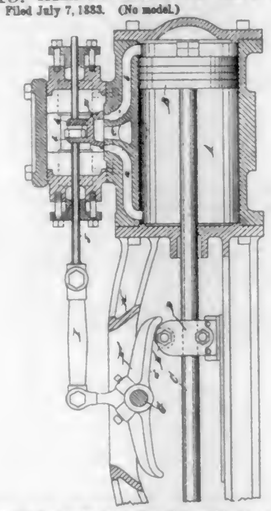
298,916. DRIER FOR FRUIT, &c. FRANCIS M. TRAVIS, New London, Va. Filed Nov. 5, 1883. (No model.)

Claim.—1. The combination of the frame, the series of trays supported therein, the transverse perforated partition within each tray, the steam-inlet pipes entering the chambers of the trays and said partitions, and terminating at or near the middle of the trays, and perforated for the escape of steam, the steam-supply pipe for connecting said pipes with a steam-generator, and valves for controlling the passage of steam from the steam-supply pipe to the several trays, substantially as described.



2. The combination of the hollow tray, the transverse perforated partition within the same, and the steam-inlet pipe entering the chamber of the tray and the said partition, and perforated for the escape of steam, substantially as and for the purposes set forth.

298,917. WEFT STOP-MOTION FOR LOOMS. FREDERICK O. TUCKER, Hartford, Conn. Filed July 28, 1882. (No model.)



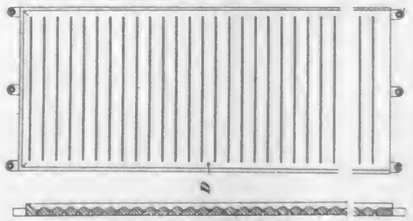
Claim.—The forked bar G, in combination with the feeler-block F, the feelers E, the cam H, the lever J, the frame D, and the arm C, said bar and feeler-block being connected to the frame D, adapted to be attached to the lay, and said cam and lever being connected with the arm C, adapted to be attached to the breast-beam or other stationary part of a loom, substantially as described.

298,918. CAR-COUPLING. CHARLES UEHLINGER, St. James, Ind. Filed Mar. 12, 1884. (No model.)

Claim.—The combination, with a draw-head, of a spring-bar secured beneath the same, and a beveled block secured to the free end of the spring and in front of the draw-head, whereby the coupling-links of high and low draw-heads may be guided within said draw-heads, substantially as set forth.

298,919. STEAM-ACTUATED VALVE. JOHN H. VAILE, Dayton, Ohio. Filed July 7, 1883. (No model.)

Claim.—1. In a pumping-engine, the combination, with the main valve and its ports, of a supplemental piston located to one side, as shown, of said main valve, and united thereto by a rigid connection with suitable ports and connecting mechanism, whereby the stroke of said main valve is rendered steady and gradual at all times, substantially as described.



2. In a pumping-engine, in combination with the main valve and its rod, the supplemental piston located to one side, as shown, and within the steam-chest, said valve-rod, valve, and piston being united by a rigid connection, and both said valve and piston having suitable induction and exhaust ports, whereby the stroke of said main valve is rendered steady and gradual at all times.

3. In a pumping-engine having a main valve and a laterally controlling supplemental piston united thereto by a rigid connection, a main exhaust extending under and communicating with the valve of the supplemental piston, substantially as described.

4. In a pumping-engine, the steam-chest provided with a main valve, a supplemental-piston chamber, N, in which is fitted a valve-controlling piston united to the main valve by a rigid connection, substantially as described.

5. In a pumping-engine, the combination, with a main piston-rod provided with a cross-head carrying a friction-roller, of the double bell-crank lever F, link I, valve-rod J, and supplemental controlling piston M, located to one side of the valve, as shown, and united thereto and to the valve-rod by a rigid connection, the parts being relatively arranged in the manner and for the purpose specified.

298,920. OIL-PRESS MAT. JOHN H. VAILE, Dayton, Ohio. Filed Jan. 18, 1884. (No model.)

Claim.—1. A mat for oil-presses, having its upper surface corrugated, and with slots extending through it in the depressions of the corrugations, and with the under sides of said slots enlarged, substantially as and for the purpose specified.

2. In an oil-press having a series of telescopic boxes, the combination, with each of said boxes, of supplemental side walls extending up and bent in for some distance, and recessed in the under side of the box, whereby a smooth and unbroken pressing-surface is obtained, as and for the purpose specified.

298,921. DECORATIVE TILE. SAVILLION VAN CAMPEN, Jersey City, N. J. Filed Mar. 7, 1884. (No model.)

Claim.—1. As a new article of manufacture, a metal-faced tile composed of a sheet of metal and a sheet of felt or other coarse paper secured together by overlapping the edges of the metal on the paper with relief designs on its surface, as set forth.

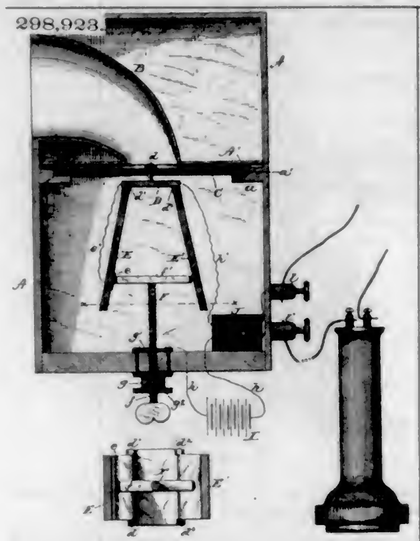
2. The process of making metallic-faced tiles which consists in first securing together a sheet of thin metal and a sheet of paper of coarse texture by overlapping the edges of the metal over the paper and then submitting the same to electrotype dies, as set forth.

298,922. ARMATURE FOR ELECTRIC MOTORS AND DYNAMO-ELECTRIC MACHINES. JOSEPH C. VETTER and STEPHEN G. PUTNAM, New York, N. Y. Filed Dec. 5, 1883. (No model.)

Claim.—1. A rotary armature having a core which is doubled or returned upon itself, or, in other words, a core which extends from side to side of the armature in its coarse around, or in the direction of the circumference of the armature, substantially as and for the purpose herein described.

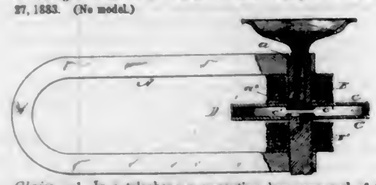
2. In a rotary armature, the combination of a core composed of a circular series of sections wound with wire and extending in the direction of the length of the axis of the armature, and side sections connecting the wound sections, so as to form a core which is magnetically continuous throughout the circumference of the armature, and disks or heads of non-magnetic material to which the side sections of the core are secured, substantially as and for the purpose herein described.

3. In a rotary armature, the combination of heads or disks of non-magnetic material, a core consisting of side sections, A', and sections A, and bobbins D, severally wound on tubes and slipped upon said sections A, substantially as herein described.



298,923. TELEPHONE-TRANSMITTER. HENRY E. WAITE, New York, N. Y., assignor to Charles F. Livermore, Trustee, same place. Filed Oct. 4, 1883. (No model.)

Claim.—1. In a telephone-transmitter, an electrode suspended from the sound-board and having a hinged pendent section, in combination with a second electrode adapted to be adjusted for varying the pressure of the hinged pendent section upon it, substantially as described.

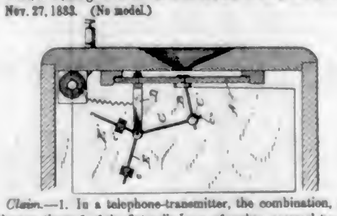


2. In a telephone-transmitter, the combination of the sound board or plate C, the electrode consisting of the plate D and hinged plates E and E', suspended from said sound-board, and the electrode F, provided with the cross-head *f'*, interposed and adjustable between the pendent plates E and E', substantially as described.

3. The combination, with the transmitter-case A, provided with the perforated partition A', of the mouth-piece or tube B, sound board or plate C, the electrode suspended therefrom, consisting of the plate D and the hinged pendent plates E and E', and the adjustable cross-head forming the second electrode, all substantially as described.

298,923.

298,924. TELEPHONE-RECEIVER. HENRY E. WAITE, New York, N. Y., assignor to Charles F. Livermore, Trustee, same place. Filed Nov. 27, 1883. (No model.)



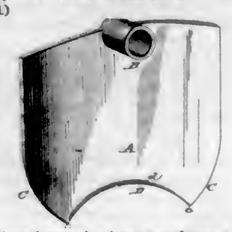
Claim.—1. In a telephone, a resonating-box composed of two parallel diaphragms connected at their edges by a suitable rim, an ear-tube communicating with the interior of said box, and the diaphragms thereof connected to a magnet, substantially as described.

2. A telephone resonating-box composed of two diaphragms united at their edges by a rim and connected to the poles of a magnet, and an ear-tube communicating with the interior of said resonating-box through one of the diaphragms.

3. A telephone-receiver consisting of a permanent magnet, the magnetic cores secured thereto in line one with the other, and a resonating-box mounted upon said cores and suspended between them.

4. In a telephone, the combination of the permanent magnet, the magnetic cores secured to poles of the magnet, the resonator-box mounted upon and supported between said cores, and an ear-tube communicating with the interior of said box through the tubular magnetic core, substantially as described.

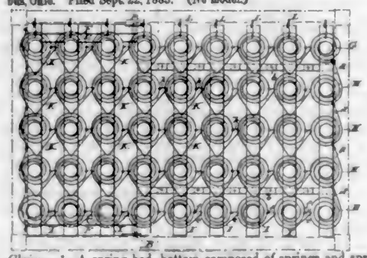
298,925. TELEPHONE-TRANSMITTER. HENRY E. WAITE, New York, N. Y., assignor to Charles F. Livermore, Trustee, same place. Filed Nov. 27, 1883. (No model.)



Claim.—1. In a telephone-transmitter, the combination, with the diaphragm thereof, of the flat cylinder *a*, of carbon, secured to a flanged hub projecting through a perforation in the diaphragm, whereby the said carbon cylinder is adapted to be revolved or adjusted, for the purposes and substantially as described.

2. In a telephone-transmitter, the combination, with the diaphragm thereof, carrying the electrode *a*, adjustable as and for the purpose described, of a pencil, B, balanced in contact with electrode *a* by means of the arms E, E', and C, secured to the hub D', pivoted within in a standard, D, secured to the diaphragm, the arms E E' being provided with adjustable weights or counterbalances for regulating and adjusting the pencil B relatively to the electrode *a*, substantially as described.

3. In a telephone-transmitter, the combination, with the diaphragm thereof, of a pencil-electrode, B, balanced in delicate contact therewith by means of an arm, C, and the arms E E', carrying the weights *c c'*, all of said arms C, E, and E' radiating from a common hub, D', pivoted between the arms of a standard-bracket, D, secured to the said diaphragm, the said weights *c c'* being adjustable lengthwise of the arms E E' for varying the amount of pressure of the pencil B upon the electrode *a*, substantially as specified.



4. In a telephone-transmitter, the combination of a pencil-electrode, B, adjustable relatively to the diaphragm, in combination with pivoted arms C E E', provided with adjustable weights *c c'*, the arms E E' and weights *c c'* being so arranged that the pencil-electrode B may be balanced in contact with electrode *a* whatever may be the position or inclination of the diaphragm A.

298,926. HOE. SAMUEL WATSON, Marion, S. C. Filed Feb. 19, 1884. (No model.)

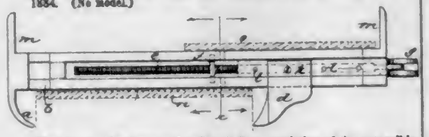
Claim.—As an improved article of manufacture, a turf-hoe or ditching-hoe having a curved blade cut away to form rounded corners, and having a concaved cutting-edge between the lower rounded corners, as and for the purpose shown and set forth.

298,927. SPRING BED-BOTTOM. LA FAYETTE WILDERMUTH, Columbus, Ohio. Filed Sept. 22, 1883. (No model.)

Claim.—1. A spring bed-bottom composed of springs and spring-bearing slats, and links pivoted to and connecting said slats, as described, in combination with the hinged and adjustable head-section A and supplemental frame F, as set forth.

2. A spring bed-bottom composed of sections A and A' and F, hinged together as described, section A consisting of slats and links pivoted to and connecting the same together, as set forth.

3. A bed-bottom composed of a series of spiral springs, said springs having arms *g*, bent to form two angles, *h* and *i*, which embrace the top coils of two adjacent springs, and return-arm *k*, adapted to hook over the top coil of its own spiral, in combination with slats and links pivoted to and connecting the same, as set forth.

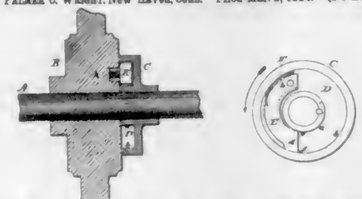


298,928. SAW-SHARPENING MACHINE. DANFORD WILLEY, Concord, N. H. Filed Dec. 15, 1883. (No model.)

Claim.—1. In a machine for sharpening circular saws, the combination of the saw-rest F, having flange *f* and teeth *f'*, and provided with the spindle G, to which are threaded the nuts H I, with the tilting table D having spring-catch S, said parts F and D being connected and rendered capable of rotary motion, substantially in the manner described.

2. In a machine for sharpening circular saws by means of an emery-wheel having an iron base, to which may be attached a sliding carriage, the tilting table D, hinged to said carriage, and provided with a spring-catch, S, in combination with the revolving saw-rest F, having flange *f* and teeth *f'*, and the spindle G, to which are threaded the nuts H I, operating substantially as and for the purposes specified.

298,929. PULLEY-BELTER. JAMES N. WILSON, Higginsville, Mo., assignor to himself and James H. Campbell, same place. Filed Mar. 23, 1884. (No model.)



Claim.—1. The improved pulley-belter, consisting of the extensible clamp *a b c d*, adjusting-screw *e*, and the flanges *m*, combined and arranged substantially as described.

2. The combination of the extensible clamp *a b c d*, adjusting-screw *e*, and the clamping-lever *g*, substantially as described.

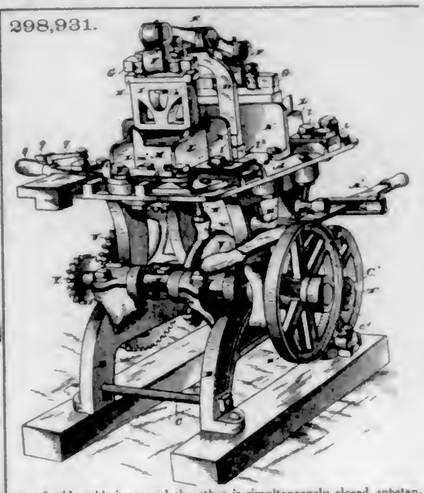
3. The adjusting-screw *e* and clamping-lever *g*, in combination with the extensible clamp *a b c d*, said screw being fitted to slide in the bearing *h*, and having the reacting-spring *i*, substantially as described.

298,930. DEVICE TO PREVENT RETROGRADE MOVEMENT. PALMER C. WRIGHT, New Haven, Conn. Filed Mar. 3, 1884. (No model.)

Claim.—1. The herein-described device for preventing retrograde movement in sewing-machines, consisting of the wheel or pulley B, loose on the shaft, the disk C, fixed on the shaft, one of said parts B C constructed with a concentric recess, D, on its side next the other part, and a dog arranged in said recess, constructed at its nose end to engage the two walls of the recess in the right direction of revolution, but free therefrom in the opposite direction, the said dog at its tail end connected with the said other part, B, by a stud, *h*, on the one part and corresponding slot in the other to permit play of the stud, and whereby the rotation of the one is communicated to the other when turned in the driving direction, but left free when turned in the opposite direction, substantially as described.

2. The combination of the disk C, fixed to the shaft, constructed with the concentric recess D in one of its sides, the dog E, arranged loosely in said recess, the bar *l* through the nose of the dog and arranged to take its bearing against the opposite walls of the recess in one direction, but free in the opposite, and the tail end of the dog constructed for engagement with a device loose upon the shaft, substantially as described.

298,931. PRESS. CHARLES H. ADAMS, Quincy, Ill. Filed Mar. 28, 1884. (No model.)



Claim.—1. As an improvement in tobacco-pressing machines, a mold composed of a stationary back and bottom and a movable front and ends which are closed inward by the operation of one lever, substantially as and for the purpose specified.

2. A tobacco-mold having a stationary bottom and back and a movable front and ends, which ends are first moved inward and said front then closed by the operation of one mechanism, substantially as and for the purpose shown.

3. A tobacco-pressing machine provided with two sets of compressing devices, which are adapted to be simultaneously operated in opposite directions by one mechanism, so as to alternately receive a charge of tobacco, and to compress the same into a lump, substantially as and for the purpose set forth.

4. A tobacco-press provided with two molds, which are each adapted to be opened and closed, in combination with mechanism whereby when

298,931.

one of said molds is opened the other is simultaneously closed, substantially as and for the purpose shown and described.

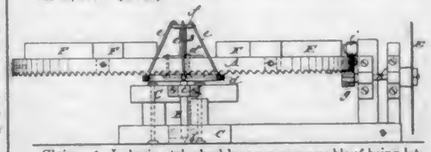
5. In combination with the front plates, M, the bar R, extending between and connected with said plates, and the levers Q, pivoted to the table A and upon said plates or their supporting-blocks, substantially as and for the purpose specified.

6. In combination with the end plates, L, the longitudinal bar R, adapted to be moved longitudinally by means of the levers Q, and provided with the cam-slots *r'*, and the transverse bars S, each connected at one end with one of said plates, and having its opposite end, through the bolt *s*, engaged with one of said cam-slots, substantially as and for the purpose shown.

7. The plunger I, secured to the bar H, and made vertically adjustable with reference to the cross-head G by means of the screws *g'*, substantially as and for the purpose set forth.

8. The combination of the cross-head G, provided with the journal *g*, the link F, and the walking-beam E, substantially as and for the purpose shown and described.

9. In combination with the plungers I, connected with and moved vertically by means of the walking-beam E, the shafts T and X, the gear-wheels U and Y, the belt-wheel Z, the eccentric V, the connecting-rod W, and the strap *w*, all arranged to operate substantially as and for the purpose specified.



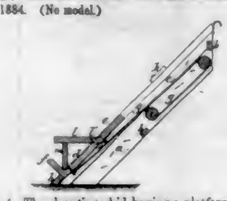
10. The combination of the shaft X, the pulley Z, provided with the hub *z*, having a toothed face, *z'*, the clutch-section z^2, the lever A', and the strap a^3, substantially as and for the purpose shown.

11. In combination with the shifting-lever A, adapted to operate the clutch-section z^2, and provided with the stud a^3, the wheel C', provided with a peripheral cam-groove, *c'*, substantially as and for the purpose set forth.

12. In combination with the wheel C', provided with the peripheral groove *c'*, the laterally-adjustable blocks c^3, fitted within the transverse grooves c^2, and provided each with an offset continuation, c^4, of said groove *c'*, substantially as and for the purpose shown and described.

13. The hereinbefore-described tobacco-pressing machine, in which the molds adapted to be closed and opened, the plungers, with their actuating mechanism, and the mechanism for starting and automatically arresting the motion of said actuating mechanism, are constructed and combined to operate in the manner and for the purpose substantially as specified.

298,932. HORSE-POWER. HOMER ADKINS, Concordia, Kans. Filed Oct. 27, 1883. (Model.)



Claim.—1. In horizontal-wheel horse-powers capable of being laterally tipped or tilted to provide for the entry and removal of the draft-animals within and from the wheel, the combination of the balance-wheel A and its shaft B with the tipping or tilting lower supporting-frame, C, substantially as specified.

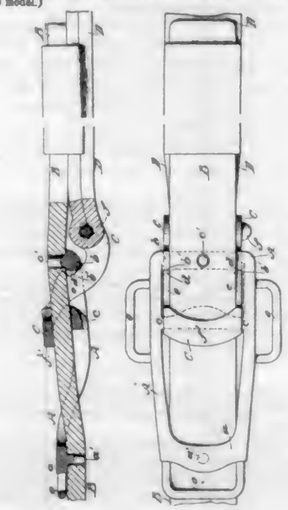
2. The horizontal balanced wheel A, having its hub constructed of plates *d d' f* and braces *e e*, arranged in relation to the wheel and its shaft B essentially as shown and described.

3. The combination of the wedge or shifting prop D with the lower supporting-frame, C, and the wheel A, arranged to tip or tilt laterally along with said frame, substantially as and for the purposes herein described.

4. In horizontal-wheel horse-powers capable of being laterally tipped or tilted, as described, the combination, with the tipping or tilting lower supporting-frame, C, of the shaft B and the balanced wheel A, provided with weight-holding receptacles F, to steady the run of the wheel, essentially as specified.

298,933. SKID-ELEVATOR. SYLVESTER BABCOX, Elba, Ohio. Filed Apr. 14, 1884. (No model.)

Claim.—1. The elevating-skid having a platform provided with an upper hinged section adapted, when raised, to fall out of the way over the end of the skid, substantially as described, for the purpose specified.



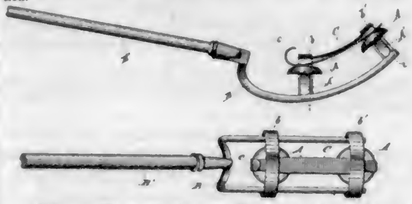
2. The elevating-skid having an inclined platform supplemented with a removable horizontal platform, substantially as described, for the purpose specified.

3. The supplemental platform having one end beveled and a cross-piece on one side near its other end, combined with the inclined platform and means for fastening the supplemental platform to the upper edge of the inclined platform, substantially as described, for the purpose specified.

4. The inclined platform having an upper hinged section, combined with a supplemental horizontal platform adapted to be supported upon and removably attached to the lower section of the inclined platform, the skid, and means for elevating the platform, substantially as described.

5. The elevating-skid herein described, consisting of the skid, the inclined platform of hinged sections, the attachable supplemental horizontal platform, the cord *g*, the roller *h*, the cranked winding-roller *i*, and the pivoted stop *k*, all constructed and arranged substantially as set forth.

298,934. TRACE-BUCKLE. CHAS. C. BAUDER, Barnside, Ill., assignor to himself and George E. Bauder, Valley City, Dak. Filed Dec. 10, 1883. (No model.)



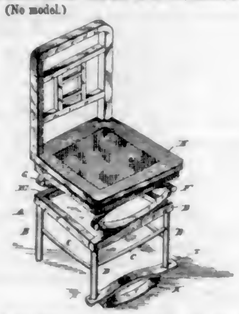
Claim.—1. The main part A, having the oppositely-arranged tongues *a' c'*, adapted for holding the tug B, in combination with the grip-loop C, arranged to grasp the tug B, substantially in the manner and for the purposes set forth.

2. The grip-loop C, formed with the notches *d*, in combination with the main part A, having the cross-piece *b*, and devices on opposite sides of its ends for holding the tug, substantially as and for the purposes set forth.

3. The grip-loop C, formed with the notches *d*, in combination with the bar *b*, formed with the lips *b'*, substantially as and for the purposes set forth.

298,935. RAILWAY-TORPEDO. JAMES H. BEVINGTON, Cleveland, Ohio. Filed Sept. 24, 1883. (No model.)

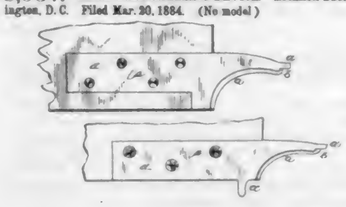
Brief.—The torpedo is provided with an attached signal-torch made of an easily-ignitible compound, and as the device for attaching the torpedo to the rail is being withdrawn therefrom it ignites the torch by friction.



Claim.—1. The combination of a railway-torpedo provided with a signal-torch and an attaching device provided with means for igniting or lighting the torch.

2. A railway-torpedo provided with a phosphorescent or other easily-ignitible compound, and means carried by the attaching device for igniting or rendering luminous the said compound, substantially as set forth.

3. The bands *b* and *b'*, provided with suitable springs adapted to press upon the torpedoes and ignite or light a torch on the torpedoes, substantially as described, and for the purpose specified.

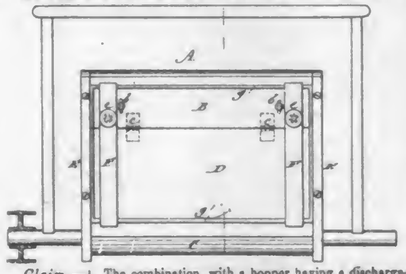


4. The combination, with the fork B, of the bands *b* and *b'* and the springs C and *c*, substantially as shown and described.

298,936. SPRING-CHAIR. ANDREW M. BLAKE, Columbus, Ohio. Filed June 7, 1883. (No model.)

Claim.—An elliptic spring, in combination with a metallic bar having slots at its ends, whereby the whole may be secured to the legs of chairs of different widths, substantially as and for the purposes specified.

298,937. HAND CORN-SHELLING DEVICE. LOCKRUM BLUE, Washington, D. C. Filed Mar. 20, 1884. (No model.)

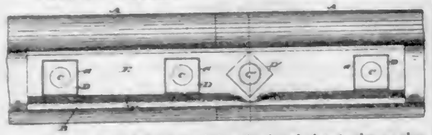


298,937.

Claim.—1. The shelling plate or blade formed with the starting or shelling tooth and the shelling-edge, and suitably adapted to be secured, substantially as described.

2. The plate or blade formed with the starting or shelling tooth, the shelling-edge, and the shank, in combination with a suitable support, substantially as described.

298,938. FEEDER FOR MILLS, PURIFIERS, &c. WM. S. BONNARD and WM. H. GRUPE, Terre Haute, Ind. Filed Feb. 8, 1884. (No model.)



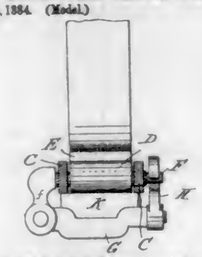
Claim.—1. The combination, with a hopper having a discharge-opening, *d*, and the feed-roller C, of the valve D, hinged to the hopper and provided with the flange *g'*, and the springs F, secured at their upper ends to the hopper, and having their free ends resting on the flange of the valve, substantially as herein shown and described.

2. The hopper having a discharge-opening, *d*, and the springs F, thickened at their upper ends and provided with grooves *f*, in combination with the strip B, arranged on the front of the hopper, over its opening, and provided with a rib or flange, *g*, constructed to fit within the grooves of the springs, the thumb-screws *e*, and the valve D, substantially as specified.

298,939. FERTILIZER. BENJAMIN C. BRIGGS, Paris, Me. Filed Dec. 1, 1883. (No specimens.)

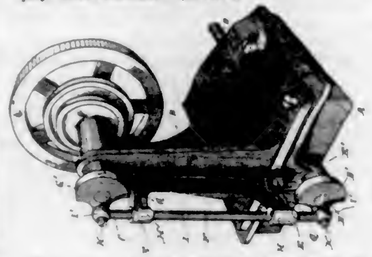
Claim.—The within-described fertilizing compound, composed of bone-meal or plaster, ashes, hen-manure or guano, muck, chamber-lye, and salt, all the different ingredients treated as described, and united in the proportion substantially as set forth.

298,940. NUT-FASTENER. ISAAC BROOKS, Pottstown, Pa. Filed Jan. 9, 1884. (No model.)



Claim.—A nut-fastener consisting of a slotted plate having an elastic lip, both plate and lip being formed integral of sheet metal, the lip extending unbroken the length of the plate, and curving outwardly from the plate across the path of the sides of the nuts, whereby, when the nut is turned, the angles or corners thereof compress the lip, and the latter then exerts its holding power on said corners, and thus on the nut, substantially as and for the purpose set forth.

298,941. PAINT. LOUIS BROWN, New York, assignor of three-fourths to Lacy Nichols White, Rye, N. Y. Filed June 2, 1883. (Specimens.)



Claim.—A paint made of sublimated-zinc powder, of the character herein specified, combined with whiting or other suitable coloring or filling matter and a vehicle.

298,942. THILL-COUPLING. MILTON E. CAMPANY, Muskegon, Mich. Filed Jan. 22, 1884. (Model.)

Claim.—In a thill-coupling, the combination, with the coupling-pin F, provided with the arm *f* at one end, of the block G, pivoted to the end of the said arm, the hook H, pivoted to the free end of the block, and the cushion K, secured to the upper face of the block, substantially as herein shown and described.

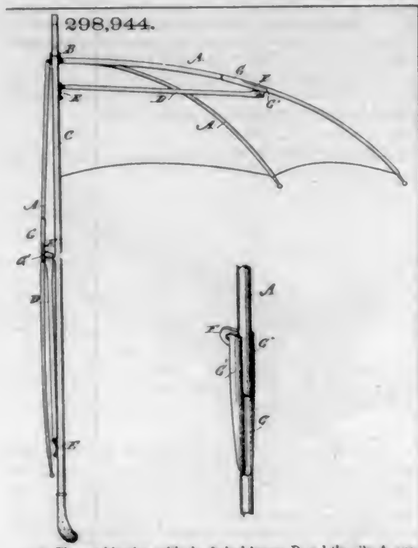
298,943. MECHANICAL MOVEMENT. ANDREW C. CAMPBELL, Bridgeport, Conn., assignor to the Wheeler & Wilson Manufacturing Company. Filed Mar. 20, 1884. (No model.)

Claim.—1. As a means for transmitting isochronous rotary movement, a rod pivoted to crank-plates upon a driving and a driven shaft, said rod being supported by guides upon a rock-shaft, said shaft and rod being so adjusted that the rock-shaft acts to assist the rod at the points where a dead-center is otherwise possible.

2. The combination, with a rod and crank-pins which pivotally connect the same to disks upon a driving and a driven shaft, of oscillating guides which support said rod, as described, and for the purpose set forth.

3. A driving-shaft and a driven shaft having plates at their ends carrying crank-pins, and a rod carried by said pins and sliding freely thereon, in combination with a rock-shaft having guides which support said rod, substantially as described.

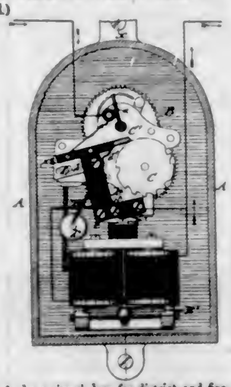
4. A rock-shaft having arms, at the outer ends of which are guides, and a sliding rod supported in said guides, in combination with rotating crank-pins which carry said rod, whereby the movement of the driving-shaft is transmitted to the driven.



5. In a mechanical movement, guides H, which oscillate in an arc and support rod I, in combination with crank-pins which carry rod I, and which move in a circle whose diameter is equal to the chord of the arc described by the oscillations of guides H, as described, and for the purpose set forth.

6. A rod connecting two shafts and carried by crank-pins at the ends of said shafts, in combination with guides upon a rock-shaft, which support said rod and oscillate in an arc, said rock-shaft and rod being parallel, and the centers of the crank-pins and of the shafts being an equal distance apart.

298,944. UMBRELLA AND PARASOL FRAME. ANTONIO CARRARA, Newark, N. J., assignor to himself and Alfred Girardet, same place. Filed Feb. 12, 1884. (No model.)

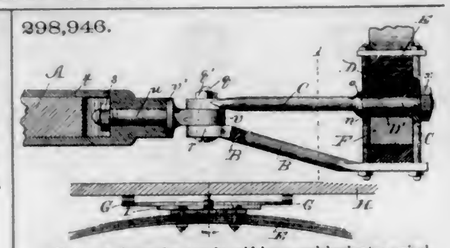


Claim.—1. The combination, with the forked braces D and the ribs A, provided on their under sides with perforated lugs F, of spring shanks or strips secured to the ribs on either side of the said lug, whereby the forked ends of the braces will engage said spring-shanks, substantially as set forth.

298,944.

2. The combination, with the forked braces D and the ribs A, provided on their under sides with the perforated lugs F, of the semi-tubular piece G, secured to the ribs to one side of the perforated lugs, and formed with two spring-shanks extending along the ribs on either side of the lugs, substantially as set forth.

298,945. SIGNAL-BOX FOR DISTRICT AND FIRE-ALARM TELEGRAPHS. CHARLES H. CARTER, Brooklyn, N. Y. Filed Sept. 27, 1883. (No model.)

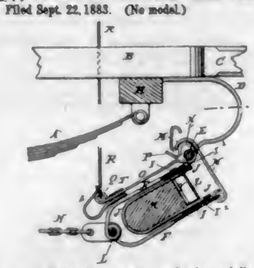


Claim.—1. In a signal-box for district and fire-alarm telegraphs, the combination, with a circuit-breaking wheel and its circuit-closing spring, of a switch arranged in contact with the break-wheel, and a signaling device which is thrown into circuit when the switch drops into the recesses of the break-wheel, substantially as set forth.

2. In a signal-box for district and fire-alarm telegraphs, the combination, with a circuit-breaking wheel and its circuit-closing spring, of a switch device placed in contact with the break-wheel, a signaling device that is thrown in or out of circuit by the switch, and means, substantially as described, whereby the switch may be actuated and the signaling device thrown into circuit for testing the line, substantially as and for the purpose specified.

298,946. VEHICLE RUNNING-GEAR. HARVEY W. CHAMBERLAIN and FREDERIK G. HARRIS, Lockport, Ill., assignors of one-half to Moses S. Greenebaum and MAYO A. LOEWE, both of Chicago, Ill. Filed Oct. 20, 1883. (No model.)

298,946.



Claim.—1. In running-gear for vehicles, a reach having two swivel-joints, as shown, in combination with a third swivel-joint formed in line with the swiveled reach, the forward end of the said reach forming the pin of the said third swivel-joint, whereby the extreme swivels shall operate harmoniously to relieve the reach and wagon-body from strain, and at the same time cause the wagon-body to maintain its horizontal position when, from any cause, a front wheel shall assume a position higher or lower than its companion wheel, substantially as described.

2. A vehicle-gear comprising, in combination, a fifth-wheel secured to the under side of the wagon-body, a spring upon which the fifth-wheel is rigidly secured, an axle connected with the said spring by means of a swivel-joint, and a reach the forward end of which forms the pin for the said swivel-joint, the whole being constructed and arranged to operate substantially as described.

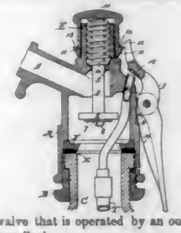
3. A swivel-joint in the forward part of a vehicle-gear in line with the reach, comprising the plate D, secured to the lower portion of spring E, and having downward-projecting bearings *n*, provided with apertures, and the plate D', secured to the upper side of the forward axle-bed, and having a socket, *n'*, with which the apertures in the said bearings *n* coincide, the said parts being secured together by means of a bolt or brace, C, forming the forward end of the swiveled reach, and provided with the nut or head *z* and the flange *e*, substantially as described.

298,947. DRAFT-CLEVIS. FOSTER HALLET CHENEY, Beaver City, Nebr. Filed Sept. 22, 1883. (No model.)

Claim.—1. A draft-clevis constructed substantially as herein shown and described, and consisting of a wide outer clevis connected with the body-frame of a wagon by bars or springs, with the running-gear by rods or chains, and with the double-tree by a wide inner clevis and a bolt or pin, as set forth.

2. In a draft-clevis, the combination, with the supporting bars or springs D, the draw rods or chains G H, and the double-tree K, of the outer clevis, F, the inner clevis, J, and the bolt or pin I, substantially as herein shown and described, whereby the said double-tree can be readily detached, as set forth.

3. In a draft-clevis, the combination, with the outer clevis, F, the inner clevis, J, the connecting bolt or pin I, and the double-tree K, of the spring Y, substantially as herein shown and described, whereby the double-tree will be protected from being broken and from slipping in its clevis, as set forth.



4. In a draft-clevis, the combination, with the outer clevis, F, of the catch M and the lever O, having projection N and the toe P, substantially as herein shown and described, whereby the said clevis will be held securely when closed and can be readily released, as set forth.

5. In a draft-clevis, the combination, with the outer clevis, F, and the locking and unlocking lever O, of the spring-catch S and the flanges T, substantially as herein shown and described, whereby the said lever will be held from accidental movement, as set forth.

298,948. VENT-FAUCET FOR BOTTLES. GEORGE W. CLARK, Brooklyn, assignor to Henry Downes, New York, N. Y. Filed Dec. 13, 1883. (No model.)

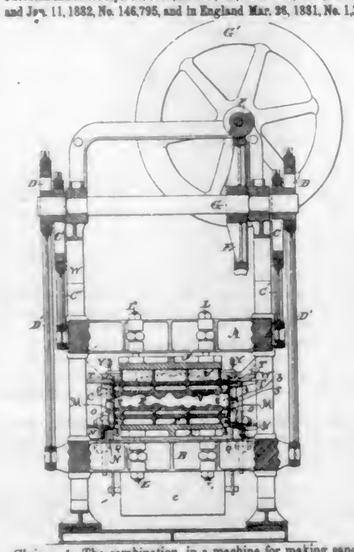
Claim.—1. A vent-faucet having a pouring-spout controlled by a reciprocating valve operated by an outside plunger and a stationary vent-

298,948.

pipe controlled by a valve that is operated by an outside vibrating lever, substantially as described.

2. In a vent-faucet, the combination, with an eduction-opening or pouring-spout and its reciprocating controlling-valve, of a vent-pipe the valve whereof is controlled by a vibrating lever, and means whereby the reciprocating valve actuates said lever to open the vent-pipe valve, substantially as described.

3. In a vent-faucet, the combination, with a spring-seated valve controlling the pouring-spout, of a valve operated by an independent lever for controlling the vent-pipe, and means whereby the said lever locks both valves open, substantially as described.



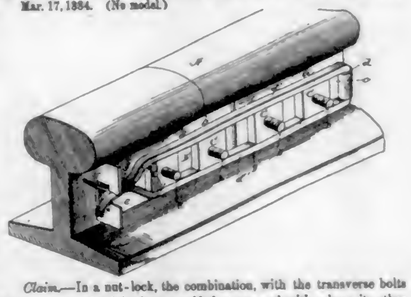
4. In a vent-faucet, the combination, with the spring-seated plunger, of the reciprocating valve that controls the pouring-spout, and with the spring-seated lever of the valve that controls the vent-pipe, and means whereby said lever locks both valves open, and when tripped permits their closing movement, substantially as described.

5. A faucet consisting of the case A, pouring-spout S, spring-seated reciprocating valve 2, cam 11, a vent-pipe, 6, and a valve, 18, carried by a spring-seated lever-valve, L, having a cam end, substantially as described.

6. A faucet consisting of the case A, pouring-spout S, spring-seated reciprocating valve 2, catch 13, a vent-pipe, 6, valve 18, lever L, and latch 12, substantially as described.

7. A faucet consisting of the case A, having spout S, spring-seated reciprocating valve 2, cam 11, catch 13, a vent-pipe, 6, valve 18, lever L, with cam end, and latch 12, substantially as described.

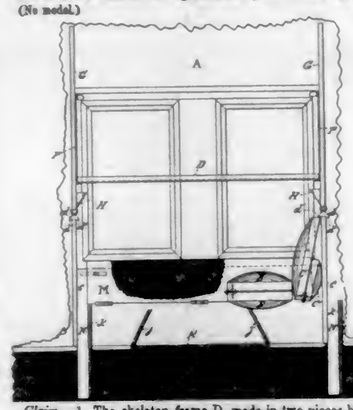
298,949. MACHINE FOR MAKING OR PREPARING MOLDS FOR CASTING METAL. JULES DEMOUBUY, Dunkirk, assignor to the Société L. Demouvilliers et Fils, Paris, France. Filed Jan. 16, 1884. (No model.) Patented in France Apr. 14, 1880, No. 136,124, and Jan. 9, 1882, No. 146,766, and Jov. 11, 1882, No. 146,795, and in England Mar. 26, 1881, No. 1,354.



Claim.—1. The combination, in a machine for making sand molds for castings, of the boxes M and T, the flask S, the plates U and P, and the patterns V and R, all arranged substantially as set forth.

2. The combination, to form a mechanism for tilting the box T, of the post *b*, provided with a shoulder or projection, *l*, the slotted or grooved lever Z, bearing a pawl, *d*, and the weight *s*, all arranged to operate substantially as set forth.

3. The combination, with the box M, provided with wheels O, and four screws, Q, of the plate P, mounted or resting on said screws, and the pattern R, resting on plate P, all substantially as herein set forth.



4. The combination, with the box T, provided with a flange, *b'*, and rods Y, of the plate U, springs X, and pattern V, all constructed and arranged substantially as and for the purposes set forth.

298,950. NUT-LOCK. MILLARD FILLMORE DILLON, Gillespia, Ill. Filed Mar. 17, 1884. (No model.)

Claim.—In a nut-lock, the combination, with the transverse bolts and their nuts, of a fish-plate provided at one end with a loop its other end being turned outwardly and provided with a T-shaped slot, and a locking-plate adapted to inclose said nuts, and provided at one of its ends with a bar engaged by the loop of the fish-plate, while its other end is formed with an extension, the end of which is split and bent to engage the T-shaped slot of said fish-plate, substantially as set forth.

298,951. SLEEPING-CAR. JOHN H. DOREE, Philadelphia, Pa., assignor of one-fifth to William H. Wigmore, same place. Filed Aug. 14, 1883. (No model.)

Claim.—1. The skeleton frame D, made in two pieces hinged together, in combination with the slotted braces F F, for the convenience in handling and connecting the frame with the wall of the car, either at the upper or lower part of the window, substantially as described.

2. The combination of textile fabric coated with dissolved gum-shellac with the frames of partitions G, the fabric being confined on each side of a frame between two frames, substantially as and for the purpose set forth.

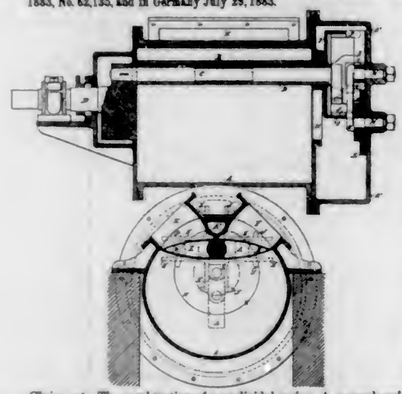
3. The combination of the double hinged detachable back-cushions C and C' of the two seats of the section, with the skeleton frame D, to form the bed-bottom of the upper berth, substantially as described.

4. The combination of the middle curtains, I' I', with the side curtains, I I, which overlap them for the purpose of intercepting the view of the upper and lower berths, substantially as described.

5. In a sleeping-car having middle curtains, I' I', and overlapping side curtains, I I, made of bamboo, rattan, or wood splints, the combination of turn-buckles, substantially as described, with the curtains, to prevent the flapping of the latter.

6. In combination with the chamber L, a lining of textile fabric coated with dissolved gum-shellac, to preserve cleanliness and prevent the infection of bugs, substantially as described.

7. The combination of the door M with the skeleton frame D, for holding the latter in place when folded up, said door being connected with the wall A at the lower part of the window, in the manner and for the purpose set forth.



8. In combination with the floor and lower ceiling between two seats, the partition i, whereby to divide the space into two compartments, L' L', to be reached, respectively, from the openings under the seats, substantially as described.

9. The detachable boards *j j*, in combination with the seat-frames B B and wall A, for the purpose (by removing the boards) of making a free communication to the chambers L' L' for stowing the bedding therein or removing it therefrom, substantially as set forth.

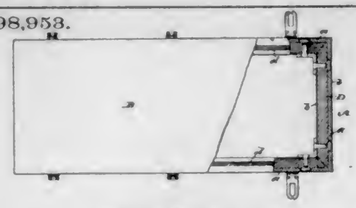
10. The combination of textile fabric coated with dissolved gum-shellac with the compartments or chambers L' L', to preserve their cleanliness and protect them from the infection of bugs, substantially as described.

11. The pockets H, having slots *f* and *f'*, in combination with the partitions G, having headed pins *e* and *e'*, the lower slots, *f*, being open at their lower ends, and the upper slots, *f'*, having an enlargement at their lower ends, whereby the pockets can be instantly connected with the partitions when required for use, and also quickly removed therefrom when desired, substantially as described.

298,952. ROTARY PUMP. EDWIN BRYAN DOWLIN, Bermondsey, England. Filed Aug. 13, 1883. (No model.) Patented in England Jan. 13, 1883, No. 216; in France July 12, 1883, No. 156,519; in Belgium July 26, 1883, No. 62,135, and in Germany July 29, 1883.

Claim.—1. The combination of a cardioidal casing, A, a crank-axis, D, and crank-pin C, revolved therein, a piston, B, mounted upon the crank-pin, and caused to make one-half a revolution for each revolution of the crank-axis, and an inlet-port, E, and outlet-port F, separated by the inward bend A^x of the casing, such inward bend being made to fit to the piston, substantially as described.

2. The combination of a cardioidal casing, A, a crank-axis, D, and crank-pin C, revolved therein, a piston, B, mounted upon the crank-pin, a tubular neck, B', projecting from one end of the piston and carried through a disk, H, which is concentric with the crank-axis, and is capable of revolving in an aperture in the end of the casing, and mechanism situated outside this disk for causing the piston B to make one-half a revolution for each revolution of the crank-shaft.



3. The combination of a cardioidal casing, A, a crank-axis, D, and crank-pin C, revolved therein, a piston, B, mounted upon the crank-pin, pairs of guide-bars K, carried by the piston, and blocks L, received between the guide-bars, and capable of turning on pins M, to control the movement of the piston, substantially as described.

4. The combination of a cardioidal casing, A, a crank-axis, D, and crank-pin C, revolved therein, a piston, B, mounted upon the crank-pin, pairs of guide-bars K, carried by the piston-blocks L, received between the guide-bars, and capable of turning on fixed pins M, a bar, N, carried by one or both pins M, and an arm, C^x, on the end of the crank-pin C, carrying a pin concentric with the crank-axis, which pin is received into a bearing in the bar N, substantially as described.

298,953. BURIAL-CASKET. EDWARD S. EARLEY, Philadelphia, Pa. Filed Mar. 26, 1884. (No model.)

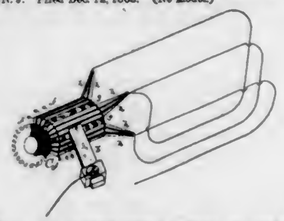
Claim.—The method of protecting the body and lid of a burial-casket, consisting in forming the same of wood, heating the wood, coating it with asphalt, applying felt paper to the wood, and running a hot iron or tool over the paper, pressing the hot paper against the wood, whereby the wood and paper become saturated with asphalt, and the paper is united to the wood, the asphalt of the wood and of the paper becoming homogeneous, substantially as and for the purpose set forth.

298,953.

298,954. DYNAMO-ELECTRIC MACHINE. THOMAS A. EDISON, Menlo Park, N. J. Filed Dec. 12, 1883. (No model.)

Claim.—1. An electrically-divided current-collector each of whose divisions is of such width as not to bridge the space between the commutator-bars, in combination with a resistance external to said brush, forming a high-resistance bridge between said bars, substantially as set forth.

2. The current-collector formed of alternate layers of metal and insulation, in combination with resistances external to said current-collector through which the metal layers are connected, substantially as set forth.



3. The combination of the metal bearing strips or wires of a current-collector, resistances attached thereto and connected together and to the main conductor, and insulating material between the bearing ends and between the resistances, substantially as set forth.

4. The combination, with the metal bearing-strips and the interposed insulation, of the insulating-sleeve holding them together, substantially as set forth.

5. The combination, with the metal bearing-strips and the interposed insulation, of the insulating-sleeve and wedge holding them together, substantially as set forth.

6. The current-collector formed of strips of metal and interposed insulation, in combination with resistance-strips attached at one end to said metal strips and all connected together at their other ends, substantially as set forth.

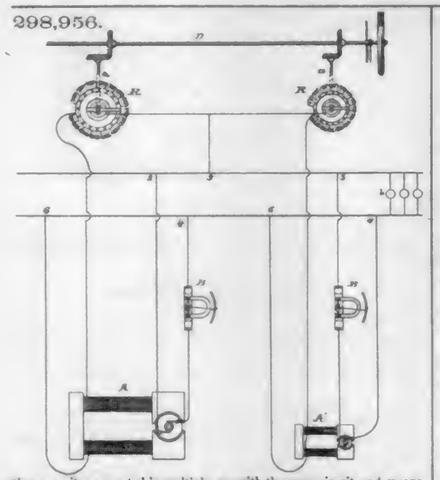
298,955. DYNAMO-ELECTRIC MACHINE. THOMAS A. EDISON, Menlo Park, N. J. Filed Dec. 12, 1883. (No model.)

Claim.—1. In a dynamo-electric machine, the combination, with the commutator-bars and the armature-coils, of high-resistance connections between them, substantially as set forth.

2. In a dynamo-electric machine, the combination, with the commutator-bars and the armature-coils, of connections between them of varying resistance, the highest resistance being in circuit when the current-collector leaves a bar, substantially as set forth.

3. In a dynamo-electric machine, the divided commutator-bars, all the divisions of a bar being connected at the same point to the armature-coils, substantially as set forth.

4. In a dynamo-electric machine, the combination, with the armature-coils and the commutator-bars, of connecting-strips of high-resistance material between them, substantially as set forth.



5. In a dynamo-electric machine, the combination of the divided commutator-bars, the armature-coils, and the connecting-pieces of high-resistance material, all the divisions of a bar being connected at the same point to the armature-coils, substantially as set forth.

298,956. MODE OF OPERATING DYNAMO-ELECTRIC MACHINES. THOMAS A. EDISON, Menlo Park, N. J. Filed Jan. 24, 1884. (No model.)

Claim.—1. The combination of two machines of different generative capacity connected in multiple arc with the same circuit, and having their respective electro-motive forces adjusted as described, substantially as set forth.

2. The combination of dynamo-electric machines of different gener-

298,956.

ative capacity connected in multiple arc with the same circuit, and means for regulating the electro-motive force of one or more or all of said machines, substantially as set forth.

3. The method of operating dynamo-electric machines of different generative capacity in multiple-arc connection with the same circuit, consisting in adjusting the electro-motive force of one or more or all of said machines until each gives its right proportion of the entire current, substantially as set forth.

4. The method of operating dynamo-electric machines of different generative capacity in multiple-arc connection with the same circuit, consisting in separately adjusting their electro-motive force until each gives its right proportion of the entire current, and then adjusting their electro-motive force simultaneously according to variations in the common load, substantially as set forth.

5. The combination of dynamo-electric machines of different generative capacity connected in multiple arc with the same circuit, and an adjustable resistance in the field-circuit of each, the coils of the resistances being proportioned to the machines, and said resistances being adjustable separately or simultaneously, substantially as set forth.

298,957. BUTTON-HOLE SEWING-MACHINE. FREDERICK EGGE, Bridgeport, Conn., assignor to the Smith & Egge Manufacturing Company, same place. Filed July 1, 1882. (Model.)

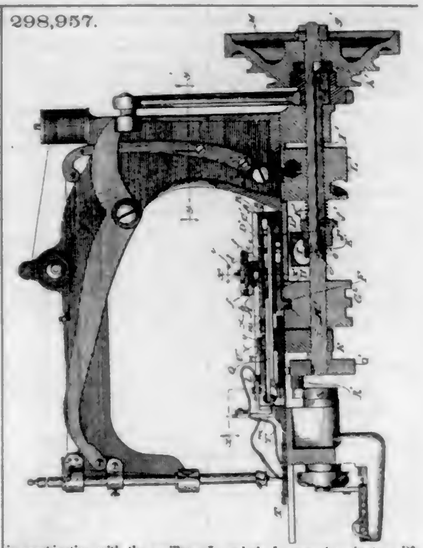
Brief.—A switch-cam operates, by means of a drive-bar connecting with a sliding plate, the mechanism carried by said plate, and the latter, by a pin projecting into a diagonal slot in a transversely-sliding piece carrying one end of the oscillator-bar pivoted thereto, oscillates the latter. From the front of the tray an arm projects, so as to operate dogs engaging with a grappling device to move forward or backward the bar carrying the cloth-clamp. This bar rests and slides upon the oscillator-bar.

Claim.—1. In a button-hole sewing-machine or attachment, the combination of the drive-bar, tray, jog-link, and mechanisms for operating the same, substantially as set forth.

2. The drive-bar D′, provided with pins E C, in combination with means for imparting motion to said bar, dogs *f*, pivoted to the standard H, and tray D^2, substantially as described.

3. The tray D^2, having a pin, I, in combination with means for operating said tray, jog-link D^3, provided with a diagonal slot, and the oscillator, substantially as shown and described.

4. The standard H, mounted on the tray D^2, and having pivoted spring-dogs *f*, in combination with means for raising said dogs, the drive-bar D′, having pin C, and mechanism for actuating said bar, substantially as set forth.



5. The spindle G, provided with the pin *i*′, disk *b*, with beveled trip C, and disk *d*, with beveled trip *e*, in combination with toothed wheel N′ and means for operating the same, dogs *f*, feed-bar Q, and push-bar S, and hook-arm R and means for actuating the same, as and for the purpose set forth.

6. The spindle G, extending through the standard H, and provided with trips *c e*, in combination with the dogs *f* and trigger C′, as set forth.

7. The drive-bar D′, provided with pins E C, in combination with the switch-cam G^2, having traveler F, dogs *f*, pivoted to the standard H, and tray D^2, substantially as set forth.

8. The jog-link D^3, provided with gating K, and diagonal slot A^3,

298,957.

in combination with the oscillator L, and pin I, secured to the tray D^2, and means for operating said tray, substantially as set forth.

9. In combination with the jog-link provided with a gating, the oscillator L, and adjustable plate O, as described.

10. The vibrating pocket M, arranged in the adjustable slide O, in combination with the oscillator L, jog-link D^3, provided with diagonal slot, and tray D^2, having secured thereto the pin I, substantially as described.

11. The arm A′, pivoted to the tray D^2, in combination with the pivoted dogs *u v* and adjusting-screw *a*′, substantially as described.

12. The vise V, provided with jaws *n o*, and pivoted nose S, in combination with the feed-bar Q, dogs *u v*, lever A′, provided with tooth *w* and tray D^2, and means for operating the same, substantially as described.

13. The vise V, pivoted at the forward end with spring-acting jaws, as described, in combination with the pivoted nose and means for operating the latter, and the feed-bar, substantially as described.

14. The jaw *o*, pivoted to the vise-bar V, in combination with the spring-jaw *n* and pivoted nose *s*, substantially as set forth.

15. The combination of the vise-bar provided with spring-jaws with the feed-bar and means for imparting an intermittent action to said jaws, and means for effecting a reciprocating movement of the vise-bar in a horizontal plane, whereby the feed-bar may be grasped by the said jaws and carried forward or backward, substantially as described.

16. The pivoted dogs *u v*, in combination with the nose *s*, jaws *n o*, feed-bar Q, and means for operating said dogs, substantially as shown and described.

17. The nose *s*, pivoted to the forward end of the vise V, and provided with inclined sides 1 2, and with its rear corners beveled, in combination with the jaws *n o* and means for operating said nose, substantially as set forth.

18. The combination of the arm A′ with the dogs *u v*, vise V, and feed-bar Q, substantially as set forth.

19. The feed-bar Q, with hook-arm R and adjustable arm S, in combination with mechanism for actuating the same, trip *e*, secured on the lower portion of the spindle G, and wheel N′ and means for operating the same, substantially as set forth.

20. The combination of the drive-bar D′ and tray D^2 with the oscillator L, jog-link D^3, arm A′, pivoted dogs *u v*, vise V, and feed-bar Q, whereby the forward portion, T, of the latter will have a forward and at the same time an oscillatory motion, as and for the purpose set forth.

21. The oscillator L, pivoted at its rear end to the jog-link D^3, and provided at its forward end with a groove, in combination with the forward portion, T, of the feed-bar and means for operating said oscillator and feed-bar, substantially as described.

22. The oscillator L, pivoted to the jog-link D^3, in combination with the vibrating pocket M in the adjustable block O and means for operating said jog-link, substantially as shown and described.

23. The combination of the spindle G, provided with the trips *c e*, pivoted dogs *f f*, feed-bar Q, with hook-arm R and adjustable arm S, wheel N′, pawls *j j*, standard H, pin C′, and cap O′, substantially as set forth.

24. The wheel N′, provided with teeth, and recessed as described, in combination with the spindle G, having pin *i*′, pawls *j*″ *j*′, sliding tray D^2, and mechanism for operating the same, feed-bar Q, with hook-arm R and adjustable arm S, and trip *e*, secured on the lower extremity of said spindle, substantially as set forth.

25. The cap-plate O′, with elongated central opening, and provided with spring-pawls *j*′, in combination with the spindle G, attached to the tray and carrying the toothed wheel N′, mechanism for actuating said tray, feed-bar Q, with hook R and adjustable arm S, and trip *e*, secured on the lower extremity of said spindle, substantially as shown and described.

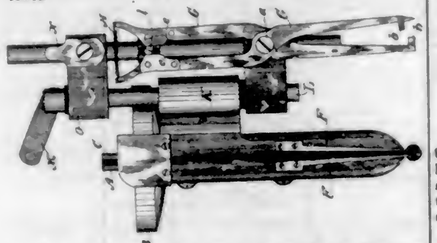
26. The combination of the arms R S, trip *e*, trip *c*, trigger C′, dogs *f*, pivoted at the sides of the standard H, tray D^2, pin C, attached to the drive-bar D′, and wheel N′, and means engaging therewith to partly revolve it, substantially as set forth.

27. The catch-lock B′, provided with a central opening, a spring, D, and tooth *b*′, in combination with the bar E′ and spring-actuated collar J′, substantially as set forth.

28. The arm E′, arranged as shown and described, in combination with the tooth *b*′ on the catch-lock B′, and mechanism, as described, for throwing the shaft into connection with the driving-wheel, as set forth and described.

29. The trip *e* on the spindle G, in combination with the trigger C′ of the catch-lock B′, substantially as set forth and described.

30. The combination of the wheel N′, spindle G, with trips *e c*, standard H, with pivoted spring-dogs *f*, feed-bar Q, with arms R S, pin C and means for operating the same, pawls *j*″ *j*′, and trigger C′, substantially as described.



31. The combination of the drive-bar D′, tray D^2, and jog-link D^3, with pivoted arm A′, dogs *u v*, vise V, feed-bar Q, provided with arms R S, trip *e*, arranged on spindle G, trip *c*, dogs *f*, wheel N′, pawls *j*′, catch-lock B′, provided with trigger C′ and beveled tooth *b*′, arm E′, collar J′, spring K′, and feather I′, all arranged and operating as and for the purpose hereinbefore set forth.

32. The wheel Q′, with raised periphery *m*′, in combination with the pivoted arm R′, auxiliary presser-foot P′, and spring O′, substantially as and for the purpose set forth.

33. The catch-lock B′, with spring D, bearing upon the lower portion, and with the upper part extended through the casing or bed-plate of the machine, in combination with the trip *e* on the spindle G, arm E′, sliding collar J′, spring K′, feather I′, and driving-wheel M′, substantially as set forth.

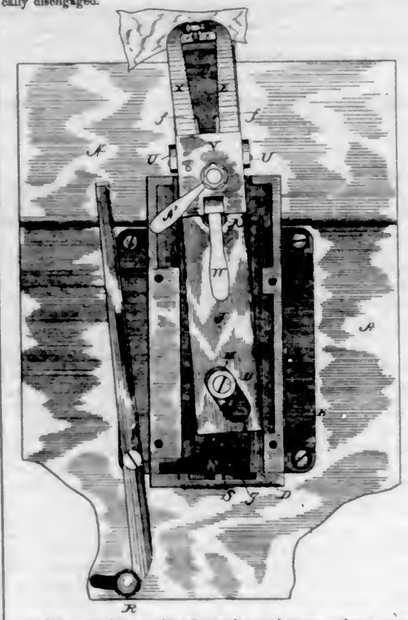
298,958. BUTTON-SEWING MACHINE. FREDERICK EGGE, Bridgeport, Conn., assignor to the Smith & Egge Manufacturing Company, same place. Filed June 22, 1883. (No model.)

Brief.—The device feeds buttons having a shank-eye, and arranges them with their shanks in a horizontal plane, ready to be clamped by suitable mechanism and conveyed to the fabric to which they are to be sewed.

Claim.—1. In combination with means for feeding the buttons, as described, means connected with the needle-bar for operating on the loop of the button-eye intermittently, whereby the button is turned and the said loop brought into a plane parallel with the work-plate of the machine, substantially as set forth.

2. In a button-sewing attachment or sewing-machine, a device for feeding buttons arranged to swing on the machine and be locked in position, in combination with means for operating upon the loop of the button-eye, as described, substantially as set forth.

3. In a button-sewing attachment, the fingers pivoted to the frame of the machine and provided with lugs at the lower extremities, and connected by a coil-spring at the upper extremities, and having their inner upper edges beveled, in combination with a pin attached to the needle-bar collar, and means for feeding the buttons, whereby the loop of the button-eye may be operated upon and brought into the required position, substantially as set forth.



4. In a button-sewing attachment, fingers pivoted to the frame of the machine and adapted to operate on the loop of the button-eye, in combination with mechanism for vibrating said fingers, substantially as set forth.

5. In a button-sewing attachment, the fingers pivoted to the frame of the machine and adapted to operate on the loop of the button-eye, in combination with mechanism for vibrating said fingers, and means for feeding the buttons, substantially as shown and described.

6. The tube A, provided with longitudinal opening C, and having secured at its lower extremity the spring-rest D, with shoulder J, and spring-arms F F, in combination with mechanism for operating on the loop of the button-eye, substantially as set forth.

298,959. MACHINE FOR SEWING ON BUTTONS. FREDERICK EGGE, Bridgeport, Conn., assignor to the Smith & Egge Manufacturing Company, same place. Filed June 22, 1883. (No model.)

Brief.—The button is grasped by jaws and brought down into position for being sewed on. A switch-cam gives a longitudinal reciprocation to a pin carrying a roller and operating in a diagonal slot in the oscillator, whereby the latter moves the button so that the needle passes repeatedly first within and then without the eye of the button. On the completion of a certain number of stitches the driving-wheel is automatically disengaged.

Claim.—1. In a machine for sewing on buttons, a clamp secured to the oscillating mechanism, and having independently-pivoted arms held at their forward extremities, in a distended position, by means of a spring, in combination with means for operating the arms, whereby the buttons may be grasped and brought down to the proper position for sewing, substantially as set forth.

2. In a machine for sewing on buttons, the clamping-jaws pivotally attached to a block, which is pivoted within standards projecting upward from the oscillator, in combination with a spring for keeping the jaws distended and the block elevated at its forward portion, and means, substantially as described, for closing the jaws and elevating the rear end of said block, as set forth.

3. The block V, mounted in standards U, secured to the oscillator, and having spring-jaws X, pivoted to the under side, in combination with the post K, and suitable cams and levers for operating said jaws, substantially as shown and described.

4. The sliding plate C, having secured thereto mechanism for determining the number of oscillations, in combination with the switch-cam, the oscillator, and means for holding the shaft in connection with the driving-wheel.

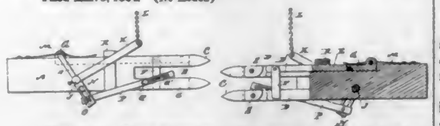
5. The spring-dog S, beveled at its upper portion, and adapted to hold the shaft in connection with the driving-wheel, as described, in combination with mechanism for tripping said dog, whereby the action of the machine is stopped, substantially as shown and described.

6. The wheel C′, having peripheral teeth *g*, and teeth h, projecting downward from its face, in combination with means for rotating and re-

ciprocating the same, whereby the teeth A may act intermittently on the mechanism which holds the shaft in connection with the driving-wheel, substantially as described.

7. The wheel C', secured to the sliding plate C, and having teeth *g* h, projecting from its periphery and face, respectively, in combination with means for rotating the said wheel, and the pivoted spring-dog S, substantially as described.

8. The wheel C', secured to the sliding plate C, and having teeth *g* h, as described, in combination with the pawl D', connected with spring E', click F', and pivoted spring-dog S, substantially as set forth and described.



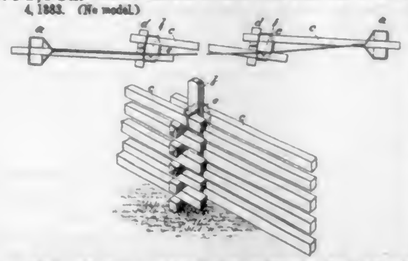
9. The spring-dog S, pivoted to the frame of the machine, in combination with the pivoted lever Q and sliding collar M, as set forth.

10. The block V, having jaws X, pivoted thereto, and pivoted lever A', operating the cam Z, in combination with the lever W, carrying cam B', and post K, substantially as described.

11. The oscillator pivoted within the frame B, in combination with the sliding plate C, provided with pin D, and carrying the wheel C', having peripherical and face teeth, as described, means for rotating said wheel intermittently, and the pivoted spring-dog S, substantially as set forth.

12. The combination, with the spring-dog S, pivoted to the frame B, and lever Q, pivoted to the bed-plate, of the collar M, and feather L, secured thereto, spring N, collar O, and driving-wheel P, having recess *b* and lug *c* therein, substantially as shown and described.

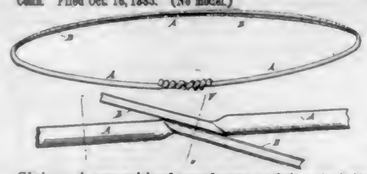
298,960. CAR-COUPLING. JOSEPH FLAVIOUS FAIRFIELD, Alma, Nebr. Filed Mar. 5, 1884. (No model.)



Claim.—1. The combination, with a draw-head, of a sliding bar held on the same, a coupling-pin pivoted in the sliding bar, and means for automatically sliding the bar carrying the pin forward when the draw-heads come together, whereby the pin will be caused to drop into a suitable coupling on the opposite draw-head, substantially as herein shown and described.

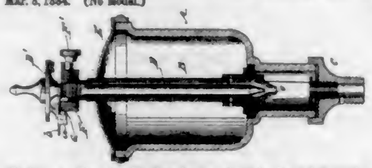
2. The combination, with the forked draw-head, of a sliding bar in the top of the same, a coupling-pin pivoted on the outer end of the sliding bar, a crank-frame, H, connected with the rear end of the sliding bar, the spring M, resting on the crom-piece of the frame H, and means for rocking the said frame, substantially as herein shown and described.

3. The combination, with a draw-head, of the sliding bar E, the coupling-pin F, pivoted in the same, the rocking frame H, mounted on the shaft J, the slotted arm N, projecting downward from the shaft J, and the bar P, held on the side of the draw-head and connected with the arm N, substantially as herein shown and described.



4. The combination, with a draw-head, of the sliding bar E, the coupling-pin F, pivoted in the same, the rocking frame H, mounted on the shaft J, the slotted arm N, projecting downward from the shaft J, the bar P, held on the side of the draw-head and connected with the arm N, and the projections or buttons S on the sides of the draw-head, substantially as herein shown and described.

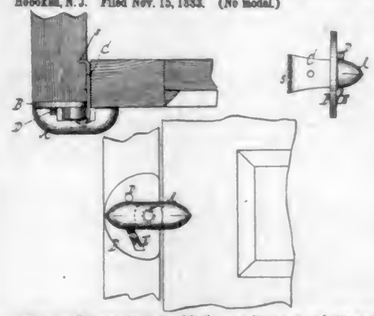
298,961. FENCE. BENJAMIN FRANKLIN FORD, Hollis, Tex. Filed Oct. 4, 1883. (No model.)



Claim.—The fence constructed substantially as described, having its rails arranged diagonally to the line of fencing, consisting of the double end posts, *a a*, bound together at their upper ends by means of the crown-wire, as shown, the intermediate single posts, *b*, the horizontal rails having their ends alternately lapping the inner and outer sides of the said single posts, the transverse blocks *d*, interposed between the respective rails *c*, and the top rails bound to the single posts by means of the wire loops *e*, all substantially as and for the purposes specified.

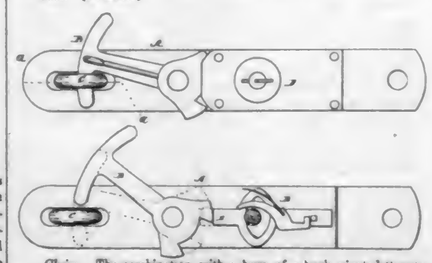
298,962. METALLIC BARREL-HOOP. ELLSWORTH FORD, Westville, Conn. Filed Oct. 16, 1883. (No model.)

Claim.—A new article of manufacture consisting of a half-round metal hoop-blank twisted at its opposite ends in reverse directions for a quarter-revolution, thus bringing toward each other the flat sides of the ends, as described.



298,963. OIL-CUP. WILLIAM A. FOSTER, Fitchburg, Mass. Filed Mar. 3, 1884. (No model.)

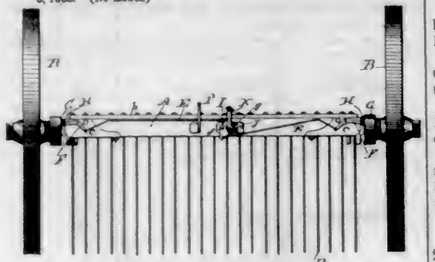
Claim.—1. The ring F, placed upon the tube B, and formed with a suitable detent, in combination with the spring H, secured to the spindle or valve D, and arranged to engage with the detent, substantially as and for the purposes set forth.



2. The ring F, formed with slot G, and provided with set-screw F', in combination with the spring H, formed with lip *a*, and adapted to be secured to the spindle D, substantially as and for the purposes set forth.

298,964. DOOR-SECURER. CHARLES FRANKE and AUGUST PETERS, Hoboken, N. J. Filed Nov. 15, 1883. (No model.)

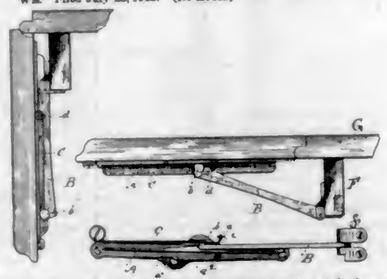
Claim.—The combination, with the turn-button A and the supporting-plate B, of the fixed stop D and the yielding stop E, for holding the button in a locked position, substantially as shown and described.



298,965. HASP-LOCK. WILLIAM FRY, Akron, Ohio. Filed Oct. 6, 1883. (No model.)

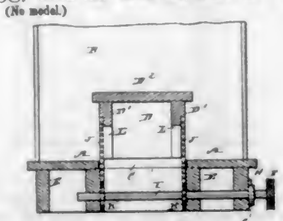
Claim.—The combination, with a hasp, of a hook pivoted thereto and provided with rearwardly-projecting lugs, and a lock attached to said hasp provided with a reciprocating bolt adapted, when thrown forward,

to engage one of said lugs and retain the hook in position, all constructed and arranged as shown, and for the purpose specified.



298,966. HORSE-RAKE. HENRY W. GETMAN, Ilion, N. Y. Filed Oct. 8, 1883. (No model.)

Claim.—1. The combination of the rods E, pawls F, ratchet-wheels G, disks H, having slots *e*, double crank-lever I, bracket J, bell-crank lever K, rod L, and foot-lever M, pivoted on the bracket M', substantially as shown, and for the purpose described.



2. The combination of the rod O, secured by brackets *j* to the seat-standard, and provided with the foot-piece *k* and hook *k'*, the spring *l*, and rake-teeth D, substantially as shown, and for the purpose described.

298,967. TABLE-LEAF SUPPORT. HERBERT JAMES GOOLD, Boscobel, Wis. Filed July 23, 1883. (No model.)

Claim.—In a table-leaf support, the combination of the lever B, having angular hook *b*, projecting bar F, rail A, having base *a*, shoulder or stop a^2, spring C, eye *d*, and bracket *f*, substantially as shown and described.

298,968. STOCK-CAR. HENRY HESS, Canfield, Ohio. Filed Mar. 12, 1884. (No model.)

Claim.—1. The combination, with a car, of the vertically-movable platform D, having recesses L in its sides, the racks J, the shafts I, and the cog-wheels K, substantially as herein shown and described.

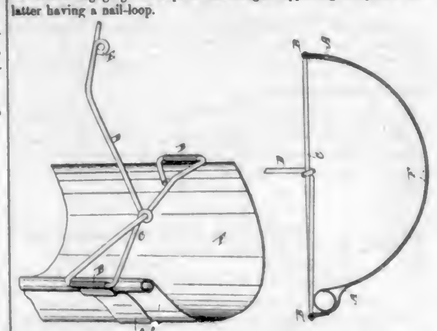
2. The combination, with a car, of the vertically-movable platform D, the racks J, the shafts I, the cog-wheels K, the ratchet-wheels G, and the pawls H, substantially as herein shown and described.

298,969. STRAP-FASTENING LOOP FOR CARRIAGE-CURTAINS. HENRY HIGGS, Newport, Ky. Filed Apr. 3, 1884. (No model.)

Claim.—1. A strap-fastening loop provided with a central recess, C, and projecting stud D, adapted to be secured to the base F, substantially as specified.

2. A strap-fastening loop provided with a central opening, C, formed of the blank B, struck up to form a joint in the bottom *b*, substantially as specified.

3. A strap loop, A, having a central opening, C, struck up from the blank B, provided with overlapping lips *c*, in combination with the stud D, substantially as specified.



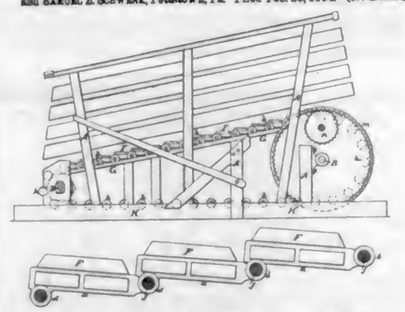
4. A strap-fastening loop, A, having a central opening, C, struck up from blank B, provided with overlapping lips *c*, in combination with the stud D and washer E, substantially as specified.

5. The strap-fastening loop A A, having central openiog, C, stud D, washer E, and tangs *a*, in combination with fastening-strip G, for securing the loop to its base, substantially as specified.

6. A strap-fastening loop having a central recess or opening, C, fastening-stud D, and washer E, and fastening-tangs *c*, for securing the loop to the base F, in combination with fastening-strip G, substantially as specified.

298,970. EAVES-TROUGH HANGER. HENRY JOHN HOEFTNER, Athens, Ohio. Filed Nov. 28, 1883. (No model.)

Brief.—The cross-piece and hanging-wire are made in one piece, the former engaging the loops of the trough-supporting strap, and the latter having a nail-loop.

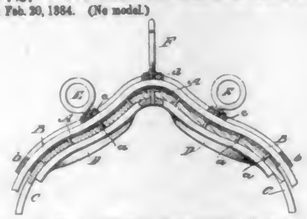


Claim.—1. The herein-described eaves-trough hanger, consisting of a metal strap or band secured to the ends of a cross-piece made of one continuous wire with the hanging-wire, substantially as herein shown and described.

2. In an eaves-trough hanger, the combination, with a cross-piece, C, made integral with the hanging-wire D, of a metal strap or band, A, provided at the ends with loops B, substantially as herein shown and described.

3. In an eaves-trough hanger, the combination, with the metal strap or band A, provided with the loops B, of the cross-piece C and the hanging-wire D, made integral with the cross-piece, and provided with the loop E, substantially as herein shown and described.

298,971. HORSE-POWER TREAD. NATHAN HOFFMAN, HIRAM ELLIS, and SAMUEL Z. SCHWINK, Pottstown, Pa. Filed Feb. 25, 1884. (No model.)

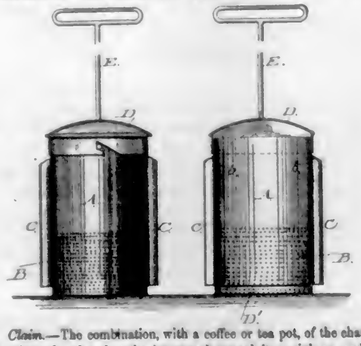


Claim.—1. The link having the rear eye, *d*, below and in advance of the rear edge of the body, whereby the connecting-rod *f* is covered and protected by the lug F, as set forth.

2. The link having the front eye, *b*, in line with the body, and the rear eye, *d*, below and in advance of the rear edge of the body, as set forth.

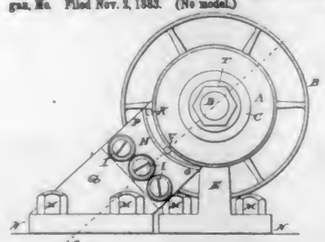
3. The combination of the chain and its supporting-rollers A with an end shaft having wheels for supporting the chain, and with a rotating guard-plate, whereby the rollers A are retained in place while the chain is passing around the wheels, as set forth.

4. The combination of the shaft B and its sprocket-wheels, the chain having supporting-rollers *h*, and the gear-wheel *m*, forming a guard for said rollers, as set forth.



298,972. HARNESS-SADDLE. DANIEL B. HOLSBURG, Granville, Ill. Filed Feb. 20, 1884. (No model.)

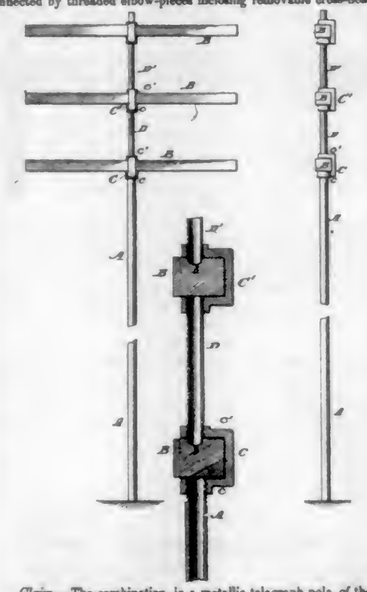
Claim.—1. The combination of the channeled tree A, provided with cross-piece *b c d*, integral therewith, with the strap C and pads D, secured to the under side of the tree by rivets *a* passing through the bottom of the tree, and the strap B passing loosely through the channel, substantially as set forth.



2. As an improved article of manufacture, the tree A, formed in channel shape, and provided at its center with cross-piece *d*, cross-pieces *c c* below the same, and cross-pieces *b* at the ends of the tree, all made in one piece with the tree, whereby supports for the check-hook and terrets and keepers to the main strap are provided, substantially as set forth.

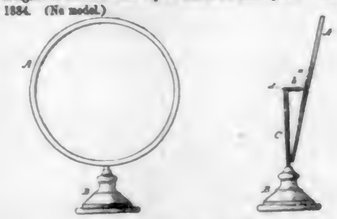
298,973. ATTACHMENT FOR COFFEE-POTS. ROBERT A. HOLT, Lebanon, Me. Filed Dec. 4, 1883. (No model.)

Claim.—The combination, with a coffee or tea pot, of the chamber A, perforated at *b* and at the lower end around its periphery, and side pipes, C, having open lower ends and closed upper ends, and a cover, D, having handle E, and locked to the chamber A, all constructed to operate substantially as and for the purpose herein set forth.



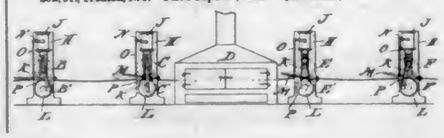
298,974. WIRE-CUTTING MACHINE. DARIUS HOUGHTON, Skowhegan, Me. Filed Nov. 2, 1883. (No model.)

Claim.—In a wire-cutting machine, the combination of the moving cutter with a stationary cutter, the two cutters being arranged with their cutting-edges directly opposite each to the other, forming a tapering and vanishing recess between them, substantially as described.



298,975. TELEGRAPH-POLE. JAMES HUNTER, Ruff's Dale, Pa. Filed Mar. 13, 1884. (No model.)

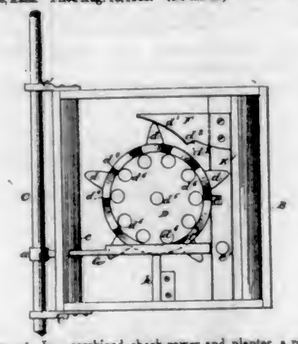
Brief.—A pole is provided with threaded sections or extensions connected by threaded elbow-pieces inclosing removable cross-heads.



Claim.—The combination, in a metallic telegraph-pole, of the pole A, elbow-pieces C, removable arms or cross-heads B, and threaded clamping sections or extensions D, substantially as and for the purpose shown and set forth.

298,976. PLAQUE-HOLDER. DAVID M. IRELAND, Waterbury, Conn., assignor of one-half to Henry A. Matthews, same place. Filed Mar. 22, 1884. (No model.)

Claim.—A metal plaque constructed with a shank, *a*, extending from its back at an inclination to the plane of the surface of the plaque, combined with a holder consisting of a post arranged upon a suitable base, with a socket extending therefrom at substantially right angles, and so as to receive the shank of the plaque, substantially as specified.

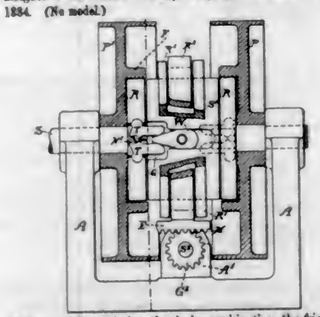


298,977. MACHINERY FOR ROLLING WIRE. WILLIAM H. JACKSON, Jr., Trenton, N. J. Filed Sept. 27, 1883. (No model.)

Claim.—1. The combination, with a pair of wire-reducing rollers mounted in suitable uprights, and one of said rollers having a crank-wheel, L, of the engine J, above said rollers and connected with the crank-wheel by its piston and the connecting-rod K, and a lever, M, pivoted on the upright and connected to the valve-rod N by rod O, substantially as set forth.

2. The combination, with a pair of wire-reducing rollers, of the engine J, the lever M, and brake-shoe P, the lever being connected to adapt it for cutting off steam to the engine, and at the same time for applying a brake to the wheel L, substantially as and for the purposes set forth.

298,978. CHECK-ROWER AND CORN-PLANTER. DANL. W. JACOBY, Abilene, Kans. Filed Aug. 18, 1883. (No model.)

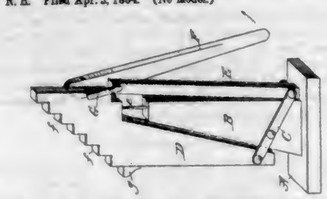


Claim.—1. In a combined check-rower and planter, a rock-shaft, C, carrying forked arms H, and arms *a* and *b*, the latter having a spring, *b'*, in combination with draw-rods entering the seed-boxes and provided with pawls, the seed-delivering wheels D, provided with projections *d* and *d'*, the slide E', having attachment F, with the curved edge, and pin *d'*, as shown, the seed-tube I, and the valve J, engaging with the slide, substantially as set forth.

2. In a planting-machine, a hopper, B, having therein a seed-delivering wheel, D, provided with cam-like projections *d*, in combination with slide E', having attachment F, with the curved edge, as shown, and pin *d'*, and a seed-tube having a valve engaging with the slide, substantially as and for the purpose set forth.

3. In a check-rower and planter, a hopper, B, with guide *h*, a wheel, D, having projections *d* and *d'*, and apertures *d*², and slide E', provided with attachment F and pin *d'*, in combination with tube I, having valve J, draw-rods G, with pawls, and suitable mechanism for operating them, substantially as set forth.

298,979. FRICTION-CLUTCH. MOSES C. JOHNSON, Hartford, Conn., assignor to the Pratt & Whitney Company, same place. Filed Mar. 10, 1884. (No model.)

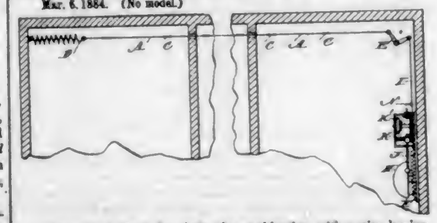


Claim.—1. In a friction-clutch, in combination, the friction-ring R, toggle-levers T, a block, N, and the taper-head screw N', substantially as and for the purpose described.

2. In a friction-clutch mechanism, in combination, the ring R', the ring R², having a rack, M, and a shaft, S², having a pinion gearing with that rack, combined and operating substantially as described.

3. In a friction-clutch mechanism, a shaft, S, having an enlarged portion, S', a wheel and friction devices upon said shaft, at each side of the said enlarged portion thereof, a ring, as R', adapted to have a reciprocating motion upon the enlarged portion of said shaft, ring R², shaft S², rack E, and pinion G², combined and operating substantially as described.

298,980. LIFTING-JACK. ADIN PHILLIPS JOY, New Market Junction, N. H. Filed Apr. 3, 1884. (No model.)



Claim.—1. In a lifting-jack, the combination, with the standard B and rest-piece D, of the levers C C, handle F, link G, and connecting rod or bar E, substantially as described.

2. In a lifting-jack, the combination, with the notched rest-piece D, of the supplemental rest *g*, having a spur, A, and secured to the rest-piece, substantially as described.

3. In a lifting-jack, the combination of the standard B, the notched and recessed rest-piece D, having a supplemental rest, *g*, the levers C C, handle F, link G, and connecting-bar E, substantially as described.

298,981. FIRE-ALARM. CHARLES H. JUDSON, Greenville, S. C. Filed Mar. 6, 1884. (No model.)

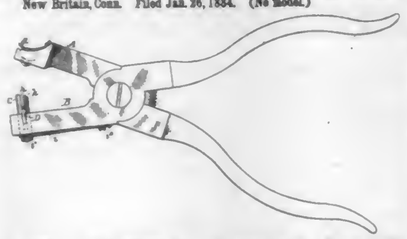
Claim.—1. In a fire-alarm, the combination, with a wire having fusible connections, of the spring D at one end of the same, a less powerful spring, F, at the opposite end, a mechanical bell-ringing mechanism, a gong or bell, H, the trigger-lever M, formed with two arms, one of which engages the alarm mechanism and the other of which projects outward therefrom, and the projection N, formed on the wire and adapted to act on the said outwardly-projecting arm of the trigger-lever M, substantially as herein shown and described.

2. The combination, with the bell-wire A', the elbow-lever O, and the cord or pull P, of a spring connected at the upper end with the elbow-lever, and with a wire having a fusible connection and holding the upper end of the spring and preventing it from pulling or turning the elbow-lever, substantially as herein shown and described.

3. The combination, with the bell-wire A', the elbow-lever O, and the cord or wire pull P, of the spring Q, secured to the wall and the elbow-lever, and the wire R, having a fusible connection and secured to the ceiling or wall and to the upper end of the spring Q, to prevent it from contracting, substantially as herein shown and described.

298,982. BREECH-LOADING FIRE-ARM. PIUS KAUL and CHARLES KAUL, Lancaster, Pa. Filed Feb. 20, 1884. (No model.)

Claim.—1. The combination of the hand-lever G, having the arms G' G², the sliding block L, having an opening, L², receiving arm G², and the hammer E, having the curved recess E², receiving arm G' and being engaged thereby, substantially as shown and described, whereby the lever is adapted to pull down the said block and cock the hammer simultaneously, and then to return the block and leave the hammer cocked.



2. The combination of the lever G, having arm G^3, and the sliding block L, having the opening L^2, provided with a curved bottom, against which said arm G^3 may be made to bear to pull down the block, and a shoulder, *g*, at its top, against which the end of arm G^3 may be made to bear to hold the block in a raised position, substantially as shown and described.

3. The combination of the vertically-sliding block L, having the vertical longitudinal openings L^2 and *l*, the opening *l* being of greater vertical extent than the opening L^2, the lever G, having the arm G^3 placed in the opening L^2, and the cartridge-extractor having the arm O^2 placed in the opening *l*, whereby the block may be drawn down and the cartridge-extractor may be operated only at the end of the downward movement of the block, substantially as specified.

298,983. PROCESS OF PURIFYING MOLTEN IRON AND STEEL. HORATIO KEELER, Chicago, Ill. Filed Dec. 1, 1882. (Specimens.)

Claim.—The herein-described method of improving the grade and quality of iron and steel, consisting in combining them while in a molten state with a mixture formed of pure copper filings and pulverized resin in the proportions hereinbefore mentioned, substantially as specified.

298,984. BUTTON-SETTING INSTRUMENT. ELEAZER KEMPSHALL, New Britain, Conn. Filed Jan. 26, 1884. (No model.)

Claim.—1. The combination, with a shank-bending die, of a yielding guide-block slotted laterally and longitudinally, and an anvil within said slot, substantially as described, whereby a single T-shaped button-fastener can be inserted edgewise into said block, and the shank of the fastener bent by said die into the form of a hook, as set forth.

2. The combination, with a shank-bending die and a button-holding clamp for presenting the shank-eye of a button in line with said bending-die, of a yielding guide-block laterally and longitudinally slotted, for the edgewise reception of a T-shaped button-fastener and an anvil in said slot, substantially as described.

3. In a button-setting instrument, the combination of the slotted guide-block adapted to receive the head of a T-shaped fastener sliding in and through a guide-bearing, and a spring at the base of said block and outside of its bearing, substantially as described, whereby said block can yield under pressure and be longitudinally guided, as set forth.

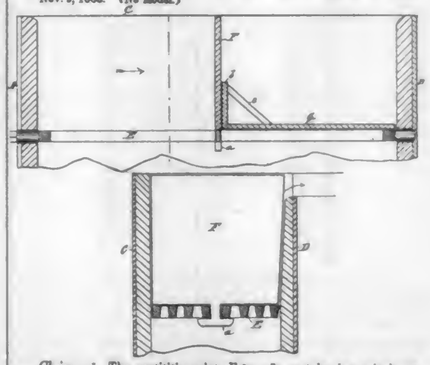
4. The guide-block slotted to receive the head of a T-shaped fastener fitted to slide longitudinally in a guide-bearing, in combination with a spring connected to the base of said block, substantially as described, whereby said block is not only enabled to yield to pressure, but is also limited in its longitudinal movements, as set forth.

5. In a button-setting instrument, a yielding guide-block provided with a longitudinal slot having at one or both sides thereof a spring for compressing the shank of a button-fastener, and preventing it from tilting edgewise in said slot, substantially as described.

6. The combination, with a slotted yielding guide-block, of an anvil occupying said slot, and a shoulder near one end of said anvil, to serve as a gage for contact with one end of the head-bar of a single-shanked fastener, substantially as described, whereby the shank of the fastener can be readily located centrally and vertically in the slot of the guide-block, as set forth.

298,985. BIB. GEORGE E. KENDALL, Franklin, Mass. Filed Aug. 22, 1883. (No model.)

Claim.—1. A bib provided with a pocket at about the middle of its front for receiving and securely holding a nursing-bottle, substantially as herein shown and described.



2. A bib provided with a pocket for receiving and holding a nursing-bottle, which pocket is provided at its top with a button and button-hole or other device for holding the top of the pocket closed on the bottle, substantially as herein shown and described.

3. In a bib provided with a pocket, B, neckbands C, and body-bands D, substantially as herein shown and described.

298,985.

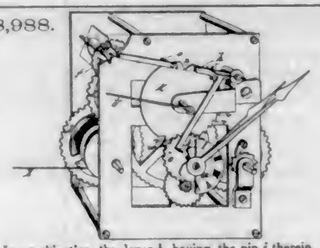
298,986. COOKING-STOVE. ERNST J. KRAUSE, Carlisle, Pa. Filed Nov. 9, 1883. (No model.)

Claim.—1. The partition-plate F for a fire-pot, having at its lower end a bead of less width than the space between the grate-bars, and of greater length than the same, to adapt it to be inserted edgewise, and then turned to catch beneath the grate-bars to hold it in place, as described.

2. The combination, with the partition-plate of a fire-pot, of an obstruction-plate, G, having an upright flange, *b*, at one end, with handle-brace *c*, as and for the purpose described.

298,987. EAR-ORNAMENT FASTENER. GEORGE KREMENTZ, Newark, N. J. Filed Feb. 21, 1884. (No model.)

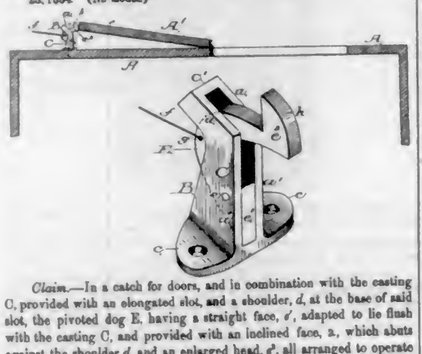
Claim.—1. The combination, with an ear-wire holding an ornament, of a hollow nut through which the ear-wire passes, provided with a clamp for engaging the ear-wire between its walls and locking the same to the wire, substantially as herein shown and described.



2. The combination, with a nut fitting on an ear-wire for holding an ear-ornament, of a clamping-frame hinged in the nut, substantially as herein shown and described.

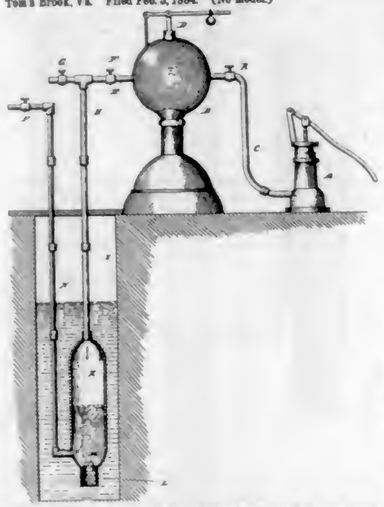
3. The combination, with a nut fitting on an ear-wire for holding an ear-ornament, of a frame, E, hinged in the nut and provided with a projection, F, at its hinged end, which projection is adapted to clamp on the ear-wire, substantially as herein shown and described.

298,988. TIME PIECE FOR OPERATING MECHANICAL DEVICES. JAMES A. LAKIN, Westfield, Mass. Filed Feb. 1, 1884. (No model.)



Claim.—1. The combination, with an actuating clock-train, substantially as described, and with a clock provided with the usual alarm-starting devices, of a lever having a pin projecting from its side, and adapted to have one end bear upon the alarm-cam, and to have its other end engage with one of the wheels of said train, the hour-wheel of the clock having a pin therein projecting from its face, and a toothed disk having a notch in its periphery, and carrying a pointer to rotate over a scale-plate on the clock-dial, and adapted to rotate under the pin projecting from the side of said lever, substantially as set forth.

298,988.



2. In combination, the lever A, having the pin *i* therein, the disk K, having teeth and the notch *x* in its edge, the wheel *c*, and means, substantially as described, for engaging said wheel with said disk, substantially as set forth.

298,989. DOOR-CHECK. JOHN J. LAMB, Waterloo, Iowa. Filed Feb. 23, 1884. (No model.)

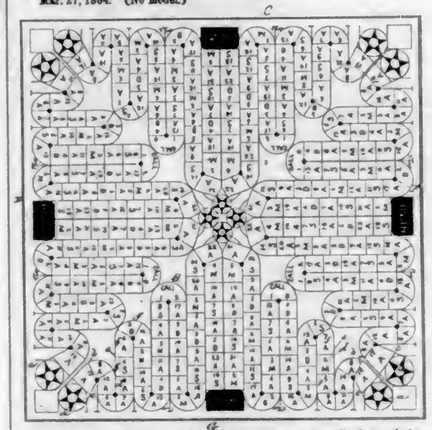
Claim.—In a catch for doors, and in combination with the casting C, provided with an elongated slot, and a shoulder, *d*, at the base of said slot, the pivoted dog E, having a straight face, *e'*, adapted to lie flush with the casting C, and provided with an inclined face, *a*, which abuts against the shoulder *d*, and an enlarged head, e^2, all arranged to operate substantially as and for the purpose herein set forth.

298,990. COMPRESSED-AIR WATER-ELEVATOR. JOHN K. LEEDY, Tom's Brook, Va. Filed Feb. 5, 1884. (No model.)

Claim.—The combination, in a water-elevator, of an air-pump, an air-chamber connected thereto by a pipe provided with a stop-cock, said air-chamber having a safety-valve, a water-chamber connected to the air-chamber, said connection having an inlet and outlet stop-cock, and the water-chamber having a water-inlet properly valved, and an outlet-pipe for the water, also provided with a stop-cock, all the parts being arranged to operate as and for the purpose specified.

298,991. PLAYING-CARDS. EDGAR J. LEVEY, New York, N. Y. Filed Mar. 29, 1884. (No model.)

Brief.—Improvement on Patent No. 178,863, dated June 20, 1876.



Claim.—1. A pack of playing-cards having cards in each suit which contain the picture of the court-card they are intended to represent, together with the spots or suit-pips they are intended to represent, substantially as described.

2. A pack of playing-cards having imprinted on one of each suit a picture to represent the knave and also eleven spots or pips, and a picture to represent the queen and also twelve spots or pips, and a picture to represent the king and also thirteen spots or pips, respectively, substantially as described.

3. A pack of playing-cards having in each suit a card containing eleven spots or pips and the head of a knave, a card containing twelve spots or pips and the head of a queen, and a card containing thirteen spots or pips and the head of a king, substantially as described.

4. A pack of playing-cards having in each suit a card containing eleven pips or spots and the head of a knave, a card containing twelve spots or pips and the head of a queen, and a card containing thirteen spots or pips and the head of a king, together with characters upon the upper left-hand margin of each of these cards, as follows: the first letter of the title of the court-card, a pip of the kind contained on the card, and a number corresponding with the number of pips on the card, substantially as described.

298,992. GAME-BOARD. JOSEPH M. LEWIS, Trenton, N. J. Filed Mar. 27, 1884. (No model.)

Claim.—1. The improved game-board herein described, consisting of two or more divisions, each containing a path or paths divided into a series of spaces, each containing a numerical character and a letter indicative of one of the mathematical divisions, substantially as set forth.

2. The improved game-board herein described, consisting of two or more divisions, each having one or more serpentine paths, merging at their respective ends with a symbol or character located in one of the corners, and with a goal or home, said paths being subdivided into a series of spaces, each containing a numerical character and a letter in that of one of the mathematical divisions, substantially as and for the purpose set forth.

3. The combination, in a game-board arranged and designed as herein described, of space *g*, containing a numerical character and the word "Call," or other word of like significance, as and for the purpose set forth.

298,993. COMBINED BUTTON AND CUFF-HOLDER. CHARLES H. LOWELL, Boston, Mass. Filed Mar. 27, 1884. (No model.)

Claim.—The combined sleeve-button and cuff-holder herein described, composed of the spring-clip having two arms adapted to grasp a cuff, and the button having a flat shank attached to said plate and extending crosswise thereof, whereby the shank and clip are prevented from turning when the shank is in place in the sleeve button-holes, as set forth.

298,994. TRICYCLE. MATTHIAS FRANKLIN MCMAHAN, Trappe, assignor of one-half to Matthias Merrick, Kirkham, Md. Filed Mar. 11, 1884. (No model.)

Claim.—1. In a tricycle, the combination, with the base provided with a central opening, of the turn-table carrying the operating mechanism, and wheels or pulleys secured to the turn-table and working on the base around the opening, as set forth.

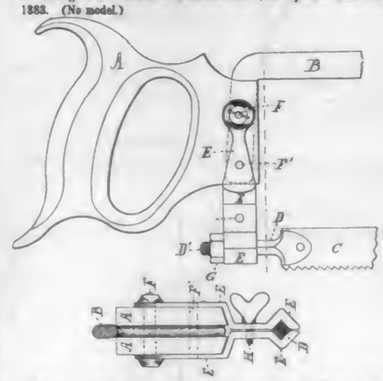
2. In a tricycle, the herein-described hub, comprising the two side sections or disks, the circular rim, and the rollers or balls journaled in the side sections and bearing against the axle, whereby the friction is lessened and the machine runs with greater ease, as set forth.

3. In a tricycle, the herein-described brake, comprising the spring brake-lever, fitted to a U-shaped plate, a corresponding U-shaped plate to which it is pivoted, and an inclosing-frame, as set forth.

4. In a tricycle, the combination, with the base, of the turn-table moving in the same, a frame mounted on the turn-table and carrying the operating mechanism, and a handle formed on or attached to the rear end of the frame for steering the machine, as set forth.

5. In a tricycle, the combination, with the base and a frame arranged upon the same, of the turn-table moving in the base, a frame mounted on the turn-table and carrying the operating mechanism and swiveled in the frame of the base, a handle formed on or attached to the frame, and a seat arranged in rear of the frame, as set forth.

6. In a tricycle, the combination, with the base, of a turn-table moving in the same, a frame mounted on the turn-table, the steering-wheel journaled in the frame and working through the turn-table, a balance-wheel, treadle, and intermediate gearing connecting the balance-wheel and treadle to the steering-wheel, as set forth.



7. In a tricycle, the combination, with the base, of the turn-table moving in the same, a frame mounted on the turn-table, the steering-wheel mounted on a shaft journaled in the frame, a crank or handle connected by intermediate gearing with the steering-wheel, and a fly or balance wheel, as set forth.

8. In a tricycle, the combination, with the base, of a turn-table moving in the same, a frame mounted on the turn-table, the steering-wheel W, mounted on a shaft journaled in the frame, a driving-wheel, V^2, the intermediate gearing connecting the driving-wheel and steering-wheel, and operating means for the driving-wheel, as set forth.

9. In a tricycle, the combination, with the base, of the turn-table moving in the same, a frame mounted on the turn-table, the large wheel mounted on a shaft journaled in the frame, operating means for the same, and a balance or fly wheel connecting with the large wheel and adapted to start the machine, as set forth.

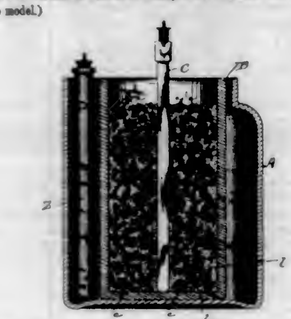
10. In a tricycle, the combination, with the base, of a turn-table provided with wheels or pulleys running on the base, the frame mounted on the turn-table, the large steering-wheel mounted in the frame, and operating means for the steering-wheel, as set forth.

298,995. CLAMP FOR FRAME-SAWS. ANDREW MCNIECE, Newark, N. J., assignor of one-half to Rowland Hilton, same place. Filed Oct. 25, 1883. (No model.)

Claim.—1. The combination, with the handle A, of the frame B, fitted into a slot in the handle, as described, and a stretcher-clamp formed in two parts, and provided with grooves to fit the stretcher D, and a screw, as G, to clamp the parts upon the stretcher.

2. The clamp for a saw-blade stretcher, consisting in two symmetrical parts secured to the opposite sides of the handle and clamped upon the stretcher by a screw, substantially as herein shown and described.

298,996. PROJECTILE. DAVID M. MEFFORD, Toledo, Ohio, assignor, by direct and mesne assignments, of part to Armor J. Fair, Detroit, Mich., and Harvey D. Wilmot, New York, N. Y. Filed Oct. 19, 1883. (No model.)



Claim.—1. The projectile described, consisting of the cylindrical front portion and the frusto-conical rear portion, having a closed or solid base, the whole being free from all projections for centering or rifling purposes, substantially as described.

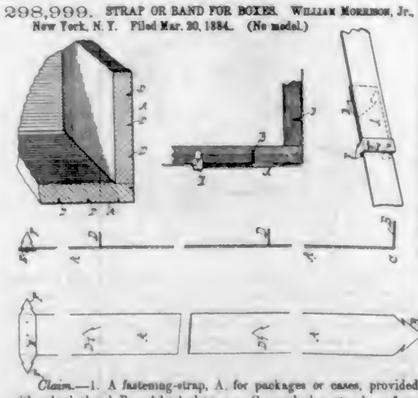
2. The combination, with the cylindrical tubular portion B, of the frustum A, having a cylindrical portion, a' a^2, adapted to enter and close the rear of said tube, the whole constituting a projectile free from projections, substantially as described.

3. The combination of the hollow cylinder B, the frustum A, adapted to enter and close the rear of said tube, and the cap C, forming a cover to said tube, the whole constituting a projectile free from external projections for centering or rifling purposes, substantially as described.

298,997. ELECTRIC BATTERY. ORSON MILLARD, Flint, Mich., assignor of one-half to Charles B. Crampton, same place. Filed Oct. 3, 1883. (No model.)

Claim.—1. A galvanic battery in which lead chromate is an electrolyte.

2. A galvanic battery employing lead-chromate powder as an electrolyte in connection with an alkaline solution.



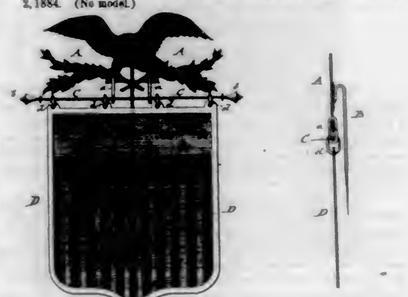
3. A galvanic battery in which lead chromate is arranged in contact with the negative electrode, and the two electrodes and said lead chromate are immersed in a solution or solutions which will act on the positive electrode and release hydrogen to combine with the oxygen of the lead chromate, essentially as set forth.

4. A galvanic battery in which a mixture of lumps of carbon and lead chromate in the form of a salt is placed in contact with a carbon negative electrode, substantially as described.

298,998. OBTAINING BROWN DYES FROM THE AROMATIC DIAMINES. PROSPER MONNET, St. Fons, Rhône, France, assignor to the Société P. Monnet et Cie., same place. Filed Jan. 26, 1884. (No specimens.)

Claim.—The herein-described method of dyeing materials brown, which consists in saturating the material in a bath composed of chlorhydrate of parasphenylene diamine, or its specified equivalent, sulphuric acid, and water, then wringing, and then treating the material to an oxidizing-bath for developing the color, substantially as set forth.

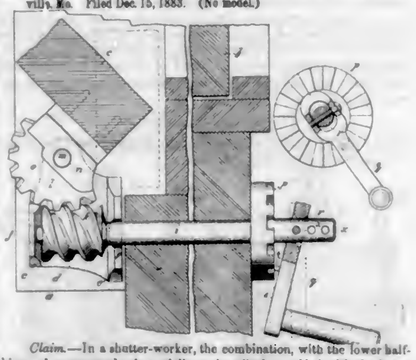
298,999. STRAP OR BAND FOR BOXES. WILLIAM MORRISON, Jr., New York, N. Y. Filed Mar. 20, 1884. (No model.)



Claim.—1. A fastening-strap, A, for packages or cases, provided with a barbed end, B, and barbed tongues C, punched or struck out from the body of the strap, substantially as described.

2. The strap A, having its front end barbed, and having barbed tongues intermediate of its ends, as described, in combination with the transverse piece E, with barbs F F, secured to the rear end of the strap, substantially as described.

3. A fastening-strap for packages or cases, provided at its rear end with a fastening extending transversely to the strap, so that the barbs F F of the fastenings are outside of the edges of the strap when the rear end of the strap overlaps the front end, substantially as described.

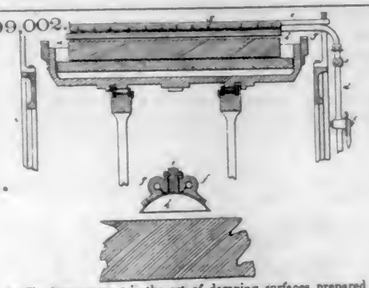


299,000. BADGE. FRANK NEUBERT, Springfield, Mass. Filed Apr. 2, 1884. (No model.)

Claim.—1. A badge consisting of a suspension-piece provided with a fastening device at the back, an intermediate transverse bar suspended from the suspension-piece, and a main piece suspended from the bar, substantially as and for the purpose set forth.

2. A badge composed of a suspension-piece provided with a pin or other fastening device at the back, an intermediate transverse bar suspended by links from the suspension-piece, and a main piece suspended by rings from the transverse bar, substantially as set forth.

299,001. SHUTTER-WORKER. DOCTOR FRANKLIN OLIVER, Huntsville, Mo. Filed Dec. 15, 1883. (No model.)



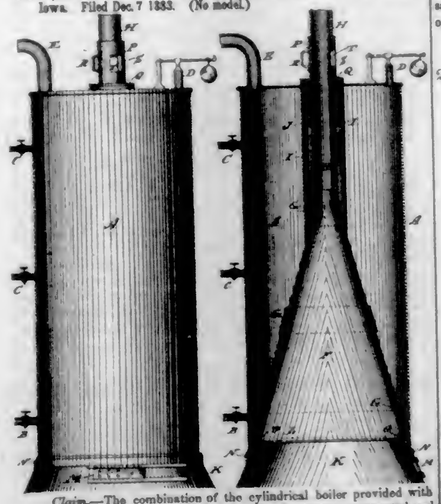
Claim.—In a shutter-worker, the combination, with the lower half-hinge, *d*, constructed substantially as described, provided with the lugs *e e'*, having bearings for the operating-shaft, as shown, and a bottom projection, *l*, having the pintle *m*, to engage the eye *n*, of the upper half-hinge, which is provided with a segmental gear, *o*, the shaft *i*, having the worm-gear *k* at its outer end, and its inner end provided with a plurality of perforations, the annular notched plate *p*, and crank *q*, having the oval slot *r* and pin *t*, whereby the crank-arm may be adjusted on the shaft with relation to the plate *p*, and the device adapted for window-casings or walls of various thicknesses, substantially as specified.

299,002. METHOD OF AND APPARATUS FOR DAMPING LITHOGRAPHIC SURFACES. JOHN W. OSBORNE, Washington, D. C., assignor to William H. Forbes, Boston, Mass. Filed June 18, 1881. (No model.)

Claim.—1. The improvement in the art of damping surfaces prepared for printing in the lithographic manner, which consists in mixing the vapor of water, or air saturated with the vapor of water, with air which has been cooled, for the formation of a cloud of condensed and suspended water particles, and then depositing said particles of atomized water upon the surface to be damped.

299,002.

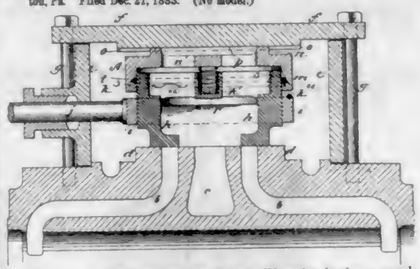
2. The improvement in the art of damping surfaces prepared for printing in the lithographic manner, which consists in mixing the vapor of water, or air saturated with the vapor of water, with air which has been compressed, cooled to ordinary temperature, and then released from pressure, for the formation of a cloud of condensed and suspended water particles, and then depositing said particles of atomized water upon the printing-surface.



3. That improvement in the art of damping surfaces prepared for printing in the lithographic manner, which consists in bringing simultaneously upon the surface of a lithographic stone or its described equivalent, and upon the same part of it, water in the form of vapor at any temperature and air sufficiently below the dew-point of said vapor to effect the condensation and conversion of the same into a cloud of water particles, which latter by their propulsion against and attachment to the printing-surface accomplish its damping, substantially as and for the purpose described.

4. The combination, substantially as described, of a condensing-atomizer, with means, substantially as described, for controlling, directing, and circumscribing the quantity, movement, and distribution of the generated cloud of atomized water over a surface prepared for printing in the lithographic manner, and with a lithographic press, substantially as and for the purpose described.

5. In an apparatus for damping printing-surfaces by projecting atomized water against the same, two tubes provided with adjacent terminal openings, and communicating the one with a steam-generator and the other with a reservoir furnishing compressed air at ordinary temperatures, substantially as and for the purpose described.



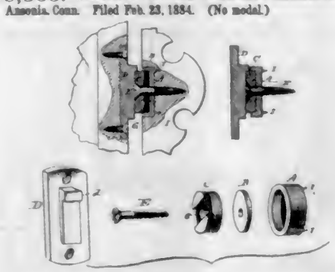
6. In an apparatus for damping printing-surfaces by projecting atomized water against the same, a mixing-chamber opening upon a lithographic stone or its described equivalent, and furnished with orifices for entering jets of steam, and for air cooled by expansion or otherwise, in combination with said printing-surface, substantially as and for the purpose described.

299,003. AGRICULTURAL BOILER. GEORGE PATTON, St. Charles, Iowa. Filed Dec. 7 1883. (No model.)

Claim.—The combination of the cylindrical boiler provided with the conical fire-box, the smoke-flue, and the flue-jacket, constructed and arranged as described, and the movable collar fitting the flue upon the top of the boiler, and provided with a bottom flange fitting over the air-chamber formed by the flue-jacket, and with an aperture adapted to register with a corresponding aperture in the flue, substantially as and for the purpose set forth.

299,004. BALANCED SLIDE-VALVE. WILLIAM A. PEARSON, Scranton, Pa. Filed Dec. 21, 1883. (No model.)

Claim.—1. The combination, with a slide-valve having a round neck, of a balance plate or cover, A, interposed between the valve and the top of the chest, and having a round neck engaging steam-tight with the neck of the valve, and having a square or rectangular abutting margin, *n*, to bear upon the top of the chest or its equivalent, and with means, substantially such as described, to prevent the rotation of the same, substantially as herein set forth.

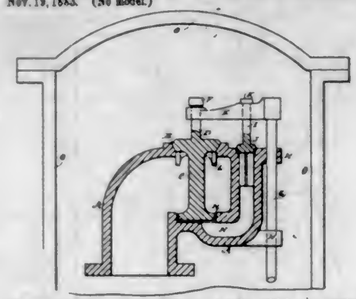


2. The combination, with a slide-valve having a cylindrical neck, *k*, of the balance-cover A, interposed between the valve and the chest-cover, having the circular neck *m*, engaging the neck *k*, and the rectangular abutting neck *n* with longitudinal guides *o o*, between which said neck fits, substantially as and for the purpose set forth.

3. The combination, with a steam-chest and its slide-valve, of a balance-cover fitting between the top of the chest and the valve, and engaging together in the manner of a piston and cylinder, the top of the balance-cover being rectangular, with the chest-cover *f*, formed with the raised bearing-surface *p* to receive said rectangular top, and with guides *o o* to embrace the same, substantially as and for the purpose set forth.

4. In combination with the slide-valve A and balance-cover A, engaging in the manner of a cylinder and piston, the oblique groove *s* in one of said engaging parts, with the split packing-ring *t* of soft metallic wire fitted in said groove, and the springs *u*, placed beneath the ring and serving to press it out upon the other part, substantially as herein shown and described.

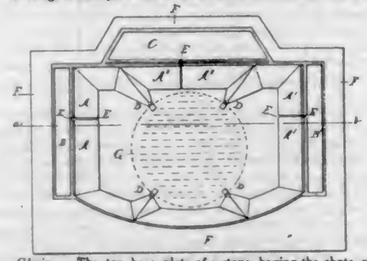
5. The combination, with a slide-valve and a balance-cover, A A, having necks which engage in the manner of a cylinder and piston, of an oblique groove, *s*, formed in one of the necks, and a packing-ring, *t*, placed in said groove, and means, substantially as described, for pressing said ring up in the oblique groove, and thereby wedging it against the opposite neck, substantially as herein shown and described.



299,005. MIRROR-PIVOT. DON C. PECK and FREDERICK L. GAYLORD, Ansonia, Conn. Filed Feb. 23, 1884. (No model.)

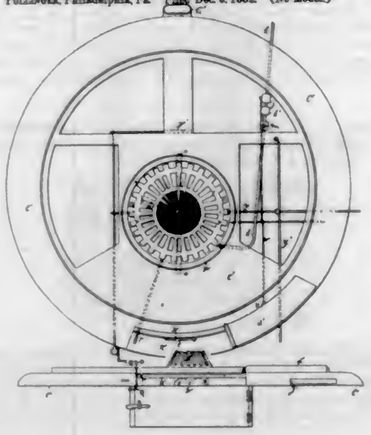
Claim.—1. The combination of the metal socket A, disk C, having a dovetail-shaped groove, *c*, diametrically across its face, with screw E, and plate D, having a dovetail-shaped rib, *d*, on its face corresponding to the groove *c*, substantially as and for the purpose specified.

2. The combination of the metal socket A, disk C, having a dovetail-shaped groove, *c*, diametrically across its face, and a spring-disk, B between the socket A and disk C, with screw E, and plate D, having a dovetail-shaped rib, *d*, on its face corresponding to the groove *c*, substantially as and for the purpose specified.



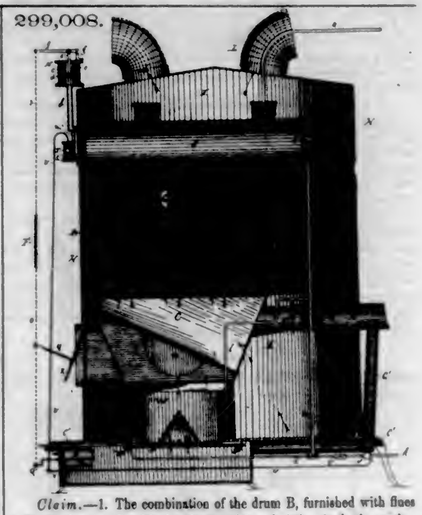
299,006. PUPPET-VALVE. WM. A. PEMBEY, Detroit, Mich. Filed Nov. 19, 1883. (No model.)

Claim.—1. In combination with a main valve which extends through its seat to a point near the opposite wall of the shell, a steam-passage in the shell extending from the steam side of the valve to a point opposite the extended end thereof, and a small auxiliary valve adapted to close said steam-passage, both the main and auxiliary valves being so connected with a valve-stem that the auxiliary valve will open before and close after the main valve, substantially as shown and described.



2. The combination of the valve-seat B, valve C, extending through its seat and terminating in the recess M in the opposite wall of the shell, steam-passage N, and valve J, said valves C and J being so connected with a valve-stem that the motion thereof will open valve J before opening valve C, substantially as shown and described.

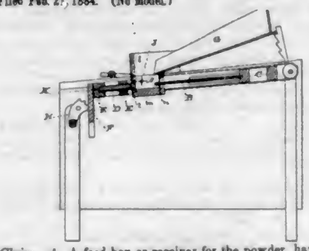
299,007. STOVE-CASTING. GEO. H. PHILLIPS, Troy, N. Y., assignor to George H. Phillips & Co., same place. Filed Oct. 11, 1883. (No model.)



Claim.—The top base-plate of a stove, having the chute-plates integral with the rim-plate, but divided at E, as and for the purpose specified.

299,008. HOT-AIR AND STEAM GENERATING FURNACE. WM. PULLDOER, Philadelphia, Pa. Filed Dec. 6, 1882. (No model.)

299,008.



Claim.—1. The combination of the drum B, furnished with flues A B', air-chamber C, with chambers *u u'* for admitting fresh air, smoke-pipes G, jacket H, with pipes L for carrying off hot air, and fire-box W, all substantially as and for the purpose set forth.

2. In a hot-air and steam generating furnace, the air-chamber C, with cold-air inlets *u u'*, and passages D, corresponding to similar openings in drum B, in combination with said drum B, fire-box W, base-plate C', and jacket H, substantially as set forth.

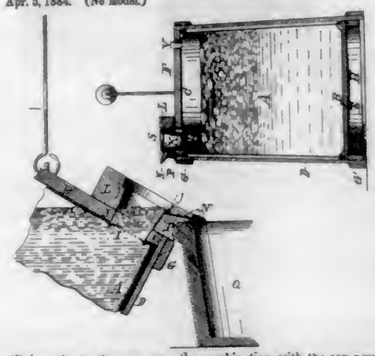
3. The combination, in a hot-air and steam generating furnace, of the boiler J, flues A B', drum B, jacket H, fire-box W, water-pipes *l* and *m*, and steam-domes K, all substantially as and for the purposes set forth.

299,009. CARTRIDGE-LOADING APPARATUS. WILLIAM R. QUINAN and FRANK KIMPPEL, San Francisco, and JACOB OLSEN, Marin County, Cal. Filed Feb. 2?, 1884. (No model.)

Claim.—1. A feed-box or receiver for the powder, having two series of holes, one on each side, one series being equipped within the short tubes, in combination with the clamp E, for holding the cartridge-cases, board F, and lever H for bracing the cartridge-clamps, rods B, and supporting cross-head, with their operating mechanism, substantially as described.

2. An apparatus for packing powder into cartridge-cases in successive small charges, consisting of a feed-box into which the powder is placed, and through the lower part of which a number of parallel rods are adapted to reciprocate, short tubes through which the powder is forced by the rods, and a means for holding the cartridge-cases in line with the rods, so as to receive the powder as it is forced out by the rods, substantially as herein described.

3. A powder-packing apparatus consisting of a feed-box or receiver for powder, a series of parallel rods passing through opposite sides of the box, and having thin outer ends secured to a cross-head by which they may be caused to reciprocate, in combination with short tubes projecting from the side of the box opposite the cross-head to receive one end of the cartridges, and a clamp or means for holding the cartridges in line, substantially as herein described.



4. A powder-packing apparatus consisting of a feed box or receiver for powder, a series of parallel rods passing through opposite sides of the receiver near the bottom, and having a guide or cross-head by which

they are caused to reciprocate, in combination with a support or clamp by which the cartridge-cases are held in line with the rods, a board or backing against which the action of the rods is resisted, and a mechanism by which the board may be raised or lowered, substantially as herein described.

5. A powder-packing apparatus consisting of a feed-box or receiver, a series of parallel rods passing through opposite sides of the receiver near the bottom, and having one end connected with a cross-head by which they are reciprocated and guided, a clamp or holder by which the cartridge-cases are held in line to receive the powder, in combination with a device for stirring or agitating the powder within the receiver, substantially as herein described.

6. A powder-packing apparatus consisting of a receiver or feed-box, through opposite sides of which a series of parallel rods are caused to reciprocate by means of a sliding cross-head to which one end of the rods are fixed, a clamp or holder by which cartridges are held in line with the rods, so as to receive the powder forced out by them, in combination with agitators or stirrers supported upon a shaft within the feed-box, which shaft is actuated by a mechanism which transmits motion from the cross-head, substantially as herein described.

299,010. SHIPPING-CAN. GEORGE J. RECORD, Cornwall, Ohio. Filed Apr. 5, 1884. (No model.)

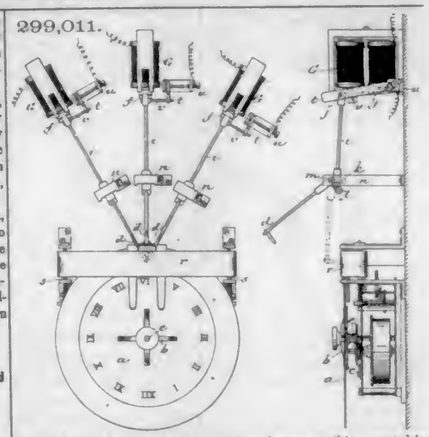
Claim.—1. In shipping-cans, the combination, with the can proper and its wooden jacket, of the nozzle J and the nozzle-protector L, having the spout N, as described, said protector consisting of an annular ring having the notch P and recess L'', as described, for the object stated.

2. In shipping-cans, a protector for the nozzle, consisting, essentially, of an annular ring of wood, having the central aperture, L', and recess L'', forming the shoulder *l*, said nozzle being provided with a flange, *j*, bearing upon said shoulder, as specified.

3. In shipping-cans, the combination, with the can A, having the nozzle J, of the annular protector L, having the aperture L', recess L'', the stopper K, and the seal S, substantially in the manner as and for the object stated.

4. In shipping-cases, the combination, with a nozzle-support, of the seal S, fixed to said support, substantially as described and specified.

299,011. WATCHMAN'S ELECTRIC RECORDER. JEROME REDDING, Malden, assignor to himself, and HARVEY REDDING, Everett, Mass. Filed Jan. 31, 1884. (No model.)



Claim.—1. In a watchman's electric register, the combination, with a rotating dial which carries the register-sheet, of a series of hammers or markers having types or printing-characters differing in each hammer from the others, and arranged to strike on the face of the dial, and means for operating said markers, comprising a series of electro-magnets mechanically connected with said markers and circuit-closers at different points, substantially as described.

2. In a watchman's electric register, a rotating dial which carries the register-sheet, a series of hammers or markers arranged, as described, to strike at the same point on the face of the dial, and electro-magnetic circuits which actuate said markers, all in combination substantially as described.

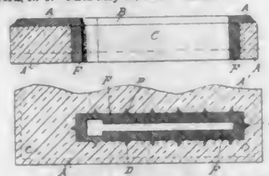
3. In a watchman's electric register, a rotating dial, an ink-ribbon placed adjacent to the face thereof, a series of marking devices or hammers arranged, as described, to make an impression at the same place through the ribbon on the dial, and an electro-magnetic circuit to actuate said hammer, all in combination as set forth.

4. In a watchman's electric register, the combination, with a sheet-carrying mechanism, of a marking type or hammer, an electro-magnetic device for actuating the same, and an automatic circuit-breaking device

299,011.

in the electric circuit, whereby the type or hammer will be actuated by a succession of impulses, substantially as described.

5. The combination, with a recording hammer or marker actuated by an electro-magnet and its armature in an electric circuit, of a metallic arm forming a part of said circuit and normally in yielding contact with said armature, said arm being adapted to momentarily break the circuit by momentum after the armature has been fully attracted by the magnet, and thereafter to automatically close the circuit, as set forth.



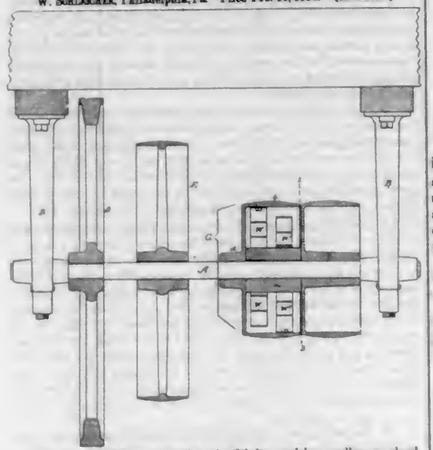
6. In a watchman's electric register, the combination of a rotating dial or its equivalent, a hammer or marker having a printing type or character adapted to make an impression on said dial, an electric circuit including a circuit-closer adapted to be operated by a watchman, and an electro-magnet having an armature adapted to operate said marker, and an automatic circuit-breaker, whereby the hammer may be caused to give a rapid succession of blows while the circuit is normally closed, as set forth.

7. In a watchman's electric register, the combination of a rotating dial or its equivalent, a hammer or marker adapted to make an impression on said dial, an electric circuit including a circuit-closer adapted to be operated by a watchman, and an electro-magnet having an armature adapted to operate said marker, and a gravitating metallic arm in circuit with said magnet and caused to break the circuit by momentum after the armature is attracted by its magnet, and thereafter to automatically close the circuit, whereby the hammer may be caused to give a rapid succession of blows while the circuit is normally closed, as set forth.

8. The method hereinbefore described of imprinting a character on a recording-sheet, which consists in actuating a hammer or marker by an electro-magnetic circuit, and causing said circuit to be broken repeatedly and automatically, whereby the character is imprinted by a series of taps, substantially as described.

9. In a watchman's electric register, the combination of the rotary dial or its equivalent, operating mechanism therefor, one or more markers electrically operated, as described, a case in which said dial, mechanism, and markers are contained, a lock for said case, a circuit-closer operated by the retraction of the lock-bolt, and an additional marker and operating devices therefor in circuit with said circuit-closer and contained in said case, whereby the unlocking of the case is indicated, as set forth.

299,012. MORTISED WOODEN BLOCK FOR ELECTROTYPE OR STEREOTYPE PLATES. FREDERICK A. RINGLER and EMIL I. ALFELD, New York, N. Y. Filed July 23, 1883. (Modal.)

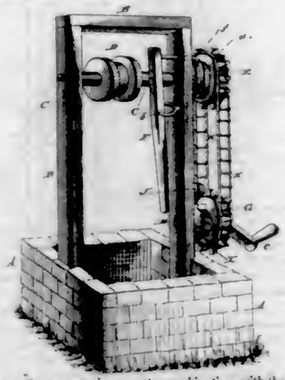


Claim.—1. An electro or stereo type plate having therein an opening of the size of the type to be used, in combination with a wooden block, a portion whereof is cut away and the space so made occupied by a metal collar having therein an opening corresponding with that in the plate, and forming therewith the mortise for the type, substantially as described.

2. A wooden block adapted to be used with electro or stereo type

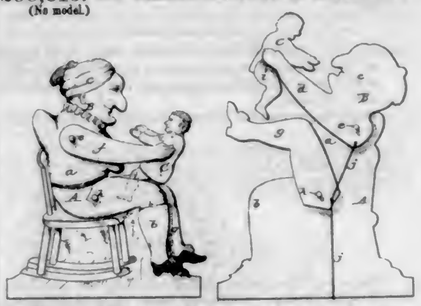
plates by having therein an opening, within the sides of the walls of which are grooves or recesses, and a metal collar cast in the opening, and retained in position by the metal projecting into the grooves or recesses, such collar having an opening therein corresponding to the type to be used, whereby the same is made to form a part of the mortise for the type when the plate is attached to the block, substantially as shown and described.

3. A block for electrotype or stereotype plates, made of wood, having therein an opening larger than an opening in the plate, and within which is secured a metal collar, reducing the size of the opening in the block to that of the one in the plate, substantially as described.



299,013. DRIVING-GEAR. ELIAKIM T. ROBB, Chester, and ADOLPH W. SCHLEICHER, Philadelphia, Pa. Filed Feb. 16, 1884. (No model.)

Claim.—1. The combination of a driving or driven pulley or wheel, a shaft, and a fly-wheel and hub carried thereby with a helical spring or springs contained within the pulley, interposed between the rim of the latter and the hub, and connected to both rim and hub, all substantially as set forth.

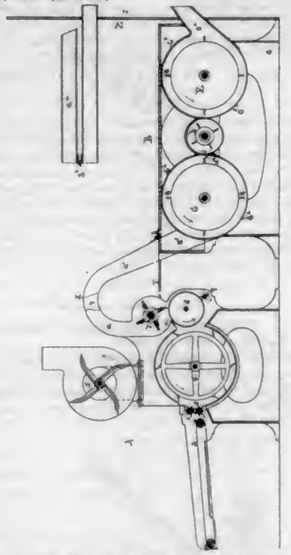


2. The combination of a driving or driven pulley or wheel, its shaft, and fly-wheel and hub carried thereby with two or more helical springs contained within the said pulley, and secured to the rim of the latter and to the hub at such points that the said springs will balance each other, substantially as set forth.

299,014. WATER-ELEVATOR. WILLIAM I. ROREX, Winfield, Kans. Filed Oct. 4, 1883. (No model.)

Claim.—In a water-elevator, the combination, with the shaft C, provided with a spline, of a sprocket-wheel mounted on said shaft and formed with an annularly-grooved shoulder and an internal groove, a lever fulcrumed upon the frame by means of a loop or yoke, *b*, and a rod secured at one end to the lever and passing through one side of the frame, and formed at its opposite end with arms to rest in the groove of the shoulder of the sprocket-wheel, substantially as set forth.

299,015. TOY. WILLIAM R. SALES, Oshkosh, Wis. Filed Mar. 3, 1884. (No model.)



Claim.—1. The herein-described toy, consisting of part A, representing the body and leg of a human figure; part B, representing the head and arm thereof, pivoted to part A, part *g*, representing a leg of the figure, likewise pivoted to part A; part C, representing the figure of a child, and string *j*, or its described equivalent, connecting parts B and *g* in rear of their pivots, and extended downward, substantially as and for the purpose set forth.

2. In a toy, the combination of parts A, B, C, and *g*, parts B and *g* being pivoted to part A, and string *j* connecting said parts B and *g*, substantially as shown and described.

3. In combination with a figure of a man, arms pivoted to said figure, a child's figure carried by said arms, and a cord or its equivalent attached to said arm in rear of its pivot, substantially as shown and described.

299,016. MACHINE FOR BURRING AND CLEANING WOOL. FREDERICK G. SARGENT and ALLAN C. SARGENT, Graniteville, Mass. Filed Oct. 21, 1881. (No model.)

Claim.—1. The combination of a burr-picker mechanism with a multiple-cone-duster mechanism, substantially as described, and means for conveying the material operated upon, whereby the wool will pass from the picker direct into the duster, as specified.

2. The combination of the burr-picker A and the cone-duster B with the discharge-pipes *a'* and *a⁴*, whereby the fibers passing from the picker may be made to pass either into the cone-duster or the fiber-compartment, substantially as described.

3. The combination of picker-cylinder 4, barring-cylinder 6, doffer 7, fiber-passage *a a'*, and cone-duster C, substantially as described.

4. The combination of picker-cylinder 4, barring-cylinder 6, doffer 7, fiber-passage *a a'*, and two or more cone-dusters, C D, substantially as described.

299,017. SEAMLESS MULTIPLY-FABRIC HOSE. JUNIUS SCHENCK and BENJAMIN L. STOWE, Brooklyn, assignors, by direct and mesne assignments, to the Eureka Fire Hose Company, New York, N. Y. Filed Oct. 17, 1883. (No model.)

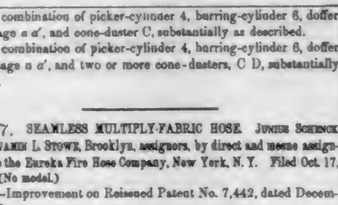
Brief.—Improvement on Reissued Patent No. 7,442, dated December 19, 1876.

Claim.—1. In a seamless multiply-fabric hose, the combination, with the plies, of warp or longitudinal strands placed in and incorporated with the fabric so as to lie therein substantially straight and without corrugation or abrupt bend, substantially as and for the purposes hereinbefore set forth.

2. Seamless multiply-fabric hose containing straight longitudinal strands or cords for preventing elongation of the hose, in combination with coupling and clamps, whereby the ends of the said straight cords or strands are prevented from drawing back into the fabric when the hose is under pressure, substantially as hereinbefore set forth.

299,018. SEAMLESS MULTIPLY-FABRIC HOSE. JUNIUS SCHENCK and BENJAMIN L. STOWE, Brooklyn, assignors, by direct and mesne assignments, to the Eureka Fire Hose Company, New York, N. Y. Filed Oct. 17, 1883. (No model.)

Brief.—Improvement on Reissued Patent No. 7,442, dated December 19, 1876.

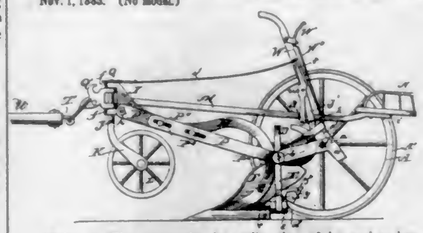


Claim.—1. Seamless multiply woven hose in which the outer ply or plies, tying-strands, and inner weft-strands are combined with straight longitudinal strands laid and held between the inner weft-strands and the adjoining ply, substantially as and for the purposes hereinbefore set forth.

2. Seamless multiply woven hose consisting of outer ply or plies, tying-strands, and inner weft-strands, combined with straight longitudinal strands laid between the inner weft-strands and the next adjoining ply, and the rubber lining, which, by its adhesion to the fabric, serves to assist in holding the strands in position, substantially as hereinbefore set forth.

299,019. EYELETING-MACHINE. GEORGE O. SCHNELLER, Ansonia, Conn. Filed Dec. 17, 1883. (No model.)

Claim.—1. In an eyeleting-machine, the combination of two slides arranged to reciprocate toward and from each other, the one carrying a series of dies and the other a corresponding series of punches, each series corresponding to the series of eyelets to be set, a work-plate between said dies and punches, and through which the said punches will pass, and a corresponding series of channels leading from a supply-hopper, said channels having a reciprocating movement imparted thereto, and each channel terminating in holding-fingers, whereby the lowermost eyelet in each channel will be presented over a corresponding die, the several punches constructed to pass through the fabric and eyelet, and also constructed with an upsetting-shoulder, whereby a series of eyelets will be set through the series of holes made by said series of punches, substantially as described.



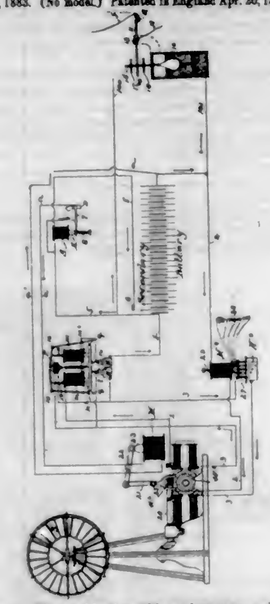
2. The combination of two slides arranged to reciprocate toward and from each other, the one carrying a series of punches, the other a corresponding series of dies, the said dies arranged loosely in their seats, a work-plate between said punches and dies, and through which the said punches work, and a corresponding series of channels terminating in fingers, whereby a series of eyelets will be presented between the said punches and dies, substantially as described.

3. In an eyeleting-machine, the combination of two slides arranged to reciprocate toward and from each other, the one carrying a series of punches, the other a corresponding series of dies, the punches constructed to enter said dies, and with a shoulder corresponding to the face of the respective dies, a series of channels corresponding to said series of punches and dies, and mechanism, substantially such as described, for imparting to said series of channels a reciprocating movement, said channels terminating in holding-fingers, which, by said reciprocating movement, are presented in a position between said punches and dies and then withdrawn therefrom, a hopper from which said channels lead, and a horizontal bar in said hopper, with mechanism, substantially such as described, for imparting reciprocating movement to said bar, substantially as and for the purpose described.

4. The combination of the two slides arranged to reciprocate toward and from each other, the one carrying a series of punches, the other a corresponding series of dies, a work-plate between said punches and dies, and through which the punches may pass, a slide arranged in guides at substantially right angles to the plane of the punch and die-carrying slides, mechanism, substantially such as described, to impart reciprocating movement to said slide, said slide carrying a series of channels corresponding to said punches and dies, through which eyelets are fed and presented between said punches and dies, and a locking-lever whereby said slide and the channels which it carries may be held out of feeding position or permitted to feed when required, substantially as described.

299,020. SULKY-PLOW. CHARLES SCHWEER, Eldon, Iowa. Filed Nov. 1, 1883. (No model.)

Claim.—1. The combination, in a sulky-plow, of the carriage having a main axle and carrying-wheels mounted on the ends thereof, a frame pivoted to the carrying-frame and supporting the plow proper, a pivoted pawl located at the lower portion of the plow-supporting frame, devices located on the main frame for raising the plow-supporting frame, so as to permit said pivoted pawl to engage the main axle and suspend the plow-supporting frame, and a bell-crank lever pivoted on the main frame, and having one portion located on the point of the main axle which the pivoted pawl engages, and connections on the main carriage connected to said bell-crank lever to move the same upon its pivot, substantially as and for the purpose set forth.



2. The combination, in a sulky-plow, of a carriage, of bars located at each side, keyed on the main axle, and extending forwardly, a plow-supporting frame pivotally secured to the forward ends of said bars, and provided with bars *n'*, spring-dogs located on the said bars of the main carriage, and devices for depressing the plow-supporting frame to cause the bars thereof to engage the said spring-dogs, substantially as set forth.

3. The combination, in a sulky-plow, of a carriage, a plow-frame pivoted thereto, provided with arms *n'* and braces O P, as described, and carrying the plow, a lever fulcrumed on the carriage-frame for effecting by its movement the elevation or depression of the plow-frame, and spring-dogs located on the carriage, and adapted to engage the arms *n'* for locking said plow-frame in its elevated position, substantially as set forth.

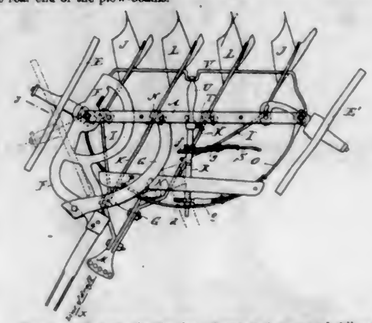
4. The combination, in a sulky-plow, of a carriage, a plow-supporting frame pivoted thereto, and provided with brace-rods O P, having curved or hooked ends *l*, adapted to be adjustably clamped in yoke-brackets *n*, secured to the side of bars *n'*, secured to the plow-frame, spring-dogs located on the carriage, connections and devices for effecting the elevation of the carriage and the engagement of the spring-dogs with the rods *n'*, and devices for effecting a disengagement of the same, substantially as specified.

5. The combination, in a sulky-plow, of a main carriage, a plow-supporting frame pivoted to said main carriage, levers and connections mounted on said main carriage to effect the elevation and depression of the plow-supporting frame, a guide-wheel supported in a yoke turning in bearings at the front of the machine, and having connected therewith a horizontal bar, each end of which is connected by a cable with a centrally-pivoted vertical bar provided with a stirrup at its lower end, each to receive one of the feet of the operator, substantially as set forth.

299,021. APPARATUS FOR CHARGING SECONDARY BATTERIES. ROBERT PERCY SELLON, Surbiton, County of Surrey, England. Filed Nov. 15, 1883. (No model.) Patented in England Apr. 20, 1883, No. 2,023.

Claim.—1. The combination, with a prime motor, a dynamo, and a secondary battery, of mechanism for throwing the dynamo into or out of gear with the said motor, and appliances, such as explained, for automatically operating said mechanism as the secondary battery is charged or discharged, substantially as described.

2. The combination, with the dynamo having its field excited in a derived circuit, of a contact-maker in said circuit, mechanism for operating said contact-maker to break the circuit, and a magnet in a loop around said contact-maker for re-establishing the broken circuit when it becomes sufficiently energized or excited, substantially as described.



3. The combination, with the dynamo, the prime motor for driving the same, and the secondary battery to be charged by the dynamo, of the automatic mechanism, such as explained, for throwing the dynamo into and out of gear, and the automatic safety device, such as explained, for making and breaking the charging-circuit, substantially as described.

4. The combination, with a motor of variable speed, of the dynamo driven thereby, the storage or secondary battery, the mechanism, as explained, for automatically throwing the dynamo into and out of gear with said motor, and the automatic regulator for maintaining approximately constant the electro-motive force of said generator notwithstanding variations in the speed, substantially as described.

5. The combination, with the dynamo having its field excited in a derived circuit, of contact-makers in the main and field circuits, respectively, a magnet in the main circuit for operating said contact-makers to break the circuit, a loop derived from the field-circuit, a magnet in said loop, and connected devices for operating said contact-makers to close the circuit when said loop-magnet is sufficiently excited, substantially as described.

299,022. GANG-PLOW. ABRAHAM SHAFFER, Canopolis, Mich. Filed Aug. 1, 1883. (No model.)

Brief.—The swiveled wheel-post is governed by the tongue-plate. The latter may be locked at any angle or left free to turn. A shaft actuated by a lever has a cam upon it which raises or lowers a bail beneath the rear end of the plow-beams.

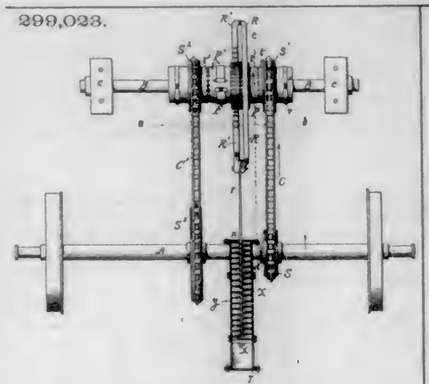
Claim.—1. A gang-plow having a frame, as A, arranged obliquely to the line of travel, an adjustable land-wheel, E', and a series of plow-beams carrying plows arranged to correspond with the angle of said frame, in combination with lever-frame F, tongue-socket *a*, guide-bar G, and spring-latch H, as and for the purposes set forth.

2. In a gang-plow, and in combination with the frame A, stub-axles, and wheels, as described, the vertical rods B, the frame O, the beams K, having staples which embrace rods B, and having draft attachments M, and the frame F, having pole-socket *a*, as set forth.

3. In combination with the oblique frame A of a gang-plow, the plow-beams I I K K and plows J L, said plow-beams having staples and attached to an equalizing draft-clevis, M, common to all, said clevis being adapted to engage with a hanger, P, for determining the elevation of the outer ends of the plow-beams and the pitch of the plows and the sliding brackets embracing said beams, substantially as and for the purposes described.

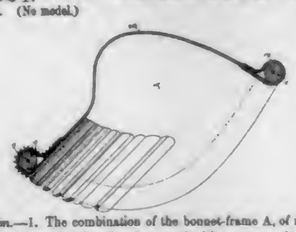
4. In combination with a gang-plow constructed substantially as herein described, the shaft R, lever S, bail V, and bar U and cam T, adapted to raise and lower the plows, substantially as set forth.

5. In combination with the frame A of a sulky-plow, constructed substantially as described, the bracket C, stub-shaft D, wheel E, and lever-frame F, carrying pole-socket *a*, for adjusting the line of travel of such wheel, the bar G, and spring foot-catch H, substantially as and for the purposes described.



299,023. CAR STARTER AND BRAKE. BENJAMIN F. SHAKESPEARE, Chester, Pa. Filed Mar. 26, 1884. (No model.)

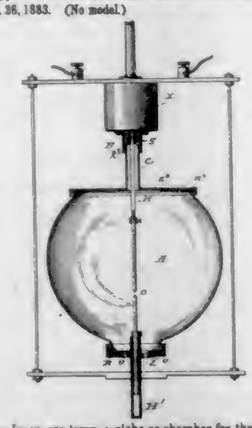
Claim.—1. The combination of the sliding drum S', adapted to engage with the pinion-drum P, rack R, pinion P', rack R', the sliding drum S², adapted to engage with pinion-drum P', the spring X, and rod *r*, connecting said spring and racks, together with means, substantially as described, for connecting said sliding drums with the axle of the car, all constructed and arranged in correlation and adapted to operate substantially as and for the purpose set forth.



2. The combination, with the car-axle, of the sprocket-wheel S thereon, the loose ratchet and sprocket drum S', chain C, lever L, the loose pinion and ratchet drum P, its rack R, pinion and ratchet drum P', its rack R', (said racks being on opposite sides of said pinions, respectively,) the loose ratchet and sprocket drum S², lever L', chain C', and sprocket-wheel S², together with the spring X and connecting-rod *r*, substantially as and for the purpose set forth.

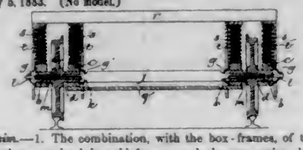
3. The combination, with the drum S', pinion P, rack R, pinion P', rack R', drum S², and spring X, connected to said racks, all constructed and adapted to operate substantially as set forth, of the friction brake or band F upon pinion-drum P', with means for tightening and releasing said band, substantially as and for the purpose described.

299,023.



299,024. BONNET. DE LANA SHEPLEE, Boston, Mass. Filed MAY. 17, 1884. (No model.)

Claim.—1. The combination of the bonnet-frame A, of rice-lace or other similar material, the wire *d*, covered with a woven tubular jacket, *c*, attached to the edge of said frame, and the outer or finishing fabric, B, laid over and upon said frame and jacket in the form of a roll, substantially as described.



2. The combination of the bonnet-frame A, the covered wire *d*, attached to the edge thereof and having its ends brought together, and the clasp *e*, closed around the abutting ends of said wire *d* and its covering, substantially as described.

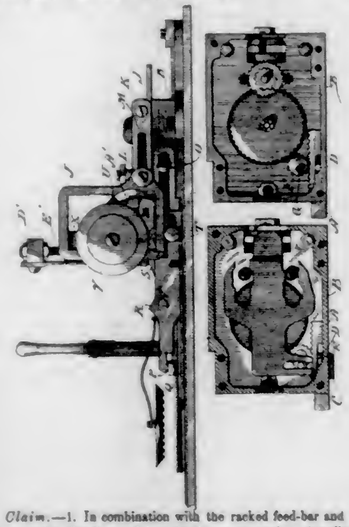
299,025. ELECTRIC-ARC LAMP. SIDNEY HOWE SHORT, Denver, Colo. Filed Oct. 26, 1883. (No model.)

Claim.—In an arc lamp, a globe or chamber for the arc, closed air-tight at the bottom and on all sides, a regulator above the globe or chamber, a tight tube forming a passage between the regulator and the globe or chamber, and a carbon-holder extending loosely through the said tube, whereby the gases are retained in the globe, undue pressure avoided, and free movement of the carbon secured, all substantially as described.

299,026. CAR-TRUCK. GEORGE W. SIMONDS, Boston, Mass. Filed May 5, 1883. (No model.)

Claim.—1. The combination, with the box-frames, of the tubular wheel-axles contained in said frames, and the connecting-bar passing through said tubular axles, and having rigid bearings resting on both sides of each frame, as set forth.

2. The box-frames having the hollow bosses *g g'*, forming oil-reservoirs and supports for the shoulders or bearings on the connecting-bar, as set forth.



3. The combination of the box-frames having the oil-reservoirs and the boxes communicating therewith, the axles having the tapering longitudinal passages, and the connecting-rod having tapering portions fitting in said passages, the tapering form of said passages and rod facilitating the passage of oil from the outer to the inner box, as set forth.

4. The combination of the box-frames having the oil-reservoirs and the boxes communicating therewith, the tubular axles journaled in said boxes, and the connecting-bar having cylindrical portions passing through the axles, and longitudinal passages extending from one oil-reservoir to the other in each frame, as set forth.

5. In a car, the combination of the series of box-frames connected longitudinally by suitable bars and laterally by bars passing through the box-frames and through the wheel-axles, to form a rigid primary frame or structure, the wheels journaled independently in said box-frames, and the secondary load-supporting frame resting on springs interposed between the primary and secondary frames, as set forth.

6. In a car-truck, the combination of the box-frames, as *c*, which surround and inclose the wheels, said box-frames being connected longitudinally by rigid bars, the wheels and separate axles inclosed by said box-frames, the axles being connected by bars *j*, and the secondary body-frame *r*, supported on the box-frame by springs, all arranged to co-operate substantially as described.

299,027. BUTTON-HOLE SEWING-MACHINE. CARL J. A. SJOBERG, Bridgeport, Conn., assignor to the Smith & Egge Manufacturing Company, same place. Filed June 22, 1883. (Model.)

Claim.—1. In combination with the racked feed-bar and pinion and means for vibrating said bar, the frame recessed as described, and actuated by the intermittently-revolving wiper-wheel, substantially as set forth.

2. The wiper-wheel arranged on the same shaft with the ratchet-wheel having two long teeth and intermediate shorter teeth, in combination with the frame, means for imparting an intermittent motion to said ratchet-wheel, and mechanism for effecting the barring and reversing the feed, substantially as described.

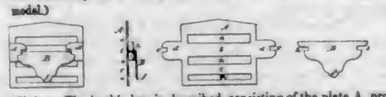
3. In a machine for stitching button-holes or other similar machines, the sliding bar having inclined projections and connected with the feed-bar, in combination with means for actuating the feed-bar, the wiper-wheel, and mechanism for operating the same, substantially as set forth.

4. The sliding bar having inclined projections and connected with the feed-bar, in combination with means for feeding said bar, the wiper-wheel, ratchet-wheel, and means for operating the same, the frame recessed as described, pinion, and mechanism for vibrating the feed-bar, substantially as shown and set forth.

5. The wiper-wheel secured within the frame, in combination with the ratchet-wheel secured on the same shaft with said wiper, pivoted dog with pawl attached thereto, sliding bar having inclined projections, means for operating the ratchet-wheel, and the feed-actuating mechanism, substantially as described.

6. The frame connected to mechanism for operating the racked feed-bar laterally, whereby the pinion may be thrown in and out of gear with said bar, in combination with the wiper-wheel, ratchet and pawls for operating the same, pivoted dog, sliding bar having inclined projections, and feed-actuating mechanism, substantially as and for the purposes set forth.

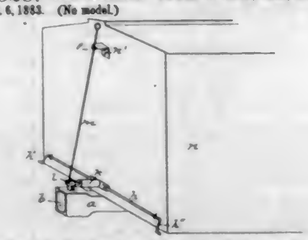
7. The ratchet-wheel having two long teeth and intermediate shorter teeth, in combination with means for imparting an intermittent rotary motion to the same, the wiper-wheel, frame, the feed-bar and means for vibrating the same, and the feed-actuating mechanism, substantially as set forth.



8. The ratchet-wheel W, having two long teeth and intermediate shorter teeth, in combination with the pivoted dog Z, carrying pawl A', pawl C', attached to the reciprocating cross-bar D', sliding bar N, attached to the feed-bar, and the feed-actuating mechanism, substantially as set forth.

9. The frame recessed as described, in combination with the wiper-wheel arranged interiorly therein, washers V, ratchet-wheel W and mechanism for operating the same, and the feed-actuating mechanism, substantially as set forth.

10. The sliding bar N, with inclined projections R S, the latter being adjustable, whereby the distance between said projections may be varied, in combination with the feed-bar and means for operating the feed, and the mechanism which operates to effect the barring and reverse the feed, substantially as described.

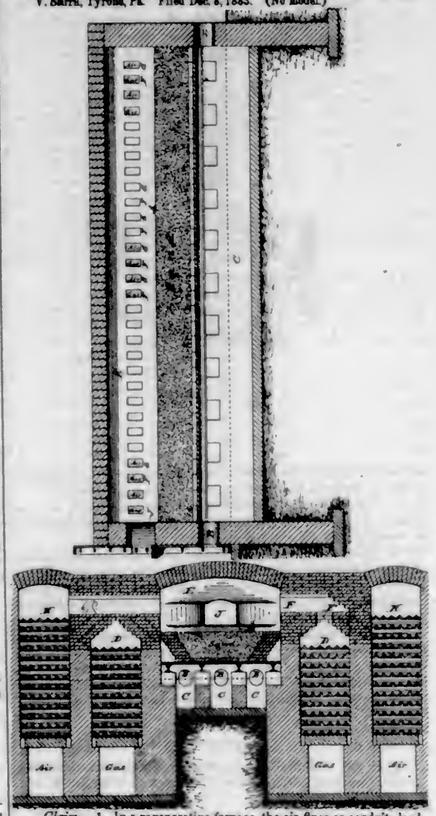


11. The frame J, recessed as described, and connected to the rack-bar A, in combination with the toothed crank-wheel F, racked feed-bar and means for vibrating the same, pinion and mechanism for actuating the same, wiper-wheel U, ratchet-wheel with two long teeth and intermediate shorter teeth, sliding bar N, having inclined projections R S, the latter adjustable as described, feeding mechanism, pivoted dog Z, carrying pawl A', and pawl C', attached to the reciprocating cross-bar D', substantially as described.

299,028. BUCKLE. DWIGHT L. SMITH, Waterbury, Conn., assignor to the Waterbury Buckle Company, same place. Filed Apr. 5, 1884. (No model.)

Claim.—The buckle herein described, consisting of the plate A, provided with ears *d d* at the right and left, each of said ears constructed with a notch, *e*, combined with the lever B, constructed with bearings corresponding to said notches *e* in the ears, the ears turned backward and over into a plane parallel with the plane of the frame, the lever introduced between them, the notches on the ears interlocking with the lever, and substantially as and for the purpose described.

299,029. CAR-COUPLING. GEORGE W. SMITH, Athol, Mass. Filed Mar. 6, 1883. (No model.)



Claim.—1. In a car-coupler, in combination, car *n*, rotary rod *k*, bearing-sleeve *k*, fork *l*, pivoted to the coupling-pin *c*, and draw-bar *a*, all substantially as described.

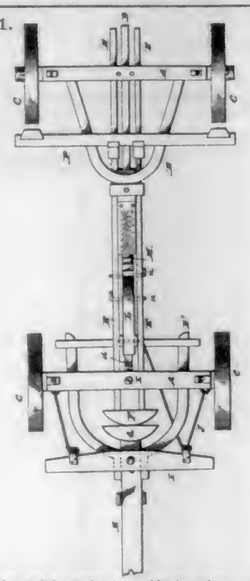
2. In a device for supporting the rod *m*, a spring-clamp, *o*, having jaws with openings *p* and *q*, all substantially as described.

3. In combination, car *n*, draw-bar *a*, rotary rod *k*, having handles *k' k''*, and bearing-sleeve *k*, fork *l*, pin *c*, pivoted to said fork, rod *m*, and clamp, all substantially as described.

299,030. REGENERATIVE SKELP-HEATING FURNACE. MARTIN V. SMITH, Tyrone, Pa. Filed Dec. 8, 1883. (No model.)

Claim.—1. In a regenerative furnace, the air flues or conduits leading from the air-regenerators, extending across and over the gas-regenerators, and entering the combustion or melting chamber at the sides thereof, and on the same level and parallel to the gas flues or conduits, as set forth.

2. In a furnace of the character described, the air-regenerators of which open into the combustion or working chamber by a series of air flues or ports alternating with gas flues or ports opening into the combustion-chamber at the sides thereof, and on the same level with the air-flues, the bottoms of the air-flues forming the arch or cover of the gas-regenerator, as set forth.



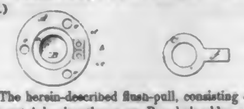
3. In a regenerative furnace, the air flues or conduits leading from the air-regenerators, extending across and over the gas-regenerators, the walls of said gas-regenerators being extended upward above said flues, to form the abutments or skewbacks for the support of the arch or roof of the combustion-chamber, as set forth.

4. A furnace for heating skelp, consisting of a long narrow heating and working chamber, with air and gas regenerators on each side, which connect with the combustion-chamber by ports or flues opening directly into the sides thereof and in alternate series, said air and gas ports being arranged on the same level, as set forth.

299,031. AUTOMATIC BRAKE. WALKER W. SMOOT and QUINN D WILCOXSON, Boston Station, Ky. Filed Feb. 23, 1884. (No model.)

Claim.—1. The combination, with the slotted perch and the hounds, of the sliding bars on each side of the perch, the brake-bar, the convex buffer at the forward end of the bars, the sliding pole adapted to abut

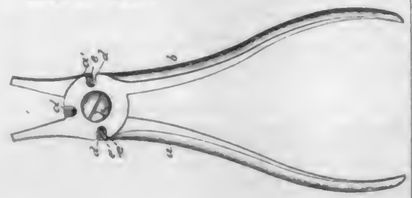
299,031.



against the buffer, and the ratchet-bar and its detaining-pawl, all arranged to operate the brake and hold it against the wheels, as specified.

2. The combination, with the slotted perch, the hounds, and the brake, of the ratchet-bar, the spring actuating the same, the pawl, and its operating-lever, all arranged substantially as described.

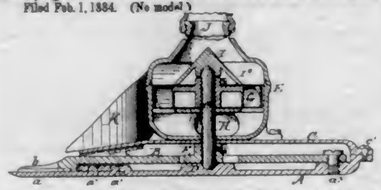
3. The combination, with the recessed perch, the brake, and the sliding bars, of the ratchet-bar, the spring actuating the same, the pawl and lever, the pins securing the ratchet-bar in the perch, the whiffletree, and the cord adapted by means of the said whiffletree to operate the lever and pawl, for the purpose specified.



4. The combination, with the perch, the hound, and brake, of the sliding bars, the ratchet-bar, the spring, the buffer on the end of the bars, the sliding pole, the pawl and lever, the whiffletree, and the cord connecting the same to the lever, all the parts combining to automatically operate the brake, substantially in the manner and for the purpose specified.

299,032. FLUSH-PULL. JAMES SPENCE, Waterbury, Conn., assignor to the Scovill Manufacturing Company, same place. Filed Nov. 10, 1883. (No model.)

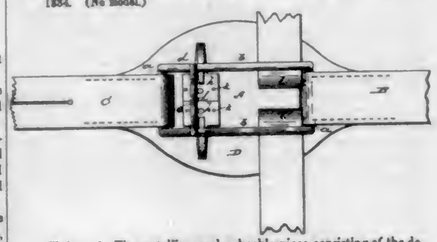
Claim.—The herein-described flush-pull, consisting of the plate A cut from sheet metal, having the recess B and shoulder *a* struck therein, with the opening *b* and ears *d d* formed in said opening and turned downward, combined with a handle corresponding to the shoulder of the recess, and constructed with a knuckle to pass into the opening *b* and between the ears *d d*, and a pintle through said ears and knuckle, substantially as described.



299,033. WIRE-CUTTER. ELISHA STEVENS, Middletown, Conn. Filed Dec. 28, 1883. (Model.)

Claim.—1. The combination of the pivoted lever-handles with the heads bearing the laterally-opening sockets and the disk-shaped blades bearing jaws and fixed against rotation in said sockets, all substantially as described.

2. The combination of the lever-handle *a* with the head *a'*, having sockets *c*, openings *d*, and lug *g*, lever *b*, with duplicate corresponding blade-socket, openings, and lug, a bolt, *h*, and the disk-shaped blades with peripheral jaws located and held in the respective sockets, all substantially as described.

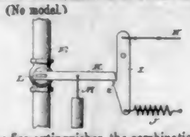


299,034. ANIMAL-SHEARS. EDWARD E. STONE, Washington, D. C. Filed Feb. 1, 1884. (No model.)

Claim.—1. An animal-shear provided with a curved guide secured to the casing, substantially as specified.

2. The combination of the case A C, having stop D, shear B, cam F, shaft *e*, and a water-motor secured to said shaft, substantially as shown and described.

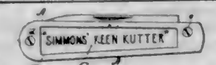
299,035. TRACE-CARRIER. HANS TAY, Arcola, Ill. Filed Mar. 10, 1884. (No model.)



Claim.—1. The metallic guard or buckle-piece consisting of the depressed end bars, *a*, the raised side bars, *b*, having the loop portions *c*, formed with spurs *g*, the arched portions *d*, and the cross-brace *e*, substantially as specified.

2. The combination, with the metallic guard having the raised side bars and the depressed end bars connected to the back-strap and crupper-strap, of the leather pad under said guard, and the upwardly and inwardly turned hook secured to the leather pad and having their terminal portions under the side bars, substantially as specified.

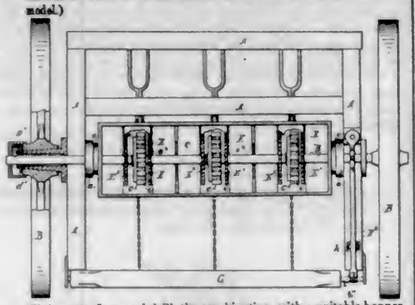
3. In a trace-carrier, the combination, with the metallic guard, constructed as described, of the hooks E, having broad bases A, provided on their under sides with the spurs *k* to engage the pad D, the said hooks extending partially beneath the side bars, *b*, of the guard, substantially as and for the purposes specified.



299,036. FIRE-EXTINGUISHER. GEORGE W. TAYLOR, ABNER R. COX, WILLIAM CARREL BROWN, and JOHN N. SUTHERLAND, Belton, S. C. Filed Jan. 9, 1884. (No model.)

Claim.—In a fire-extinguisher, the combination, with the inflammable cords arranged in each room of a building, of the water-distributing pipes communicating with each room, valves arranged in said pipes, weighted arms attached to the valves, levers supporting said arms, springs attached to one end of the levers, and the inflammable cords connecting with the other end, arranged and operating to cause the valve in any one pipe to open when the cords are burned, as set forth.

299,037. HANDLE FOR POCKET-KNIVES. GEORGE H. THOMPSON and EDWARD HOTTENDAN, New Haven, Conn. Filed Mar. 12, 1884. (No model.)



299,037.

Claim.—1. The herein-described improvement in cutlery-handles, consisting in the scale constructed in the form of a frame, so as to leave an opening upon the side, the edges of the opening projecting inward, combined with a panel introduced into said opening between the lining and the scale, substantially as described.

2. A handle for cutlery, having the scales constructed in the form of a frame, so as to leave an opening upon the side, the edges of the opening projecting inward, combined with a panel introduced into said opening between the lining and the scale, the scales secured to the lining by screws introduced through the scale on one side and into the scale on the opposite side, substantially as described.

299,038. SEED-DRILL. FRED E. TOWER, Milford, Mich., assignor of one-half to Solon H. Wilhelm, same place. Filed July 2, 1883. (No model.)

Claim.—1. In a seed-drill, the combination, with a suitable hopper, of a seed-tube provided with a vertical spout leading thereto, and a feed-wheel mounted upon a shaft, said wheel provided with buckets open to the periphery of the wheel, said buckets adapted to gather the grain upon the edges at the periphery of the wheel and to discharge it into said spouts from the opposite side, substantially as described.

2. In a seed-drill, the combination, with a suitable hopper provided with a seed-tube constructed with a spout leading thereto, of a feed-wheel mounted upon a shaft, said wheel provided with buckets opening upon the periphery of the wheel between two lateral faces, one of said faces provided with a flange adapted to project more or less over the top of the spout, substantially as described.

3. In a seed-drill, the combination, with a suitable hopper, of a seed-tube provided with a spout constructed in the form of a segment of a circle, and a feed-wheel having buckets located between two lateral faces, said buckets opening on the periphery of the wheel, the diameter of the wheel being such that the spout may be located within the circumference of the inner edges of the buckets, one of said faces of the wheel provided with a flange adapted to project more or less over the mouth of the spout, the construction being such that grain may be gathered upon the buckets at the periphery of the wheel and discharged from the opposite side into the spout as the wheel is rotated, substantially as described.

4. In a seed-drill, the combination, with a suitable hopper provided with a seed-tube and a vertical spout communicating therewith, of a feed-wheel mounted upon a shaft provided with buckets located between two lateral faces, said buckets opening upon the periphery of the wheel, said buckets adapted to gather seed thereon at the edges adjacent to the periphery and to discharge it into said spout from the opposite edge, one of said faces of the wheel constructed with a flange adapted to be projected more or less over the mouth of the spout, and mechanism for adjusting the relation of the feed-wheel and the spout, substantially as and for the purpose set forth.

5. In a seed-drill, one or more suitable hoppers, each provided with a seed-tube communicating with a vertical spout, a feed-wheel mounted upon a shaft provided with buckets located between two lateral faces, said buckets opening to the periphery of the wheel, and adapted to gather grain thereon at the periphery and to discharge it into the spout on the opposite side, and mechanism for regulating the adjustment of said shaft in relation to said spouts, substantially as described.

6. In a seed-drill, a feed-box consisting of one or more hoppers, each provided with a seed-tube communicating with a vertical spout, a feed-wheel mounted upon a shaft provided with buckets located between two lateral faces and opening at the periphery of the wheel upon the opposite edge, and means for regulating the adjustment of said wheels in relation to said spouts, consisting of a suitable collar and set-screw located upon one end of the shaft, the construction being such that the mouth of the spout may be more or less opened to receive seed from the buckets, substantially as described.

7. In a seed-drill, a feed-box consisting of one or more suitable hoppers, each of said hoppers provided with a seed-tube communicating with a vertical spout, a feed-wheel mounted upon a shaft, said wheel provided with buckets opening upon the periphery of the wheel and adapted to discharge grain into the spout from the opposite edge, said wheel constructed to project more or less over the mouth of the spout, said shaft extended at one end so as to pass through the hub of one of the drive-wheels, and provided at its outer end with a clutch, and means for engaging said clutch upon the hub and disengaging it therefrom, substantially as described.

8. In a seed-drill, a suitable bopper provided with a seed-tube communicating with an interior vertical spout and feed-wheel mounted upon a shaft, said wheel provided with buckets located between two lateral faces, said buckets opening upon the periphery of the wheel and adapted to discharge grain into said spout as the wheel is rotated, said wheel constructed to be projected more or less over the mouth of the spout, and in combination therewith a cap located over said wheel, substantially as and for the purpose set forth.

9. The combination, with a suitable frame, of a feed-box mounted thereon, said box and frame provided with mechanism whereby the box may be kept in a vertical position in going up and down hill, substantially as described.

10. In a seed-drill, the combination, with a suitable frame, of a feed-box weighted at the bottom, mounted thereon, said frame provided with supporting-collars, and said box provided with poises at its ends, adapted to be engaged with said supporting-collars, the construction being such that the box may be kept in a vertical position in going up and down hill, substantially as described.

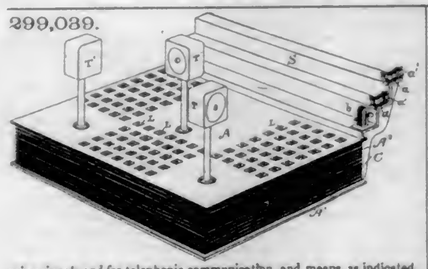
11. In a seed-drill, a feed-box consisting of one or more hoppers, each provided with a seed-tube communicating with an interior vertical spout, a feed-wheel mounted upon a shaft and adapted to be rotated over the mouth of the vertical spout, said wheel provided with buckets opening to the periphery of the wheel and adapted to discharge seed into said spout, and a lever adapted to regulate the adjustment of said feed-wheels mounted upon said shaft in relation to the spouts, substantially as described.

12. The combination, of a feed-box consisting of one or more suitable hoppers, each provided with a seed-tube communicating with an internal spout, a feed-wheel mounted upon a shaft adapted to be rotated over the mouth of the spout, said wheel provided with buckets opening to the periphery and adapted to discharge grain into the spout, a lever adapted to regulate the adjustment of said wheels in relation to said spouts, mechanism for raising and lowering the drill-hoes, and mechanism connected therewith adapted to operate said lever simultaneously with the raising and lowering of the hoes, substantially as described.

13. The combination, in a seed-drill, of a feed-box consisting of one or more suitable hoppers, each provided with a seed-tube communicating with an interior spout, a feed-wheel mounted upon a shaft adapted to be rotated over the mouth of the spout, said wheel provided with buckets opening to the periphery and adapted to discharge grain into the spout, a lever adapted to regulate the adjustment of said feed-wheels and spouts in relation to each other, and mechanism for automatically operating said lever, substantially as described.

14. In a seed-drill, the combination, with a feed-box consisting of one or more suitable hoppers, each provided with a seed-tube communicating with an interior spout, of a feed-wheel mounted upon a shaft and adapted to be rotated over the mouth of the spout, said wheel provided with buckets opening to the periphery and adapted to discharge the grain into the spout as the wheel is rotated, a lever adapted to regulate the adjustment of the feed-wheels and the spouts in relation to each other, and a weight suspended in the frame of the drill and provided with a projecting arm adapted to engage with the arm of the lever, the construction being such that in passing over uneven ground said lever will be automatically adjusted, substantially as described.

15. In a seed-drill, the combination, with a drill-hoe, of a supplementary point adjustably secured therein, substantially as and in the manner described.



16. In a seed-drill, the combination, with a drill-hoe, of an auxiliary channel adjustably secured therein, substantially as and for the purpose set forth.

17. In a seed-drill, the combination, with a drill-hoe, of a supplementary point secured therein by means of a tongue, P', clipped upon the hoe, said tongue provided with a contracted orifice adapted for the sowing of grass-seed, substantially as described.

299,039. ELECTRIC MULTIPLE-SWITCH-BOARD SYSTEM. THEODORE N. VAIL, Boston, Mass. Filed Jan. 30, 1884. (No model.)

Claim.—1. In a multiple-switch system for a telephone central station, the series of horizontal switch-boards, each furnished, as described, with annunciators for a definite number of lines, and with line-plates equaling in number and connected with every line entering the station, the auxiliary manipulating-boards provided with apparatus for sending out-

299,039.

going signals and for telephonic communication, and means, as indicated, whereby an operator at one board may ascertain whether any line is in use at any other board, substantially as described.

2. In a multiple-switch-board telephone-exchange system, the combination of a horizontal switch-board composed of alternate layers of conducting connecting-strips and non-conducting insulating-plates, the whole surmounted by line-plates, with annunciators for receiving incoming signals, means for sending outgoing call-signals, and other means, substantially as indicated, for connecting the central-station telephones with one or more lines, as specified, and for the purposes set forth.

3. The combination, with a horizontal multiple switch-board constructed as herein described, of a series of annunciators to give incoming signals—one for each line—and means for automatically resetting the said annunciators, whereby they are adapted to subserve the purpose of a disconnecting-signal.

4. The combination, in a multiple-switch-board system, of the divided line-plates, spring-contacts for normally connecting two of the segments of said line-plates, circuit-connections uniting the spring-contact of the line-plate at each board with the main part of the line-plate at the next, a limit-pin for each spring-contact, and a wire connecting all the limit-pins of the same line together, with the telephone, its cord and plug, and a battery in a normally-open earth-circuit, whereby each line may be tested before use, substantially as specified.

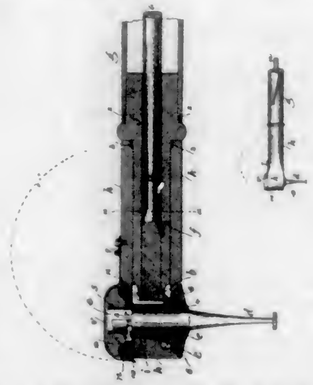
5. In combination with the connecting-strips of a horizontally-disposed switch-board of the character hereinbefore described, the said strips being arranged in pairs, a generator of electricity, keys for directing the current of said generator to the said strips, and a normally-closed loop-circuit including a spring-circuit changer and a disconnecting-indicator extending from one strip of the pair to the other, for the purposes set forth.

6. In a multiple-switch-board exchange system, the switch-boards consisting of interleaved conducting-strips, and insulating-plates surmounted by line-plates, combined with the flexible cord and the detachable connecting-plug, the latter being adapted, when inserted, to unite one segment of the line-plate with one of the connection-strips, and with means, substantially as described, whereby call-signals or telephone-signals may be transmitted to the line through the said cord and plug, for the purposes described.

7. The combination, substantially as hereinbefore described, with a series of telephone-line circuits, of switching devices for connecting any two of said circuits in pairs through a loop including a disconnecting-indicator, and means for introducing the central-station telephones into said loop, whereby the central office may supervise conversation passing between any two lines.

8. The combination, substantially as hereinbefore described, of a series of line-plates, each representing a telephonic main line, with connecting-strips, constituting the normally-open ends of a loop, including a disconnecting-indicator, devices for introducing telephones into the said loop, plug-connectors for uniting any two line-plates with any pair of the said connecting-strips, means, as indicated, for sending call-signals through the loop simultaneously to line through both line-plates, and other means whereby the said loop may be severed and call-signals sent to either line independently, for the purposes specified.

9. The combination, in a telephone-exchange system, with the operators' telephones, and an electrical generator, of the spring-jaws *f* and knob K, the branch wires 43, the switches *s* and *s'*, the ground-wire *g*, key *k*, and the conducting cord and plug, all arranged as described, whereby the same calling and conversing apparatus may be used for working upon a single grounded circuit, and also for operating two circuits when connected together, dispensing with the central-station ground, as described.



10. The combination, in a switch-board comprising alternating layers of connecting-strips and non-conducting plates, of the compound line-plate consisting of a number of quadrantal or segmental divisions perforated in the center, with a connecting-plug adapted to fit in the said perforation, and to rest mechanically upon all of the said segments or quadrants, and to make electrical contact with one of said strips, and means, substantially as indicated, for insulating the said plug from all of the said segments, except the one actually connected with the line-wire, for the purposes specified.

11. The combination, in an electric switch-board consisting of line-plates surmounting a structure of interleaved conducting-strips and insulating-plates, of the said conducting connecting-strips, with branch circuits leading to a key system, whereby any of the said strips may be connected with a telephone or with an electric generator, as described.

12. The combination, in a multiple-board telephone-exchange system, of two or more horizontal switch-boards of the character described, means, as indicated, for receiving incoming and for sending outgoing call-signals, other means for ascertaining at one switch-board whether the line is in use at another, and an automatic device whereby a line-annunciator located at any one of the switch-boards may be reset from any one of the other switch-boards.

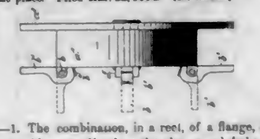
13. The combination, in a telephone-exchange system, with two or more horizontal multiple switch-boards provided each with plug-sockets representing every line entering the exchange, of lines extending from each plug-socket on each board to the plug-socket of the same number on the next board, and contact-springs permanently connected with such lines, and normally maintaining the continuity of the main line through all the switch-boards, together with normally-discontinuous lines—one for each main line—provided with a limit screw or pin at each board immediately in the rear of each contact-spring, and adapted to limit the outward play of the same, and plug-connectors adapted, when inserted, to press aside the contact-spring, thus severing the main line from its normal termination through the switch-boards to earth, and simultaneously forcing the said contact-spring against the limit-pin of the normally-discontinuous line, connecting the same to earth, substantially as hereinbefore described, and for the purposes set forth.

299,040. ANGLE ATTACHMENT FOR DENTAL ENGINES. AUGUST WEBER, New York, N. Y., assignor of one-half to George E. Hodge, same place. Filed Jan. 28, 1884. (No model.)

Claim.—1. The combination, with the shaft *a*, the bevel-gears, and tool, of the tubular bearing *f* for the shaft *a*, the screw 3, and the stock A, screwed upon the tubular bearing, substantially as set forth.

2. The combination, with the tubular shaft *i*, the bevel-gears, and the tool, of a tubular split chuck within the shaft adapted to receive, clamp, and hold the tool, substantially as set forth.

3. The combination, with the shaft *a*, the bevel-gears, and the stock A, of a tubular shaft having a conical bearing at one end, a conical washer surrounding the other end, and a nut to secure the parts in place, substantially as set forth.



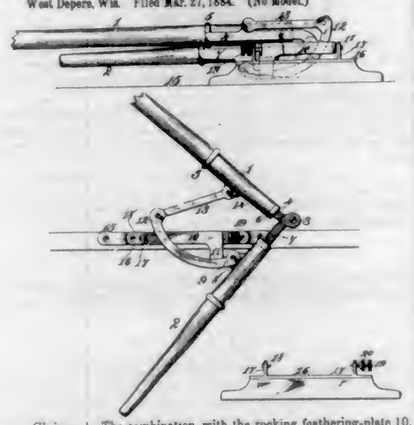
4. The combination, with the stock, shaft, and bevel-gears, of a tubular shaft having a conical end bearing, a chuck within such shaft for holding the tool, and a nut for closing the chuck and clamping the tool, substantially as set forth.

5. The combination, with the stock, shaft, and bevel-gears, of a tubular shaft having an end bearing, a chuck within such shaft, a washer forming a bearing against the stock, and a nut to act upon the chuck and hold the tool, substantially as specified.

6. The tubular shaft having an end bearing, in combination with the bevel-gearing, the washer, the nut, and a pin acting to insure the rotation together of the chuck, the tubular shaft, the washer, and the tool, substantially as set forth.

7. The combination, with the angle attachment for dental engines, containing a clamping chuck and nut, of a movable cap covering the nut, substantially as set forth.

299,041. REEL FOR NAILING AND OTHER MACHINES. HORACE WEEKS, Boston, Mass., assignor to the Corrugated Wire Fastening Company, same place. Filed Mar. 22, 1884. (No model.)

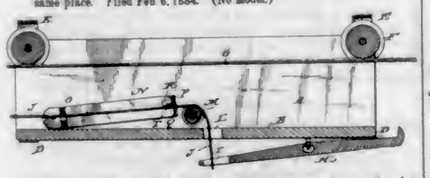


Claim.—1. The combination, in a reel, of a flange, a^3, and barrel a^4, and the movable arms b', adapted to be moved independently into and out of operative position, all substantially as and for the purposes described.

2. The combination of the barrel a^4 and flange a^3 of a reel with the movable arms b' and their independent automatic locking devices for locking the same in position, all substantially as and for the purposes described.

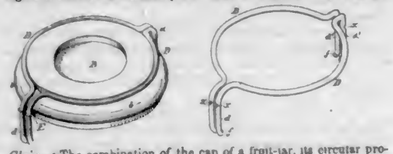
3. The combination, in a reel, of the flange a^4, drum or barrel a^4, with the arms b', hinged as described, and adapted to be separately and independently automatically locked at the end of their outward movement, all substantially as and for the purposes set forth.

4. In a reel, the combination of the barrel a^4 with the arms b', hinged as described, and the springs b^2, all substantially as and for the purposes described.



299,042. BOW-FACING ROWING MECHANISM. JOHN P. WILLARD, West Depere, Wis. Filed Mar. 27, 1884. (No model.)

Claim.—1. The combination, with the rocking feathering-plate 10, of the arm 9, rigidly secured to said plate, and projecting forwardly across the same, the toggle or link 13, pivoted to the outer end of said arm, and the oar 1 and lever 2, pivoted together, and jointed, respectively, to the toggle or link and the inner end portion of the arm, substantially as described.



2. In a bow-facing rowing mechanism, the combination, with the oar 1, of the lever 2, connected together by the joint 3, the feathering-plate 10, to which the lever 2 is pivoted, and the toggle or link 13, connecting the oar with the gunwale, substantially as described.

299,043. WATER ELEVATOR AND CARRIER. JULIUS MARIAN WILLIAMS, Dutch Mills, Ark., assignor of one-half to James T. Williams, same place. Filed Feb 6, 1884. (No model.)

Claim.—The combination of the carriage having self-operating dog H, the bucket and bucket-rope having knot or enlargement T, the hinged latch consisting of parallel arms N N, cross-head P, having notch Q, and projecting arm R, and eye-piece O, forming a guide for the bucket-rope, as and for the purpose shown and specified.

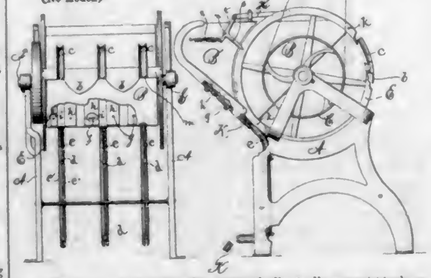
299,044. FRUIT-JAR COVER. ALLEN F. WILSON, Clayton, N. J., assignor to John M. Moore, same place. Filed Feb. 18, 1884. (No model.)

Claim.—The combination of the cap of a fruit-jar, its circular projection A, and recess *c*, with a fastener consisting of the ring D, adapted to the said projection and having fingers *d d'*, and the retaining-wire E, attached to the fingers and fitting in the said recess of the cap, all substantially as set forth.

299,045. METALLIC HEEL-PLATE. CHARLES B. WILSON, Bridgeport, Conn. Filed Mar. 29, 1884. (No model.)

Claim.—A plate for the heels of shoes cut away at the center, and provided at its forward portion with a spur projecting upwardly and inwardly, and at its rear portion with a single screw-hole, substantially as set forth.

299,046. MARKING AND SHADING PEN. ELBERT E. ALDERMAN, Portville, N. Y. Filed Feb. 5, 1884. (No model.)



Claim.—1. In a fountain rubber marking or shading pen, the rubber piece or working-end portion B, of wedge shape at its lower end, as described, and provided with exterior feeding-grooves, *b*, down its sides, essentially as described.

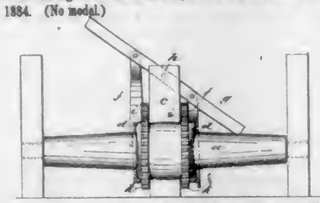
2. In a fountain rubber marking or shading pen, the combination of the socket A, constructed to form a supply chamber or reservoir, with the rubber piece or working-end portion B of the pen, provided with externally-arranged feeding-grooves *b*, substantially as specified.

3. In a fountain rubber marking or shading pen, the combination, with the socket A, constructed to form a supply chamber or reservoir, of the rubber piece or working-end portion B of the pen, constructed to leave channels or spaces between it and the portion of the socket within which it fits, essentially as and for the purpose herein set forth.

299,047. SPOOL-FEEDER. EDWIN ALLEN, Norwich, Conn., assignor to the Allen Spool and Printing Company, same place. Filed Oct. 5, 1883. (No model.)

Claim.—1. As a means for automatically feeding spool-blanks or similar articles in which the length is equal to or greater than the diameter, and in combination with a fixed two-part receiver, B B', supported substantially as shown and described, one or more conducting-

pipes, *e*, pieces *k*, having means for lateral adjustment to provide gutters *i*, and a system of agitators which pass upward through the mass of blanks and downward on the outside of said receiver, as and for the purpose specified.

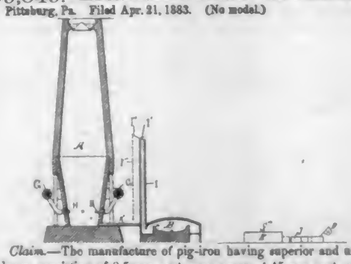


2. In combination with the two-part receiver, adjustable gutter-pieces *k*, and rotating agitators, one or more conducting-troughs, *e*, so made and secured that they may be adjusted or spread apart for the purpose of conducting blanks of different diameters, as hereinbefore described.

3. In combination with the two-part receiver, adjustable gutter-pieces, one or more adjustable conducting-troughs, and the rotating agitator-arms, one or more semicircular pieces, *c*, so located in line with said gutters and conducting-troughs that they tend to move said blanks and lay them lengthwise in the gutters in proper position to enter the troughs *e*, as described.

4. The combination of the supporting-frame, two-part receiver, gutters, conducting-troughs, the revolving rim E, carrying lugs *b* and semicircular pieces *c*, and the spurs *m*, located at any practical point in pieces *c*, for the purpose of turning such blanks as are nearly in line with the gutters, as described.

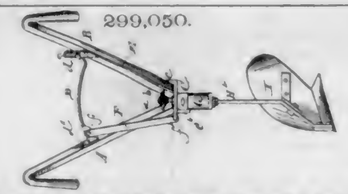
5. In combination with the two-part receiver and rotating rim E, carrying semicircular pieces *c*, the kicking or dislodging device herein described, consisting of a rocker-arm pivoted in B', having an arm, *o*, to engage pins *k*, an upward extension, *l*, having pivoted in its free end the reciprocating piece H, and a spring, *s*, said spring being secured to the rocker-arm below its pivotal point, the other end being secured to B', as and for the purpose specified.



299,048. SHIP-WINDLASS. AMBROSE ARIRO, Pubnico, Nova Scotia, Canada, assignor to himself and Byron Hines, same place. Filed Feb. 16, 1884. (No model.)

Claim.—1. The combination of the centrally-pivoted lever *g*, and pawls *f*, pivoted thereto at their upper ends, and formed with hooks and guide-flange at their lower ends, with the ratchet-wheels and mechanism for connecting them with the drum of the windlass, substantially as set forth.

2. The hand-brake lever *g*, pivoted at the middle to the support *c*, located at the side of the drum *a* and midway between the ends, and having a hook-pawl, *f*, each side of its pivot, said pawls being forked to form guide-flanges *f'*, in combination with a ratchet-wheel, *d*, for each pawl, geared with the drum *a* of the windlass through the wheels *e*, intermediate wheel, *i*, and wheels *k*, substantially as described.

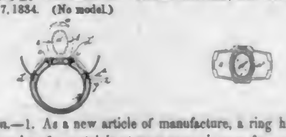


299,049. MANUFACTURE OF PIG-IRON. JOHN FRANCIS BENNETT, Pittsburg, Pa. Filed Apr. 21, 1883. (No model.)

Claim.—The manufacture of pig-iron having superior and uniform hardness, consisting of 8.5 per cent. manganese, 4.45 per cent. carbon, 05 per cent. silicon, with or without phosphorus, sulphur, aluminum, calcium, and other metals, and the remaining part of the percentage iron, by the process herein described, which consists in smelting iron and manganic ores, in the proportions herein indicated, in a blast-furnace, desiliconizing in a reverberatory furnace, and then casting onto a pig-bed or casting-molds, according to the form desired.

299,050. VINEYARD-PLOW. BYRON C. BRADLEY, Chicago, Ill., assignor to Furst & Bradley Manufacturing Company, same place. Filed Jan. 14, 1884. (No model.)

299,050.

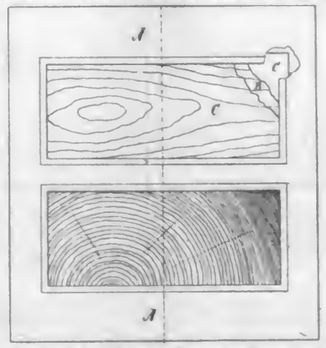


Claim.—1. The hinged handle A, in combination with the spring brace or rod D, for maintaining the handle in its extended position and allowing it to be folded, substantially as and for the purpose specified.

2. The hinged handle A and spring brace or rod D, in combination with the bar E and pivoted bar F, substantially as and for the purpose specified.

3. The hinged handle A, stationary handle B, and spring brace or rod D, in combination with the stationary bar E, pivoted bar F, and plow-beam G, substantially as and for the purpose specified.

299,051. FINGER-RING. RUDOLF BRETTNER, New York, N.Y. Filed Mar. 7, 1884. (No model.)

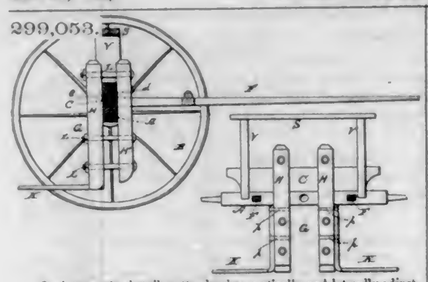


Claim.—1. As a new article of manufacture, a ring having apertures or openings for containing two or more pictures, &c., said apertures being covered by wings or coverings, substantially as shown, and for the purpose specified.

2. As a new article of manufacture, a ring having apertures or openings, with wings or coverings, and springs in combination with and operating said wings, substantially as described, and for the purpose specified.

3. As a new article of manufacture, a ring having apertures *b*, *b'*, and *b²*, wings *a a' a²*, operated or acted upon by springs *g g'*, and the studs *j* and *j'*, with holes *i i' i²* in said covers, substantially as described, and for the purpose specified.

299,052. WOOD-EXHIBITING CARD. HENRY BROOKS, West Medford, and WILLIAM E. REED, Boston, Mass. Filed Oct. 12, 1883. (No model.)



Claim.—A wood-exhibiting card having an opening therethrough, in which is held a veneer of wood covered on both sides by a glazed covering, whereby the wood is protected, and the grain of the wood can be examined when held between the light and the eye, substantially as set forth.

299,053. STALK-CUTTER. AZARIAH R. BROWN, Gainesville, Tex., assignor to O. T. Cottle, D. T. Jeffries, and M. N. Savior, all of same place. Filed Nov. 23, 1882. Renewed Dec. 4, 1883. (No model.)

Claim.—1. The combination, with an upright frame supported on two wheels, of the vertically and laterally adjustable standards G, each consisting of a front and rear upright beam and connecting-bolts, and the horizontal rearwardly and outwardly directed foot-knives K, having upright arms secured to said standards, substantially as specified.

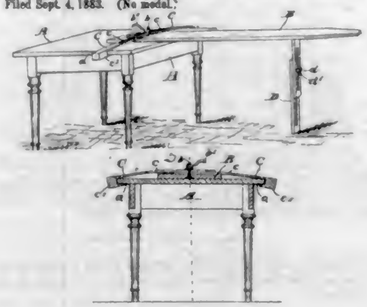
299,053.

2. A two-wheel stalk-cutter having vertically and laterally adjustable standards G, and the horizontal oblique knives K, extending outwardly and rearwardly, and having vertical arms *m* secured to said standards, substantially as specified.

299,054. METHOD OF ENAMELING METAL FOR JEWELRY AND OTHER FANCY ARTICLES. NICOLAS A. BUELL, New York, N.Y. Filed Dec. 22, 1883. (Specimens.)

Claim.—The method herein described of enameling metal, which consists in covering a metallic foundation-plate with a layer of broken enamel of uniform thickness and then exposing the so-covered plate to white heat, whereby the enamel liquefies and forms a uniform coating on the metal plate, substantially as set forth.

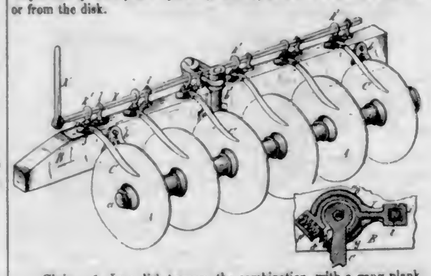
299,055. PROCESS OF FASTENING DIAMONDS IN TOOLS. THOS. W. COLLINS, New York, N.Y., assignor of one-half to Alfred H. Smith & Co., same place. Filed June 19, 1883. (No model.)



Brief.—Renders gems conductive by reduced gold or silver.

Claim.—1. The method of fastening diamonds or analagous substances in tools, consisting in providing the diamonds with a metal coating, placing the coated diamonds in notches in the tool, and then uniting the coated diamonds and the tool by means of electric deposits of metal, substantially as herein shown and described.

2. The method of fastening diamonds or analogous stones in tools, consisting in providing the diamond with a metal covering by means of metal deposited by electricity, depositing metal around the notches in the tool by electricity, then placing the coated diamonds in said notches, and then depositing metal in the notches and on the diamond and the tool, and thus uniting the covered diamonds and the tool, substantially as set forth and described.



299,056. IRONING-TABLE. GEORGE W. COREN, Jamestown, Ind. Filed Sept. 4, 1883. (No model.)

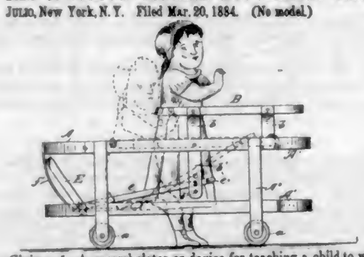
Claim.—The combination, with the table A, of the ironing-board B, and clamps C and clamp-bolt *b*, for securing the same in position, said clamps being hooked to engage with the edges of the table at their outer ends, and extended past and overlapping each other at their inner ends, and said bolt extending up through said board and said clamps, and provided with a nut, *b'*, substantially as described, and for the purposes specified.

299,057. DISK-HARROW. GEORGE G. CROWLEY, Little Falls, N.Y. Filed Jan. 14, 1884. (No model.)

Brief.—Spring-pressed scrapers independently pivoted to gang-plank and connected by pivoted arms or carriers to a rock-shaft, whereby they are adapted to yield separately and may be moved in unison toward or from the disk.

Claim.—1. In a disk-harrow, the combination, with a gang plank or frame, of scrapers pivoted thereto, a rock-shaft mounted on said plank or frame, and pivoted arms or carriers, whereby the motion of the rock-shaft is transmitted to the scrapers, substantially as set forth.

2. In a disk-harrow, the combination, with a gang plank or frame, of scrapers pivoted thereto, a rock-shaft mounted on said plank or frame, pivoted arms or carriers connected with said rock-shaft, and springs interposed between said arms or carriers and the scrapers, substantially as set forth.



3. In a disk-harrow, the combination, with a gang-plank, B, of a scraper, C, pivot *d*, housing D, spring *f*, and rock-shaft *k*, substantially as set forth.

4. In a disk-harrow, the combination, with a gang-plank, B, of a scraper, C, pivot *d*, housing D, provided with an arm, I, rock-shaft *k*, and arm *l*, substantially as set forth.

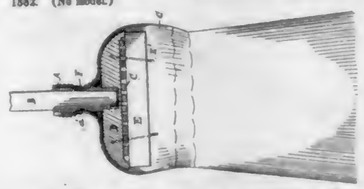
5. In a disk-harrow, the combination, with the scraper C, of the housing D, provided with a shoulder, *g*, and socket F, a spring, *f*, seated in said socket, and a rock-shaft, *k*, substantially as set forth.

6. In a disk-harrow, the combination, with the scraper C, of the housings D, provided with arms I, pivots *d*, provided with eyes *k'*, shaft *k*, supported in said eyes, and arms *l*, secured to the shaft *k*, substantially as set forth.

299,058. COMBINED PERAMBULATOR FOR TEACHING CHILDREN TO WALK AND AUTOMATIC SEAT THEREFOR. ANGLO DE JULIO, New York, N.Y. Filed Mar. 20, 1884. (No model.)

Claim.—1. A perambulator or device for teaching a child to walk, provided with a yielding table for supporting the child, secured upon pivoted legs held in an upright position by springs, which allow the said table to be depressed when the child throws his weight upon it, substantially as set forth.

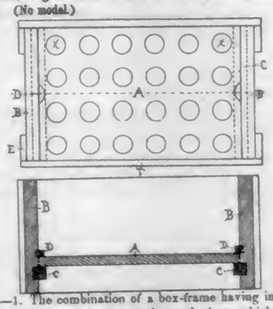
2. In a perambulator or device for teaching a child to walk, the combination, with the yielding support for the child, of a movable seat connected with the support, which will be thrust automatically under the child as the support is depressed and automatically withdrawn when the support is elevated.



3. The combination of the frame A, support or table B, springs D, movable seat E, and connections thereto, arranged and combined to throw the seat under the child when it sits down and withdraw it again when the child rises automatically by the depression and elevation of the

table B, substantially as set forth.

4. The combination, with the frame A, support or table B, arms *b*, and springs D, the rear arms, *b*, being provided with downward extensions *b'*, of the connecting-rods *e*, pivoted to the extensions *b'*, and the seat E, swiveled on the connecting-rods *e*, substantially as set forth.



5. The combination of the frame A, provided with the seat-supports and guides *f f*, set in a horizontal position near the base of the frame, and the curved guide *f''*, suspended from the upper portion of the frame, with the pivoted movable seat E, yielding table or support B, and connections between said table or support and the seat, as set forth.

299,059. BROOM. CHARLES DOUGLAS, Detroit, Mich. Filed Dec. 27, 1882. (No model.)

Claim.—The broom consisting of the combination, with the head and clamp constructed as shown, and secured together by means of wires or fastenings, of the handle-socket having an interior tapering orifice and an exterior annular groove, a removable handle adapted to be received in said socket, and the broom-straw, a portion of which is held between the head and clamp, and a portion thereof brought around the head and fastened about said socket by a suitable wrapping of wire or twine, substantially as described.

299,060. BOX FOR CARRYING BOTTLES. THOMAS DRUMMOND, Chicago, Ill., assignor to Julius C. Wintermeyer, same place. Filed Dec. 24, 1883. (No model.)

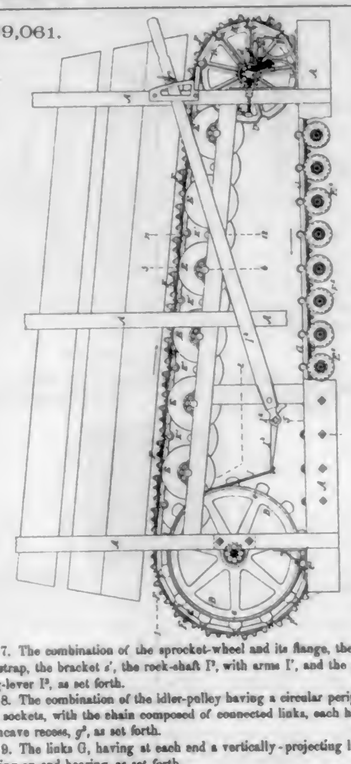
Claim.—1. The combination of a box-frame having inner grooves on each end, a perforated bottle-carrier, and cleats which rest in the grooves and sustain the carrier.

2. The combination of a box-frame having inner grooves on each end, a perforated bottle-carrier, cleats which rest in the grooves and support the carrier, and fastenings which are secured to the frame above the carrier and serve to hold the same in position.

299,061. HORSE-POWER. JOHN ELLIS, Pottstown, Pa., assignor to George B. Ellis, same place. Filed Mar. 24, 1884. (No model.)

Claim.—1. The combination of bearing-wheels E' on the frame of the horse-power with endless chains, the links of which have flanges *a* projecting beyond the ends of the lags, so as to form a supporting-track for the chain on its return, as set forth.

2. The links having inner flanges *a* with guide-ribs *a'*, as set forth.



3. The combination of the links having inner flanges with ribs *a'*, the guide-wheels E', carried by shafts *a*², and means for confining said shafts laterally to the frame of the power, as set forth.

4. The combination of the shaft or spindle *b'* and the centrally-grooved anti-friction rollers *b*² with a wheel-hub open at both ends, internally chilled and having a central rib, *b*, as set forth.

5. The combination of the sprocket-wheel, idler-pulley, and chains of a horse-power, with the frame having brackets H with guides *d'*, the boxes *d*, carrying the shaft of the idler-pulley, and set-screws *d*² for adjusting said boxes, as set forth.

6. The combination of a friction brake-strap and operating-lever therefor with a sprocket-wheel having a flange for the action of said brake-strap, as set forth.

299,061.

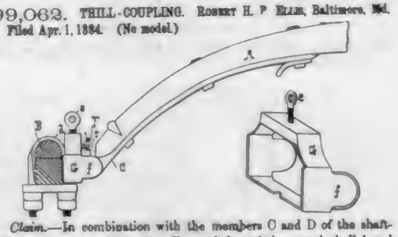
7. The combination of the sprocket-wheel and its flange, the friction-strap, the bracket *c'*, the rock-shaft I², with arms I', and the operating-lever I², as set forth.

8. The combination of the idler-pulley having a circular periphery with sockets, with the chain composed of connected links, each having a concave recess, *g*², as set forth.

9. The links G, having at each end a vertically-projecting lug, A, forming an end bearing, as set forth.

10. The links G, each having at one end a hook, *g'*, and at the opposite end lugs *g*², carrying a hollow pin, *f*, as set forth.

11. A metallic lag for the tread of a horse-power, said lag comprising longitudinal ribs and transverse connecting-bars, as set forth.



12. A metallic lag, F, comprising hollow longitudinal ribs *m* and transverse braces *n'*, extending between and across said ribs, as set forth.

13. A metallic lag, F, comprising longitudinal ribs *m*, tapered from the center toward each end, and having a top flange, *m'*, in combination with connecting plates and braces for said ribs, as set forth.

14. The combination of a link, G, having a tubular projection, *i*, with a metallic lag, F, having end plates with openings *i*², as set forth.

15. The combination of the lags F with the links G, each having inclined projections *n*², forming the bearings for the lag, as set forth.

299,062. THILL-COUPLING. ROBERT H. P. ELLIS, Baltimore, Md. Filed Apr. 1, 1884. (No model.)

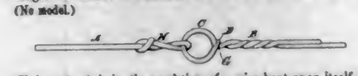
Claim.—In combination with the members C and D of the shaft-coupling, the removable wedge F, consisting of the metal shell *b* and rubber block *c*, the pin E, and the clamp G, having the screw *e* and side plates, *f*, substantially as and for the purpose specified.

299,063. WIRE BALE-TIE. LEMUEL E. EVANS, East Orange, N. J., assignor to Charles G. Patterson, New York, N. Y. Filed Apr. 16, 1884. (No model.)

Claim.—1. A wire bale-tie having a loop on one end of the band and the hook upon the other end of the band, said hook being braced by having its downward and forward projecting end bent backward upon itself, and secured by passing the loop on the end thereof over the head of the hook, substantially as described.

2. A wire bale-tie, substantially as described, consisting of a hook formed on one end of the band, braced by bending the downward and forward projecting portion of said hook back upon itself and over the head of the hook, and a loop on the other end of the band, adapted to be passed over said braced hook to secure the tie.

3. In a bale-tie, a loop or eye at one end of the band and a hook at the opposite end, adapted to receive said loop, said hook being provided with downward-projecting braces adapted to rest upon the upper and opposite sides of the said loop when the band is under strain, substantially as described.



4. In a bale-tie, a loop or eye at one end of the band and a hook at the opposite end, adapted to receive said loop, said hook being provided with three braces, two resting upon the upper and opposite sides of the loop and the third adapted to be passed over the head of the hook, said hook forming a bearing, substantially as described.

5. A braced hook, D, on one end of the band, formed by bending the doubled wire, as shown, in combination with the loop C on the other end of the band, and adapted to serve together, as and for the purpose set forth.

6. The combination, with the bale-tie hook D, of the downwardly-projecting braces G' G' and backwardly-bent brace H, made continuous therewith, substantially as described.

7. In a bale-tie, the combination of the wire A, having a loop at its extremity, and the wire B, having at its end a loop longer than the loop C, said loop last mentioned being bent to form the hook D, bights E and F, and brace H, substantially as described.

299,064. WIRE BALE-TIE. LEMUEL E. EVANS, East Orange, N. J., assignor to Charles G. Patterson, New York, N. Y. Filed Apr. 16, 1884. (No model.)

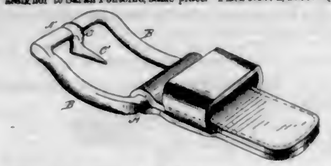
Claim.—1. A bale-tie consisting of a wire bent upon itself at one end to form a loop within which the doubled wire is located to form a circular eye, and said double wire bent backward to form a shoulder, upon which the eye of the loop bears when under strain, said eye adapted to receive the free or straight end of the band and be knotted or twisted to secure the tie, substantially as described.

2. A wire bale-tie made by bending one end of the band upon itself to form a loop, and passing the ends of the wire through the loop to form a circular eye, then bending the wires and twisting, for the purpose of forming a bearing for the eye in the same plane as that in which the strain is applied, said eye being adapted to connect with the free end of the band, substantially as described.

3. In a wire bale-tie consisting of a loop on one end of the band, adapted to receive the straight end of the band, said eye formed by bending the wire upon itself to form a loop by inserting the ends of the wire within the eye of the loop, and bending to form a shoulder, upon which the loop rests, and securing the end of the wires beyond the loop by twisting them upon themselves, substantially as described.

4. A bale-tie fastener consisting of a wire band which is doubled at one end and bent to form a loop, the said loop being bent in such a manner as to include the strands of wire within it, said strands being bent backward and twisted to form a socket or shoulder, in which and on which the eye of the loop rests and bears, said eye so formed adapted to receive and connect with the free end of the band, substantially as and for the purpose set forth.

5. In a wire bale-tie, an eye formed of two strands of wire at one end of the band, said strands forming the loop, being secured by inserting them within the eye of the loop, and bending to form a socket and shoulder, in which the eye of the loop rests and upon which it bears, and twisting the ends of the strands together, the said eye receiving and connecting with the free end of the band.

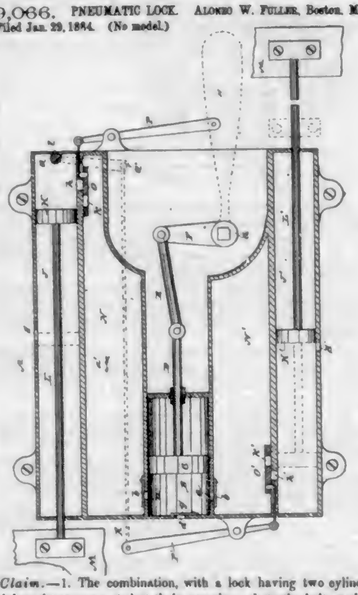


6. A wire bale-tie of one piece of wire, having an eye on one end formed by doubling the wire upon itself and then bending the double portion to form a locked eye, said eye being adapted to connect with the free end of the band to secure the tie, substantially as described.

7. A bale-tie consisting of a wire bent upon itself to form a loop, through which the ends of the wire are passed to form a circular eye, then bent backward to form a shoulder, on which the loop bears, and finally twisted, said eye adapted to receive the free end of the wire and be secured, substantially as described.

8. In a bale-tie, the combination of the free or straight end of the wire A with the end of the wire B, having the eye C at its extremity, said eye C being adapted to receive the free end A, which is twisted to secure the tie, substantially as described.

9. A wire bale-tie bent, locked, and twisted at one end to form the eye C, said eye being adapted to receive the straight end of the band to secure the tie, substantially as described.



299,065. HARNESS-BUCKLE. HERMAN A. FONTEINE, Auburn, N. Y., assignor to Sarah Fonteine, same place. Filed Nov. 1, 1883. (No model.)

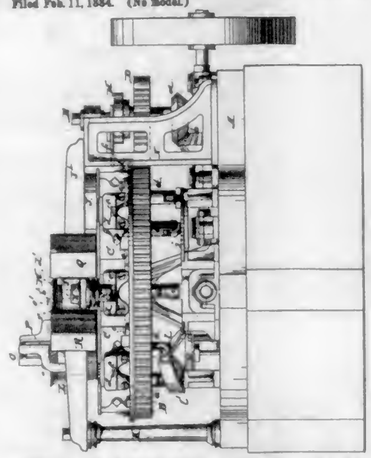
Claim.—1. A trace-buckle composed of the side and end bars, and having a rigid tongue depending from one of its end bars, made in angle form, whereby the draft portion of the tongue shall be at right angles to the end bar, with its end portion at right angles to the draft portion, substantially as and for the purpose set forth.

2. A trace-buckle made in rectangular form, and having the curved side bars, in combination with the rigid tongue depending from the end bar, made in angle form, and having the draft portion at right angles to the end bar and its end portion at right angles to the draft portion, substantially as and for the purpose described.

299,066. PNEUMATIC LOCK. ALONZO W. FULLER, Boston, Mass. Filed Jan. 29, 1884. (No model.)

Claim.—1. The combination, with a lock having two cylinders containing pistons connected at their opposite ends to the bolt mechanism of the lock, of a third cylinder on said lock containing an air-compressing piston and connected with the other two cylinders by suitable valve mechanism, to admit air alternately on opposite sides of said pistons, substantially as herein shown and described.

2. The combination, with the casing A, having the cylinders B and J J', of the pistons C K K', the bolt-frame M, connected with the pistons K K', and of means for working the piston C in the cylinder B, substantially as herein shown and described.



3. The combination, with a casing, A, having cylinders B and J J', and the chambers N N', of the valves O O', connecting said chambers with cylinders J J', and located in rear of the pistons C K K', a bolt-frame connected with the pistons K K', at their opposite ends, and means for operating the piston C in the cylinder B, substantially as herein shown and described.

4. The combination, with the casing A, having the cylinders B J J' and the compartments N N', of the pistons C K K', the valves O O', connecting chambers N N' with cylinders J J', as shown, the levers P P', outside of the casing and connected to said valves, a bolt-frame connected

with the pistons K K', as shown, and of means for operating the piston C in the cylinder B, substantially as herein shown and described.

5. The combination, with a lock-casing having two cylinders, each containing a piston connected to the bolt mechanism of a lock, which pistons work in opposite directions, of an air-compressor, openings for admitting compressed air into the cylinders, and connected mechanism for permitting the compressed air to escape from one cylinder at the same time that the air is being admitted into the other cylinder, substantially as herein shown and described.

299,067. BRICK-MACHINE. WILLIAM L. GREGG, Philadelphia, Pa. Filed Feb. 11, 1884. (No model.)

Claim.—1. In a brick-machine, a pressure-plate, J, provided with holes or vents for the purpose of permitting the escape of air and surplus clay from the mold when pressure is applied to its contents, in combination with an intermittently-rotating mold-table and an agitated hopper, substantially as and for the purpose specified.

2. In a brick-machine, a movable receptacle, Q, automatically operated for the purpose of distributing coloring material or other material over the upper surface or edge of a brick while being made, substantially as specified.

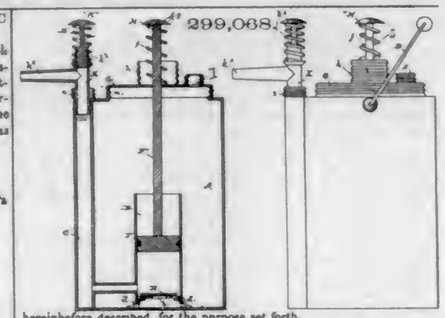
3. In a brick-machine, a movable box, R, automatically operated for the purpose of pushing the brick from the table, and at the same time applying coloring material or other material to the surface of the piston or follower, substantially as specified.

4. The combination of the shaft T, mutilated gear-wheel *t*, gear-wheel *u*, shaft W, and arm *v*, for the purpose of operating the stamp and receptacles Q R, substantially as specified.

5. The combination of the shaft T, mutilated gear-wheel *t*, gear-wheel *u*, shaft W, arms *v* and *c*, rod *r*, lever P, arm *p*, and stamp N, substantially as and for the purpose specified.

6. The combination of the shaft T, mutilated gear-wheel *t*, gear-wheel *u*, shaft W, arms *v* and *b'*, and receptacle Q, substantially as and for the purpose specified.

7. The combination of the shaft T, mutilated gear-wheel *t*, gear-wheel *u*, shaft W, arms *v d' d'*, and receptacle R, substantially as and for the purpose specified.



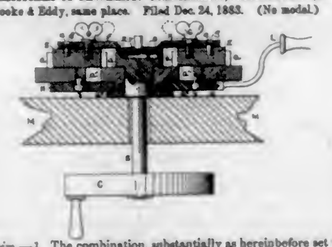
299,068. OIL-CAN. JOHN A. GRISWOLD, San Francisco, Cal. Filed Oct. 10, 1883. (No model.)

Claim.—1. The combination, with the can or holder A, of the fixed cylinder with valved inlet *b*, piston F, and rod F', fixed outlet tube or passage C, terminating in the socket or coupling *c*, head or handle H, to operate the piston-rod from the outside of the can, and the cut-off spout K, with valve and valve-spring, substantially as hereinbefore described.

2. The combination, with the can or holder A, having the socket or coupling *c*, for connection of a nozzle, and the piston-rod F', arranged to be returned into the can through the aperture in the can-top, of the screw-threaded rims around the apertures *c h*, and screw-caps to fit thereon, substantially as hereinbefore described, for the purpose set forth.

3. The combination, with the can or holder A, of the fixed cylinder having valved inlet *b* and an outlet, the piston F, and piston-rod F', working through the top of the can, the fixed outlet tube or passage C, the screw-threaded rims *c h*, and caps or nozzles therefor, substantially as

299,068.



hereinbefore described, for the purpose set forth.

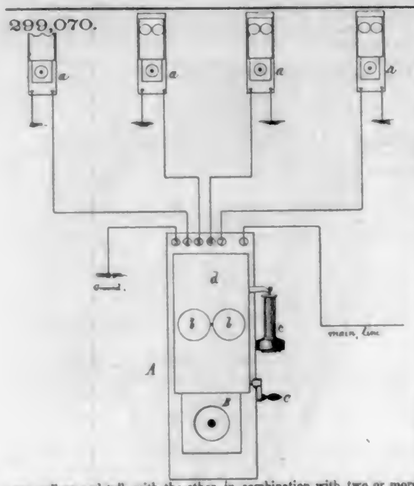
4. The combination, with the can or holder A, having the fixed outlet tube or passage C, terminating in the socket or coupling *c*, of the cut-off faucet K, with valve k^2, spring L, and spout *k'*, adapted to receive attachment of a nozzle, substantially as described.

5. The can or holder A, having socket or couplings *c* on the outside, the piston-rod aperture *h* and surrounding rim, fixed cylinder B, fixed outlet-passage C, a piston-rod, F', of suitable length to be returned into the holder through its aperture, the caps or covers to close said parts *c h*, and the removable head or top, all in combination, substantially as hereinbefore described.

299,069. MACHINE FOR ATTACHING THE BACKS AND FRONTS OF ARTICLES OF JEWELRY. JOHN HAGERTY, Providence, R. I., assignor to Cooke & Eddy, same place. Filed Dec. 24, 1883. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of a work-holder adapted to be rotated, one or more bending-tools arranged, as described, to be slid over upon the work, and thereby to turn down the rim thereof, suitable guides for determining the path of movement of said bending tool or tools, and suitable means, as described, for forcing said tool or tools over the work and for retracting the same.

2. The combination, substantially as hereinbefore set forth, of a work-holder adapted to be rotated, oppositely-located bending-tools arranged, as described, to be slid over upon the work, and thereby to turn down the rim thereof, and to hold down said work, suitable guides, as described, for determining the path of movement of said bending-tools, and suitable means, as described, for forcing said tools toward each other over the work and for retracting the same.



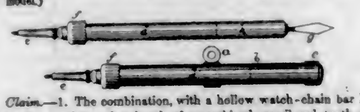
3. The combination of a bed, A, a work-holding spindle, B, mounted to revolve on said bed, bending-tools F F, blocks E E, having studs K K, and a pivoted plate, H, having cams A, and provided with a handle, substantially as described and shown.

299,070. TELEPHONE-EXCHANGE SYSTEM. F. REDMOND HERRON, New York, N. Y. Filed Jan. 29, 1884. (No model.)

Claim.—1. A telephone-exchange system consisting of the following elements: a number of subscribers' telephone-circuits electrically connected with the central office of the system, one of said telephone-circuits being provided with a telephone and calling apparatus for communicating with the central office, which telephone is centrally located, so as to form a common telephone for the general use of a number of subscribers whose offices are near, electrical signaling or calling apparatus arranged at each of the common subscribers' offices, and electrical connections and means for operating each common subscriber's calling apparatus from the central office, whereby the central operator may call up any desired one of said subscribers in his office.

2. The herein-described common-telephone system, consisting of two main offices electrically connected by a telephone-circuit, and provided with telephone and calling apparatus, whereby each main office

299,070.



may call up and talk with the other, in combination with two or more branch or local offices situated near one of the said main offices, and provided with electric call-bells or signal-receiving apparatus, circuits connecting each of these local electric call-bells or signal-receiving apparatus with the said main office, and mechanism at the latter office whereby an operator at the distant main office may cause an electric current or impulse to be transmitted over any of the branch circuits, so as to operate the calling apparatus of any desired local office at pleasure, substantially as described.

3. The herein-described common-telephone system, consisting of two main offices electrically connected by a telephone-circuit, and provided with telephone and calling apparatus, whereby each main office may call up and talk with the other, in combination with two or more branch or local offices situated near one of the said main offices, and provided with independent electric call-bells or signal-receiving apparatus, a circuit connecting each local call-bell or signal-receiving apparatus with the said main office, and electro-magnetic switching mechanism at the latter office, constructed to be operated by electric currents sent over the main circuit from the distant main office, and to connect the said main circuit with any of said local circuits, respectively, as desired, substantially as described.

4. The combination, with the electro-magnet J, lever H, and step-by-step contrivance E, constructed to be actuated by the said electro-magnet, and set as desired by a predetermined number of electrical impulses, of the lever or hook R, upon which the telephone is hung, said lever being mechanically connected with the said step-by-step contrivance, so as automatically to restore said contrivance to normal condition when the telephone is removed from its hook, substantially as described.

299,071. WATCH-CHAIN BAR. JOHN HOAGLAND, Providence, R. I., assignor to Pearce & Hoagland, same place. Filed Nov. 19, 1883. (No model.)

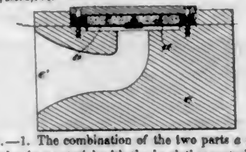
Claim.—1. The combination, with a hollow watch-chain bar having one open and one closed end, of a combined pencil and tooth-pick case composed of two parts arranged to turn upon each other, and adapted for insertion into and removal from the said bar, as described.

2. The combination, with a hollow watch-chain bar having one closed and one open end, of a pencil and tooth-pick case formed in two sections, one of which carries a turning cap, and adapted to be inserted removably within the said bar, the tooth-pick being operated by turning the sections upon each other, as described.

3. The combination, with the tubular bar *b*, having one of its ends closed by the cap *c*, of the case *d h*, formed in two sections, and arranged to fit tightly within the bar and provided with the cap *f*, and containing a pencil, *e*, and tooth-pick *g*, as described.

299,072. FENCE-ROD. WM. G. HOWELL, Philadelphia, Pa., assignor of one-half to Bernard C. Leath, same place. Filed Feb. 4, 1884. (Model.)

Claim.—1. As a new manufacture, the within-described fence-rod,



299,072.

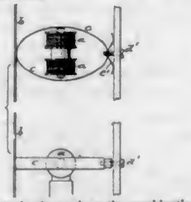
the same consisting of a rolled strip of iron or steel having at intervals flattened roll-finished sharp-edged fin-like projections *a'*, forming integral parts of the rod, and extending from the middle portion of the same, as set forth.

2. The within-described twisted fence-rod, the same consisting of a rolled and twisted strip of iron or steel having at intervals flattened, roll-finished, sharp-edged, and fin-like projections extending from the middle portion of the rod, and forming integral parts of the same, as described.

299,073. TELEPHONIC TRANSMITTER. JOSÉ DOTTIN HENRARDS, London, England, assignor to the American Bell Telephone Company, Boston, Mass. Filed Jan. 4, 1883. (No model.) Patented in England June 24, 1882, No. 3,008.

Claim.—1. The combination of the two parts *a a* of the divided disk of a conducting material with the insulating material *b*, uniting the said halves or parts and the bridge of carbon or other suitable material, substantially as described.

2. The combination of the parts *a a* of the divided metallic disk forming the diaphragm and the electrodes, the carbon bridge between the parts *a a*, and means for holding the carbon bridge in contact therewith, substantially as described.



3. In an electric transmitting-telephone, a compound diaphragm consisting of two segments of conducting material mechanically united by a non-conducting partition, but electrically insulated one from another, as described.

4. In an electrical transmitting-telephone, the combination of a diaphragm or vibrative disk, the said disk consisting of two segments of conducting material electrically separated but mechanically united by a non-conducting partition, a mass of carbon or other conducting material connected with both segments of the said disk and adapted to vary the resistance between them, and a suitable tube or mouth-piece leading to the said disk and adapted to concentrate sound-waves thereon for the purpose of vibrating the same.

5. The combination, substantially as hereinbefore described, in an electric transmitting-telephone, of a compound diaphragm consisting of two conducting-segments united by a non-conducting partition, carbon or other conducting material in a granulated or finely-divided condition disposed upon the said disk in contact with both segments and adapted to vary the resistance between them, leading-out wires—one for each segment—whereby the said disk may be connected in an electric circuit, and a mouth-piece or directing-tube leading to the said disk, whereby sound-waves may be directed thereon.

6. A transmitting-telephone consisting, substantially as hereinbefore described, of a compound diaphragm or vibrating disk composed of two metallic segments mechanically united by a non-conducting partition, a mass of granulated carbon or like conducting material placed on the said disk, and a containing-case perforated by a mouth-piece or directing-tube, whereby sound-waves may be directed to the under side of the said disk for the purpose of vibrating the same, and thus varying the resistance between the two segments thereof.

299,074. TELEPHONIC RECEIVING-INSTRUMENT. JOSÉ DOTTIN HENRARDS, London, England, assignor to the American Bell Telephone Company, Boston, Mass. Filed Jan. 4, 1883. (No model.) Patented in England June 24, 1882, No. 3,006.

Claim.—1. In a telephonic receiver, the combination of an electro-magnet, an elastic armature therefor and controlled thereby, and a diaphragm, the elastic armature being in contact at its center with the diaphragm, and thence projecting angularly in opposite directions into magnetic proximity to the poles of the magnet, opposite parts of the

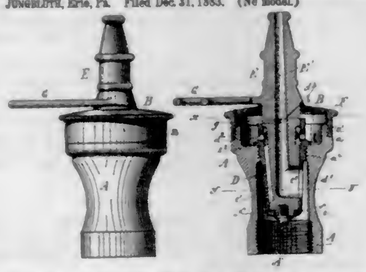
armature being in such proximity to the opposite poles of the electro-magnet, substantially as described.

2. In a telephonic receiver, the combination of a diaphragm, an elastic or flexible armature in contact therewith and controlling the vibrations thereof, and extending therefrom in opposite directions from the point of contact, and an electro-magnet arranged with its poles in magnetic proximity to opposite parts of the flexible or elastic diaphragm and controlling its movements, substantially as described.

3. In a telephonic receiver, the combination, with an electro-magnet, of a flexible or elastic armature, opposite portions of which are in proximity to the poles of the magnet, and a diaphragm, with which the armature is in contact between its portions opposite the poles of the magnet, substantially as described.

4. In a telephonic receiver, the combination of a diaphragm, an elastic or flexible armature contacting therewith and extending angularly therefrom in opposite directions, an electro-magnet having its poles in magnetic proximity to the portions of the armature so extending, and means for regulating the proximity of the armature to the poles of the electro-magnet, substantially as described.

5. In a telephonic receiver, the combination of a diaphragm, an elastic or flexible armature contacting therewith and extending angularly therefrom in opposite directions, an electro-magnet having its poles in magnetic proximity to the portions of the armature so extending, and means for regulating and varying at the same time the tension of the contact of the diaphragm and armature and the proximity of the armature to the poles of the electro-magnet, substantially as described.

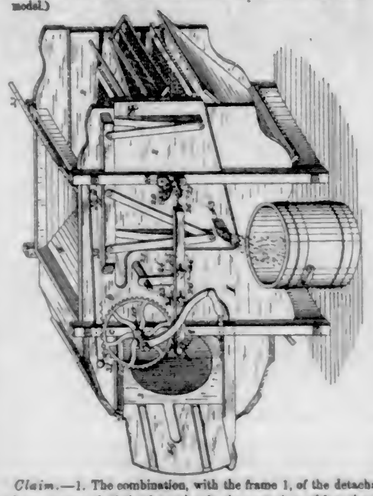


6. In a telephonic receiver, the combination of a diaphragm, an elastic or flexible armature contacting therewith and extending angularly therefrom in opposite directions, an electro-magnet having its poles in magnetic proximity to the portions of the armature so extending, and a set-screw, *d'*, whereby at the same time the tension of the contact of the armature and diaphragm and the proximity of the armature to the poles of the electro-magnet may be controlled and regulated, substantially as described.

299,075. SAFETY-PIN. JOEL JENKINS, Montclair, N. J., assignor of one-half to George P. Farmer, same place. Filed Apr. 7, 1884. (No model.)

Claim.—A safety-pin with its shield made integral with the wire of the pin, and consisting of three parallel folds of wire doubled over and forming the shield B, with a central bar, *a*.

299,076. COMBINED STREET AND LAWN SPRINKLER. JOSEPH JUNGBLUTH, Erie, Pa. Filed Dec. 31, 1883. (No model.)



Claim.—1. A combined street and lawn sprinkler consisting of a hollow main part having a rose attached thereto, a fixed interior bushing provided with openings to communicate with the main part and the rose, a nozzle provided with means to communicate with the main part and the rose, said nozzle being adapted to turn axially in the bushing, so as to shut off the water or conduct it to the nozzle or to the rose, substantially as set forth.

2. The combination of a main part, A, having a rose, B, a bushing, D, secured into the main part and having a side opening, d^2, and openings d^3, a nozzle, E, turning axially in the bushing and provided with a side opening, e^2, and a channel, e' e^3, substantially as specified.

3. The combination of a hollow main part or shell having a contracted neck, a rose, B, attached to the shell, an interior bushing having a shoulder, *d*, abutting against said contracted neck, side openings, d^2, below and radial openings d^3 above said neck, and a nozzle, E, fitted into the bushing, so as to turn axially therein, and provided with a side opening, e^2, and channel e', substantially as set forth.

299,077. FANNING-MILL. ANDREW W. KENDRICK, Brooklyn, and CHARLES A. VAN DUZEE, Gouverneur, N. Y. Filed Jan. 30, 1884. (No model.)

Claim.—1. The combination, with the frame 1, of the detachable fan-drum, composed of the drum-heads, the central partition, the thin boards, the thick boards rabbeted and grooved to receive said heads and partition, the grooved and rabbeted boards alternating with and overlapping the thin boards, and means for securing the overlapping boards upon the drum-heads, substantially as and for the purpose set forth.

2. In a fanning-mill, the combination of a main frame or casing made in detachable sections and rectangular in form, a fan-drum made in detachable sections, and a fan having separately detachable blades and detachable shaft, whereby the fanning-mill frame and fan are rendered reducible to a single compact package, as hereinbefore set forth.

3. The combination of the fan-shaft having plain faces or sides, the detachable fan-blades having arms halved or cut away at their inner ends and adapted to fit over each other in succession upon the fan-shaft, and means for detachably securing them to the fan-shaft, substantially as and for the purpose set forth.

4. The combination of the screens, the fan having a double or divided set of blades, the single continuous fan-drum having air-inlets, and the stationary vertical central partition dividing the drum into two non-communicating air-chambers, substantially as and for the purpose set forth.

5. The combination of the shaking screens, the fan having a double or divided set of blades, the single continuous fan-drum having an air-inlet at each end, and the stationary vertical central partition dividing said drum into two non-communicating air-chambers, said partition being cut away on the rear edge within the circle described by the fan, substantially as and for the purpose set forth.

6. The combination of the fan, the fan-drum, the grooved cleats, and the valve-board having the top and bottom projections at its inner edge adapted to enter the grooves, substantially as and for the purpose set forth.

7. The combination of the main frame, the hopper constructed with the feed-slide, the lever pivoted at one end to the frame and at its middle engaging the feed-slide, the casing having the inclined guide-slot, the post mortised below the upper line of the casing, the rest-pin, and the push-bar connected with the lever at one end, and notched on its under side and extending above the crank-wheel through the mortise, substantially as and for the purpose set forth.

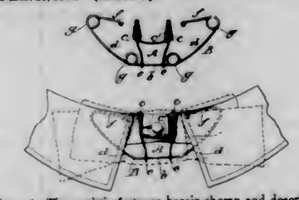
8. The combination of a blast-fan, a reciprocating screen inclined downwardly toward the blast-fan, with its upper surface exposed thereto, a knocker, and means for causing it to deliver a blow endwise against the end of the screen nearest the fan, substantially as and for the purpose set forth.

9. The combination of a fan, a pitman, a screen receiving its motion from the fan-shaft through the pitman, a rock-shaft, a knocker suspended from the rock-shaft, and means connecting said rock-shaft with said pitman, substantially as and for the purpose set forth.

10. The combination of a crank-shaft, a pitman, a screen receiving its motion therefrom, a swinging knocker, and means, substantially as described, by which said knocker and pitman may at will be connected positively or loosely to give a swinging blow, substantially as set forth.

11. The combination of a blast-fan, a shaking screen, a knocker suspended between said fan and said screen, and mechanism, substantially as described, for operating the screen and knocker.

12. The combination of a pitman, means for reciprocating said pitman, the screen, the knocker, the rock-shaft having the depending arm, and the adjustable blocks, substantially as and for the purpose set forth.

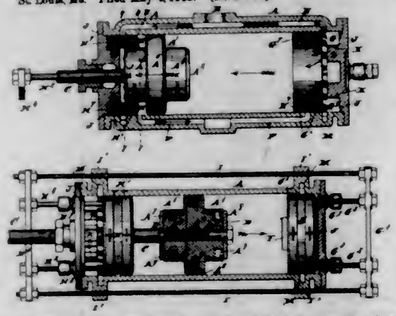


13. The combination of the shoe, the screen, the knocker striking the end of the screen, the buttons for retaining the screens in place against the blows of the knocker, and means, substantially as described, for operating the knocker and screen, substantially as and for the purpose set forth.

14. The combination, with the crank-shaft, the shoe, the swinging knocker, and the mechanism connecting it to the pitman, of the pitman adjustable in length, the elbow-lever, and the link connecting it to the shoe, substantially as set forth.

15. The combination of the shoe having the opening in the side plate, the detachable cockle-screen and box, the detachable spout having the flange, and the pivoted plate, substantially as and for the purpose set forth.

16. The combination of the shoe having the discharge-opening in the side plate, the detachable spout having the flange on its upper side, and the pivoted plate, said plate being adapted to confine the spout in position and to close the discharge-opening in the absence of the spout, substantially as set forth.



299,078. NECKTIE-FASTENER. FREDERICK KUSEL, Riverside, Iowa. Filed Mar. 25, 1884. (No model.)

Claim.—1. The necktie-fastener herein shown and described, consisting of the hooked central wire, A, and outer wire, B, bent to form spring-arms *d*, substantially as and for the purpose set forth.

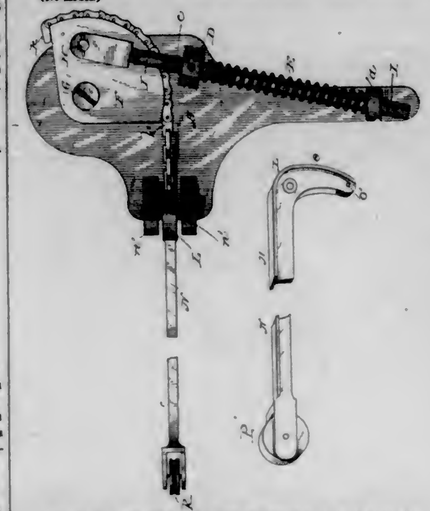
2. The wire B, bent to form the spring-arms *d* and horizontal arm *f*, in combination with the centrally-attached wire A, bent to form hooks *c*, the arms *f* being held by arms *d* slightly above the hooks *c*, substantially as and for the purposes described.

299,079. MEANS FOR OPERATING VALVES. FRANCIS M. LUDLOW, St. Louis, Mo. Filed May 4, 1883. (No model.)

Claim.—1. The combination, with a piston, of a valve, the piston adapted to force a part of the fluid in advance thereof to the inlet side of the valve, to move the valve toward the piston to open the inlet and close the outlet, as set forth.

2. The combination, with a piston, of a valve having a passage through it to permit a part of the fluid in advance of the piston to pass to the opposite side of the valve, to force the valve toward the piston, as set forth.

3. In a steam or other engine, the combination, with the piston, of the ring-valves adapted to be operated by the piston through means of compressed air, vapor, or other similar matter, substantially as set forth.

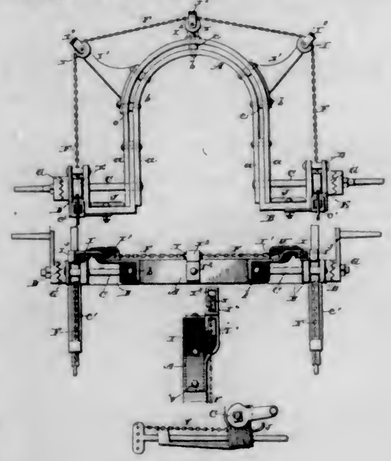


4. In a steam or other engine, the combination, with the piston having a hub, of the ring-valves adapted to receive the hub of the piston, and having chambers behind them to receive the compressed air, vapor, or other similar matter, for the purpose of causing the valves to be moved in the opposite direction to which the piston is traveling, to open and close the inlet and exhaust ports, as set forth.

5. In a steam or other engine, the combination, with the piston having a hub provided with compressible packing-rings, of the valves adapted to receive the hub of the piston to be operated thereby, as set forth.

6. In a steam or other engine, the combination, with the piston, of the valves adapted to be operated by the piston, and having collapsible packing-rings, substantially as shown and described, for the purpose set forth.

7. In a steam or other engine, the piston and valves, the latter adapted to be operated by the former, substantially as shown and described, in combination with a suitable mechanical device for insuring an operation of the valves at all times, as described.

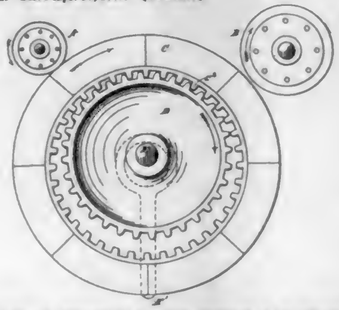


299,080. DOOR-SPRING. PHILIP MCALEER, Washington, D. C., assignor of one-half to Elisha R. Bradford, same place. Filed Jan. 21, 1884. (No model.)

Claim.—1. The bed-plate A, having lugs *a* *a'* *a'*, in combination with the pitman I, spring E, quadrant F, chain K, and arm N, as set forth.

2. The bed-plate A, having lugs *a* and *a'* *a'*, in combination with the pitman having adjustable nut D and spring E, and the chain K and arm N, having cam portion L, as set forth.

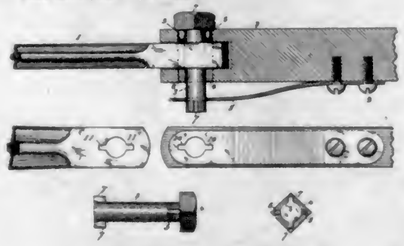
299,081. TONGUELESS CULTIVATOR. JOHN J. MCCLEN, Bushnell, Ill. Filed Nov. 8, 1883. (No model.)



Claim.—1. The combination, with an arched frame provided with forwardly-extending arms, axles rigidly secured to said frame, and drag-bars secured to the axle or frame, of longitudinally-sliding draft-bars upheld by said arms, and chains or equivalent devices connecting said draft-bars and passing around or over the arched frame, substantially as set forth.

2. The combination, with the arched frame provided with forwardly-extending arms, axles rigidly secured to the frame, and pulleys journaled to the axles, of draft-bars resting on the forwardly-extending arms of the frame, and equalizing devices connecting the draft-bars, substantially as set forth.

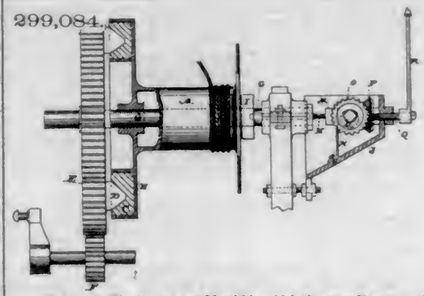
3. The combination, with the frame provided near opposite sides with forwardly-extending arms, each of which is provided with an angular collar, axles rigidly secured to the frame, and pulleys journaled to the axles, of the angular draft-bars, and chains passing over the arched frame and connecting the draft-bars, substantially as set forth.



4. The combination, with an arched frame provided with forwardly-extending arms, the arms I', having pulleys journaled thereto, and axles rigidly secured to said frame, of longitudinally-sliding draft-bars upheld by said forwardly-projecting arms, and chains connecting the forward ends of said draft-bars and passing over the pulleys, substantially as set forth.

299,082. **MECHANICAL MOVEMENT.** JOHN MCEWEN, Wellsville, N.Y. Filed Apr. 17, 1884. (No model.)

Claim.—A mechanical movement consisting of the combination, substantially as shown, of the following elements: three shafts having fixed bearings and provided with proper gears, such as A, B, and D, an eccentric sleeve loosely mounted, so as to be rolled upon the intermediate shaft, and an intermediate communicating gear mounted loosely on said eccentric sleeve, and adapted, as shown, to be always in gear with the gear on the intermediate shaft, and to be thrown into gear with either of the gears on the other shafts by properly moving the said sleeve on the intermediate shaft.

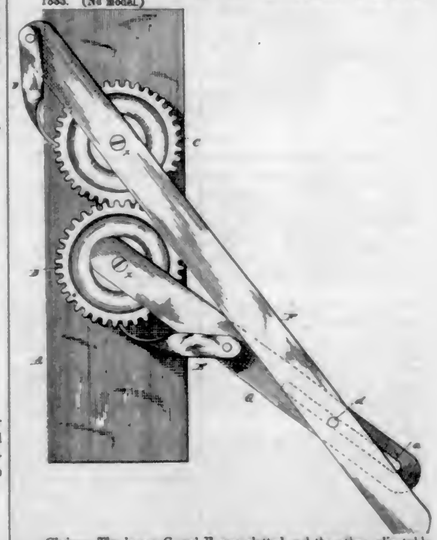


299,083. **COUPLING-PIN.** JAS. C. MURRAY, South Charleston, Ohio. Filed Jan. 16, 1884. (No model.)

Claim.—A coupling-bolt, 3, provided with one or more ribs or feathers, 7, near its point, in combination with a slotted plate pressed outward against the said rib or feather when the bolt is turned after insertion, and a locking device to prevent the spontaneous turning of the bolt.

299,084. **HOISTING APPARATUS.** WILLIAM F. MURRAY, San Francisco, Cal. Filed Mar. 3, 1884. (No model.)

299,084.

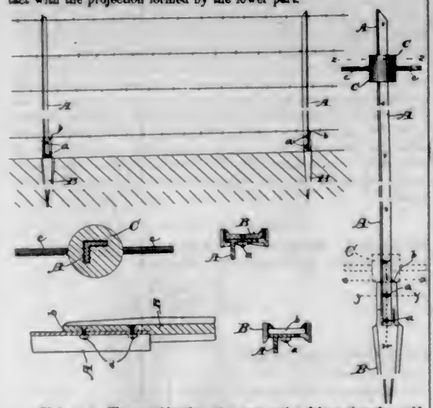


Claim.—1. The box or step M, within which the stem H turns, and the cam or eccentric mounted behind the step with an operating-lever, in combination with a rope-drum turning loosely upon a driving-shaft, a driving-gear, and intermediate frictional surfaces, substantially as herein described.

2. In a hoisting apparatus, the driving-gear and loosely-revolving rope-drum with intermediate frictional surfaces, a stem extending axially into the shaft and having a transverse bar extending out through slots, so as to act against the end of the drum, in combination with the eccentric or cam L, and operating-lever, the step or box M, interposed between the eccentric and the stem, and the spring-arm N, upon which the box is mounted, and by which it is retracted when relieved of pressure, substantially as herein described.

3. The driving-gear and loosely-moving rope-drum with intermediate frictional surfaces, the stem H, acting to force the surfaces into contact, and a cam or eccentric by which the stem is moved, in combination with a frame upon which the eccentric is supported, and the screw-bolts and adjusting-nuts by which it is secured to the main frame, substantially as herein described.

4. In a hoisting apparatus, the driving-gear, and loosely-revolving rope-drum with adjacent frictional surfaces, a stem extending axially into the end of the shaft, and having a transverse bar extending out through slots to act against the end of the drum and force the frictional surfaces into contact, in combination with an eccentric or cam fixed to a shaft, so as to act against the end of the stem or an interposed step, and gears and levers by which the cam-shaft may be rotated, substantially as herein described.

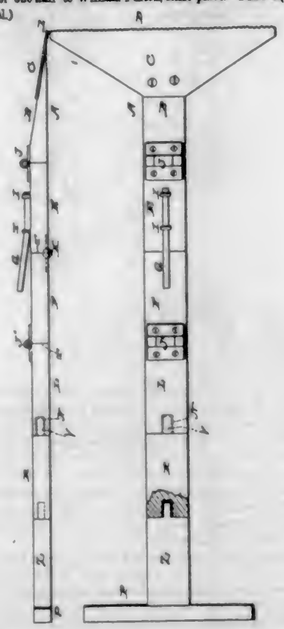


299,085. **MECHANICAL MOVEMENT.** FRANCIS M. NIXON, Luna, Ill., assignor of one-half to Edward W. Shoesmith, same place. Filed Dec. 27, 1883. (No model.)

Claim.—The levers G and F, one slotted and the other adjustably pivoted or connected thereto, and each carrying a pawl, in combination with two intermeshing gear-wheels, B and C, substantially as and for the purpose herein set forth.

299,086. **POST-DRIVER.** EWALD OVER, Indianapolis, Ind. Filed Jan. 29, 1884. (No model.)

Brief.—A post formed of two parts, the lower part formed with a projection. A suitable driver slides on the upper part and comes in contact with the projection formed by the lower part.

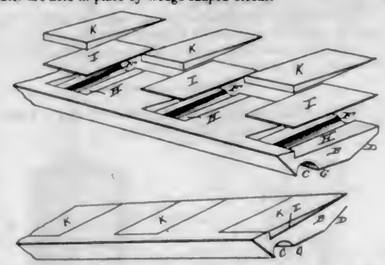


Claim.—1. The combination of a post and a driver therefor, said post consisting of a straight upper portion and an enlarged lower portion having a projecting portion, *b*, with which the driver is adapted to come in contact, and said driver consisting of a solid heavy block having a hole which is adapted to slip over the straight portion and come in contact with said projection as it descends, substantially as shown and specified.

2. The combination, with a fence-post consisting of the parts A and B, the latter of which has a portion, *b*, forming a projection on said post, of a driver, C, adapted to slide up and down the portion A and drive the post by coming in contact with the projection *b*, substantially as set forth.

3. The combination of the fence-post A B, having projection *b*, and the driver C, having a hole therein and handles *c*, substantially as shown and described, and for the purposes specified.

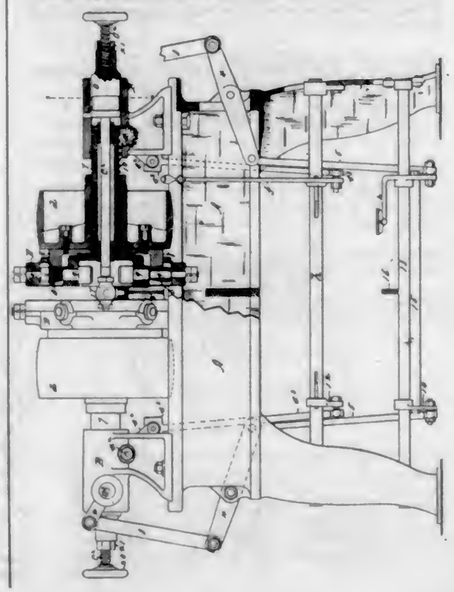
299,087. **CARPET-STRETCHER.** HARVEY M. PRESLEY, Oakdale, Ill., assignor of one-half to William Fulton, same place. Filed Apr. 5, 1884. (No model.)



Claim.—A sectional carpet-stretcher extending lineally from one wall of a room nearly to another, and consisting of a base-section at one end, an engaging section having an inclined serrated plate at the other, a toggle-joint hinged to the engaging section, an intermediate section or sections between the toggle-joint and the base portions, and an operating-lever connected to the first member of the toggle-joint, substantially as specified.

299,088. **COMPOSITION OF MATTER TO BE USED AS A FIRE AND WATER PROTECTIVE PAINT.** FRANKLIN I. PUTT and J. B. STRATTON, Middlebury, Ind. Filed Jan. 23, 1884. (No specimens.)

Claim.—The herein-described composition of materials to be used as a paint, consisting of coal-gas tar, chloride of sodium, Wisconsin mineral paint, Venetian red, sulphur sublimate, resin, (merchant,) asphaltum, pulverized alum, biborate of soda, and opaline, mixed in suitable proportions, and in the manner described.



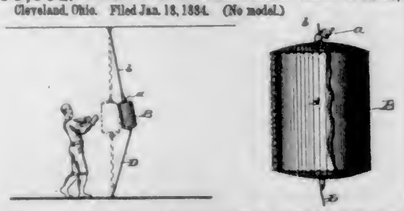
299,089. **WEATHER-STRIP.** PERRY E. REYNOLDS, King City, assignor of one-half to William Hawkins, Albany, Mo. Filed Sept. 22, 1883. (No model.)

Brief.—A weather-strip consisting of a grooved sill, apertures, and channels. The channels are in wedge-shaped recesses, and the bottom plates are held in place by wedge-shaped blocks.

Claim.—The combination, in a weather-strip, of the sill B, having longitudinal groove C, provided with apertures E and channels F, located in wedge-shaped recesses H, in which are secured the plates I and wedge-shaped blocks K, as shown and described.

299,090. **VALVE-BODY MILLING-MACHINE.** FRANCIS H. REMARDS, Cleveland, assignor to the Joel Hayden Brass Company, Lorain, Ohio. Filed Aug. 14, 1883. (No model.)

Claim.—1. A valve-body milling-machine consisting of the following elements, viz: two cutter-heads each provided with a series of cutter-shafts, arranged in lines radiating from its center, two center spindles passing through said cutter-heads from each end of the machine, means, substantially as described, for rotating said cutter-shafts, and means, substantially as described, for imparting to said cutter-heads and to said center spindles, respectively, simultaneous movements toward and from each other, combined and operating substantially as set forth.

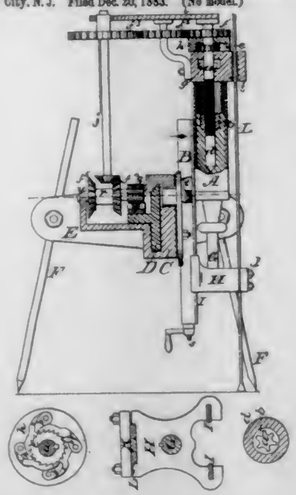


2. A cutter-head for operating a series of cutters around a common center, consisting of a suitable case having a series of cutter-shafts arranged in lines radiating from its center, a driving face-gear wheel, 8, supported in one side of said case, and having geared connections with all the cutter-shafts, and a belt-pulley concentric with and secured to said driving-gear wheel, whereby all the cutter-shafts are driven simultaneously, substantially as described.

3. In combination, the head-stock B, the nut *c*, capable of a sliding movement in said head stock, the center spindle, c^3, passing through said nut, and means, substantially as described, for imparting to said nut a forward or backward movement, combined with cutter-heads of the character described surrounding said spindle in said head-stock, all as set forth.

4. In combination, the cutter-head D, having a bearing on the bed A and a pulley-shaft thereon entering the head-stock B, and provided with a rack, 10, the pinion *d'*, engaging with said rack, the head-stock B, and means, substantially as described, for giving to said pinion a reciprocating rotary motion, as set forth.

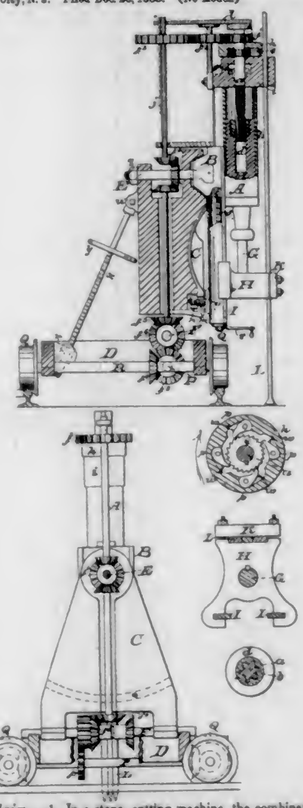
5. In combination, the support *i*, provided with the stud 18, the spindles c^3 c^3, and means, substantially as described, for imparting to said spindles simultaneous and equal movements toward and from said support, substantially as set forth.



299,091. STRIKING-BAG FOR EXERCISING. ALBERT R. RIDDY, Cleveland, Ohio. Filed Jan. 18, 1884. (No model.)

Claim.—1. An exercising device consisting, essentially, of an inner rubber bag, an outer bag or covering, preferably made of canvas, and a suspending-cord secured to the outer bag, substantially as set forth.

2. The combination, with an inner elastic bag and an outer bag or covering, preferably made of canvas, of an inelastic cord for suspending the bag and an elastic cord secured to the outer bag and adapted to operate as set forth.

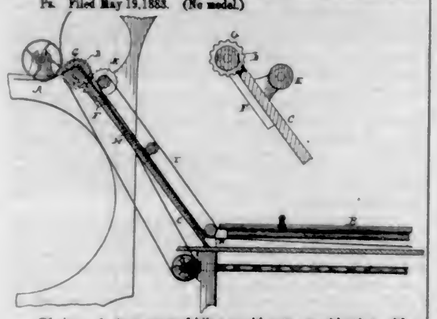


299,092. STONE-CHANNELING MACHINE. WILLIAM L. SAUNDERS, Jersey City, N. J. Filed Dec. 20, 1883. (No model.)

Claim.—1. In a stone-channeling machine, the combination, with the cutting-tool, of a piston to which said tool is attached, means for communicating a reciprocating motion to said tool, and supporting mechanism consisting of a horizontal bar and suitable transverse supports therefor, a train of gearing operating to move the drill-carriage along said bar, said gearing being actuated by the to-and-fro movement of the piston, whereby said reciprocating action will automatically move the cutting-engine in a horizontal path in the direction of the cut.

2. In a stone-channeling machine, the combination, with a cutting-tool, of a piston to which said tool is attached, means for communicating a reciprocating motion to said piston, and mechanism consisting of the horizontal bar D and supports E E therefor, a train of gearing attached to the drill-carriage, and engaging and being supported upon the horizontal bar, and a rifled bar operated by the piston to impart motion to said gearing at each stroke of the piston, whereby the cutting-engine is moved step by step along the horizontal bar, substantially as herein described.

299,093. STONE-CUTTING MACHINE. WILLIAM L. SAUNDERS, Jersey City, N. J. Filed Dec. 20, 1883. (No model.)

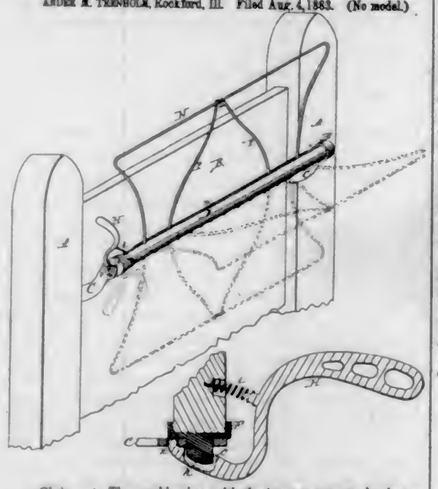


Claim.—1. In a stone-cutting machine, the combination, with a gang of drills, of a piston to which said gang is attached, mechanism for giving a reciprocating motion thereto, a spirally-formed or rifled bar and corresponding nut, said nut being fixed to the piston, and said rifled bar being provided at its outer end with connections for actuating a train of gearing and arranged to slide through said nut and within the piston when the latter is operated, whereby the to-and-fro motion of the piston and gang is converted into rotary motion of the train of gearing and connecting-rods extending to and connected with the shaft of the carriage which supports the machine.

2. The combination, with the shell B and cylinder A and means for moving said cylinder vertically within its shell, of the supporting-piece C, a horizontally-moving carriage to which the support C is attached, and a bolt or shaft E, extending between and serving to detachably connect the shell and its support, said bolt being provided with and forming

the axis for an idle wheel or gear, f^4, for completing a train of gearing extending from the cutting-tool to the wheels of the carriage.

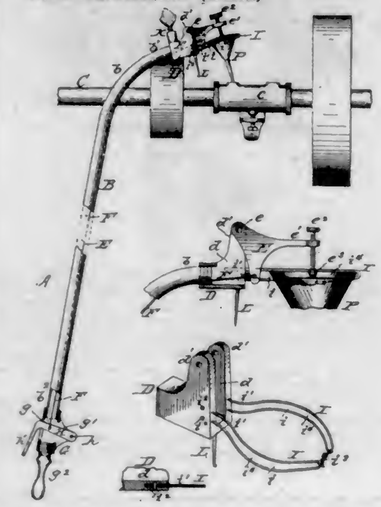
3. In a stone-cutting machine where the cutting-tool is attached to the piston-rod, the combination of the rifled bar *a*, operated by the piston, and carrying ratchet *e* and pawl *p*, the head-piece *h*, revolved by said ratchet and pawls, the gears *f*, axle R, and the wheels Q, by which mechanism the reciprocating motion of the piston causes the propulsion of the said engine and cutting-tool in the direction of and parallel with the cut.



299,094. PAPER-FOLDING MACHINE. JOHN H. STONEBRETS, Erie, Pa. Filed May 19, 1883. (No model.)

Claim.—1. In a paper-folding machine, the combination, with a system of conveyer-tapes, of a roller having milled or corrugated disks or sections of a larger diameter than the tape bearing or supporting surfaces of said roller, whereby the milled sections of the roller project beyond the tapes and have a faster surface-speed, substantially as and for the purpose set forth.

2. In a sheet-conveying attachment for paper-folding machines, the combination, with a board or table having a system of conveyer-tapes and adapted to bridge the space between a folding-machine and printing-press, of an upper tape-guiding roller having milled or corrugated disks or sections of a larger diameter than the tape bearing or supporting surfaces of said roller, substantially as and for the purpose herein set forth.



299,095. PILLOW-SHAM HOLDER. EZRA W. TRENHOLM and ALEXANDER M. TRENHOLM, Rockford, Ill. Filed Aug. 4, 1883. (No model.)

Claim.—1. The combination, with the bracket-supports having an open bearing, of a roller having end journals, one of which is reduced on opposite sides to enter said open bearing, a lever pivotally secured to one end of said roller, and means, substantially as described, for securing the pillow-sham holder at different angles to the head-board, as set forth.

2. The combination, with the roller and bracket supports formed with openings to receive the pin of a lever-detent having a pivotal connection with the stud-journal of the roller, and provided with a pin to enter the openings, of the bracket-supports and a spring for holding the detent in engagement with the bracket-supports, substantially as set forth.

299,096. DEVICE FOR OILING SHAFT-BEARINGS. THOMAS Y. WHITE, Philadelphia, Pa., assignor of one-half to Alfred Whitney, Camden, N. J. Filed Feb. 28, 1884. (No model.)

Claim.—1. An oiling device comprising a handle or bracket, a clutch, an oil can or receptacle, and means for ejecting oil from said can, substantially as shown and described.

2. An oiling device comprising a handle or bracket, a spring-clutch, an oil can or receptacle, means for ejecting oil from said can, and a picker for cleansing the oil-holes of a shaft box or bearing, substantially as shown and described.

3. An oiling device substantially as herein shown and described, having a lamp, K, and a picker, L, as and for the purpose set forth.

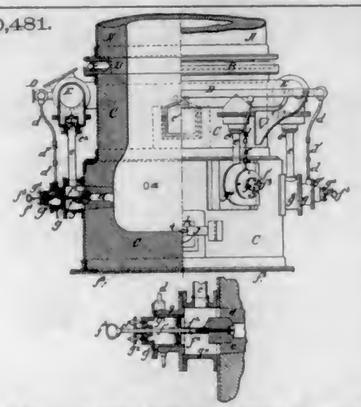
4. An oiling device comprising a tubular handle or bracket with bell-crank levers at each end, one of which is provided with an adjustable screw, means for vibrating said screw, and a clutch with removable oil-can, substantially as shown and described.

5. An oiling device comprising a tubular column, B, having hollow slotted end boxes, D G, pivoted levers E H, connection F, adjustable screw e^3, clutch I, and can P, substantially as shown and described.

6. An oiling device comprising a tube, B, boxes G D, pivoted levers H and E, having, respectively, handle A and adjustable stud or screw e^3, connection F, and clutch I, with can P, substantially as shown and described.

7. In an oiling device as shown and described, the adjustable vibrating finger e^3, having pad e^3, as and for the purpose set forth.

8. In combination with stem B, the box D, having lever E, with screw or finger e^3, clutch I, can P, and box G, having lever H, with connection F, substantially as shown and described.



9. In an oiling device as shown and described, the clutch I, composed of slotted spring-fingers *i i*, substantially as and for the purpose set forth.

10. In an oiling device as shown and described, the spring fingers or arms *i i*, having elastic connection i^3, as and for the purpose set forth.

REISSUES.

10,481. CUPOLA-FURNACE. WILLIAM JOHN CLAPP, Nantyglo, and THOMAS GRIFFITHS, Blaenavon, County of Monmouth, England, assignors to James Porter Witherow and Henry Wm. Oliver, Jr., both of Pittsburg, Pa. Filed Apr. 15, 1884. Original No. 271,663, dated Feb. 6, 1883; Reissue No. 10,432, dated Jan. 1, 1884. Patented in England Mar. 28, 1881, No. 1,372; in France Sept. 27, 1881, No. 145,039; in Belgium Sept. 27, 1881, No. 55,846; in Germany Sept. 27, 1881, No. 18,250; in Austria Sept. 27, 1881, and in Spain Oct. 1, 1881.

10,481.

Claim.—1. In a cupola-furnace, the combination of a bottom section or vessel having a tuyere-opening and external blast and steam chambers, and a plug provided with a stem and a piston fitted in said chambers, with a pipe for admitting steam in rear of the piston for forcing the plug into the tuyere-opening, and an air-blast pipe leading into the chamber in front of said piston, for removing the plug from the tuyere-opening and admitting air through the latter into the bottom section of the furnace, substantially as and for the purposes described.

2. The combination of the vessel C, having the tuyeres *a*, external air-chamber, g^4, and vertical pipes *e*, leading into said chamber, and the stationary air-pipe E, having bottom openings for the reception of the pipes *e*, and valves for closing said openings, with the shaft of the furnace, and means for elevating and transporting the vessel C, as and for the purpose set forth.

3. The combination of the vessel C, having tuyeres *a* through its sides, external air-chamber, g^4, attached to the vessel, stopper *f*, and hollow stem f', communicating with both air-chamber and tuyere when the tuyere is closed by the stopper, substantially as and for the purposes described.

4. A cupola-furnace or converter having a removable lower section or crucible, tuyeres in said lower section below the metal-line, a blast-pipe, detachable connections between said blast-pipe and tuyeres, and means for simultaneously closing the tuyeres against the passage of the metal therethrough, substantially as and for the purposes described.

5. A cupola-furnace or converter having a removable lower section or crucible provided with tuyeres in its sides, a blast-pipe supported on the fixed section of the converter, detachable connections between said blast-pipe and tuyeres, and means for closing the openings of the blast-pipe when the connections are removed, substantially as and for the purposes described.

6. A cupola-furnace or converter having tuyeres fixed in its sides below the metal-line, a blast-pipe, and external air-chambers fixed to its sides, with which the tuyeres communicate and from which they receive the blast, in combination with plugs, stoppers, or valves situate in said chambers, and means for simultaneously operating the stoppers from the outside to open or close the tuyeres at pleasure, substantially as and for the purposes described.

7. A cupola-furnace or converter having a tuyere or tuyeres, and an external air chamber or chambers with which the tuyere communicates and from which it receives the blast, in combination with a plug, stopper, or valve to close the tuyere to prevent the escape of the molten metal therethrough, means for operating the stopper, and a passage for admitting a small stream of air through the tuyere when the stopper is closed, substantially as and for the purposes described.

8. The combination of a fixed converter or cupola-furnace for treating molten metal, having all of its pneumatic tuyeres provided with plugs, stoppers, or valves, and organized means for seating and unseating said plugs, stoppers, or valves simultaneously during the operation of the converter, substantially as described.

PHOTO-LITH. NORRIS PETERS WASHINGTON, D.C.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF UNITED STATES COURTS IN PATENT CASES.

DECISIONS OF THE U. S. COURTS.

Supreme Court of the United States.

COCHRANE *et al.* v. BADISCHE ANILIN AND SODA FABRIK

Decided April 14, 1884.

1. The claim in Reissue Letters Patent No. 4,321, granted to Charles Graebe and Charles Liebermann, April 4, 1871, is: "Artificial alizarine produced from anthracine or its derivatives by either of the methods herein described, or by any other method which will produce a like result." Unless it is shown that the method described in this patent was followed to produce the defendant's article, or unless it is shown that that article could not be produced by any other process, the defendant's article does not infringe the patent.
2. Every patent for a product or composition of matter must identify it so that it can be recognized aside from the description of the process for making it, or else nothing can be held to infringe the patent which is not made by that process.
3. While a new process for producing the old article (alizarine) was patentable, the product itself could not be patented, even though it was a product made artificially for the first time, in contradistinction to being eliminated from the madder-root. Calling it "artificial alizarine" did not make it a new composition of matter, and patentable as such by reason of its having been prepared artificially for the first time from anthracine, if it was set forth as alizarine, a well-known substance.
4. The reissue patent certainly is for a different invention from that described in the original patent, unless the product claimed in the reissue is precisely that product, and no other, which the process described in the original patent produces.

APPEAL from the Circuit Court of the United States for the Southern District of New York.

Mr. E. N. Dickerson for the appellants.

Mr. B. F. Thurston for the appellee.

Mr. Justice BLATCHFORD delivered the opinion of the Court.

This is a suit in equity brought in the Circuit Court of the United States for the Southern District of New York by Badische Anilin and Soda Fabrik, a corporation organized under the laws of the Grand Duchy of Baden, in the Empire of Germany, against the appellants for the infringement of Reissue Letters Patent No. 4,321, granted to Charles Graebe, of Frankfort-on-the-Main, and Charles Liebermann, of Berlin, Prussia, April 4, 1871, for an improvement in dyes or coloring-matter from anthracine. The original patent (No. 95,465) was granted to the same persons October 5, 1869, for an improved process of preparing alizarine. It was reissued on two separate amended specifications, Division A and Division B. No. 4,321 is Division B.

The following is the text of the specifications of No. 4,321 and No. 95,465. Reading in it what is outside of brackets and what is inside of brackets, omitting what is in italics, gives the specification of No. 4,321. Reading what is outside of brackets, including what is in italics, omitting what is inside of brackets, gives the specification of the original patent:

Be it known that we, Charles Graebe, of Frankfort-on-the-Main, and Charles Liebermann, of Berlin, in the Kingdom of Prussia, have invented a [new and useful Improvement in the Manufacture of Alizarine:] *Process for Preparing Alizarine from Anthracine;* and we do hereby declare the following to be a full, clear, and exact description thereof, which will enable those skilled in the art to make and use the same.

We first change the anthracine into anthrakinon, (oxanthracine,) a substance known to [the] chemists by the investigations of Anderson. For this purpose we take one part, by weight, of anthracine, two and a half parts, by weight, of bichromate of [potash] *potassa*, and ten or fifteen parts, by weight, of concentrated acetic acid, and we heat these substances together in a vessel, either of glass or clay, to about 100° centigrade to 120° centigrade, till nearly all of the bichromate of [potash] *potassa* is dissolved and the liquid has acquired a deep green color. We then recover the acetic acid not consumed in the reaction by distillation and treat the residuum with water to remove the chromic acetate. From the insoluble mass we obtain the anthrakinon in a pure state by distilling the whole from a retort of glass or iron. In the place of *the* acetic acid, sulphuric acid, diluted with one or two parts of water, may be employed.

Instead of the method just described, we also employ the following one: We heat *the* anthracine in a vessel of glass or clay, with ten parts of concentrated acetic acid, to about 100° centigrade, or a little higher, and we add nitric acid of about 1.3 specific gravity, in small portions, till the violent reaction ceases. After distillation of the acetic acid we purify the residuum, as before. We then convert the anthrakinon, prepared by one of the methods described, into bibromanthrakinon. For this purpose we take three parts of anthrakinon, five parts of bromine, and we heat these substances for ten or twelve hours, or until nearly the whole of the bromine has disappeared, to a temperature, by preference, of about 100° centigrade, in a suitable close vessel, either of glass or enameled or glazed iron, which is capable of sustaining the pressure [which is] generated by the reaction. The apparatus is then allowed to cool. It is opened in order to permit the escape of [bromic] *hydrobromic* acid, which can be recovered by absorption either in water or in *an* alkaline solution. We purify the bibromanthrakinon remaining in the vessel as a solid substance by crystallization from benzole.

Instead of the method above described for preparing bibromanthrakinon, we also employ the following: We convert first the anthracine into a bromine derivative, into the tetrabromanthracine, known to chemists by the investigations of Anderson. We take one part of this tetrabromanthracine and we heat it in a retort of glass or clay with about five parts of nitric acid of about 1.3 specific gravity to 100° centigrade, as long as vapors of bromine are evolved. We distill off the greater portion of the nitric acid, wash the residuum with water, and purify it by crystallization from benzole. We thus receive the bibromanthrakinon, as before, in *the form of* a yellow, solid mass. We then convert the bibromanthrakinon into alizarine. For this purpose we take one part of bibromanthrakinon, two to three parts of caustic potash or soda, and so much water as is necessary to dissolve the alkali, and we heat the whole in an open vessel of glass, glazed or enameled iron, or silver, to about 180° to 260° centigrade for one hour, or [till] *until* the mass has acquired a deep blue color. We then dissolve it in water and filter the violet solution, from which we precipitate the alizarine by *an* inorganic *or organic* acid. We collect the yellow flocks of alizarine thus obtained on a filter and wash them with water.

By these methods we receive the alizarine in a form in which it can be employed in the same manner as the different preparations from madder.

In the place of bromine, chlorine [also] may *also* be employed, but not so conveniently, as the reactions above described are more difficult to accomplish with chlorine than with bromine.

Having thus described the nature of our invention and the manner of performing and carrying out the same, we would have it understood that we do not confine ourselves to the exact details hereinbefore given.

The claim of No. 4,321 is as follows:

Artificial alizarine produced from anthracine or its derivatives by either of the methods herein described, or by any other method which will produce a like result.

The claim of the original patent was in these words:

The within-described process for the production of alizarine, by first preparing bibromanthrakinon or bichloranthrakinon, and

then converting these substances into alizarine, substantially as above set forth.

The bill of complaint alleges that No. 4,321 was issued "for a distinct and separate part of the same invention, on a corrected specification," on the surrender of No. 95,465; and No. 4,321 states on its face that on such surrender new letters were ordered to issue "on two separate amended specifications." But Division A, No. 4,320, is not in the record before us. The bill alleges the infringement to have been committed by making, selling, or using the invention or dyes containing it. The answer denies the manufacture of alizarine, but avers that the defendants have sold in the United States alizarine lawfully made in Germany and imported as an article of commerce, which was not made by the process described in No. 4,321, or any process substantially the same, but was made according to processes which were invented subsequently to the date of No. 95,465, and are the subject of different and independent letters patent. The answer also avers—

That alizarine is a natural product, having a well-known definite constitution; that it is not a composition of matter within the meaning of the statute, but has been well known in the arts from time immemorial for the purpose of dyeing, and has generally been extracted from "madder-root" and from other analogous products by various processes suitable for that purpose; that therefore there can be no valid patent granted for alizarine, and that No. 4,321 is void.

The answer refers to "Watts' Chemical Dictionary," published before 1869, under the title "Alizarine," to show that alizarine was well known long before the said patent, and also sets up that the patent had expired because prior patents granted to the patentees in foreign countries for the same invention had expired. Proofs were taken, and on final hearing the circuit court decreed that No. 4,321 was valid, and had been infringed, and ordered a reference as to profits and damages and a perpetual injunction against the making, using, or selling of the article designated in No. 4,321, "artificial alizarine," or dyes containing the invention described in and secured by No. 4,321. Afterward there was a final decree against the defendants for $13,326.65 and costs, of which $12,871.86 was for profits made by the defendants, "by the sale of artificial alizarine, in infringement" of No. 4,321. From this decree the defendants have appealed. This reissued patent (No. 4,321) has been adjudicated in the circuit courts in several cases. It was before the circuit court in Massachusetts, in February, 1878, and the decision of Judge Shepley is in *Badische Anilin and Soda Fabrik* v. *Hamilton Manufacturing Company*, (3 Banning & Arden, 235, and 13 O. G., 273.) It was also before the Circuit Court for the Southern District of New York, in September, 1878, and the decision of Judge Wheeler is in *Badische Anilin and Soda Fabrik* v. *Higgin*, (15 Blatchf. C. C. R., 290, and 3 Banning & Arden, 462, and 14 O. G., 414.) The decision of Judge Wheeler in the present case, in April, 1879, is in 16 Blatchf. C. C. R., 155, and in 4 Banning & Arden, 215. The patent was also before the circuit court in Massachusetts in September, 1879, and the decision of Judge Lowell is in *Badische Anilin and Soda Fabrik* v. *Cummins*, (4 Banning & Arden, 489.) In all of these cases the validity of No. 4,321 was sustained.

In the case before Judge Shepley it was held that No. 4,321 was a valid patent for a manufacture and composition of matter, an artificial dye-stuff, called "artificial alizarine," being a new product, produced by a new process, not a chemically pure alizarine, but having combined with the alizarine in it anthrapurpurine, isopurpurine, and other bodies not known to have existed before they were produced by Graebe and Liebermann, the presence of some of which bodies appeared to much enhance the value of the dye-stuff. It was decided that the defendants had used that article.

In the case against Higgin it was held that the product of the process described in No. 4,321 contains isopurpurine, anthrapurpurine, monoxanthraquinone, and other ingredients, which were not only not ingredients in pure alizarine or madder alizarine, but did not exist in any dye-stuff with chemically-pure alizarine, $C_{14}H_8O_4$, before that of Graebe and Liebermann, and are useful coloring-agents, so that the product invented is a new composition of matter. It was decided that the defendants had used or sold dye-stuffs substantially the same, though claimed to be the product of a different process.

In the present case it was insisted in the circuit court by the defendants that the patented product was the same thing as the natural dye-stuff, alizarine, found in the root of the madder plant, and chemically known by the formula $C_{14}H_8O_4$, and not patentable. But it was decided that the article which Graebe and Liebermann had made synthetically from anthracine, though having the same chemical formula as madder alizarine, was essentially different in capabilities and properties from chemically-pure alizarine, madder alizarine, or any coloring-matter before known; that the article dealt in by the defendants was produced by the process of United States Letters Patent No. 154,536, granted July 28, 1874, to Heinrich Caro, Charles Graebe, and Charles Liebermann; that the use of sulphuric acid in the process of the latter patent performs the same office in the same way as the bromine in the process of No. 4,321, and that the products of the two processes are identical.

In the case before Judge Lowell he held that what Graebe and Liebermann sought to discover, and supposed they had discovered, was the alizarine, which is the dye-stuff of madder; that what is called "artificial alizarine" contains important dyeing substances not found in madder—namely, anthrapurpurine and isopurpurine (accordingly as these may be two substances or one and the same substance) and flavopurpurine—which substances produce valuable effects not produced by any extracts from madder; that although the defendant insisted that those new purpurines were not found in the artificial alizarine made by the bromine process of No. 4,321, and were found only in artificial alizarine made by methods invented since Graebe and Liebermann invented that process, and the evidence on that point was in much conflict, yet it was shown that pure alizarine, pure isopurpurine, and pure flavopurpurine were all contained in the patented article; that the artificial alizarine of No. 4,321 is different in some important respects from any article known before; that the new article of manufacture claimed in No. 4,321 was new in fact, and that the infringement was made out.

In Watts' Dictionary of Chemistry, volume I, page 113, published in 1866, *Alizarin* is stated to be a red coloring-matter obtained from madder, first prepared by Robiquet and Colin. This was in 1826. The correct formula of alizarine, $C_{14}H_8O_4$, was first arrived at by Strecker in 1866. It means that there are fourteen

atoms of carbon, eight atoms of hydrogen, and four atoms of oxygen in each molecule. At this stage Graebe and Liebermann took up the subject, and treated madder alizarine with the view of determining what was its mother substance. They tell the story themselves in a paper in the record entitled "Artificial Alizarine," which is a translation from the original, prepared in German by them, contained in the Official Report of the Vienna Exhibition of 1873, and also published separately in 1876. They heated madder alizarine with zinc dust, and made the alizarine give up its four atoms of oxygen, and take up two atoms more of hydrogen. They thus obtained a hydrocarbon identical with that found in coal-tar, called "anthracine," and having the formula $C_{14}H_{10}$. They then conceived the idea of converting anthracine into alizarine. Anthracine was difficult to obtain, and the experiment was conducted on a small scale. But it resulted in the process described in No. 4,321, of converting anthracine into anthrachinon, the formula of which was $C_{14}H_8O_2$, and then heating the anthrachinon with bromine and obtaining bibromanthrachinon, and heating that with caustic potash or soda and obtaining alizarine. Graebe and Liebermann thus solved the problem of the synthesis of alizarine. It was a matter of great scientific interest, and gave them much reputation. The paper states that the first method described in No. 4,321 for preparing the bibromanthrakinon was so laborious that they devised the other method described of first converting anthracine into tetrabromanthracine, and then treating that with nitric acid to obtain bibromanthrakinon. "This method," they state, "made it possible to obtain the alizarine more readily, and aroused hopes of its technical execution," although it involved two more reactions than the first method.

In regard to the alizarine thus obtained, the same paper says:

The artificial alizarine, besides having the same composition, had also the same properties as vegetable alizarine. In hydrated alkalies it is soluble, with a blue violet to purple color. The solutions of the alkali salts give with lime, baryta, lead, iron, alumina, and tin salts, lakes corresponding to the madder lakes. Cloth printed with mordants dyes exactly alike with both coloring-matters. From these salt-like compounds yellow flocculent alizarine is set free by the addition of a mineral acid. The artificial coloring-matter shows the same solubilities, and the solutions of the alkaline salts the same absorption spectra, which are known of the natural coloring-matter. The free coloring-matter sublimes in beautiful yellow to red needles, which cluster together like feathers. On oxidizing with nitric acid, phthalic acid and oxalic acid are formed. Heated with zinc dust, the artificial alizarine is again converted into anthracine.

The paper then proceeds:

The above methods, which now, from a technical point of view, have only a historic interest, and are therefore described without further detail, make up the subject of the patents taken out in England on the 18th of December, 1868, and then also in France, Prussia, most German States, Austria, Russia, and America.

The provisional specification deposited in the English Patent Office December 18, 1868, which was the date of the patent, gives a short description of the process, and says:

The alizarine prepared in this artificial way is perfectly pure, and can be employed in all the applications for which the different preparations of madder are used.

The full specification, filed June 17, 1869, is substantially identical with the specification of No. 95,465, and claims—

The artificial production of alizarine by first preparing bibromanthrakinon or bichloranthrakinon, and then converting these substances into alizarine, as herein described.

In further pursuing the history of the matter the same paper proceeds:

The discoverers of the synthesis of alizarine soon found it necessary to enter into connection with some large dye-factory. This was necessary in order that the raw material could be more easily obtained, and that the experiments could be made on a large scale and further developed. This could be done best with an establishment already in existence, where the doubtful question, whether this might be the basis of an industry with hopes of success could be solved. One of the chief difficulties experienced was the fact that the raw material was not only known in commerce, but also in the tar industry, and it was difficult to say whether it could ever be obtained in sufficient quantity. It was also doubtful whether the artificial alizarine could compete with the natural. Furthermore, there was much difficulty in transferring the above methods to a large scale. Graebe and Liebermann therefore entered into connection with the Baden Anilin and Soda Works in Ludwigshafen, on the Rhine, the largest works of the kind in Germany, even on the continent. [Originally the experiments were limited to the purification of the anthracine and the manufacture of anthrachinon by the second-mentioned bromine method, because this, notwithstanding its difficulties, showed some hopes of success.]

The passage above in brackets, by another translation, reads thus:

The first trials principally embraced the purification of anthracine, the manufacture of anthrachinon, and the practical application of the second above-mentioned bromine method as the same, notwithstanding the great difficulties, still gave assurance that it could be used practically.

The paper then goes on:

The latter (meaning the second-mentioned bromine method) was dropped as soon as the observation was made that the alizarine could be made more simply by means of anthrachinon sulpho-acids. Graebe and Liebermann had originally attempted to obtain anthrachinon sulpho-acids by acting on anthrachinon with sulphuric acid. But they made the mistake of using too low heats. The temperatures they employed were not high enough, being not greater than those generally employed in the preparation of sulpho-acids. They had also been misled by the observation that anthrachinon could be sublimed unchanged from strongly-heated sulphuric acid. Therefore they hoped little from sulpho-acids, and gave all their attention to improving the above methods. This mistake was avoided, and the modification of the synthesis of alizarine, which forms the basis of the industry of to-day, was discovered first by Heinrich Caro, who, as an officer at the Baden Anilin and Soda Works, made it his task to give, in combination with Graebe and Liebermann, life to the alizarine industry. Caro first noticed that anthrachinon, if heated with sulphuric acid to above 200°, would give sulpho-acids, which, on fusing with hydrate of potash, formed alizarine, the same as the bromine compound. Perkin noticed the same fact shortly after or at about the same time. This method was further developed by Caro and the original discoverers, and the English patent was taken out on June 25, 1869, (Caro, Graebe, and Liebermann, English patent, 1869, No. 1,936.) The patent of Perkin is dated June 26th. (Perkin, English patent, 1869, No. 1,948.) Two methods were discovered analogous to the two bromine methods. In the first and most important the anthracine is oxidized to anthrachinon. This is converted into sulpho-acids by heating with sulphuric acid to 200° to 260°, and these, by the beautiful method of Kekulé, Wurtz, and Dusart, by fusing with caustic potash or soda, are converted into alizarine. The first process is therefore identical with the first bromine method given above. In the second method, the sulphuric acid acts on the anthrachinon in such a manner that, besides the anthrachinon monosulpho-acid as principal product, a small amount of anthrachinon bisulpho-acid is also formed. This was subsequently determined analytically by Graebe and Liebermann. In the patent only the anthrachinon sulpho-acids are mentioned. From analogy, Perkin, in his paper, (Jour. Chem. Soc., (2) viii, 133, and Ann. Chem. Pharm., clviii, 335,) considered the bisulpho-acid only. It is also formed in larger quantity by the excess of acid he employs in his method than it is by the method of Caro, Graebe, and Liebermann.

The reactions in the second method are then given by formulas, in reference to anthrachinon monosulpho-acid and anthrachinon bisulpho-acid, and it is then said:

On fusing the two sulpho-acids they give alizarine exactly like the monobrom and bibrom anthrachinon. The anthrachinon bisulpho-acid behaves for the greater part, if not altogether, like the monosulpho-acid, and furnishes, instead of the corresponding bioxyanthrachinon, [which is the alizarine of the process of No. 4,321,] essentially trioxyanthrachinon—the isopurpurin.

They then give the two sets of chemical equations, one producing alizarine and the other producing isopurpurin. Further on in the same paper they say:

As far as has been observed, it seems that only the anthrachinon monosulpho-acid will produce alizarine, while the anthrachinon bisulpho-acid produces isopurpurin.

In an article by Graebe in the "New Handbook of Chemistry," published in 1871, he had said:

Alizarine, lizaric acid, madder red, matière colorante rouge, first prepared from madder by Robiquet and Colin, (1826;) artificially by Graebe and Liebermann, (1868,) from anthracine. Formula, $C_{14}H_8O_4$, is derived from anthracine, and is to be considered as bioxyanthrachinon, $C_{14}H_6(O_2)''(OH)_2$.

In another publication by Graebe and Liebermann, in 1868, they had said:

By treating alizarine with zinc dust a hydrocarbon was produced having the composition $C_{14}H_{10}$, and coinciding exactly in its properties with anthracine. * * * According to our experiments alizarine, which is hence a derivative of anthracine, must have the formula $C_{14}H_8O_4$.

In another publication by them, in 1869, they had said:

We have produced from anthracine artificial alizarine. The properties of the product obtained by us, as well as the colors which we have produced with the same on mordanted cotton, exhibit perfectly the identity of the artificial alizarine with that obtained from madder-root. * * * The methods which have led to the above results, and which we shall describe later, confirm the accuracy of the rational formula for alizarine recently advanced by us.

Again, in a further publication in 1869, they had said:

In our first notice we have already hinted that we have detected no difference between the natural and artificial alizarine, and that the very characteristic colors which both possess when fixed on cotton mordanted with alumina and iron are perfectly identical. We believe, therefore, that it is with one and the same chemical individual we have to deal, and not with isomerous compounds, of which an extraordinarily great number is conceivable, and of which an example already exists, as we have hinted, in chrysophanic acid. In conclusion, we will call attention to the fact that our production of alizarine is the first example of the artificial formation of a coloring-matter occurring in plants.

The various papers thus referred to are, it is understood, put in evidence by stipulation, with like effect as if the authors of them had testified to the facts stated in them.

In Prussia a patent for five years was granted to Graebe and Liebermann, March 23, 1869, for their bromine process, on condition that it should be put into practical operation in twelve months within the kingdom. On the 7th of July, 1870, after several notices to them, the patent was declared extinct, because proof had not been produced of the carrying out of the patented methods. In view of what Graebe and Liebermann themselves state in the publication before cited, it is manifest that the Prussian patent was revoked because the process described was not a practical one. There was nothing practical until the sulpho-acid discoveries were made. In regard to this the paper first cited says:

The patent of Caro, Graebe, and Liebermann is dated one day earlier than that of Perkin. If any value at all is to be placed in the date, then Caro must certainly be mentioned first, since the application for a patent by the German chemist was delayed by an error. The signing took place at the patent agent's in Berlin. In reference to the above two English patents, Perkin and the Baden Anilin and Soda Works, proprietors of Caro and Graebe and Liebermann's patent, made an agreement, in consequence of which the patents became common property. By the publication of these patents the sulpho-acid methods of preparing alizarine became known, and a series of works were erected in States which gave no or insufficient protection to the patentees.

This shows that the only methods practiced commercially were the sulpho-acid methods. The English patent for the bromine methods expired December 18, 1871, for the want of payment of a further fee.

The statement of Graebe and Liebermann is that Caro discovered that, by using anthrachinon with sulphuric acid, he could obtain sulpho-acids, and then, with hydrate of potash, procure alizarine, "the same as the bromine compound"—that is, the alizarine of the process of No. 4,321; but that the bisulpho-acid process developed by Perkin produces, not the alizarine of the process of No 4,321, which is bioxyanthrachinon, but trioxyanthrachinon or isopurpurin. The article sold by the defendants is this last substance made by the bisulpho-acid process, carried on abroad at the present day, and containing large proportions of coloring-matters not shown to be found to any practically useful extent in the alizarine of the process of No. 4,321, such as isopurpurine or anthrapurpurine, one or both—two articles, if they are different, or one, if they are the same, as seems to be shown. No. 4,321 furnishes no test by which to identify the product it covers, except that such product is to be the result of the process it describes. The process by which the defendant's article is made is not shown to be the same process as that described in No. 4,321. Graebe and Liebermann, as appears from their own statement, experimented with sulphuric acid and failed. It was not obvious that sulphuric acid would accomplish any result, nor was it obvious how to employ it. Their experiments with it led them to hope little from it and to withdraw their attention from it and devote themselves to improving the bromine and chlorine methods. They state that Caro avoided their mistakes, and was the first to discover the modification which led to success, and that Perkin was an independent discoverer of it about the same time. It is therefore impossible to say that the sulphuric-acid process was a known equivalent process at the time. It is easy now, after the event, for scientific men to say, with the knowledge of to-day, that the thing was obvious; but the crucial facts contradict the assumption.

It does not satisfactorily appear that the process of No. 4,321 will produce the defendant's article to any useful extent, if at all. The process of No. 4,321 never was, and is not now, practically carried on anywhere. The article of No. 4,321 was called "artificial alizarine," and the article now in the market is called by the same name; but the identity, in the sense of the patent law, between them and between the processes for producing them is not shown.

The English patent to Caro and Graebe and Liebermann having been granted June 25, 1869, and the full specification filed January 13, 1870, an application for a patent in the United States for producing artificial alizarine by the sulpho-acid processes was filed by them January 26, 1870. It was granted as No. 154,536 July 28, 1874. The full specification of the English patent and that of No. 154,536 are identical. The specifications state that the invention relates to improvements on the invention described in the English patent to Graebe and Liebermann of December 18, 1868, and in No. 95,465, "in which the preparation of artificial alizarine is based upon the action of caustic alkalies upon bibromanthrakinon or bichloranthrakinon."

They then proceed:

We have now discovered that a similar result may be obtained by substituting sulphuric acid for bromine or chlorine in the above process. We thus obtain the sulpho-acids of anthrakinon, which, by being dissolved in and heated with an excess of caustic alkali, are converted into alizarine. This invention relates to improvements in the production of coloring-matters, and more especially to improvements in the method of producing what is known as "artificial alizarine" from anthracine, a method of producing which was described in [the English patent of December 18, 1868, and in No. 95,465,] and consisted in the production of artificial alizarine by converting anthracine into either bibromanthrakinon or bichloranthrakinon, and then acting upon the same by means of an alkali, and precipitating the alizarine contained in the alkaline solution by means of an acid. In the complete specification of the aforesaid letters patent, granted to Charles Liebermann and Charles Graebe, two different series of processes are described for obtaining the brominated or chlorinated derivatives of anthrakinon. In the first of these processes the anthracine is submitted to the action of oxidizing agents, as is well understood, and the oxidized anthracine or anthrakinon is then treated with bromine or chlorine. In the second of these processes the anthracine is first treated with bromine or chlorine, and subsequently submitted to an oxidizing process, in order that the desired compound—videlicet, bibromanthrakinon, or bichloranthrakinon—may be obtained. In an analogous manner we now employ sulphuric acid as a substitute for the bromine or chlorine employed in the processes above referred to, and we thus obtain the sulphuric acid derivatives of anthrakinon, which we call "the sulpho-acids of anthrakinon."

The specifications then go on to describe the two new processes. The first is to alter the anthrakinon by heating it with sulphuric acid. The product is then put in solution and treated with carbonate of lime, and then with carbonate of potash or of soda, and potash or soda salts of the sulpho-acids of anthrakinon are produced. These are treated with caustic soda or potash under heat, and the artificial alizarine is precipitated by an acid. In the second process anthracine is heated with sulphuric acid, the product is put in solution and treated with peroxide of manganese under heat. Caustic lime is then added in excess till there is an alkaline reaction. The mixture is then filtered and carbonate of potash or soda is added to it, and the potash or soda salts of the sulpho-acids of anthrakinon are produced. These are treated with caustic potash or soda under heat, the product is put in solution, and the artificial alizarine is precipitated by an acid. It is stated in regard to this substance, made by either of these two processes, that it may be employed for the purposes of dyeing and printing, either in the same way as preparations of madder are now used or otherwise.

In each of the two specifications there are two claims, in these words:

1. The manufacture of coloring-matters by submitting anthrakinon to the action of sulphuric acid, so as to obtain soluble compounds, which we have called "sulpho-acids of anthrakinon," treating the products of such operation with an alkali, and precipitating the coloring-matters therefrom by means of an acid, as herein described.

2. The manufacture of coloring-matters by submitting anthracine to the action of sulphuric acid, oxidizing the product thereby obtained, heating such oxidized product with an alkali, and subsequently precipitating the coloring-matters therefrom by means of an acid, as herein described.

After the granting of the English patent for the sulpho-acid process, on June 25, 1869, to Graebe and Liebermann, and their application for the United States patent on January 26, 1870, it became apparent that the sulpho-acid processes and products were to be commercially valuable. Then, during the interval of the four years and a half delay in the issuing of No. 154,536, No. 95,465 was surrendered and reissued in two parts, April 4, 1871, one for the process and the other for the product, the claim in the latter (No. 4,321) being so worded as to cover "artificial alizarine produced from anthracine or its derivatives by either of the methods herein described, or by any other method which will produce a like result." Afterward Graebe and Liebermann assigned the two reissued patents of April 4, 1871, to the plaintiff on March 1, 1872.

It is very plain that the specification of the original patent (No. 95,465) states the invention to be a process for preparing alizarine, not as a new substance prepared for the first time, but as the substance already known as "alizarine," to be prepared, however, by the new process, which process is to be the subject of the patent, and is the process of preparing the known product alizarine from anthracine. The specification states that "the alizarine" is precipitated, that "the yellow flocks of alizarine" are obtained, and that "the alizarine" is in such a form that it can be employed in the same manner as the different preparations from madder, and the claim is for the "process for the production of alizarine." The provisional specification deposited in England, December 18, 1868, states that "yellow flocks of alizarine are precipitated," and that "the alizarine prepared in this artificial way is perfectly pure," and the full specification, filed in England, June 17, 1869, claims "the artificial production of alizarine." No other conclusion can be reached than that Graebe and Liebermann, in the specification of No. 95,465, intended by "alizarine" the chemical substance known by the formula $C_{14}H_8O_4$, and thought that was what their process produced. There is no suggestion of anthrapurpurine or isopurpurine or of any process for producing them. Their published statements show that it was the synthesis of the alizarine of madder which they were making, the specification of No. 95,465 shows that and nothing else, and it is not contended that the alizarine of madder contains anthrapurpurine or isopurpurine. It is very clear from the testimony that it is to anthrapurpurine or isopurpurine that the artificial alizarine sold by the defendants owes its efficiency as a dye-stuff and its practical success in the market, and that such product is produced by the bisulpho-acid process of Perkin; and it is not satisfactorily shown that the monosulpho-acid process of Caro or the bromine process of No. 4,321 will either of them practically produce that product.

Inasmuch as the defendant's article is produced from anthracine or its derivatives by some method, and is a dye-stuff called "artificial alizarine," it is contended that the sale of it infringes No. 4,321. The articles in market, called "artificial alizarine" at the present day, are substances all of which are made from anthracine; but they vary all the way from nearly pure alizarine made by the monosulpho-acid process through the products of the bisulpho-acid process, which contain combinations of alizarine and anthrapurpurine, up to an article of pure purpurine, free from alizarine. All of these are used as dye-stuffs, according to the shade of color and other qualities desired. The specific article put in evidence in this case as an infringement contains about sixty per cent. of anthrapurpurine. It is claimed by the plaintiff to be the artificial alizarine described in No. 4,321, and to be physically, chemically, and in coloring properties similar to that. But what that is is not defined in No. 4,321, except that it is the product of the process described in No. 4,321. Therefore, unless it is shown that the process of No. 4,321 was followed to produce the defendant's article, or unless it is shown that that article could not be produced by any other process, the defendant's article cannot be identified as the product of the process of No. 4,321. Nothing of the kind is shown. On the other hand, the defendant's article is made abroad and by a process different from that of No. 4,321. It therefore cannot be the product of that process. If the words of the claim "by any other method which will produce a like result" mean any other method which will produce the only product mentioned in the description—namely, alizarine, as then understood, having the formula $C_{14}H_8O_4$, the defendant's article is not that product, for it contains other dyeing ingredients which the alizarine of the patent does not contain. If the words of the claim are to be construed to cover all artificial alizarine, whatever its ingredients, produced from anthracine or its derivatives by methods invented since Graebe and Liebermann invented the bromine process, we then have a patent for a product or composition of matter which gives no information as to how it is to be identified. Every patent for a product or composition of matter must identify it so that it can be recognized aside from the description of the process for making it, or else nothing can be held to infringe the patent which is not made by that process. The circuit court found as a fact that the de-

fendant's article was produced by the process described in No. 154,536. But it regarded that process as the same process chemically as the process of No. 4,321, on the view that the bromine used in the latter was merely a vehicle, and in the former sulphuric acid was substituted as a vehicle, and though superior performed the same office in the same way; and so, as it regarded the two processes as the same, it held the two products to be the same. We consider it, however, to be established that the defendant's article is not made by the process of No. 4,321, but is made by the bisulpho-acid process of Perkin, which yields anthrapurpurine, and which, while it may involve the process of No. 154,536, goes beyond it. The bisulpho-acid process puts in two atoms of anhydrous sulphuric acid instead of one, and additional oxygen is carried in and anthrapurpurine is produced, the formula of which is $C_{14}H_8O_5$. Aside from this, it is shown that the dyeing qualities of the defendant's article depend on the anthrapurpurine or isopurpurine it contains, and not on the alizarine. As the only alizarine mentioned in No. 95,465 or in No. 4,321 is alizarine the formula of which is $C_{14}H_8O_4$, the alizarine of madder, the process described in those patents, to be a sufficient support for a valid patent, as being properly described, must be a process which will produce that article and no other; and No. 4,321, to be valid as a patent for a product, must be a patent which will produce, by the process it describes, that article and no other. Unless that process will practically produce the defendant's article, No. 4,321 is not infringed; and it is not established by the evidence that it will.

There is another view of the case. According to the description in No. 95,465 and in No. 4,321 and the evidence, the article produced by the process described was the alizarine of madder having the chemical formula $C_{14}H_8O_4$. It was an old article. While a new process for producing it was patentable, the product itself could not be patented, even though it was a product made artificially for the first time, in contradistinction to being eliminated from the madder root. Calling it artificial alizarine did not make it a new composition of matter, and patentable as such, by reason of its having been prepared artificially for the first time from anthracine, if it was set forth as alizarine, a well-known substance. (*The Wood Paper Patent*, 23 How., 566, 593.) There was therefore no foundation for Reissue No. 4,321 for the product, because on the description given no patent for the product could have been taken out originally.

Still further, the claim of No. 4,321 is not a claim merely for the product of the process described in it, but is a claim for anything which may be called "artificial alizarine," produced from anthracine or its derivatives, by either of the methods described, or by any other method, equivalent or not, which will produce anything called "artificial alizarine." The scope of such a claim is seen in this suit. An article is sought to be covered by the reissue, which it is demonstrated Graebe and Liebermann never made by their bromine process, which they knew that process would not produce, which they recognized as produced first by some one else by a different process, and which has become the subject of a large industry abroad and an extensive use in this country, through discoveries made, as they acknowledge, since their bromine process was invented. After those discoveries were made, after it was seen that the bisulpho-acid process would produce desirable dye-stuffs, and could be worked practically and profitably to that end, it was sought to control the market for the product in the United States by obtaining this Reissue No. 4,321.

We have not deemed it necessary to consider more particularly the question whether the Reissue Patent No. 4,321 is or is not for a different invention from that described in the original patent. It certainly is, unless the product claimed in the reissue is precisely that product, and no other, which the process described in the original patent produces. There can be no better evidence, as against the appellee, of what that product is than the declarations of the original patent itself and of the patentees elsewhere, as already shown. Nor have we deemed it necessary to inquire or determine whether, even if the product claimed in the reissue were the same as that which the process described in the original patent produces, it could have been made the subject of a reissued patent at the time when and under the circumstances in which this reissue was made. It is so clear that the defendants are not shown to have infringed that we have not deemed it necessary to consider other questions any further.

It results from these considerations that, if the claim of No. 4,321 is to be construed so broadly as to cover the defendant's article, it is wider in its scope than the original actual invention of Graebe and Liebermann, and wider than anything indicated in the specification of the original patent; and that, if it is to be construed as to cover only the product which the process described in it will produce, it is not shown that the defendant's article is that product or can be practically produced by that process. In either view the decree of the circuit court must be reversed and the case be remanded to that court, with direction to dismiss the bill of complaint.

Attorneys.

DEPARTMENT OF THE INTERIOR,
OFFICE OF THE SECRETARY,
Washington, D. C., May 20, 1884.

SIR: I am directed by the Secretary to inform you that he has ordered that W. C. Berringer, of Pittsburg, Pennsylvania, be not recognized from and after this date as attorney in the prosecution of any claim or other matter before the Department of the Interior or any bureau thereof.

I am, sir, very respectfully, your obedient servant,

GEO. M. LOCKWOOD,
Chief Clerk.

The Commissioner of Patents.

Issue of May 27, 1884.

DESIGNS.

15,014.—BURIAL-CASKET KNOB.—*William H. Hutchinson*, Rochester, N. Y. Application filed November 12, 1883. Term of patent 7 years.

15,015.—LADY'S COLLAR.—*Sali Loewenstein*, New York, N. Y. Application filed February 5, 1884. Term of patent 3½ years.

15,016 to 15,021, inclusive.—OIL-CLOTH.—*Charles T. Meyer* and *Victor E. Meyer*, Bergen, N. J., assignors to *Edward C. Sampson*, New York, N. Y. Applications filed April 8, 1884. Term of patents 3½ years.

15,022.—MONUMENT.—*Aaron J. Nellis*, Pittsburg, Pa. Application filed March 31, 1884. Term of patent 14 years.

15,023.—LADY'S COSTUME.—*John Quincy Reed*, New York, N. Y., assignor to *The Butterick Publishing Company, (Limited,)* same place. Application filed March 27, 1884. Term of patent 3½ years.

15,024 to 15,026, inclusive.—LADY'S COSTUME.—*Sarah Jane Shiels*, New York, N. Y., assignor to *The Butterick Publishing Company, (Limited,)* same place. Applications filed March 27, 1884. Term of patents 3½ years.

15,027. and 15,028.—MISS'S COSTUME.—*Sarah Jane Shiels*, New York, N. Y., assignor to *The Butterick Publishing Company, (Limited,)* same place. Applications filed March 27, 1884. Term of patents 3½ years.

15,029 and 15,030.—LADY'S COSTUME.—*Louise Tully*, New York, N. Y., assignor to *The Butterick Publishing Company, (Limited,)* same place. Applications filed March 27, 1884. Term of patents 3½ years.

15,031.—LADY'S BASQUE.—*Louise Tully*, New York, N. Y., assignor to *The Butterick Publishing Company, (Limited,)* same place. Application filed March 27, 1884. Term of patent 3½ years.

15,032.—MOLDING.—*Albrecht Vogt*, Rochester, N. Y. Application filed December 26, 1883. Term of patent 7 years.

15,033.—BURIAL-CASKET HANDLE.—*Albrecht Vogt*, Rochester, N. Y. Application filed December 26, 1883. Term of patent 7 years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upwards are registered under the act of March 3, 1881.]

11,194.—SMOKING AND CHEWING TOBACCO.—*G. W. Gail & Ax*, Baltimore, Md. Application filed April 22, 1884.

"The pictorial representation of a blue jay."

11,195.—CANNED CORN.—*Charles P. Mattocks*, Portland, Me. Application filed March 20, 1884.

"The figure of a bear, nually black in color, seated on his haunches nearly erect, the fore paws represented as grasping an ear of partially-husked corn or maize, with the end of the ear in the mouth of the animal."

11,196.—CIGARS.—*Reid, Murdoch & Fischer*, Chicago, Ill. Application filed April 14, 1884.

"The words 'THE PALM,' a palm-leaf fan, a banana-tree on the right, scrub-palms at its base, and the top of a palm-tree in the rear of the fan."

11,197.—SMOKING-TOBACCO.—*Tallulah Ann Richardson*, Reidsville, N. C. Application filed April 24, 1884.

"The word-symbol 'OLD UNITED STATES.'"

11,198.—SMOKING-TOBACCO.—*Timberlake, Woodson & Co.*, Lynchburg, Va. Application filed April 24, 1884.

"The word-symbol 'BUCK' and the representation of a human eye."

11,199.—SMOKING-TOBACCO.—*Timberlake, Woodson & Co.*, Lynchburg, Va. Application filed April 24, 1884.

"The word-symbol 'GREEK SLAVE' with the accompanying figure of a woman."

11,200.—STICK CANDY, CAKES, DROPS, BALLS, AND DICE.—*Darby & Co.*, Baltimore, Md. Application filed February 28, 1884.

"The representation of a striped stick of candy, in red and white, extending diagonally across a rectangular space inclosed by a border-line."

11,201.—ALLOY HAVING THE APPEARANCE OF NICKEL.—*John B. Fitch*, New Haven, Conn. Application filed April 14, 1884.

"The letter 'Z.'"

11,202.—ALLOY HAVING THE APPEARANCE OF NICKEL.—*John B. Fitch*, New Haven, Conn. Application filed April 14, 1884.

"The word 'ZENITH.'"

11,203.—CIGARS.—*Charles Gross & Co.*, Philadelphia, Pa. Application filed April 18, 1884.

"The word 'MATINEE.'"

11,204.—REMEDY FOR COUGHS AND DISEASES OF LIKE NATURE.—*Higgins, Greene & Hyde*, Rutland, Vt. Application filed February 15, 1884.

"The words 'HIGGINS' COMPOUND,' arranged in a circle, with an inner circle surrounding the letters 'T & C.'"

11,205.—PLUG AND TWIST CHEWING-TOBACCO.—*J. W. & O. G. Holland*, Danville, Va. Application filed April 22, 1884.

"The words 'BOB LEE.'"

11,206.—CANNED ROAST TURKEY.—*Charles P. Mattocks*, Portland, Me. Application filed March 20, 1884.

"The arbitrary symbol or representation of a lily of the kind known as 'calla' lily, fully blown, with leaves attached to the stem below the flower."

11,207.—CANNED CORN.—*Charles P. Mattocks*, Portland, Me. Application filed March 20, 1884.

"The arbitrary symbol of a swan colored black and swimming upon the surface of water."

11,208.—CANNED ROAST MUTTON.—*Charles P. Mattocks*, Portland, Me. Application filed March 20, 1884.

"The arbitrary symbol of a rose blown fully and surrounded by green leaves."

11,209.—MINERAL WATER.—*Sprudel Water Company*, Mount Clemens, Mich. Application filed April 28, 1884.

"The word 'SPRUDEL.'"

11,210.—CORDS, LINES, TWINES, AND ROPES.—*James P. Tolman*, West Newton, Mass. Application filed April 7, 1884.

"The designation 'SAMSON,' expressed either pictorially or by word."

LABELS.

4,127.—Title: "THE HEALTH RESTORER" (FOR A MEDICINE.)—*Joseph Bard*, Chicago, Ill. Application filed May 5, 1884.

4,128.—Title: "THE PAIN DESTROYER." (FOR A MEDICINE.)—*Joseph Bard*, Chicago, Ill. Application filed May 5, 1884.

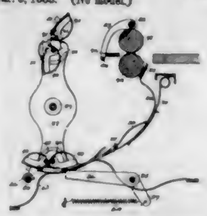
4,129.—Title: "DIME" (FOR COLOGNE.)—*F. Hoyt & Co.*, Philadelphia, Pa. Application filed April 28, 1884.

4,130.—Title: "DR. MOORE'S JUNIPER BALSAM."—*T. Edward Kirby*, Baltimore, Md. Application filed April 30, 1884.

4,131.—Title: "UNION MADE LOAF BREAD."—*Conrad J. Kraft* and *Conrad Bernhard*, Baltimore, Md. Application filed May 2, 1884.

4,132.—Title: "FRESH HOME ROASTED COFFEE."—*E. Metzenaur*, Little Rock, Ark. Application filed May 3, 1884.

DISCLAIMER.



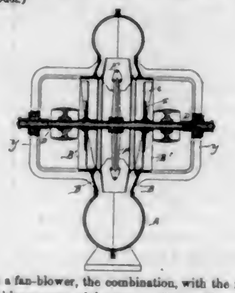
234,286.—*Warren P. Jennings*, Brooklyn, N. Y., assignor of one-half to *Abraham G. Jennings*, same place. Patent dated November 9, 1880. IMPROVEMENT IN MITT-SHAPING MACHINES. Disclaimer filed May 21, 1884, by the present owners, *Abraham G. Jennings, Warren P. Jennings*, and *Oliver T. Jennings*.

Enter their disclaimer "to the word 'seamless,' contained in the seventh claim of said letters patent."

PATENTS

GRANTED MAY 27, 1884.

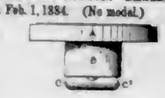
299,097. PAPER-BAG MACHINE. OSCAR W. ALLISON, Rochester, N. Y., assignor to the Union Paper Bag Machine Company, Philadelphia, Pa. Filed Mar. 3, 1883. (No model.)



Claim.—1. The combination, with the revolving arms or carriers 87, of the revolving jaws 92 93 and the oscillating arm 32, having hook 37, substantially as described.

2. The combination, with the revolving arms or carriers 87, of the revolving jaws 92 93 and the oscillating arms 34, substantially as described.

3. The combination, with the revolving arms or carriers 87, of the revolving jaws 92 93, the oscillating arm 32, provided with hook 37, and the oscillating arms 34, substantially as described.

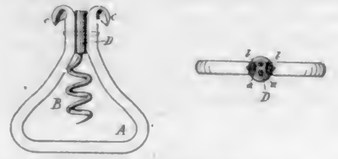


299,098. FAN-BLOWER. FREDERICK C. ANDERTON, San Francisco, Cal., assignor of one-half to Samuel Dinsmore, same place. Filed Mar. 7, 1883. (No model.)

Claim.—1. In a fan-blower, the combination, with the main fan F, set in line with the blower-case, of the two smaller auxiliary fans E, set one on each side of the main fan, and each having one side exposed to the atmosphere without cover, and having blades *e*, drawing in the air and delivering it to the center of the main fan, as set forth.

2. In a fan-blower, the combination of the blower-case and annular disks or plates B, having the wide flanges B', surrounding the circular openings, the yokes *y y*, shaft D, central fan, F, and side fans, E, revolving in the circular openings surrounded by the flanges B', substantially as set forth.

299,099. DETACHABLE BUTTON. BENJAMIN J. ANGELL, Attleborough, Mass. Filed Feb. 1, 1884. (No model.)



299,099.

Claim.—1. A detachable button composed of a head, a hollow stem, B, rigidly secured thereto, a T-shape member mounted to revolve axially in said stem and with relation to the button-head, and having cam-surfaces on its shank portion, as described, and springs located within the hollow stem and engaging the shank of the T-shape member to hold the head of said member in a position to lock the button in place, substantially as set forth.

2. The combination of the stem B, the T-shape member C, having cam-surfaces upon its shank portion, as described, and provided with a shoulder, c^2, and springs D, which engage the shank of the stem and the shoulder thereon and hold the T-shape member in the stem, substantially as set forth.

299,100. CORKSCREW. JOSHUA BARNES, Brooklyn, N. Y. Filed Jan. 19, 1884. (No model.)

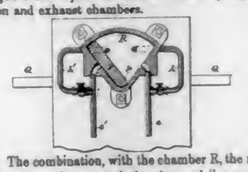
Claim.—1. A corkscrew with a folding handle provided with convex jaws fitting into corresponding concavities in the shank of a screw-coil.

2. In a corkscrew, a screw-coil, either single or double, provided near its point or points with a cutting-edge.

3. The screw-coil of a corkscrew, formed with the portion at or near its point wider than the remainder of the screw-coil, and forming a cutting-edge.

4. A corkscrew with a folding handle, provided with convex jaws fitting into corresponding concavities in the shank of the screw-coil, and provided with a hook or hooks, substantially as described.

5. In a corkscrew, a folding handle provided with convex jaws fitting into corresponding concavities in the shank of a double or single screw-coil, which has near its point or points a cutting-edge.



6. In a corkscrew, a folding handle provided with convex jaws fitting into corresponding concavities in the shank of a single or double screw-coil which has the portion at or near the point or points formed into a cutting-edge and made wider than the remainder of the screw-coil, substantially as described.

7. In a corkscrew, the shank of a screw-coil formed of parallel wires, provided with a hole drilled therein, and prevented from separating by means as described.

299,101. RAILROAD-SIGNAL. WALTER C. BECKWITH, Allegheny, assignor to the Beckwith Auto-Pneumatic Railway Signal Company, Pittsburg, Pa. Filed Feb. 8, 1883. (No model.)

Brief.—A device to be operated by a train passing the signal-section to set and to withdraw the signal by air-pressure in case of a train passing in one direction, and by air-suction in case of a train passing in

the opposite direction. An air-pump at each end of the signal-section is connected by a pipe with a chamber mounted on the signal-post and containing an oscillating signal-carrying plate, the two pipes opening into the chamber on opposite sides of the plate, and communicating by way of the chamber by means of branch pipes arranged as described, and having outwardly-opening valves. Each pump is connected by described reducing mechanism with a vibrating operating-lever arranged by the rail to receive the tread of the wheels. Pivoted to said lever is a latch having a stud adapted to engage the swinging operating-lever of a four-way cock in the air-pump, said latch being adapted, as described, to receive the impact of the first wheel before the wheel strikes the lever, whereby the cock is shifted to determine the action of the pump to suction or pressure before the pump is operated. The two pumps are reversely arranged relatively to the latches. Each pump is provided with compression and exhaust chambers.

Claim.—1. The combination, with the chamber R, the reciprocating piston P, the signal-vane Q, operated thereby, and the main pipes *e e'*, entering the chamber at the ends of the stroke of the piston P, of the branch run-around pipes *h h'*, each provided with a check-valve preventing the passage of air through it into the chamber R, but permitting its passage from said chamber, substantially as specified, whereby air moving in the main pipes may first operate the piston P, and then pass around it through the chamber R, to operate other pistons and signals, as described.

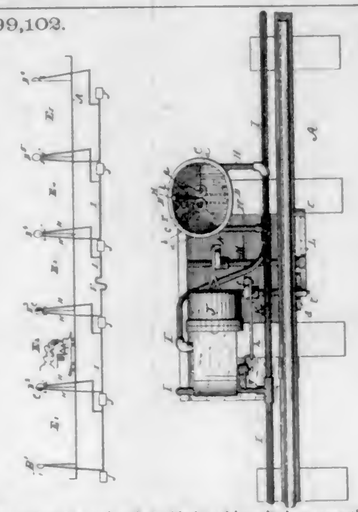
2. A lever pivoted to some fixed object on a railroad, having an arm shaped to be depressed by trains passing either way to actuate a pump, in combination with a two-armed latch pivoted to said lever to project its arms alternately beyond the sides of the lever, substantially as shown and described, whereby a passing train will first actuate the latch, and then operate the lever, and whereby the depressing of either end of the latch raises the other end, for the purpose specified.

3. The lever-arm C', pivoted to some fixed object on a railroad, the latch *l*, pivoted on said lever and having a stud, M, in combination with the lever L, having a loop-shaped aperture in it, substantially as described, whereby said latch will operate said lever when said stud is in the upper part of the loop, but will not operate the same when in the lower part thereof, nor when playing vertically therein.

4. The latch *l*, pivoted to the lever-arm C', and having two arms, *l'* and *l''*, and a stud, M, in combination with the loop-shaped lever L, connecting-rod *k*, and lever K, as shown and described.

5. The combination, with the chamber D, of the air-compression chamber F, the check-valve *f*, the exhaust-chamber F', the check-valve *f''*, and the four-way valve G, as shown and described.

299,102. RAILROAD-SIGNAL. WALTER C. BECKWITH, Allegheny City, assignor to the Beckwith Auto-Pneumatic Railway Signal Company, Pittsburg, Pa. Filed Aug. 15, 1883. (No model.)



Brief.—At each station at the end of a block or signal-section are two independent oppositely-facing signals and an air-pump. Each signal is adapted to be set by air-pressure and withdrawn by air-suction, or the opposite, through a pipe-connection between the signal and the air-pump at that station and the air-pump at that one of the two next adjacent stations from which the signal faces. Each air-pump is arranged to be operated by the passing train, and is constructed to exert pressure through one port communicating with an adjacent and an advance signal, the two facing in opposite directions, and suction through the other port, communicating with an adjacent and a rear signal facing also in opposite directions. Each air-pump is provided with mechanism whereby its action, as respects pressure or suction, may be reversed by a train moving in an opposite direction.

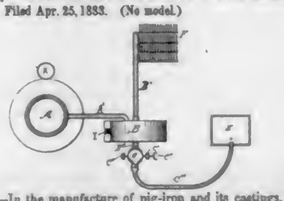
Claim.—1. A series of pumps located along a railroad and a line of pipe joining said pumps, in combination with two sets of signals independent of each other, one set facing each way along the road, and branch pipes connecting with the main pipe adjacent to pumps, one branch connecting with a signal facing one way and another with a signal facing the other way, substantially as and for the purpose specified.

2. On a railroad divided into sections or blocks, a pump located at or near each end of a block, and a line-pipe connecting said pumps, in combination with two independent signals, facing in opposite directions, at each end of a block, and branch pipes connecting the two signals facing outward at the ends of a block with the line-pipe, which connects the pumps located at the ends of said block, substantially as described.

3. On a railroad divided into sections or blocks, a pump located at or near each end of a block, and a line of pipe connecting said pumps, in combination with two independent signals facing in opposite direc-

299,103.

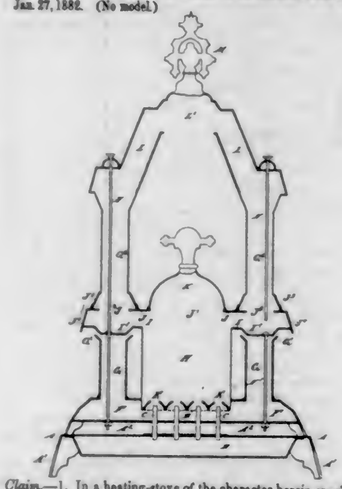
tions, stationed at each end of a block, and branch pipes connecting the two signals of a station with the line-pipe at opposite sides of the pump at that station, as shown and described.



4. A series of railway-signals arranged with two oppositely-facing independent signals at each station, connected with a line-pipe, one of said signals at each station being constructed to be exposed by pressure and the other to be concealed by suction, or vice versa, the air to expose the first being drawn from the second, as shown and described.

5. Two independent oppositely-facing signals at each of two or more stations along the road, constructed to be exposed by pressure and concealed by suction, or vice versa, and a series of pumps, and a line of pipe connecting them with each other and with the signals, constructed to be operated by a passing train to draw air from one portion of the line-pipe and the signals connected therewith, and to press the same air into another portion of said line-pipe and into the signals connected therewith, substantially as described.

6. A series of signals consisting of two sets of oppositely-facing independent signals, arranged along a railroad, in combination with a series of pumps, also arranged along said road, a line-pipe connecting said pumps, branch pipes connecting said signals with the pressure and suction of said pumps, as described, and means for operating said pumps by the action of a passing train, whereby a train passing in one direction will alternately expose and conceal said signals in outwardly-facing pairs, and a train passing in the other direction will also alternately expose and conceal the same signals, but in the reverse order, as shown and described.



7. A series of railway-signals arranged with two oppositely-facing independent signals at each station, and a series of pumps located one at or near each of said stations, and pipes connecting said signals with said pumps, substantially as described, whereby the passing of a train in either direction will act by pressure and suction to set to "danger" the outward-facing signals of the section on which the train is entering, and will conceal the signal facing to the rear at a station to the rear of the train, by the operation of a single pump.

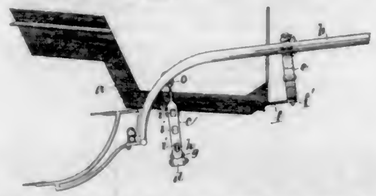
299,103. MANUFACTURE OF PIG-IRON. JOHN F. BENNETT, Pittsburg, Pa. Filed Apr. 25, 1883. (No model.)

Claim.—In the manufacture of pig-iron and its castings, such as herein described, the process herein specified, which consists in smelting iron and manganese ores in a blast-furnace, desiliconizing the fluid mass in a reverberatory furnace, and then discharging the fluid contents onto a pig-bed or into a ladle for distribution to the casting-molds, substantially as described.

299,104. HEATING-STOVE. LEWIS F. BEITS, Morton, Pa., assignor to John H. Irwin, same place, and Robert E. Dietz, New York, N. Y. Filed Jan. 27, 1882. (No model.)

Claim.—1. In a heating-stove of the character herein specified, the combination, with the burners C, surrounded by an air-chamber, F, of fresh-air conduits G, extending upward from said air-chamber upon each side of the flame-space, hot-air conduits or flues G^2, leading from a horizontally-extending chamber at the top of the flame-space to conduits I, terminating in a chamber, L', open at bottom, substantially as shown and described.

2. In a heating-stove of the character herein specified, the combination, with conduits G, bearing plates G', of plate I, containing depressions I', substantially as shown and described.



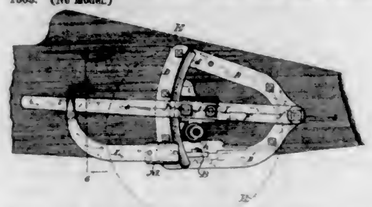
3. The combination with chimney H, of plate I, plate J, perforated at J' and J^2, and the removable dome K, substantially as shown and described.

4. In a heating-stove of the character herein specified, the combination, with chimney H, of plate I, plate J, having perforations J' and J^2 therein, and the conduits or flues G^2 and L, terminating in chamber L', said chamber being open at bottom, substantially as and for the uses and purposes shown and described.

5. In a stove of the character herein specified, the combination, with a flame-space surmounted by a horizontally-extending chamber having a radiating-surface thereabove, of two or more conduits laterally situated to said flame-space, and leading from the chamber surmounting said flame-space to a point thereover, substantially as shown and described.

6. In a stove of the character herein specified, the combination, with the flame-space surmounted by a laterally-extending chamber having a radiating-surface above said flame-space, of two or more flues or conduits extending to a point substantially over said flame-space and radiating-chamber, and adapted and arranged to direct the escaping products of combustion in a downward direction, substantially as shown and described.

299,105. TWO-WHEELED VEHICLE. JOHN C. BLOCHER, Lima, Ohio. Filed Feb. 2, 1884. (No model.)



Claim.—1. The body of a road-cart swung freely from the shafts by straps or hangers *c*, and pivoted on a vertical pivot at point *f''*, as and for the purpose set forth.

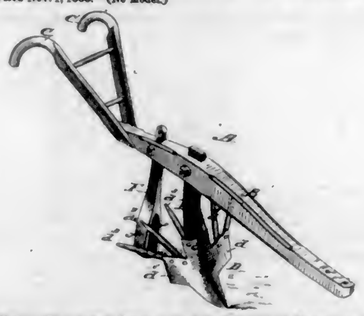
2. The combination, with the body of a road-cart pivoted on a vertical pivot at the front to the spring *e*, of hangers *c*, clips *g*, and spring *d*, as and for the purpose set forth.

3. The combination, with a road-cart pivoted on a vertical pivot at its front to the spring *f*, of the vertically-adjustable hangers *c* and spring *d*, as and for the purpose set forth.

299,106. HARVESTER. REED V. BOKE, Toledo, Ohio. Filed Oct. 23, 1883. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of the finger-beam, the grain-board, the guideway-bracket secured to the finger-beam and grain-board, the grain-wheel lever pivoted at its front end to the guideway-bracket, and having vertically-adjustable connection with said bracket, and the grain-wheel, for the purpose described.

2. The combination, substantially as hereinbefore set forth, of the finger-beam, the cranked rod, the grain-board, the guideway bracket, the grain-wheel lever pivoted at its front end, and having vertically-adjustable connection with said bracket, and the arm at the outer end of the cranked rod, with which the lever has sliding connection, for the purpose described.

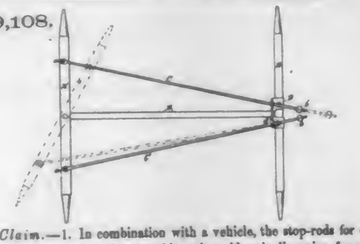


3. The combination, substantially as hereinbefore set forth, of the finger-beam, the cranked rod, the grain-board, the guideway-bracket, the grain-wheel lever pivoted at its front end, the journal-bracket secured to said lever, and having sliding engagement with the guideway-bracket, the grain-wheel, and the arm of the cranked rod, with which the grain-wheel lever has sliding connection, for the purpose described.

4. The bracket D, adapted to be secured to the grain-board, having the cranked-rod bearing, and the socket *g* for attachment to the finger-beam, and provided with the boss at its front end and the guideway at its rear end, substantially as and for the purpose hereinbefore set forth.

5. The combination of the grain-wheel lever, the journal-bracket secured thereto, the bracket to which the lever is pivoted, and having the guideway with which the journal-bracket has sliding engagement, and the cranked-rod arm with which the grain-wheel lever has sliding connection, substantially as and for the purpose hereinbefore set forth.

6. The combination of the finger-beam, the cranked rod, the arm at the outer end thereof, the grain-board, the grain-wheel lever pivotally supported at its front end, and having adjustable connection at its rear end with the arm of the cranked rod, and the grain-wheel, substantially as and for the purpose hereinbefore set forth.

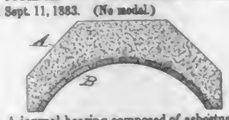


299,107. POTATO-DIGGER. CHRISTOPHER BOUL, West Belleville, Ill. Filed Nov. 1, 1883. (No model.)

Claim.—In a potato-digger, a vertical rear support, F, formed of a single piece adjustably secured directly to the beam B, and constructed with forks *f f*, which bear on the ground, in combination with a potato-digging shovel having wings *d d*, a central upward extension, d^3, and radiating fingers d^3, all constructed and adapted to operate substantially in the manner and for the purposes described.

299,108. TURNING-GEAR FOR VEHICLES. FREDERICK BRENGMAN, Indianapolis, Ind., assignor to the Emerson, Fisher Company, Cincinnati, Ohio. Filed Dec. 12, 1882. (No model.)

299,108.

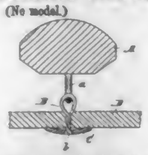


Claim.—1. In combination with a vehicle, the stop-rods for controlling the rotation of the movable axle, said rods diverging from the point where they are attached to the stationary part of the vehicle to the movable axle, and stops and devices for regulating the amount of rotation of said axle, substantially as and for the purposes specified.

2. The combination of the front and rear axles, A A′, connected by the perch B, and the stop-rods C, connected at one end to one of the axles, the other ends passing through openings *e* in the stop-plate D, connected to the opposite axle, the free ends of the rods being provided with stops to engage with the stop-plate, substantially as and for the purposes specified.

3. The combination of the front and rear axles, A A′, connected by the perch B, and the stop-rods C, connected at one end to one of the axles, the other ends passing through openings *e* in the stop-plate D, connected to the opposite axle, the free ends of the rods being provided with nuts *b*, to engage with the stop-plate, substantially as and for the purposes specified.

4. The combination of the front and rear axles, A A′, connected by the perch B, and the diverging stop-rods C, connected at one end to one of the axles, the other ends passing through openings *e* in the stop-plate D, connected to the opposite axle, the free ends of the rods being provided with nuts *b*, to engage with the stop-plate, substantially as and for the purposes specified.

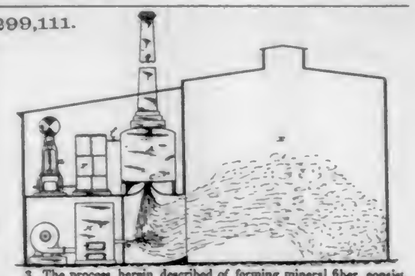


299,109. JOURNAL-BEARING. CHARLES F. BINGHAM, Worcester, Mass. Filed Sept. 11, 1883. (No model.)

Claim.—1. A journal-bearing composed of asbestus and paper-pulp treated with oxide and chloride of magnesium, in the manner and for the purpose herein specified.

2. A journal-bearing composed of asbestus and paper-pulp treated with oxide and chloride of magnesium, as herein described, and provided with a perforated metal lining on its journal side, all as described, and for the purpose set forth.

299,110. BUTTON-FASTENER. HUBERT BROSSEL, Indianapolis, Ind. Filed Nov. 12, 1883. (No model.)



Claim.—The combination, with a button provided with a shank and eye, of the fastener B, formed out of wire twisted into a loop to receive the eye *a* of the button A, and having a flattened head, *b*, and the rounded washer-plate C, provided with a slot, *c*, to receive the fastener B, substantially as described, and for the purpose specified.

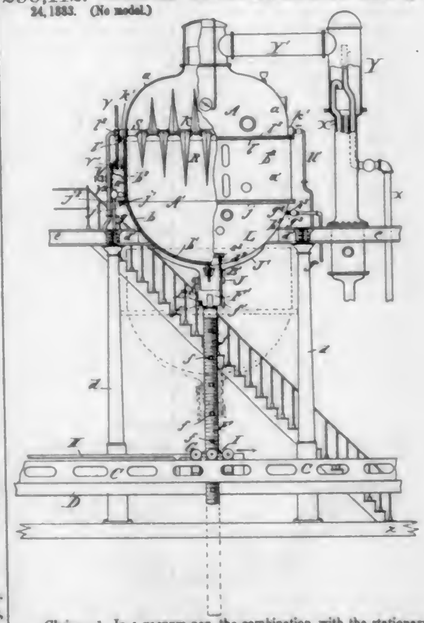
299,111. PROCESS OF AND APPARATUS FOR FORMING MINERAL FIBER OR WOOL FROM FURNACE-SLAG. ROBERT BURNS, Chicago, Ill. Filed Oct. 25, 1883. (No model.)

Claim.—1. The process herein described of forming mineral fiber, consisting in forcing molten slag or scoria under a heavy pressure through a perforated head, substantially as described.

2. The process herein described of forming mineral fiber, consisting in forcing molten slag or scoria under a heavy pressure through a perforated head, so as to form slender filaments or fibers, and means for supplying a blast of air to cool and convey the fiber into a proper receiving or settling chamber, substantially as described.

299,111.

3. The process herein described of forming mineral fiber, consisting in forcing molten slag or scoria under a heavy pressure through a perforated head, so as to form slender filaments or fibers, and means for supplying a blast of air of the required temperature, so as to produce a fiber of the required toughness or fragility, substantially as described.



4. In an apparatus for making mineral fiber, the combination of furnace A, slag-tank B, perforated head C, and accumulator F, as described, and for the purpose set forth.

5. In an apparatus for making mineral fiber, the combination of the furnace A, slag-tank B, perforated head C, accumulator F, and valve *f*, controlling communication between the accumulator and the slag-tank, as described, and for the purpose set forth.

6. In an apparatus for making mineral fiber, the combination of the furnace A, slag-tank B, perforated head C, accumulator F, and blast-pipe D, as described, and for the purpose set forth.

7. In an apparatus for making mineral fiber, the combination of the furnace A, slag-tank B, perforated head C, accumulator F, blast-pipe D, and hot-blast stove H, substantially as described, and for the purpose set forth.

299,112. VACUUM-PAN. LUCAS M. CAMPI, Havana, Cuba. Filed Aug. 24, 1883. (No model.)

Claim.—1. In a vacuum-pan, the combination, with the stationary dome, of the receiver, movable to and from the dome, substantially as and for the purposes set forth.

2. In a vacuum-pan, the combination, with the stationary dome, of the receiver, movable vertically to and from the dome and horizontally from its vertical plane of movement, substantially as and for the purpose set forth.

3. In a vacuum-pan, the receiver pivotally connected to its support, whereby it is adapted to be tilted to empty its contents, substantially as described, and for the purpose set forth.

4. In a vacuum-pan, the receiver pivotally connected to its support and held from accidentally tilting, and, when tilted, from being suddenly precipitated by the action of springs, substantially as set forth.

5. The combination, with the stationary dome A of the vacuum-pan, of the receiver A′, placed upon the screw F, whereby the receiver may be raised and lowered, substantially as and for the purposes set forth.

6. The receiver A′ of the vacuum-pan, pivoted upon its support, whereby the receiver may be tilted for emptying out its contents, substantially as described.

7. The receiver A′, held upon the screw F, which works through the truck G, in combination with the supporting-track for the truck, whereby the receiver may be raised and lowered and moved to and from the dome A, substantially as and for the purposes set forth.

8. The trucks G G, placed upon tracks C C and connected by rods or plates H, in combination with screw F, receiver A′, and stationary dome A, substantially as and for the purposes set forth.

9. The dome A, having the lower ring-casting, *a′*, in combination with the receiver A′, having the upper ring-casting, b^2, the casting *a′* being adapted to inclose the casting b^2, substantially as and for the purposes set forth.

10. The upper casting, b^2, of the jacket of the receiver, formed with the flange j' and lip j^3, in combination with the dome formed with the lower casting, *a′*, adapted to surround the casting b^2 and rest at its lower edge upon the flange j', substantially as and for the purposes set forth.

11. The dome A, formed with the recess *m*, in combination with the packing N, placed in said recess, and the receiver A′, adapted to be brought up to the packing, substantially as and for the purposes set forth.

12. In a vacuum-pan, the casting b^2, formed with the flange P and vertical plate Q, substantially as and for the purposes set forth.

13. In a vacuum-pan, the casting b^2, formed with the recess *m′*, in combination with the dome A, formed with the lip O, substantially as and for the purposes set forth.

14. The shell S and arms R, formed with the heating-space R^1, in combination with the pipe T and short pipes T′, through which steam is admitted to the spaces R^2, the arms being provided with the valves *q* and short passages *q′*, for exhausting the steam from the space R^2 into the shell S, substantially as and for the purposes set forth.

15. In a vacuum-pan, the hollow agitator K, having hollow arms R, in combination with the hollow-journal U, and means, substantially as described, for supplying steam to and revolving the agitator, substantially as and for the purposes set forth.

16. In a vacuum-pan, the coupling-pipe g^2, arranged to connect the steam-pipe *g* with the space *h* and to lock the dome and receiver together, substantially as described.

17. The box A^3, having the elongated space i^2, in combination with the longitudinally-movable screw-coupling pipe g^2, arranged to operate substantially as and for the purposes set forth.

18. In a vacuum-pan, the agitator composed of a series of hollow arms, R, connected to a shell, S, journaled in the lower edge of the dome, in combination with the pipe T and short pipe T′, the former being inclosed in the shell S, and the latter inclosed in the arms R, substantially as and for the purpose set forth.

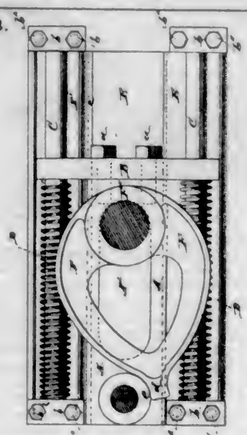
19. In a vacuum-pan, the combination, with the agitator provided with hollow arms R, connected to the shell S, having steam-tight packed journals, of the pipe U and gear-wheel V, gearing with the pinion V′, driven by suitable means, substantially as and for the purpose set forth.

20. In a vacuum-pan, the combination, with the agitator provided with hollow arms R, having the short pipes T′, and connected to the shell S, having the pipe T, of the hollow steam-tight packed journals, the pipes U and T^3, the gear-wheel V, and pinion V′, driven by suitable means, substantially as and for the purpose set forth.

21. In a vacuum-pan, the combination of the shell S, inclosing the pipe T and carrying the agitator-arms R, provided with steam-spaces R^2 and short pipes T′, the pipe U, pipe T^3, nut W, coupling and clutch nut W′, packing W^2, ring *k′*, gear-wheel V, and pinion V′, driven by suitable means, substantially as and for the purpose specified.

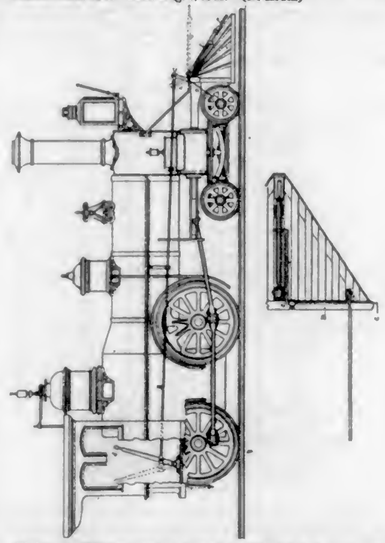
299,113. CUSHIONING DEVICE FOR SHAFTS. WM. H. CLARK, Chicago, Ill. Filed Aug. 6, 1883. (No model.)

Claim.—1. A cushioning device located between the power and the load, and operating to relieve the strain in use under varying resistance on either a forward or reverse movement of the shaft, substantially as specified.



2. A cam or eccentric, a sliding plate carrying a roller, a supporting-plate for the sliding plate, and resisting-springs for the sliding plate, in combination with a driving-crank and shaft, substantially as and for the purpose specified.

3. The combination of the cam or eccentric F and sliding plate A, having the roller *e*, with resisting-springs D, and interposed between the power and the load to receive the shock of the resistance, substantially as specified.

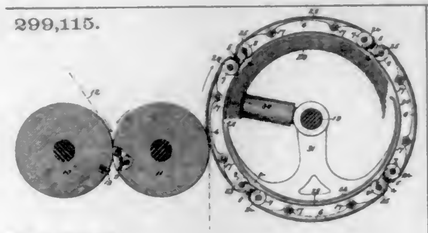


4. The sliding plate A, carrying the roller *e*, supporting-plate E, guide-rods C, and springs D, in combination with the cam or eccentric F, and interposed between the power and the load, substantially as and for the purpose specified.

5. The sliding plate A, carrying the roller *e*, cross-head B, guide-rods C, springs D, and supporting or backing plate E E′, in combination with a cam or eccentric, F, substantially as and for the purpose specified.

299,113.

299,114. LOCOMOTIVE DRAW-BAR LIFTER. CHAS. K. CORDREY, Bellefontaine, Ohio. Filed Aug. 6, 1883. (No model.)



Claim.—1. The combination, with the coupling-bar of a locomotive, of the lever E, revolving rod D, crank C, connecting-rod B, and handle A, as and for the purpose set forth.

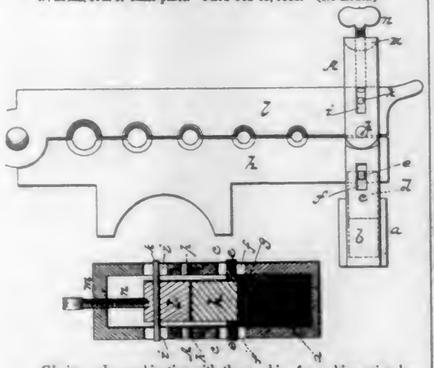
2. The combination, with the coupling-bar of a locomotive, of the lever E and revolving rod D, having a crank-handle, G, convenient for operation by the brakemen when on the ground alongside the pilot, substantially as set forth.

299,115. SHEET-DELIVERY APPARATUS. LUTHER C. CROWELL, Brooklyn, assignor to R. Hoe & Co., New York, N. Y. Filed Sept. 27, 1883. (No model.)

Claim.—1. The combination, with the rotating carrier provided with a number of pathways arranged to receive the sheets from the previous mechanism and deliver them upon the piling-table, of means for directing the leading ends of the sheets into said pathways, all substan-

299,115.

tially as described.



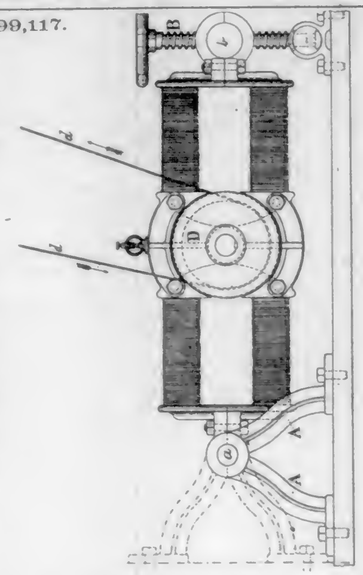
2. The combination, with a web-severing mechanism, of a rotating carrier provided with a number of pathways arranged to receive the sheets from the previous mechanism and deliver them upon the piling-table as they are carried over the same, of means for directing the leading ends of the sheets into said pathways, all substantially as described.

3. The combination, with the rotating carrier provided with a number of pathways formed of series of tapes, as 2 3, which tapes have a motion independent of that of the carrier and are arranged to receive the sheets from the previous mechanism and deliver them upon the piling-table as they are carried over the same, of means for entering the successive sheets into said pathways, and means for driving said carrier at a less speed than said previous mechanism, all substantially as described.

4. The combination, with the cutting-cylinders 10 11, provided with the switch 14, of a sheet-laying mechanism consisting of a rotating carrier provided with a number of pathways, into which the sheets are successively directed by said switch and from which they are delivered to the piling-table as they are carried over the same, all substantially as described.

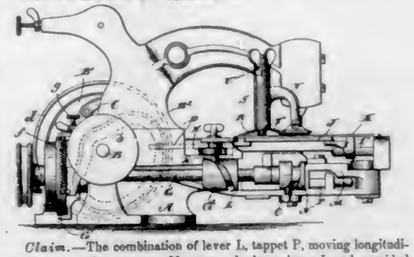
5. The combination, with the rotating carrier provided with a number of pathways formed of series of tapes, as 2 3, and arranged to receive the sheets from the previous mechanism and deliver them upon the piling-table as they are carried over the same, of means for driving said tapes and carrier, so that their combined speed will be equal to that of the previous mechanism, and means for entering the sheets into said pathways, all substantially as described.

299,116. MACHINE FOR MAKING REINS. ORANGE ARMSTRONG DEAN, Parkville, Ill., assignor of two-thirds to Isaac N. Dart and Taylor W. Brian, both of same place. Filed Oct. 13, 1883. (No model.)



Claim.—In combination with the machine for making reins, having the pivoted jaws *h* and *l*, the rectangular frame A, having the receptacle *a* to receive the spring *b*, the block *d*, having lugs *e e*, engaging the slots *f f*, and thumb-screw *n*, the whole operating as described, and for the purpose specified.

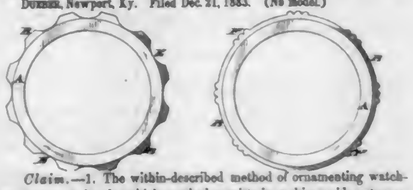
299,117. CONSTRUCTION OF ELECTRIC MACHINES. PHILIP DIEHL, Elizabeth, N. J. Filed Apr. 5, 1883. (No model.)



Claim.—1. An electric machine having a driving-pulley, in combination with pivotal supports for said machine, and with means for adjusting the height of one of said supports, and thus varying the tension of the driving-belt for said pulley, substantially as described.

2. An electric machine having a driving-pulley, and constructed with a fixed pivotal support at one end and an adjustable support at the other, combined with means for changing the height of said adjustable support, and thus varying the tension of the driving-belt for the said pulley, substantially as described.

299,117.



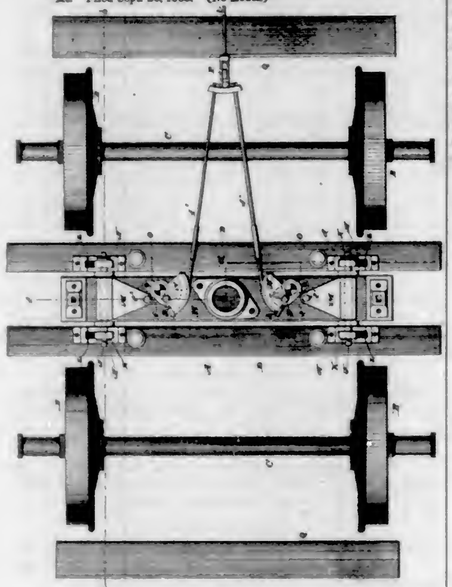
299,118. BUTTON-HOLE SEWING-MACHINE. JAMES DOWLING and JOHN CONNOLLY, London, England. Filed July 27, 1881. (Model.) Patented in France Nov. 10, 1882, No. 152,174.

Claim.—The combination of lever L, tappet P, moving longitudinally in guides thereon, arm M, arranged above lever L and provided with downwardly-extending prongs which straddle said tappet, the transversely-moving slide which carries the feeding-plate and is connected to said arm, a shaft which vibrates said lever transversely, and devices whereby said tappet may be shifted longitudinally, so as to cause the machine to sew on one side of the button-hole or the other, substantially as described.

299,119. MANUFACTURE OF WATCH-CASE CENTERS. JOHN C. DUBBER, Newport, Ky. Filed Dec. 21, 1883. (No model.)

Claim.—1. The within-described method of ornamenting watch-case centers or bands, which method consists in making said centers or bands with an integral annular flange or rib, and then subdividing said flange, so as to afford a series of projecting members arranged circumferentially around said center, substantially as described.

2. As a new article of manufacture, a watch-case center armed with a series of projecting ornaments extending circumferentially around the periphery of said center, said ornaments being integral with said center, substantially as herein described.



299,120. WHEEL. REUBEN ELLWOOD and HANS HANSON STAUGAARD, Sycamore, Ill., assignors to the R. Ellwood Manufacturing Company, same place. Filed Dec. 11, 1883. (No model.)

Claim.—1. The hub A A′, having openings *a*, and spokes B, having heads *b*, in combination with a pipe-box, C, substantially as and for the purpose specified.

2. The hub A A′, having openings *a*, and spokes B, having heads *b*, in combination with the pipe-box C and cap or cover D, substantially as and for the purposes specified.

299,121. CAR-BRAKE. HENRY FLAD and FRITZ HÖPFNER, St. Louis, Mo. Filed Sept. 20, 1883. (No model.)

Claim.—1. In a car-brake, the combination, with a movable bolster and boxes or equivalent devices, each having an inclined bearing-face, of rollers adapted to move on the inclined faces of the boxes, suitable braking mechanism, and devices connecting the rollers to the braking mechanism, whereby the movement of said rollers in one direction operates to set the brakes, substantially as set forth.

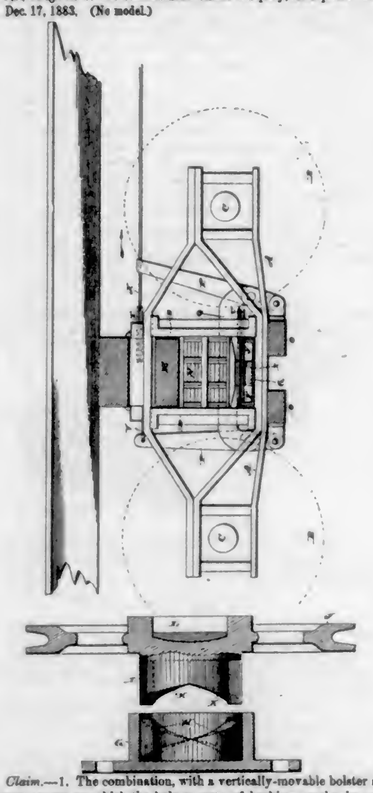
2. In a car-brake, the combination, with a movable bolster and boxes or equivalent devices, each having an inclined bearing-face, of rollers adapted to move on the inclined faces of the boxes, devices for indirectly connecting the rollers to the bolster, suitable braking mechanism, and devices connecting the rollers and braking mechanism, substantially as set forth.

3. In a car-brake, the combination, with a truck having transverse parallel beams, boxes secured to said beams, each of said boxes being provided with an inclined bearing-face, and a movable bolster situated between the transverse beams, of bars having rollers thereon which move on the inclined faces of the boxes, links for suspending the bolster from the bars, a suitable braking mechanism, and devices connecting the braking mechanism and bars, substantially as and for the purpose set forth.

4. The combination, with a truck having two transverse parallel beams, boxes or plates secured to said beams, and a movable bolster situated between the beams, of the bars J, rollers secured to said bars and adapted to move on the inclined faces of the boxes, stirrups for suspending the bolster from the bars J, and devices whereby the weight of the car operates to draw the bars toward each other and elevate the bolster.

5. The combination, with a car-truck having two parallel transverse beams, the boxes secured to said beams, and a movable bolster, of stirrups, the bars J, rollers secured to said bars, and brake mechanism indirectly connected to said bars, whereby the movement of said bars operates to control the brakes.

6. The combination, with the truck, boxes provided with abutments and inclined bearing-faces, and a movable bolster, of the bars J, rollers secured to said bars, stirrups connected to said bars and supporting the bolster, straps connected to the bars, and brake mechanism indirectly connected to said straps.



7. The combination, with a car-truck, transverse beams, the boxes, and bolster, of the bars J, rollers secured to said bars, stirrups suspended from the bars and supporting the bolster, sector-levers pivoted to the bolster, chains or equivalents connecting the sector-levers and the bars J, chains or equivalents connecting the sector-levers and brake mechanism, and means connected to the brake-lever for elevating the car-body.

8. The combination, with the car-truck, the boxes, bolster, and brake mechanism, of the bars J, rollers secured to said bars, stirrups for supporting the bolster, sector-levers pivoted to the bolster and connected to the bars, and chains connecting the sector-levers and brake mechanism.

9. The combination, with the car-truck, boxes, movable bolster, and brake mechanism, of the bars J, rollers, stirrups, straps, sector-levers, chains connecting the straps and sector-levers, and chains or equivalents connecting the sector-levers and brake mechanism, all of the above parts combined and adapted to operate as described.

10. The combination, with the truck, boxes, and brake mechanism, of the bars J, rollers, stirrups, spring-board, spring, bolster, straps connected to the bars J, sector-levers, chains or equivalents connecting the sector-levers, and straps, chains, or equivalents connecting the sector-levers and brake mechanism, and devices connected to the brake-lever for elevating the car-body, all of the above parts constructed, combined, and adapted to operate as described.

299,122. CAR-BRAKE. HENRY FLAD and FRITZ HÖPFNER, St. Louis, Mo., assignors to the Mallinckrodt Brake Company, same place. Filed Dec. 17, 1883. (No model.)

Claim.—1. The combination, with a vertically-movable bolster and two-part screws on which the bolster rests, of braking mechanism and devices for connecting the latter with the two-part screws, substantially as set forth.

2. The combination, with a vertically-movable bolster and two-part screws on which the bolster rests, of braking mechanism connected to the screws and devices for turning said screws and operating the said

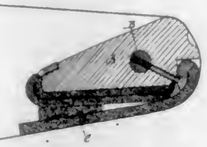
braking mechanism, substantially as set forth.

3. The combination, with a car-truck and a spring-board secured thereto, of two-part screws secured to opposite ends of said board, a vertically-movable bolster, braking mechanism, and devices for raising or lowering said bolster and operating the brake mechanism, substantially as set forth.

4. The combination, with a car-truck and a spring-board secured thereto, of two-part screws secured to the latter, a vertically-movable bolster connected to said screws, brake mechanism, pulleys, and ropes or their equivalents for raising or lowering said bolster and operating the brake mechanism, substantially as set forth.

5. The combination, with a car-truck and a spring-board secured thereto, of two-part screws secured to the latter, a vertically-movable bolster connected with said screws by intermediate springs, brake mechanism, pulleys, and ropes or their equivalents for raising or lowering and operating the brake mechanism, substantially as set forth.

6. The combination, with a car-truck and a spring-board secured thereto, of a vertically-movable bolster, two-part screws between said bolster and board and provided with pulleys, brake mechanism, a shaft connecting said bolster and board and provided with a pulley, and ropes or their equivalents connected with and passing around said pulleys, and adapted to raise or lower said bolster and operate the brake mechanism, substantially as set forth.



7. The combination, with a car-truck and a spring-board secured thereto, of two-part screws situated between the spring-board and bolster, provided with pulleys, a vertically-movable bolster, a shaft connecting said bolster and board and provided with a pulley, and ropes or chains connected to opposite sides of said latter pulley, and connected with said former pulleys and passing around the same in opposite directions, substantially as and for the purpose set forth.

8. The combination, with a truck, spring-board, and movable bolster, of two-part screws connecting said bolster and board, a rod connecting said board and bolster and provided with pulleys, brake mechanism secured to the spring-board, and ropes or chains connecting said pulleys and screws, adapted to operate the brake mechanism, substantially as set forth.

9. The combination, with a truck, spring-board, and movable bolster, of two partial screws working upon each other and connecting said bolster and spring-board, a rod connecting said bolster and board and provided with pulleys, brake-beams secured to said board and provided with brake-shoes, brake-levers, and ropes or chains connecting said screws with said pulleys and adapted to operate the brake-lever, substantially as set forth.

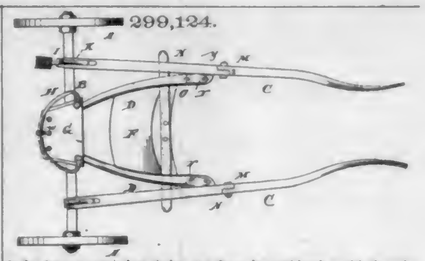
10. The combination, with the truck, spring-board, and movable bolster, of partial screws situated between the spring-board and bolster, pulleys, brake mechanism, and ropes or chains, all of the above parts combined and adapted to operate as described.

299,123. BELT-SUPPORT FOR MACHINES FOR BUFFING BOOT AND SHOE SOLES. GEORGE H. P. FLAGG, Boston, and JAMES W. MALOY, Somerville, Mass., assignors to George H. P. Flagg, Trustee. Filed Apr. 4, 1884. (No model.)

Claim.—The device above described for supporting belts, consisting of the rigid block A and the cushion C, constructed and combined together substantially as set forth.

299,124. TWO-WHEELED VEHICLE. WALTER S. FRAZER, Aurora, Ill. Filed Mar. 22, 1883. Renewed Feb. 29, 1884. (No model.)

Claim.—1. The seat G, composed of a frame, substantially as described, with removable seat-board *a*, having the projections *b* and back *d*, substantially as specified.



2. The seat composed of the frame *g h i*, attached to the arms D, and thereby forming the ledges *f*, in combination with the removable seat-board *a*, substantially as specified.

3. The combination of the seat-frame, constructed substantially as described, with the removable seat-board *a* and the removable box I, both resting upon and supported by the arms D, substantially as set forth.

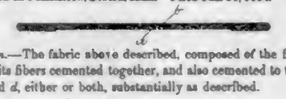
4. The combination of the removable seat-board *a*, having the spring-back *c d*, with a seat having a rail, H, substantially as set forth.

5. The extension or plate *r*, arm D, and bolt *u*, in combination with the arm E, and plates *s* and *t*, and shaft C, substantially as specified.

6. The axle B, having at each end two depending projections, *j* and

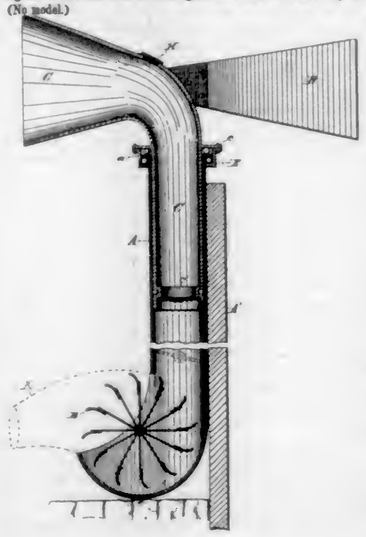
k, the former serrated on their outer faces, in combination with the spindles B′, passing through the depending projections, and having collars *l*, serrated on their inner faces, and nuts *m*, securing the spindles, substantially as described.

7. The step-shank I, having the groove or recess *q*, in combination with the axle B and the brace J, substantially as and for the purpose specified.



299,125. HEEL-STIFFENER FOR BOOTS OR SHOES. GEORGE A. FULLERTON, Boston, Mass. Filed Dec. 20, 1883. (No model.)

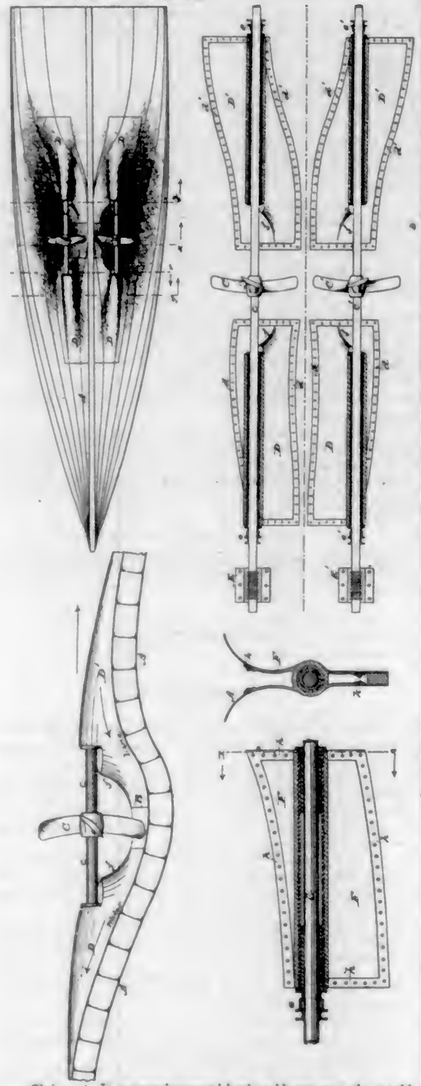
Claim.—1. The heel-stiffener above described, composed of felt, the fibers of which are cemented together.



2. The stiffener above described, composed of the fibrous sheet *a*, having its fibers cemented together, and also cemented to the covering *b* or lining *d*, either or both, substantially as described.

299,126. FABRIC OR SUBSTITUTE FOR LEATHER FOR INSOLES. GEORGE A. FULLERTON, Boston, Mass. Filed Jan. 31, 1884. (No model.)

Claim.—The fabric above described, composed of the fibrous sheet *a*, having its fibers cemented together, and also cemented to the sheets of cloth *b* and *d*, either or both, substantially as described.



299,127. WIND-POWER. CULBERSON S. GARRIGUS, Tiffin, Ohio, assignor of one-half to J. H. Pittenger, same place. Filed July 3, 1883. (No model.)

Claim.—1. The combination, with a stationary tube provided at its lower end with a wind-wheel, and a tube swiveled to the stationary tube, and provided with an open flaring mouth and vane, of a damper located above the wind-wheel, and adapted to regulate the supply of air to the latter, substantially as set forth.

2. The combination, with a stationary tube provided at its lower end with a wind-wheel, and a tube swiveled to the stationary tube, and provided with an open flaring mouth and a vane, of a damper situated above the wind-wheel, and a relief-valve situated above the damper, substantially as set forth.

299,128. SEA-GOING VESSEL. JOHN GARTNER, Rochester, N. Y. Filed Oct. 22, 1883. (No model.)

Claim.—1. In a sea-going vessel having side recesses, the combination of the propellers B, arranged therein, with the separate pillow-block castings D D′, forming parts or sections of the skin or plating A of the vessel, the pillow-bearings for the shafts projecting from the surface of said castings in lines conforming to the walls of the recesses and to the side water-lines of the vessel, entering and emerging from said recesses on each side of said pillow-block bearings, substantially as described, for the purpose specified.

2. In a sea-going vessel constructed with side recesses and having side propellers arranged therein, the separate pillow-block castings D D′, for the propeller-shafts, constructed to form parts or sections of the skin or plating A of the vessel, with the pillow-bearings projecting longitudinally in line with the sides of the vessel into said recesses, conforming to the contour of the water-lines of the vessel, and provided with suitable bushings and packings for the propeller-shafts, substantially as described.

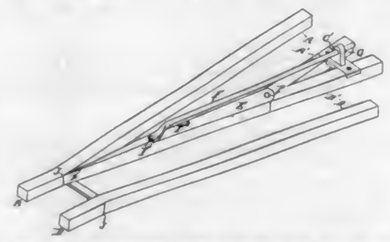
3. In a sea-going vessel, the combination, with the separate pillow-block castings D D′, forming parts or sections of the skin or plating of a vessel constructed with side recesses to the water-lines, whereof the bearing-projections of said pillow-blocks conform, of the propellers, their shafts passing through the bearings of said separate pillow-castings and the end thrust-bearings E E′, substantially as described.

4. In a sea-going vessel, the combination, with a stern propeller, of a pillow-block casting, F, forming a part or section of the skin or plating of the vessel, conforming to the water-lines of both sides of the stern, having the pillow-bearing extending through it between the plating, and provided with suitable bushings and packing, substantially as described.

5. In a sea-going vessel having both side and stern propellers, the former arranged within side recesses, the separate pillow-block castings D, D′, and F, constructed to form the bearings for the propeller-shafts and a part or section of the skin or plating of the vessel, conforming to the water-lines of the vessel's sides and stern, and provided with suitable bearings, substantially as described.

6. The combination, in a sea-going vessel constructed with side recesses, of side propellers arranged therein, with pillow-block castings forming a part or section of the skin or plating of the vessel, their bases conforming to the contour or side water-lines thereof, and having integral cut-waters, substantially as described, for the purpose specified.

7. A sea-going vessel, provided with separate pillow-block castings D, D′, and F, for the sides and stern, constructed to form parts or sections of the skin of the vessel, to conform to the water-lines thereof, substantially as described, in combination with the propellers and their shafts, having suitable bearings, bushings, and oiling appliance in said pillow-block castings, substantially as described.

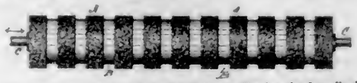


8. The pillow-block castings for the side-propeller shafts of a sea-going vessel, having side recesses for the propellers, conforming to the water-lines of the vessel, said pillow-block castings provided with integral cut-waters, and having their bases conforming to the water-lines of the vessel.

299,129. CAR-AXLE BOX. NATHAN M. GEORGE, Danbury, Conn. Filed Nov. 3, 1883. (No model.)

Claim.—A dust-guard for car-axle boxes, substantially as herein described, consisting of one apertured board, *d*, and a thin apertured piece, *c*, made of vulcanized fiber or leather, as described, the wooden board *d* having a spring, *e*, operated against its lower end, as described, and for the purpose herein specified.

299,130. STORE-SERVICE SWITCH. EDWIN L. GILES, Lowell, assignor to the Lamson Cash Railway Company, Boston, Mass. Filed Aug. 27, 1883. (No model.)

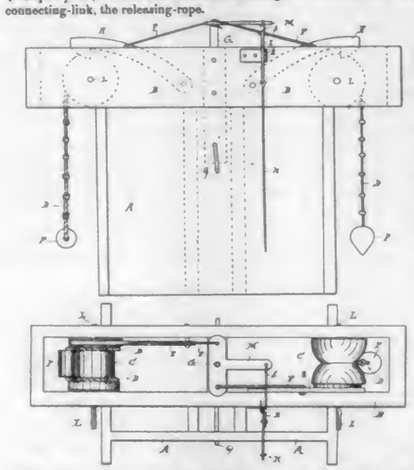


Claim.—1. The combination, with two tracks which converge into a single track, of a movable switch-rail, and means whereby a spheri-

cal carrier traveling one of said converging ways toward said switch-rail will operate said switch-rail before coming in contact with the same.

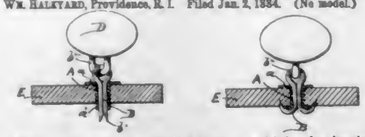
2. The combination of the two tracks converging into one, the movable switch-rail, and a movable rod placed above and pivoted to said switch-rail, between the ends of the same, and pivoted to the inner rails of said converging tracks, said rod being adapted to slide at one of said pivoted points.

3. The combination of the converging tracks, the single track, the bracket secured to the inner rails of said single track and provided with a hole, the switch-rail, and the rod pivoted to said switch-rail, as and for the purpose specified.



299,131. CARD-GRINDING ROLLER. WALTER B. GOULD, Boston, Mass. Filed Oct. 24, 1883. (No model.)

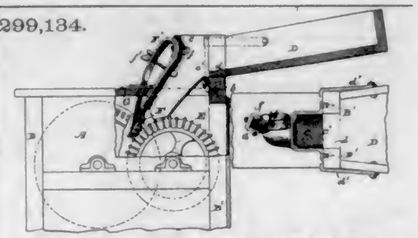
Claim.—The improved card-grinding roller herein described, extending the full width of the card, and consisting of a series of cylindrical grinding-sections, A, separated by independent circumferential grooves B, having the ventilating and edge-grinding capabilities, substantially as set forth.



299,132. FIRE-ESCAPE. JACOB HABER, Garfield, Kans. Filed MAR. 6, 1884. (No model.)

Brief.—The pawls which hold the ladder-reels are connected to a T-shaped plate, to which is also attached, through a bell-crank lever and connecting-link, the releasing-rope.

Claim.—In a fire-escape, the frame B, and the rollers C C', having shafts L, provided with ropes or flexible ladders D, in combination with pawls E, rods or links F, plate M, and bell-crank lever I, provided with cord K, substantially as described, and for the purposes set forth.



299,133. METHOD OF ATTACHING BUTTONS TO SHOES, &c. WM. HALKYARD, Providence, R. I. Filed Jan. 2, 1884. (No model.)

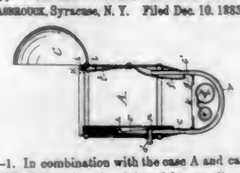
Claim.—The method of attaching buttons to fabrics, &c., herein described, which consists, first, in passing a staple through the eye or shank of the button, then inserting said staple through the neck of a flanged eyelet, after which the eyelet and staple are inserted through the fabric and clinched thereunder by suitable means at one operation, substantially as shown and set forth.

299,134. CORN-SHELLER. WILLIAM H. HALL, Tiffin, Ohio. Filed May 22, 1883. (No model.)

299,134.

Claim.—1. In a corn-sheller, the combination of the shelling mechanism, the long rear posts, and the metal hopper opening horizontally between said posts to receive from a wood hopper, chute, or conveyer, and bulging out in front of them to afford a vertical mouth for feeding by hand.

2. In a corn-sheller, the combination, with a metal hopper having a mouth opening horizontally between the long rear posts, of a wood hopper having a bottom prolonged into a tongue to fit snugly between said rear posts and come flush with the under lip of said metal hopper, and sides abutting against the rear faces of said posts, and hooks whereby said wood hopper is secured to the sheller-frame, substantially as described.



3. The combination of the rear posts of the casing, the wood hopper having its bottom prolonged into a tongue, which fits snugly between said posts and sits upon their tie-piece, and its sides arranged to abut against the rear faces of said posts, and the strap-hooks pivoted near the top of the hopper sides, and taking by their bent ends over the projecting front faces of said posts.

4. The combination, with the metal hopper bulging in front to form a secondary or vertical mouth, of the rub-iron having its shank bent at its upper end to fit the curve of said bulge, the spring bent re-enteringly at its upper end to sit over the upper end of the rub-iron shank, and the through-bolt securing them to the hopper.

5. The combination, with the metal hopper, shelling-disk, and rub-iron, of the slotted casting or keeper for said rub-iron secured to the top board of the casing.

6. The combination, with the metal hopper and shelling-disk, of the rub-iron and spring secured to the hopper by a bolt at their upper ends, and a slotted casting receiving them near their lower ends, and adapted to be secured to the top board of the casing after they have been set in proper relation to the shelling-disk to retain them permanently in such relation.

299,135. COMBINED POCKET-CASE AND CIGAR-CLIPPER. ELI PERRY HARBROUCK, Syracuse, N. Y. Filed Dec. 10, 1883. (No model.)

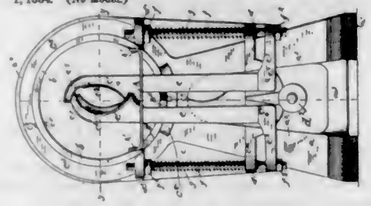
Claim.—1. In combination with the case A and catch *d*, the branch *c*, provided with the notch *n*, head *h*, and intermediate beveled portion *r*, substantially as described and shown.

2. In combination with the case A and knife *b*, the catch *d*, provided with the beveled cross-bar *d''*, and the branch *c*, provided with the notch *n*, undercut head *h*, and the intermediate beveled portion, *r*, having the face of its thickest part back of the line of the rod, substantially as and for the purpose shown and set forth.

3. In combination with the branch *c*, the catch *d*, consisting of a strip of sheet metal bent into rectangular form, and having its extremities folded one over the other across one end of the rectangle and along one side of the same, substantially as shown and described.

4. In combination with the case A and knife-carrying rod having branches *c c'*, the shield *f*, having flanges *g*, as and for the purpose shown and described.

5. In combination with the case A, the hinged cover C, provided with the cam *i*, and the spring *t*, provided with the projection *u*, substantially as specified and shown.



6. In combination with the case A and the hinged cover C, provided with the cam *i*, the spring *t*, provided with the projections *u* and with the side flanges, *l*, as described and shown.

7. The spring *t* and shield *f*, formed in one piece of metal, attached at the junction of said parts to the case, substantially as described and shown.

8. In combination with the case A, cover C, and knife-carrying rod having branches *c c'*, the spring *t*, and shield *f*, formed in one piece, and provided at their junction with an eye for the attaching screw or rivet, and with re-enforcing ribs *m m* at opposite sides of said eye, substantially as and for the purpose specified.

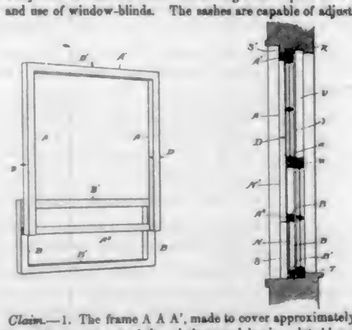
9. The combination of the case having the slit or mortise *k*, extended part way across the end of the case, and the knife *a*, formed with the tenon *o*, and with the shoulders *p* at the ends of said tenon, substantially as specified and shown.

299,136. CORN-SHELLER. JAMES M. HAWLEY, Odin, Ill. Filed MAR. 1, 1884. (No model.)

Claim.—1. In a hand corn-sheller, the annular shell *b*, provided with the cut-away portion b^4, the central triangular projection, b^2, the rear flange, *b'*, and the crank-arm b^3, all cast in one piece, substantially as specified.

2. In a hand corn-sheller, the flat plate or casting *c*, provided with the opening c^2 in its upper portion, surrounded by the annular rim c^3, provided with the curved projecting rib c^4 above the lower opening, c^5, the lugs *d d'*, horizontal flange c^{10}, and crank-handle d^3, all cast in one piece, substantially as specified.

3. In a hand corn-sheller, the combination of the standards a^2 a^2, having the vertical annular rim a^4, the annular shell *b*, having the cut-away portion b^4 and the triangular projection b^2, the cross-bar *h* over the space b^4, the rear flange, *b'*, and the crank-handle b^3, and the flat casting *c*, having the openings c^2 for the annular shell *b*, the projecting rib c^4, perforated lugs *d d'*, the shelling-jaws *e' e'*, the arms *e e*, and perforated angular extensions c^3 c^3 at their lower ends, the spring-rods *f f*, springs *g g*, and regulating-nuts *f' f''*, substantially as specified.

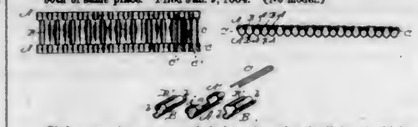


4. In a hand corn-sheller, the combination, with the flat casting having the openings c^2 for the annular shell *b*, and the perforated lugs *d d'* on its front face, of the pivoted angular arms *e e* e^2 e^2, carrying the shelling-jaws at their upper ends, the spring-rods, spiral springs, and regulating-nuts, substantially as specified.

5. In a hand corn-sheller, the combination, with the pivoted angular arms *e e* e^2 e^2, the casting *c*, having the horizontal flange c^{10}, the spring-rods, spiral springs, and regulating-nuts, of the curved shelling-jaws provided with two teeth, e^3 e^3, each, and provided on their inner faces, and cast solid therewith, with two screw-threads, e^7 e^7, arranged diagonally of the jaw-faces and in directions opposite on opposite faces, substantially as specified.

6. In a hand corn-sheller, the combination, with the pivoted angular arms *e e* e^2 e^2, carrying the shelling-jaws *e' e'*, of the standards a^2 a^2, flat casting *c*, and the annular shell *b*, provided with the triangular projection b^2 between the pivoted arms, substantially as specified.

299,137. WINDOW-SCREEN. SEDGWICK R. HAZEN, West Jersey, Ill. Filed July 23, 1883. (No model.)

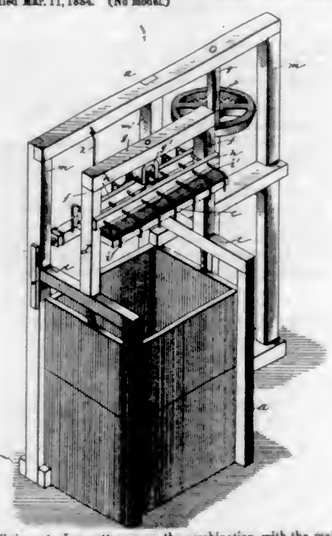


Brief.—An outside window-screen consisting of two frames—one stationary and the other movable—so arranged as to permit the operation and use of window-blinds. The sashes are capable of adjustment.

Claim.—1. The frame A A A', made to cover approximately three-fourths of the upper part of the window, and having slat A' and suitable netting, in combination with the low frame B B B' B', having suitable netting secured to its exterior face, and the strips C C, whereby it is retained in the channels below the upper sash of the window, substantially as and for the purpose herein set forth.

2. As a means whereby a frame, B, can be removable in the channels of a window-sash, the strips C C, made L-shaped in cross-section, substantially as and for the purpose described.

299,138. ORNAMENTAL CHAIN. LOUIS HECKMANN, Wrentham, Mass., assignor of two-thirds to Edward P. Davis and William H. Wade, both of same place. Filed Jan. 9, 1884. (No model.)



Claim.—1. An ornamental chain or bracelet the links of which are constructed of trefoil or quarterfoil tubing, otherwise known as "clover-leaf wire," said links being suitably secured together, as an improved article of manufacture.

2. An ornamental chain or bracelet the links of which are constructed of trefoil or quarterfoil tubing laid side by side, and secured together by means of wire staples, substantially as and for the purpose set forth.

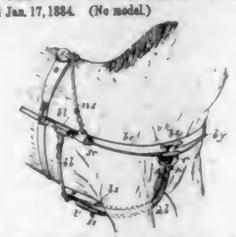
3. An ornamental chain or bracelet the links of which are constructed of trefoil or quarterfoil tubing laid side by side, and secured together by the wire staples C, having the bent-back ends C', substantially as and for the purpose described.

299,139. COTTON-PRESS. CYRUS DAVID HEFLIN, Roanoke, Tex. Filed MAR. 11, 1884. (No model.)

Claim.—1. In a cotton-press, the combination, with the main frame supporting the horizontal shaft provided with the drum and miter-pinion, and the vertical shaft having small band-wheel and large segmental miter-wheel, and the press-box, of the auxiliary frame above the press-box, provided at its top with a pulley, and the press-block connected to the rope running over said pulley to the drum, substantially as specified.

2. In a cotton-press, the combination, with the press-box, auxiliary frame, the press-block, and mechanism, substantially as described, for operating it, of the guide-crate adapted to slide upon the vertical ways of the auxiliary frame, substantially as specified.

299,140. LOCKING DEVICE FOR COFFINS. EDWIN F. HILL, Springfield, Ohio, assignor of one-half to Joseph G. Jacobs, same place. Filed May 7, 1883. (Model.)

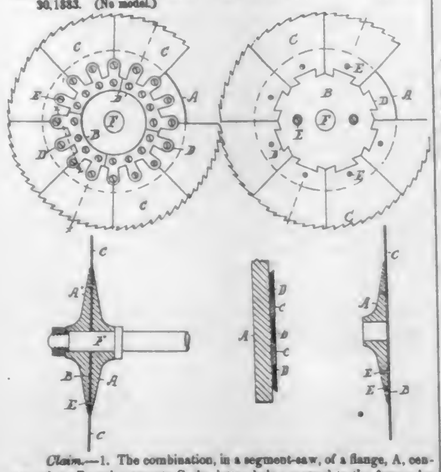


Claim.—1. In a metallic coffin, the combination, with a self-locking device, of an upright extending from the bottom plate to the upper edge of the coffin-body, within the latter, said upright being unattached to the sides of said coffin, and having a right-angled foot-piece, by which it is secured to the bottom plate, for the purpose hereinbefore set forth.

2. In a metallic coffin, the combination, with the flat upright bar extending from the bottom plate to the top of the coffin sides and ends, and unattached to either of the latter, and having an angular foot-piece secured to said bottom plate, as described, of the self-locking device at the top end of said bar, adapted to automatically engage with the catch of the lid, for the purpose set forth.

3. In a self-locking device for a metallic coffin, the combination, with the upright bar connected with bottom plate of the coffin, and having a lock upon the top end of the same, of the catch provided with a screw-threaded shank, and adapted to be attached to and detached from the lid of said coffin by means of the fingers, as hereinbefore set forth.

299,141. BREAST-COLLAR FOR HARNESS. LEVI H. HILLS, Kokomo, Ind. Filed Jan. 17, 1884. (No model.)



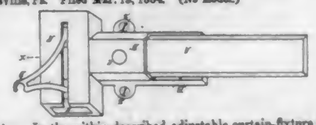
Claim.—1. The breast-yoke *by*, secured by side clamps, *sc*, to the harness-collar in the rear, said clamps adapted to be loosened to permit the removal of the breast-yoke, all combined substantially as described.

2. The breast-yoke *by*, the adjustable brace *ab*, the clamp *c*, connecting the two, the tube *t*, set-screw *as*, and the belly-band *bb*, all combined substantially as described.

3. The box-loop *bl*, provided with metal lining inside, and the breast-collar *bc*, having a metal backing, with openings to receive screws, whereby the box-loop may be secured to the breast-collar without stitches, substantially as described.

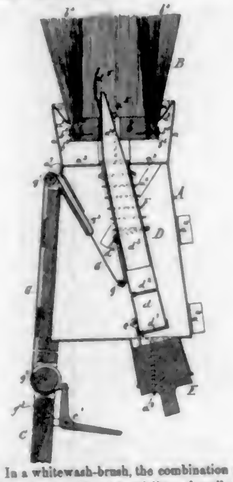
4. The breast-yoke *by*, connected by clamp *c* to the adjustable brace *ab*, moving in tube *t* at the rear, the breast-strap *bs*, neck-strap *ns*, side clamp, *sc*, securing breast-yoke to the breast-collar, the belly-band *bb*, and box-loop *bl*, secured to breast-collar *bc* by screws passing through metal plates, all combined substantially as described.

299,142. SEGMENT-SAW. JAMES HILTON, Newark, N. J. Filed Oct. 30, 1883. (No model.)



Claim.—1. The combination, in a segment-saw, of a flange, A, center plate, B, and segments C, the latter being secured to the former by the tongues and slots herein shown and described, and for the purpose set forth.

2. The combination of the flange A, center plate, B, having tongues D, secured thereto by screws E, and beveled on their edges, as described, and segments C, having slots fitted to the beveled edges of the tongues, and removable by sliding radially, as and for the purpose set forth.



3. The combination, with the center plate and segments united by tongues and slots, as described, of flanges clamped on both sides of the segments, as and for the purpose set forth.

299,143. ADJUSTABLE CURTAIN-FIXTURE. CHARLES F. HINDT, Pottsville, Pa. Filed Mar. 12, 1884. (No model.)

Claim.—In the within-described adjustable curtain-fixture for holding brackets for curtain-rollers, the combination of the stationary plate B, having inclosed portion B' and screws S S, the slide A, having attached the bracket-holder A', containing slot H, adapted to hold the bracket, and the set-screw C, as and for the purpose set forth.

299,144. FOUNTAIN-BRUSH. THOMAS HUNTSAKER, Geneva, Iowa. Filed Oct. 31, 1883. (No model.)

Claim.—1. In a whitewash-brush, the combination of a brush, B, a reservoir, A, and an elevator, D, substantially as described.

2. In a whitewashing or calciminiog brush, the combination of a fluid-reservoir, a rigid tube, *d*, having valves *d'* *d²*, a reciprocating tube, *d³*, having nozzle *d⁴*, and suitable mechanism for operating the tube *d³*, substantially as and for the purpose described.

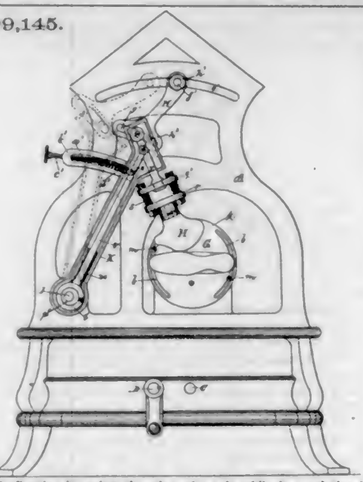
3. In a whitewashing or calcimining brush, the combination of the reservoir A, having looped studs *a⁴*, with locking-pins *a⁵*, and adjusting-washers *b²*, and the brush B, substantially as and for the purpose described.

4. The combination of the brush B, the rims *a a'*, the chamber or reservoir A, tube *d³*, stopper E, and elevator D, substantially as and for the purpose described.

5. The combination of the spraying-deflector *d⁵* with the brush B and the liquid-elevator D, substantially as and for the purpose described.

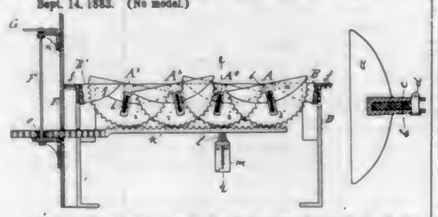
6. The combination of the reservoir A, having top rims, *a a'*, forming space *a³*, spout *a⁶*, and the brush B, substantially as and for the purpose described.

299,145. MACHINE FOR SETTING OR MOLDING THE EDGES OF BOOT OR SHOE SOLES. EDMUND BURR KELSEY, Beverly, Mass. Filed Mar. 14, 1884. (No model.)



Claim.—1. The combination of the jack provided with mechanism for automatically revolving it, with the setting or molding tool having mechanism, substantially as described, for pressing and vibrating it against the edge of a shoe-sole while in revolution by means of the jack.

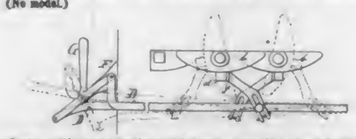
2. The combination of the two jacks applied to one shaft, having mechanism for automatically revolving it, with the two setting or molding tools having to each mechanism, substantially as described, for pressing and vibrating it against the edges of a sole while in revolution by means of the jack supporting the last carrying the shoe of such sole.



3. The combination of the toggle M, adapted to the frame A by mechanism, substantially as described—viz., the headed screw, its nut, and the curved slot in the frame—with the arm K, pivoted to the frame, and provided with the vibratory tool-carrier and operative mechanism thereof, all being substantially as described.

4. The jack having slots in it, substantially as described, and pivoted to its carrier and connected thereto by clamp-screws, and a lever and springs, all being substantially as set forth.

299,145.

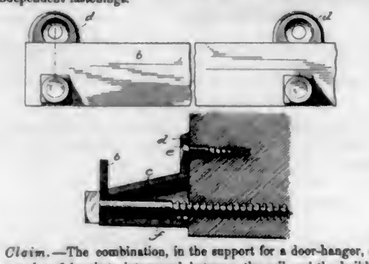


299,146. FURNACE-GRATE. THOS. KIRKWOOD, Chicago, Ill. Filed Sept. 14, 1883. (No model.)

Claim.—The plates *a*, provided with downwardly-projecting lugs *c*, and adapted to fit over bars *b*, in combination with said bars, means for holding them in position, and means for shaking such bars and plates, as and for the purpose set forth.

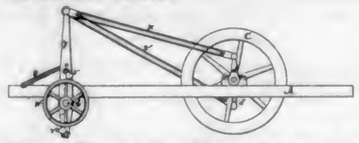
299,147. GRATE. THOS. KIRKWOOD, Chicago, Ill. Filed Dec. 19, 1883. (No model.)

Claim.—The combination, with bars *a*, carrying plates *b*, of the inclined, bent, and slotted arms C, and suitable means for operating such parts, as described and shown.



299,148. METHOD OF GILDING GLASS SIGNS AND LABELS. CHAS. E. KOKEN, St. Louis, Mo. Filed Mar. 27, 1883. (No model.)

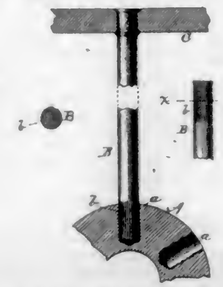
Claim.—The within-described process of gilding glass signs, the same consisting in first cleaning the glass plate, applying the design upon reverse side of the glass with a thin solution composed of chloride of gold, sulphur, oil of lavender, and oil of turpentine, in about the proportions specified, and subjecting the glass to a temperature of about 800° Fahrenheit, and finally gradually cooling the glass, all substantially as described.



299,149. DOOR-HANGER. WILLIAM J. LANE, Poughkeepsie, N. Y. Filed Feb. 21, 1884. (No model.)

Brief.—A series of brackets are interposed between the rail and the building, the rail and brackets being secured directly to the building by independent fastenings.

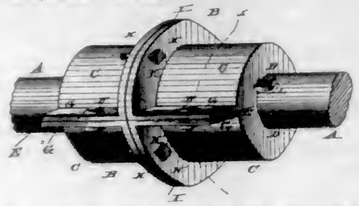
Claim.—The combination, in the support for a door-hanger, of a rail, a series of brackets interposed between the rail and the building, both rail and brackets being directly secured to the building by independent fastening devices, substantially as described.



299,150. ROAD-LOCOMOTIVE. CHARLES P. LEAVITT, Memphis, Tenn. Filed Oct. 5, 1883. (No model.)

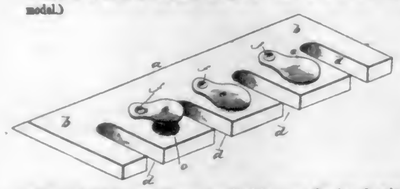
Claim.—1. The springs X and X', the cranks *d* and *d'*, the shaft *b*, the fly-wheel C, the arms T and T', the pawls V and V', the springs Y and Y', and the wheels W and W' upon the shaft E, combined, arranged, and operated substantially as described, and for the purpose set forth.

2. The springs Y and Y', in combination with the bars T T' and springs X and X', substantially as described, and for the purpose set forth.



299,151. IRON WHEEL. JAMES R. LITTLE, Quincy, Ill., assignor of three-fourths to Cyrus Smith, Thomas Hill, and Pliny Bliss Williams, all of same place. Filed Aug. 11, 1883. (No model.)

Claim.—1. In an iron wheel, the combination, with an iron hub having holes *a* for the spokes, of spokes having longitudinal corrugated ends fitted to and driven or forced firmly into the holes *a*, substantially as and for the purpose specified.

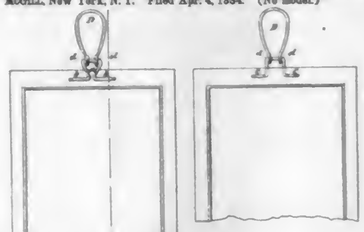


2. In an iron wheel, the combination, with an iron hub having holes *a* for the spokes, of spokes having longitudinal corrugated inner ends fitted to and driven or forced into the holes *a* in the hub, and outer ends riveted to the rim, substantially as and for the purpose specified.

299,152. SHAFT-COUPLING. SERENO S. LUKENS, Rock Falls, Ill. Filed Apr. 5, 1884. (No model.)

Claim.—The combination of the shaft A, bolts F and K, and coupling B, the latter composed of the four corresponding parts C, provided with faces E and J, substantially as shown, and for the purpose described.

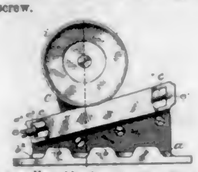
299,153. PLANER-KNIFE. PETER MCCOURT, Appleton, Wis., assignor of one-half to James H. Simpson, same place. Filed Mar. 28, 1884. (No model.)



Claim.—A set of planer-knives provided between the slots forming the knife-sections with weight-receptacles having swinging covers, and balancing material or filling in said receptacles, substantially as specified.

299,154. TAG-FASTENER. GEORGE W. MCGILL, New York, N. Y. Filed Apr. 2, 1884. (No model.)

Claim.—As an article of manufacture, a ticket-holding pin consisting of a single piece of spring-wire pointed at one end, and its other end terminating in the elongated clamping-loop folded over on a line nearly parallel with the pin-shank, substantially as and for the purposes herein specified.



299,155. RING-SUSPENDING DEVICE FOR PAPERS. GEORGE W. MCGILL, New York, N. Y. Filed Apr. 4, 1884. (No model.)

Claim.—As an improved article of manufacture, the adjustable ring-staple for holding and suspending papers, &c., consisting of a staple and a loop or ring, each made of a single piece of wire and hinged together, substantially as shown, to enable the loop or ring to be opened or closed, substantially as set forth and shown.

299,156. DOOR-HANGER. EDWARD Y. MOORE, Chicago, Ill. Filed Feb. 18, 1884. (Model.)

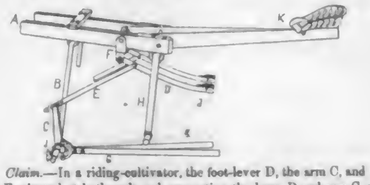
Brief.—An inclined raceway has a guide-slot extending from end to end of the raceway. The roller-bearing has a shank which is fitted to slide in such guide-slot. The adjusting-screw has its bearings in the inclined raceway. The weight of the door is borne by the raceway and not by the adjusting-screw.

Claim.—1. In an adjustable door-hanger, the combination of a raceway inclined at an angle of repose, the same being less than twenty degrees from a horizontal line, and a roller-bearing shank provided with a similarly-inclined block, substantially as described, whereby all vertical strains on said hanger, when in use, will be borne by said block and raceway, as set forth.

2. In an adjustable door-hanger, a hanger-plate having an inclined raceway provided with a lateral supporting-flange, and with a guide-slot in the top thereof, in combination with a roller-bearing having a shank which occupies said guide-slot, and has an inclined block or lateral flange in contact with the flange of the raceway, and is movable longitudinally therein throughout the length of the guide-slot, substantially as described.

3. In an adjustable door-hanger, the hanger-plate and the roller-bearing coupled together by the inclined block and the door-supporting raceway, in combination with the adjusting-screw within said raceway, substantially as described, whereby the weight of the door is wholly borne by the raceway and the screw relieved from strain, as set forth.

4. In an adjustable door-hanger, the combination of the inclined sliding block, the inclined raceway, and the rotating adjusting-screw confined longitudinally in said raceway, and connected to the block by means of the nut and its recess, substantially as described, whereby said block is adjustably moved longitudinally in the raceway by the rotation of the screw, and held by said screw in its various positions of adjustment.



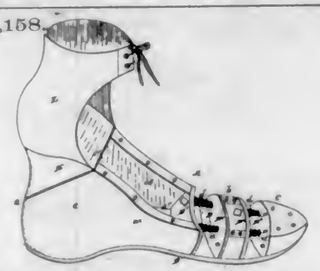
5. In an adjustable door-hanger, a rotative adjusting-screw, in combination with a hanger-plate having an inverted step-bearing for the upper end of said screw, substantially as described, whereby all strains to which said screw may be subjected will be borne with an endwise thrust toward its inverted step-bearing, as described.

6. The door-hanger plate constructed in two parts or sections oppositely recessed to form an inclined raceway, and having at the lower edge of said plate lateral flanges, substantially as described.

7. A door-hanger plate having a straight lower edge and lateral flanges, in combination with a detachable base-plate which is longitudinally slotted and laterally recessed for the reception of the flanged edge of the hanger-plate, and provided with a locking-pin hole, and with screw-holes by which it may be attached to the top edge of a door, substantially as described.

8. The double rollers coupled by the axle and locking-bolt, in combination with the flat shank, and the friction-rollers confined within a chamber formed by an annular hole in said shank and the inner sides of both rollers, substantially as described.

299,157. FOOT-LIFT FOR RIDING-CULTIVATORS. JOB B. NEFF, Burlington, Iowa, assignor to the Burlington Plow Company, same place. Filed Nov. 23, 1883. (No model.)



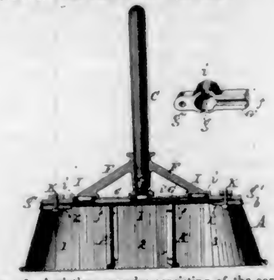
Claim.—In a riding-cultivator, the foot-lever D, the arm C, and the link E, pivoted at both ends and connecting the lever D and arm C, said arm C being rigidly attached to a coupling device, preferably a pipe-box, whereby it remains stationary while the beam can be adjusted laterally, in combination with said coupling device to which said beam is attached, as and for the purpose specified.

299,158. ARTIFICIAL FOOT AND SHOE. EDWARD L. O'CONNOR, Cincinnati, Ohio. Filed Feb. 9, 1883. (No model.)

Claim.—1. The artificial foot A, consisting of a heel-section, *a*, and one or more toe-sections, *b*, said sections being connected by a spring-connection, to permit the foot to bend in imitation of the natural foot, the surface *m* of said artificial foot being shaped to correspond with the bottom of the natural foot, and adapted to receive said natural foot, substantially as and for the purposes specified.

299,158.

2. The artificial foot A, consisting of the heel-section *a* and the toe section or sections *b*, said sections being secured to a spring sole-plate, B, and separated by spaces, in which spaces are placed springs D, capable of being compressed between the sections when the foot is bent, substantially as and for the purposes specified.



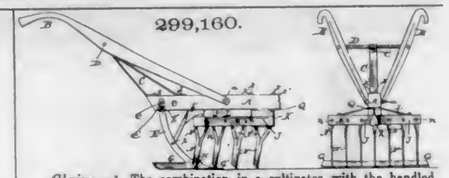
3. The combination of the heel-section *a*, having plate B', and the toe section or sections *b*, having plates B², said sections being secured to a plate, B, and the springs D, located between said heel and toe sections, and retained in position by the rods or bolts *d*, substantially as and for the purposes specified.

4. In an artificial foot, the heel-section *a*, consisting of the lower portion or base, *c*, and the upper portion or block, E, the two portions being hinged together at the front edge of said block by a hinge, *c'*, substantially as and for the purposes specified.

5. The heel-section *a*, consisting of the base *c* and the block E, hinged together, as described, in combination with the bolt F, passing through said block and base, and secured to the plate B, and the spring G, located in the recess *f* in the block E, and surrounding the upper end of the bolt F, and compressed between the head F' of said bolt and the bottom of the recess *f*, substantially as and for the purposes specified.

6. In combination with a false foot provided with a surface, *m*, shaped substantially as shown, and terminating at rear above the ordinary heel portion of a shoe or boot, the upper *n*, provided with recess *p*, substantially as and for the purposes specified

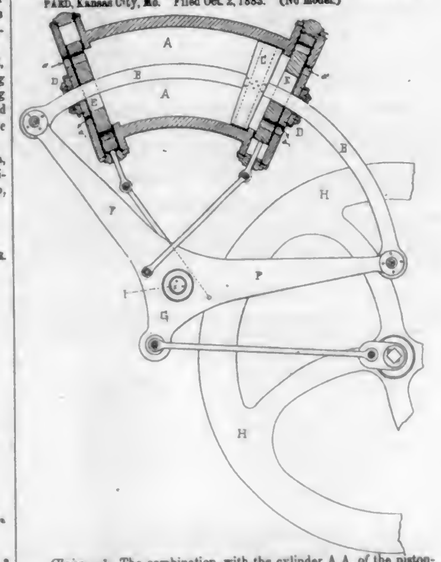
299,159. WASHING-MACHINE. WILLIAM PARK and JOHN S. PARKER, Fredonia, N. Y. Filed Feb. 13, 1883. (No model.)



Claim.—1. A clothes-pounder consisting of the combination of a sheet-metal base portion divided into compartments, each of which has an escape-opening in its top, a stiffening-frame having a handle-socket and attached to said base portion by means of arms extending over the top of each compartment and covering their openings, said frame being provided with recesses over each opening, and escape-apertures communicating with said recesses, and valves situated over said openings and in the recesses of the frame, substantially as set forth.

2. A clothes-pounder consisting of the combination of a base portion divided into compartments, each of which has an escape-opening in its top, a handle-supporting frame attached to the top of the base portion and having arms extending over said openings, recesses formed in said frame and situated over the openings, escape-apertures communicating with said recesses, valves situated over the openings and in the recesses, and ducts *f*, formed in the arms of said frame and connecting said recesses with one another, substantially as and for the purpose set forth.

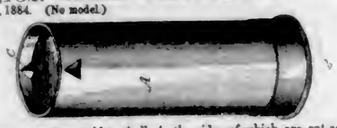
299,160. CULTIVATOR-PLOW. HENRY FARRIS, Horace, Ga. Filed Nov. 14, 1883. (No model.)



299,160.

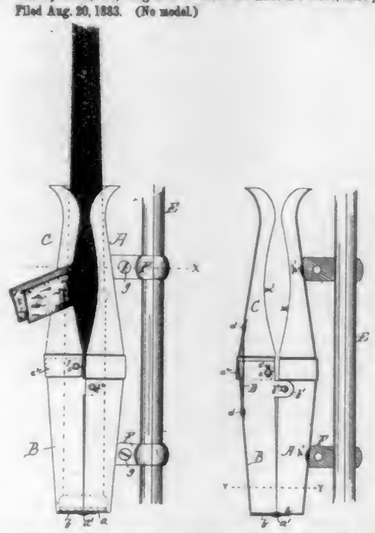
Claim.—1. The combination, in a cultivator, with the handled beam A B C, of the plow or sweep G, with curved standard E, secured at the rear of the beam and adapted for adjustment to gage the angle and depth of cut of the same, V-shaped frame J, also secured to the beam A directly in front of the sweep, teeth N, having a curved body, divided top end, by which they are secured to the frame J, and sharp front edge, *o*, and point *o'*, strap K *k*, and wedges Q, whereby the pulverizer-frame may be adjusted vertically to regulate the depth of cut of the teeth, substantially as described, for the purposes specified.

2. In a cultivator, the combination, with the frame J and metal strip M, of the colters or teeth N, the body of which is curved in cross-section, with a sharp front edge, *o*, and point *o'*, and divided ends N', which ends pass between the said band M and the frame J on alternate edges thereof, and are secured by screws *n*, which secure both the band M and teeth N, substantially as described, for the purposes specified.



299,161. STEAM-ENGINE OR WATER-MOTOR. GERRITT S. PREPARD, Kansas City, Mo. Filed Oct. 2, 1883. (No model.)

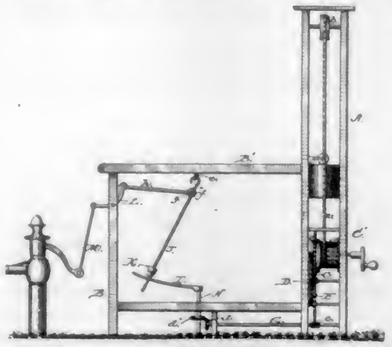
Claim.—1. The combination, with the cylinder A A, of the piston-rod of this form B, the arms F F and G, the main pin I, and the packing-boxes D, arranged for operation substantially as shown and described.



2. In an engine for motive power, a radially-bored cylinder, a piston-rod conforming to the circle of the same, and having attached the piston C, and a balanced slide-valve, with openings, as shown, at each end of the cylinder, all arranged for operation substantially as set forth.

299,162. CARTRIDGE. G. MOORE PETERS, Xenia, Ohio. Filed MAY 24, 1884. (No model.)

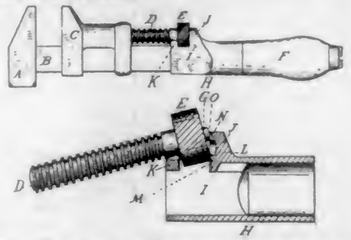
Claim.—A cartridge-shell, A, the sides of which are cut so as to leave two inwardly-projecting holding-pieces, C, the pieces being so cut that their faces form a triangular edge, the shell being entirely cut away at the bottom of said pieces C, which are forced inward so that their lower edges press against the wad or ball.



299,163. COMBINED WHIP AND LINE HOLDER. HENRY B. PITMER, Plymouth, Ind., assignor to himself and Kain K. Brooks, same place. Filed Aug. 20, 1883. (No model.)

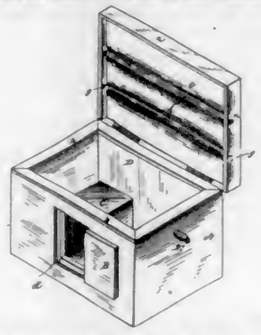
Claim.—1. The combined whip and line holder, consisting of rigid section A, rigid section B, secured thereto, and movable section C, secured to section B by rivets passing through slots in one of said sections, and spring D, said sections A and C having their edges or sides cut out or gored, so as to admit the lines between the pivotal section and the whip, substantially as specified.

2. The combination of section A, provided with ear or lug *a*, and section B, provided with ears or lugs *b* and *b'*, and riveted to said section A, movable section C, secured to said section B by rivets passing through slots in one of said sections, and spring D, riveted to said sections B and C, substantially as specified.



299,164. MECHANICAL MOTOR. GEO. W. REAMS, Burlington, Kans., assignor to Franklin D. Jones, same place, and Hamilton Milton Hart, Perry, Iowa. Filed Apr. 7, 1884. (No model.)

Claim.—1. The herein-described mechanical motor, consisting of the frame A B, provided with the weight F, cord *a*, pulley *b*, drum C', cog-gears C, D, E, and *c*, shafts G and H, provided with bevel-gears *d d'*, arm I, pendulum J, having weight or ball K, collar *f*, and set-screw *g*, elbow-lever L, and pitman M, the several parts being constructed and arranged substantially as and for the purpose specified.



2. The frame A, provided with the cog-gears C, D, E, and *c*, drum C', weight F, cord *a*, and pulley *b*, in combination with the frame B, provided with the shafts G and H, bevel-gears *d d'*, arm I, pendulum J, ball K, elbow-lever L, and pitman M, constructed and arranged substantially as and for the purpose specified.

299,165. WRENCH. SQUIRE ROBINSON, Southington, Conn. Filed Dec. 29, 1883. (No model.)

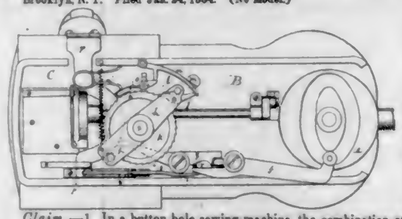
Claim.—The integral piece H, constructed with the concave grooves M and N on the face O of the step J, and constructed otherwise substantially as described.

299,166. COMBINED MILK-COOLER AND REFRIGERATOR. RICHARD M. ROCKEY, Nora, Ill. Filed Mar. 12, 1884. (No model.)

Claim.—1. In a combined milk-cooler and refrigerator, the combination, with an outer box or casing, of an inner casing constructed of thin sheet metal, and arranged within the outer casing to form an air-space, and a box or casing arranged upon the inner side of the inner casing, access being had thereto by means of an opening in the side of said casing, and a door for closing the same, substantially as set forth.

2. In a combined milk-cooler and refrigerator, the combination, with an outer and an inner casing, of a hinged cover having a lining of sheet metal provided with longitudinal grooves or recesses, and open-lugs in the sides of the cover communicating therewith, substantially as and for the purpose set forth.

3. In a combined milk-cooler and refrigerator, the combination of an outer and an inner casing, a box or casing secured therein, an opening in the side of the inner casing, a door communicating with said box, inlet and outlet tubes suitably arranged, and a hinged cover having a lining of sheet metal provided with longitudinal grooves, the sides of the cover having openings registering with said grooves, substantially as set forth.



299,167. PROCESS OF BLEACHING, DEODORIZING, AND SWEETENING BENZINE. JOHN ROWELL, Chicago, Ill., assignor of one-half to De Golyer & Bro., same place. Filed Mar. 24, 1883. Renewed Mar. 31, 1884. (No specimens.)

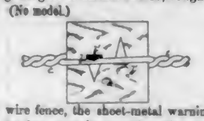
Claim.—1. The process of deodorizing, &c., petroleum-benzine wherein a given mass of the same is first treated to an application of sulphuric acid, then to a solution of a suitable alkali, and lastly to a solution of saltpeter and sulphuric acid, a washing with water being preferably resorted to after and between each of the aforesaid applications, said chemicals being used in the proportions and in the manner specified.

2. The process of deodorizing, &c., petroleum-benzine wherein a given mass is treated to, first, an application of sulphuric acid; second, an application of a solution of a suitable alkali; third, an application of a solution of saltpeter and sulphuric acid, and, fourth, an application of a solution of sugar of lead and blue copperas, all of which are used in the proportions and manner specified.

3. The process of treating petroleum-benzine wherein a given mass is treated, first, to an application of sulphuric acid; second, to a solution of a suitable alkali; third, to a solution of saltpeter and sulphuric acid; fourth, to a solution of sugar of lead and blue copperas, and, fifth, to an application of a chromate or bichromate of either potassium, sodium, or ammonium, said chemicals being used in the proportions and manner hereinbefore stated.

299,168. BUTTON-HOLE SEWING-MACHINE. FREDERICK E. SCHMIDT, Brooklyn, N. Y. Filed Jan. 24, 1884. (No model.)

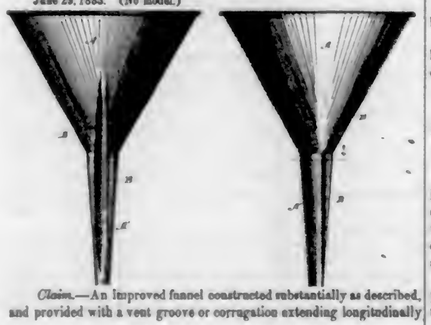
Claim.—1. In a button-hole sewing-machine, the combination of cam *e*, reciprocating work-plate C, and reciprocating cloth-clamp D, having carved rack *b*, with the pinion *d*, to which revolving but no reciprocating motion is transmitted from cam *e*, the teeth of pinion *d* being longer than the extent of lateral motion of the cloth-clamp, substantially as specified.



2. In a button-hole sewing-machine, the combination of the following elements: work-plate C, cloth-clamp D, pinion *d*, bar *h*, mechanism for transmitting motion from operating-cam to bar *h*, pawls *j j'*, ratchet-wheel *k*, spring *l*, and arbor *i*, substantially as specified.

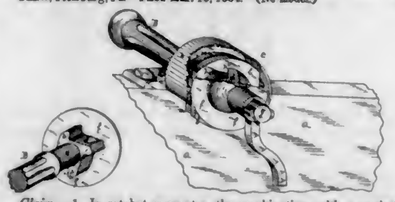
3. In a button-hole sewing-machine, the combination of pinion *d* and cloth-clamp D, having pin *a*, that projects through slot of the work-plate C, and has shoulder *a'*, with spring *p*, having raised portion, all so constructed that when pin *a* bears on raised portion of spring *p* the motion of pinion *d* is changed by means of lever or levers acting upon the feeding device, substantially as specified.

4. In a button-hole sewing-machine, the combination of work-plate C with sectional arm T, having sections *t t'*, and with the upright *u* and slotted lug *v*, the lug *v* being pivoted at one end to upright *u* and at the other end to arm *t'*, and between the two to arm *t*, substantially as specified.



5. In a button-hole sewing-machine, the combination of work-plate C with arm T, which imparts to it reciprocating motion from a cam on operating-shaft, the arm T being provided with mechanism *z b² b³*, for shifting the work-plate C, substantially as specified.

299,169. WARNING DEVICE FOR WIRE FENCES. RAPHAEL SHUMAKER, Pittsburg, assignor to Thomas B. KETT, Allegheny City, Pa. Filed May 19, 1883. (No model.)



Claim.—In a wire fence, the sheet-metal warning-plate *a*, having two projections, *b*, cut from near its central portion and turned in opposite directions and at right angles to the plate, in combination with twisted wires *c c*, the plate being secured between the twists of the wire and the wire on one side of the plate passing under the projection, while on the opposite side it passes over the projection, substantially as and for the purposes set forth.

299,170. FUNNEL. CASPER B. SHAFER, Washington, D. C. Filed June 29, 1883. (No model.)

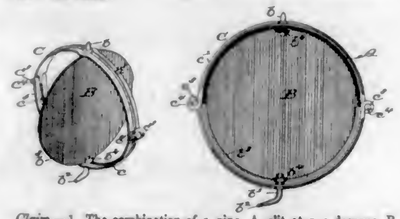
Claim.—An improved funnel constructed substantially as described, and provided with a vent groove or corrugation extending longitudinally upon the exterior side of the body and neck, said groove having its lower terminus above the lower extremity of the neck, and its upper terminus at or below the upper extremity of the body, substantially as and for the purposes set forth.

299,171. RATCHET APPARATUS FOR CHAIN-PUMPS. GENIO M. SHAW, Pittsburg, Pa. Filed Mar. 10, 1884. (No model.)

Claim.—1. In ratchet apparatus, the combination, with a ratchet-wheel, of one or more sliding tumblers supported around said wheel, and having two or more teeth, substantially as and for the purposes set forth.

2. In ratchet apparatus, the combination, with a ratchet-wheel, of two or more sliding tumblers supported around said wheel and having engaging teeth, the teeth of said tumblers being arranged alternately with each other, substantially as and for the purposes set forth.

3. In ratchet apparatus, the combination, with the ratchet-wheel *d*, of the bearing *h*, case *k*, supported thereby, guides *k'*, and one or more sliding tumblers having engaging teeth, substantially as and for the purposes set forth.



4. The combination of the power-shaft having the disk *f*, bearing *h*, case *k*, supported thereby, and ratchet apparatus supported within the box formed by the case and disk, substantially as and for the purposes set forth.

5. The combination of the power-shaft having the disk *f*, bearing *h*, case *k*, open at the base, ratchet-wheel *d*, and one or more sliding tumblers extending below said disk, substantially as and for the purposes set forth.

6. The combination of the power-shaft, ratchet-wheel *d*, bearing *h*, having the rib h^3, case *k*, supported on said bearing, and sliding tumblers substantially as and for the purposes set forth.

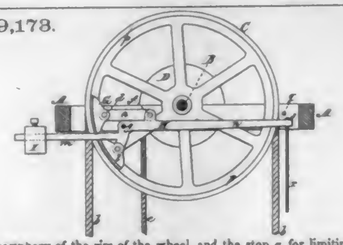
7. The combination, with the ratchet-wheel and case, of the sliding tumblers having the ribs *r*, substantially as and for the purposes set forth.

299,172. DAMPER. JOSEPH W. SHAW, St. Louis, Mo. Filed Nov. 12, 1883. (No model.)

Claim.—1. The combination of a pipe, A, slit at *a*, a damper, B, and a band encircling the pipe opposite the slit, for the purpose described.

2. The combination of the pipe A, slit at *a*, the damper B, and a band having the rib c^3, substantially as described.

3. The combination of the pipe A, slit at *a*, the damper B, and the band C, made in the parts *c c'*.



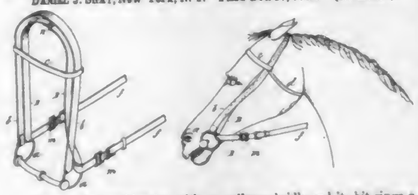
4. The combination of the pipe A, slit at *a*, the damper B, and the band C, made in the parts *c c'*, and having the rib c^3, substantially as described.

299,173. AUTOMATIC-BRAKE MECHANISM FOR HAND-POWER ELEVATORS. LORING D. SHAW, Melrose, assignor of one-eighth to Edward Howard, Boston, Mass. Filed Dec. 3, 1883. (No model.)

Claim.—1. The combination, with the wheel C, of the brake-shoe G, hinged to an arm, *e*, pivoted to the lever H, means, substantially as described, for operating the said lever to keep the shoe G in contact with the inner periphery of the wheel, and a stop, *g*, for limiting the movement of the lever in one direction, all operating substantially in the manner and for the purpose set forth.

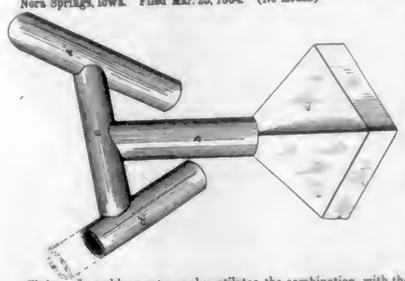
2. The combination, with the wheel C, of the adjustable lever H, provided with an arm, *m*, and weight I, and having pivoted thereto at *f* the arm *e*, carrying the brake-shoe G, adapted to be brought against the

299,173.



inner periphery of the rim of the wheel, and the stop *q*, for limiting the movement of the lever in one direction, all constructed to operate substantially as described.

3. The combination of the main brake-shoe G, arm *e*, and the lever H, provided with an auxiliary brake-shoe, *l*, adapted to be brought against the inner periphery of the rim of the wheel C when the lever is operated to release the main brake, substantially as and for the purpose set forth.

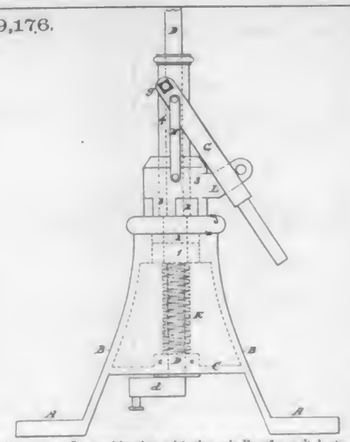


4. The combination, with the wheel C, of the lever H, having pivoted thereto the arm *e*, carrying the brake-shoe G, and having its fulcrum *g* made adjustable upon its support toward and from the periphery of the wheel, substantially in the manner and for the purpose described.

299,174. DEVICE FOR CONTROLLING RUNAWAY HORSES. DANIEL J. SHAY, New York, N. Y. Filed Dec. 17, 1883. (No model.)

Claim.—In combination with an ordinary bridle and its bit-rings *a*, the independent and removable strap B, adapted to be passed over the horse's head and through said bit-rings, as described, and provided with rings *m m*, to receive and to attach it to the reins *f f*, as and for the purpose set forth.

299,175. CHIMNEY-TOP AND VENTILATOR. JOHN M. SHEETS, Nora Springs, Iowa. Filed Mar. 25, 1884. (No model.)



Claim.—In a chimney-top and ventilator, the combination, with the base and vertical flue rising therefrom, of the horizontal cross-flue secured upon and communicating with the vertical flue, and the end flues diverging from below upward and secured to and communicating with the horizontal cross-flue, substantially as specified.

299,176. SWITCH-STAND. FRED. W. SNOW, Ramapo, N. Y. Filed Oct. 9, 1883. (No model.)

Brief.—An unyielding clutch-lock placed upon a switch-shifting crank shaft or spindle immovable in the line of its axis, the engagement and disengagement of the clutch being controlled by the switch-operating hand-lever. Together therewith a supplemental lock consisting of a yielding clutch with beveled engaging-surfaces normally in engagement, urged by a spring of strength regulated to resist hand operation and to yield to permit the clutch to slip when a passing train shifts the switch.

299,176.

Claim.—1. In combination with the spindle of a switch-stand, the clutch-locking mechanism in which the two parts of the clutch are placed upon the spindle and engage by means of beveled teeth by spring or other yielding power, so as not to hold against large powers, and provided with means for releasing the spindle from the yielding non-rotating part of the clutch, substantially as described.

2. A yielding locking device for spindle switch-stands, consisting of the following combination of parts: first, a clutch-box on the spindle, yielding but not rotating with it; second, a rotating clutch-box on the spindle, a spring tending to engage the two clutch-boxes, but permitting them to rotate under power when locked, and a locking-lever or its equivalent by means of which the spindle can be released from and rotate free of the non-rotating part, substantially as described.

3. In a switch-stand, the combination of the spindle, a clutch upon the spindle, the rotating parts of which can move upon the yielding non-rotating parts to specified positions when subject to great strain, although locked, and means for releasing the spindle from the engaged rotary part of the clutch for operation by hand, substantially as described.

4. The combination of the spindle D, the spring E, the non-rotating clutch-box 1, the rotating clutch-box 2 3, the locking-lever and links G H, and the sleeve 4, substantially as described.

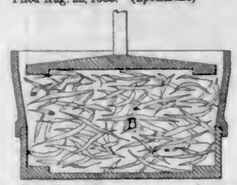
5. The combination of the spindle D, the spring E, the non-rotating clutch-box 1, the rotating clutch-box 2 3, and the locking-lever and links G H, without the sleeve 4 interposed between them and the spindle, substantially as described.

6. The combination of the standard A B, spindle D, spring E, clutch-box 1, clutch-box 2, and clutch-box 3, links H, and lever G, with the sleeve 4, substantially as described.

7. In a spindle switch-stand, the combination of a rotating spindle having no vertical movement, a non-rotating spring-locking part, 1, a rotating locking part, 2, the two locking parts being capable of sliding upon each other under great strain, an engaging part, 3, sliding on the spindle to lock part 2 to the spindle, and an operating-lever and links, or their equivalent, substantially as described.

299,177. SECONDARY BATTERY. WILLIAM STANLEY, Jr., Englewood, N. J. Filed June 19, 1883. (No model.)

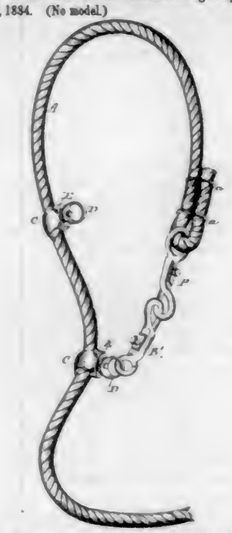
Claim.—1. A plate or electrode for secondary batteries, consisting, primarily, of a mixture of carbonate of lead and chloride of sodium, hardened as described, and attached to a suitable frame or support, substantially as set forth.



2. In a secondary battery, the combination of plates or electrodes consisting, primarily, of carbonate of lead with an electrolyte of acidulated salt-water, substantially as and for the purposes set forth.

3. In a secondary battery, the combination of plates or electrodes consisting, primarily, of a mixture of carbonate of lead and chloride of sodium with an electrolyte of acidulated salt-water, substantially as and for the purposes set forth.

4. In the manufacture of secondary batteries, the hereinbefore-described process, consisting of, first, treating plates of carbonate of lead with a solution of chloride of lime to form the positive or peroxide plate of the battery, and, second, then combining such plates in an electrolyte with a suitable negative plate to complete the battery, substantially as set forth.



5. In the manufacture of secondary batteries, the hereinbefore-described process, consisting of, first, treating plates consisting of a mixture of carbonate of lead and chloride of sodium with a solution of chloride of lime to form the positive or peroxide plate of the battery, and, second, then combining such plate in an electrolyte with a suitable negative plate to complete the battery, substantially as set forth.

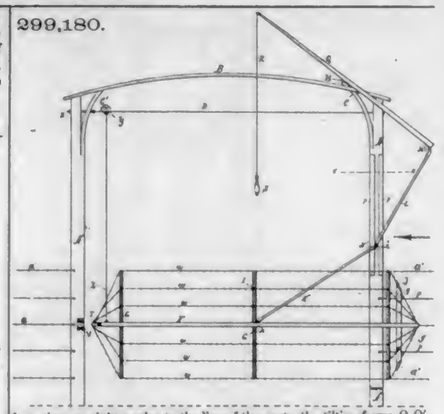
299,178. SECONDARY BATTERY. WILLIAM STANLEY, Jr., Englewood, N. J. Filed Aug. 22, 1883. (Specimens.)

Claim.—An electrode or element for secondary batteries, consisting, primarily, of tubes or hollow scraps of lead pressed together to form a plate, substantially as and for the purposes set forth.

299,179. HALTER OR TIE FOR ANIMALS. MILES SWEET, Troy, N. Y., assignor to the Sweet & Clark Manufacturing Company, same place. Filed Apr. 3, 1884. (No model.)

Claim.—1. In an animal-tie, the combination of a tubular ring having a laterally-projecting stem, a nut provided with a bail or eye, and a plate provided with a central perforation and prongs, substantially as and for the purpose described.

2. The combination of the tie A, the tube C, having a laterally-projecting stem, the nut D, provided with a bail, *d*, a snap-fastening, and a plate, E, provided with a central perforation, and prongs at both ends, substantially as and for the purpose described.



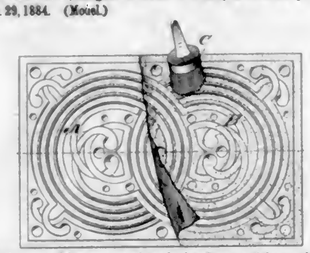
299,180. FARM-GATE. LEMUEL TAYLOR and MINER TAYLOR, Jordan, Wis. Filed June 20, 1883. (No model.)

Claim.—1. The combination of the posts A A" A'", the tilting frame Q Q' W, hinged to said posts, the pitmen L K, the hinge-joint N", connecting said pitmen, and moving in suitable vertical guides on the post A, and a sliding gate to which the lower end of the pitman K is attached, the upper end of the pitman L being attached to said tilting frame, substantially as shown and described, and for the purpose set forth.

2. The combination of the vertical cross-bars G, the central timber, F, rigidly attached to said cross-bars, and extending beyond them at both ends, and the wires *w*, strained upon said cross-bars, and meeting at the ends of said timber F, substantially as shown and described, and for the purpose set forth.

3. The combination of the posts A A" A'", a sliding gate moving

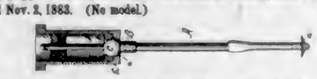
299,180.



in a plane at right angles to the line of the posts, the tilting frame Q Q' W, hinged to said posts, the pitmen L K, united by a hinge-joint at their intersection, and connecting said tilting frame and gate, the roller *i*, attached to and moving with the hinge-joint at the intersection of said pitmen L K, and the cleats *f* and guides *p*, attached to the post A, and forming a guide for the roller *i*, substantially as shown and described, and for the purpose set forth.

4. The combination of the tilting frame, the rolling or sliding gate shown and described, the pitmen L K, attached to said frame and gate, respectively, and moving in the same vertical plane, and the roller *i*, forming a joint between said pitmen, substantially as shown and described, and for the purpose set forth.

5. The combination of the plate *m'*, the cap *m*, and the grooved pulley *k*, rotating in the space between said plate and cap, said cap being horizontally bored for the passage of a wire, P, on which said roller moves, thereby forming a guide for said wire, substantially as shown and described, and for the purpose set forth.

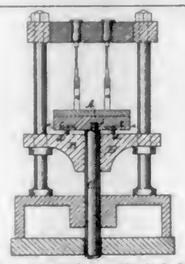


299,181. PANEL FOR WALLS, CEILINGS, &c. LOUIS C. TIFFANY, New York, N. Y., assignor to Louis C. Tiffany & Co., same place. Filed Jan. 29, 1884. (Model.)

Claim.—1. The process of producing fire-proof decorative tiles by moistening asbestus sheets and then forcing such sheets into a die containing a negative of the desired decorative relief, substantially as described.

2. A fire-proof panel composed of asbestus paper on which is placed a surface or decorative relief, substantially as described.

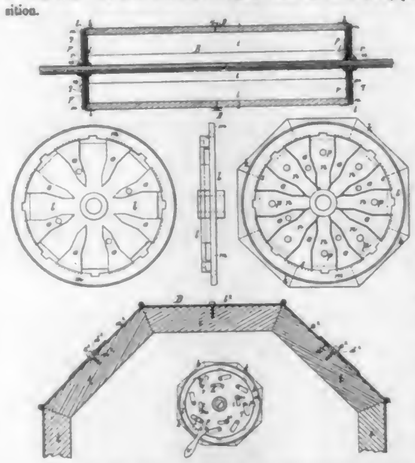
299,182. CAPSULE-CUTTER. WILLIAM A. TUCKER, New York, N. Y. Filed Nov. 2, 1883. (No model.)



Claim.—The combination of the stem A, carrying the cutter *a*, with the shaft B, ball C, pin D, cylinder E, having countersunk opening *e*, its cap F, having reversely-countersunk opening *f*, and the elastic washers G, constructed and arranged to operate as and for the purpose specified.

299,183. MECHANICAL MOVEMENT. WILLIAM A. TUCKER, New York, N. Y. Filed Nov. 30, 1883. (No model.)

Claim.—The combination of the plate B, provided with the studs *d*, the plate A, provided with the openings *c*, into which said studs project,



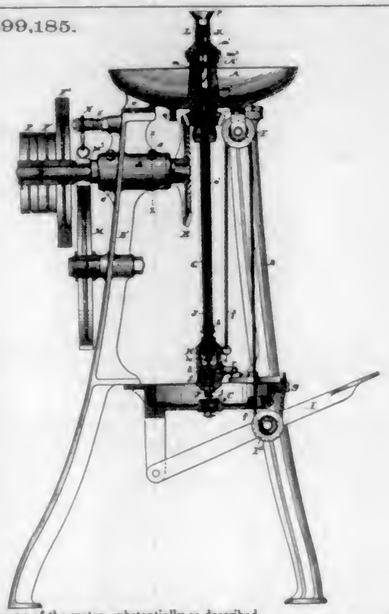
299,183.

and the rotary shaft C, provided with a crank-pin, *b*, fitted into a sleeve or hole in the plate A, whereby when the said shaft is rotated all points in plate A are severally carried in the same plane around equal independent circles with different centers, as and for the purpose described.

299,184. SEED AND FERTILIZER DISTRIBUTER. GEO. TYLER, Waltham, Mass. Filed Feb. 18, 1884. (No model.)

Brief.—The lag-supporters are radially adjustable separably and collectively in a flanged sustaining end wheel. The handle turns one disk upon the other, and the slots in the first, in which the guide-pins of the second move, being straight and oblique, the free lag-supporters are thrown straight in or out, diminishing or increasing the periphery and the spaces between the lags, and therefore regulating the supply of fertilizer or seed. Set-screws in the arcal slots secure the disks in any position.

Claim.—1. The expansive and contractile distributer, substantially as described, consisting of the series of lags, their two sets of radially-movable supporters, their sustaining-wheels and operative studs, and slotted disks, arranged and combined substantially in the manner and to operate as set forth.



2. The combination of the clamping-screws with the disk having the oblique and arcal slots, as described, and with the series of radially-movable lag-supporters and their sustaining-wheel, all being arranged and adapted substantially as represented.

3. The expansive and contractile band D, constructed and applied to the lags of the distributer substantially as described—that is to say, made of slotted sections lapped on each other, and each composed of three bars hinged together as represented, and secured to the lags by screws, as set forth.

299,185. BOTTLE-WASHER. ADOLPH VON SCHADE, Newport, R. I. Filed Apr. 12, 1883. (No model.)

Claim.—1. In machine for washing bottles, the combination of a tubular or sleeve shaft mounted in a fixed bearing, mechanism for revolving said sleeve-shaft, a second hollow shaft carrying a brush or brushes at one end, and arranged to be revolved with and moved endwise through said sleeve, and a trumpet-shaped stationary socket to receive the neck of the bottle, and provided with one or more holes for the

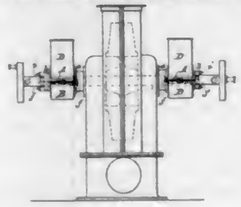
299,185.

escape of the water, substantially as described.

2. The combination of the sleeve-shaft *a*, the hollow spindle J, connected to the sleeve-shaft by a spline-groove and key, mechanism for revolving the sleeve-shaft, the cross-head H, the cord or chain *f*, the pulleys I' I², and the treadle-lever I, all arranged and adapted to operate substantially as and for the purposes described.

3. The cross-head H, provided with the chamber *h* and the passages *i* and *i'*, in combination with the hollow spindle J, arranged to be revolved therein, and to be moved endwise therewith, the water-supply pipe *r r'*, and valve *j'*, provided with the pendent stem *j²*, and arranged to be opened by the pressure of the water, substantially as described.

4. The combination of the cross-head H, provided with the chamber *h* and passages *i* and *i'*, the water-supply pipe *r r'*, the valve *j'*, provided with the pendent stem *j²*, and the slightly-yielding stop *k*, all arranged and adapted to operate substantially as described.



5. In a machine for washing bottles, the combination, with a revolving and endwise-reciprocating jet tube or spindle carrying a brush or brushes at one end, of a cross-head connected to the other end of said jet tube or spindle, and arranged to be reciprocated upon suitable guides, and adjustable stops to limit the movement of said cross-head, substantially as described.

6. In a machine for washing bottles, the combination of the sleeve-shaft *a*, the bevel-gear wheels *b* and E, the shaft D', the pinion M', the spur-gear wheel M, the grip-jaws *l' l'*, the pawl *l*, the link N', and the hand-lever N, all arranged and adapted to operate substantially as described.

7. The brush K, composed of the mass of radiating bristles *n* and the tuft *n'*, of combined bristles and fine wire, substantially as described.

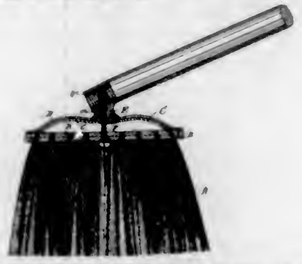
8. The brush-holder J', composed of the ring *m*, the spring-arm *m²*, and the socket *m³*, in combination with the spindle J and the grooved thimble *m²*, all arranged and operating substantially as described.

299,186. WATER-JACKET FOR ROTARY PUMPS. ALEXEY W. VON SCHMIDT, San Francisco, Cal. Filed July 23, 1883. (No model.)

Claim.—1. In a packing-box for pump-shafts, the combination, with the collars *a* and *b*, of the water-tank, adapted to contain water to envelop the said shafts, substantially as described.

2. In a packing-box for pump-shafts, the combination of the collars *a b*, the frames A A', and tanks D B, substantially as described.

3. The combination, with a pump-shaft, of the collars *a* and *b*, frames A A', and packing-ring A, substantially as described.



4. The combination, with a pump-shaft, of the collars *a* and *b*, frames A A', tanks D and B, and the packing-ring *d*, all substantially as described.

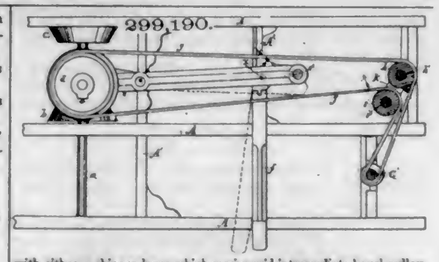
299,187. DRIVE-CHAIN. CHESTER C. WATERS, Moline, Ill. Filed Apr. 28, 1883. (Model.)

Claim.—A detachable link for drive-chains, having the side bars connected by a bar at one end and having the other ends free, the free ends being provided with knuckles in which are key-hole slots or apertures in a plane parallel with the side bars, the connected end being formed with duplex knuckles, the outer ones of which are provided with key-hole slots or apertures at an angle to the horizontal plane of the side bars, and the inner ones with circular apertures and adapted to receive splined pintles in the operation of coupling with adjacent links to form a chain, substantially as set forth.

299,188. WINDOW-BRUSH. JOHN STAPLES WHITE, Portland, Me. Filed Jan. 16, 1884. (No model.)

Claim.—The improved window-brush substantially as described, consisting of the mass of bristles, flexible backing, concavo-convex stiffening-plate and its cover, and the handle-socket and its fastening-screw arranged as set forth, and having said cover secured or sewed to the backing around the periphery of the stiffening-plate.

299,189. DOOR-PLATE. ALFRED T. ABBOTT, New York, N. Y. Filed Feb. 12, 1883. (Model.)

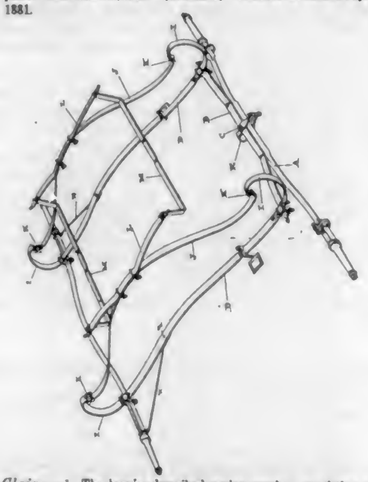


Claim.—The combination, in a door-plate, of the frame A, having a name-plate adapted to be removed at the end of the frame, with a detachable end piece secured to the frame by bolts B B, by means of screw C, nut D, and hinges F F, the bolts being withdrawn by spring E, as shown and described, and for the purpose set forth.

299,190. WOOD-WORKING MACHINE. REUBEN HENRY ANDREWS, Washington, D. C. Filed Oct. 2, 1883. (No model.)

Claim.—1. The combination, with a shaping-cutter and the driving-belt thereof, of bevel friction-pulleys, as *b c*, a bevel friction-pulley arranged, as described, between the two, so as to be brought in contact

299,190.



with either, a shipper-lever which carries said intermediate bevel-pulley, and a lever for operating said shipper-lever, substantially as described.

2. The bell-crank lever pivoted to the frame and to the shipper-lever, as shown, the shipper-lever carrying the friction driving-pulley, as described, the friction-pulleys arranged to be engaged by said driving-pulley, the guide-pulleys arranged as shown, the belt, and the cutter-carrying shaft and pulley, all arranged and combined in a wood-working machine of the character described, as and for the purposes set forth.

3. The combination, with the cutter driving-pulley, of the friction driving-pulley and its shifting mechanism, substantially as described, the idler A, mounted on shaft *h'*, and the idler *i*, mounted on a spindle on arm K, said arm being adjustably secured to shaft *h'*, substantially as shown and set forth.

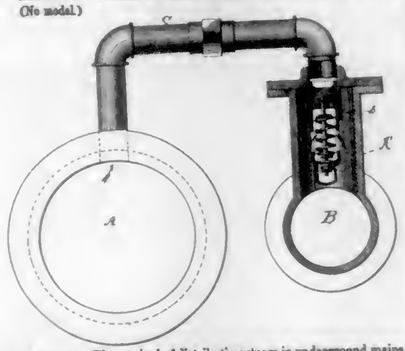
299,191. SPRING-VEHICLE. JOHN B. ARMSTRONG, Guelph, Ontario, Canada, assignor to the Guelph Carriage Goods Company, (Limited,) same place. Filed Feb. 15, 1883. (No model.) Patented in Canada Sept. 17, 1881.

Claim.—1. The herein-described spring-washer, consisting of a loop-shaped plate of resilient material inclosing the head-plate, axle, and king-bolt, and a piece or bolt secured between the ends of said loop, so as to form a closed link adapted to operate as a safety-clevis and double-spring washer combined, substantially as set forth.

2. The combination, with spring-clevis E and a suitable axle, A, of the spring B, provided with the boss or thimble *a*, and a king-bolt, C, passing therethrough, and a suitable washer adapted to inclose said boss to form a solid bearing for the spring and to prevent wear of the king-bolt, substantially as specified.

3. The combination of the side springs, J, provided with flexible connections at either end, with the superposed springs L and suitable cross-bars, M, substantially as described.

4. The side springs, J, provided with flexible connections at either end, and having the springs L and cross-bars M, rigidly attached thereto, in combination with springs I and the elastic perches D, substantially as set forth.



5. The perch D, formed with transverse extension *e*, in combination with a suitable spring provided with extension *d*, and suitable clips, all arranged and operating substantially as specified.

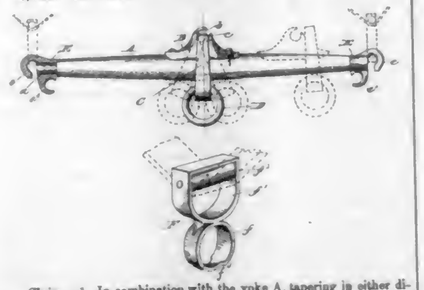
6. In combination with the axle H, formed with an indentation or indentations, the perch D, formed with extension *e*, fitting therein, the

spring I, having similar extension, *d*, adapted to be retained within the depression formed by the extension *e*, and suitable clips or clamps, substantially as set forth.

7. The combination, with the single-plate C-spring I, tapering in thickness, of the single-plate side spring, also tapering in thickness, and a swinging flexible connection between the two, substantially as described.

299,192. AUTOMATIC RELIEF DEVICE FOR STEAM-DISTRIBUTING PIPES. EDWARD H. ASHCROFT, Lynn, MASS. Filed Jan. 27, 1883. (No model.)

Claim.—1. The method of distributing steam in underground mains, which consists in conveying steam of high and low pressure in separate and adjoining conduits, and permitting the excess of steam to automatically escape from the high to the low pressure conduit at various points along the line, substantially as described.



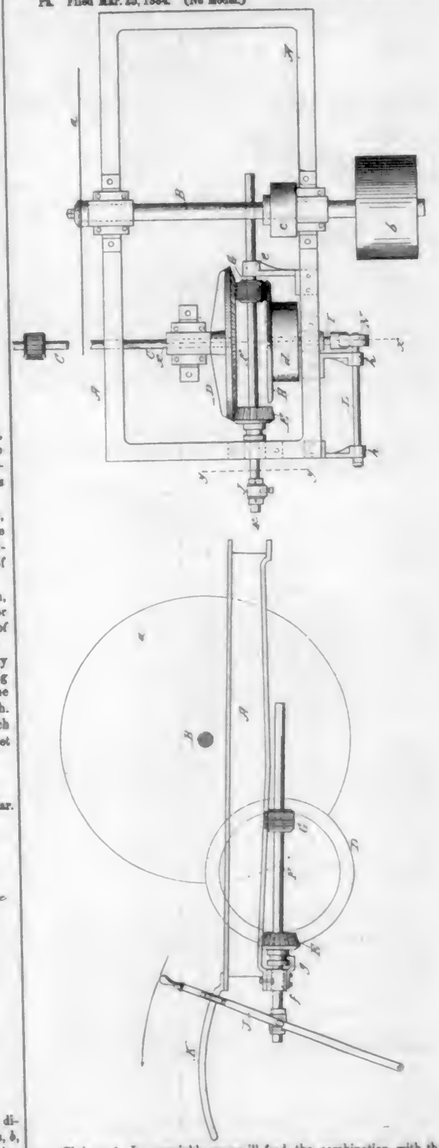
2. The combination, in an apparatus for the distribution of steam, of the main A with the auxiliary main B, having branch A', and a valve located within said branch, said mains being connected by the intermediate pipe and permitted to communicate by the automatic action of the valve, substantially as and for the purpose set forth.

3. A steam-distributing main, A, connected with an auxiliary main, B, which is provided at intervals throughout its length with safety or blow-off valves, whereby the pressure in A is relieved by the escape of steam to B, substantially in the manner and for the purpose described.

4. The combination, with a steam-distributing main, of an auxiliary main connected thereto at intervals by steam-connections containing safety-valves for permitting the escape of steam from the main to the auxiliary main, substantially in the manner and for the purpose set forth.

5. The combination of main pipe A, relief-pipe B, having branch A', which is provided with valve *b*, and the connecting-pipe C, as set forth.

299,193. NECK-YOKE. ALVA S. BAILEY, Rossville, Ill. Filed Mar. 5, 1884. (No model.)

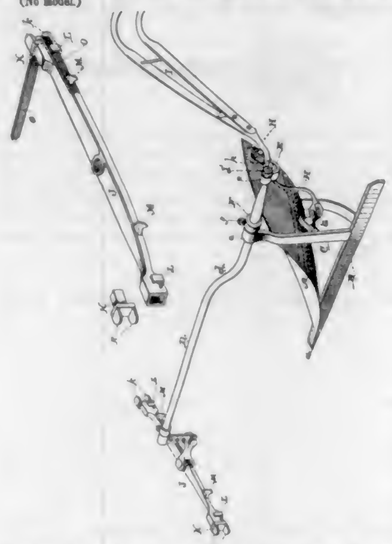


Claim.—1. In combination with the yoke A, tapering in either direction from the center, and removable cap B, having a single recess, *b*, the pole-coupling C, having bar *c* and pole-bearing, the said coupling being locked in said recess *b* except when the cap is moved toward one end of the yoke sufficiently to allow the disengagement without entirely separating the cap and yoke, as set forth.

2. In combination with a neck-yoke having hook-bands, as E *e e'*, and with the ordinary breast-strap of a harness, the coupling F, having ring *f*, stirrup *f'*, and friction-roller *f*², adapted to be kept on the said breast-strap, and the whole to serve as and for the purpose set forth.

3. In combination with the yoke A and removable cap B, having recess *b*, the pole-coupling C, having removable screw-threaded bolt G and tag H, substantially as herein shown and described.

299,194. CIRCULAR-SAW MILL. ROBERT M. BEEM, Chambersburg, Pa. Filed Mar. 25, 1884. (No model.)



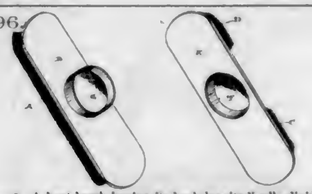
Claim.—1. In a variable saw-mill feed, the combination, with the feed-shaft C, having gear D, of the adjustable friction-disk H, actuated from the saw-mandrel, and the independent shaft F, arranged at a right angle to the feed-shaft between the feed-shaft and friction-disk, and carrying a pinion, E, and a friction-roller, G, said shaft F having an adjustment endwise, whereby the friction-roller and friction-disk can be brought into contact at any desired point to vary the feed of the log-carriage, substantially as described.

2. The combination, with the saw-mandrel B and feed-shaft C, having gear D, of the adjustable friction-disk H, the adjustable shaft F, arranged at a right angle to the feed-shaft between it and the friction-disk, the friction-roller G, mounted on the shaft F, the pinion E, feathered to the friction-roller shaft, and the lever J, for adjusting said shaft, substantially as described.

3. The combination, with the saw-arbor B, feed-shaft C, having gear D, and the independently-adjustable shaft F, arranged at a right angle to the saw-arbor and feed-shaft, and carrying friction-roller G, and pinion E, of the friction-disk H, mounted on one end of a shaft, I, means for connecting the saw-arbor and friction-disk, and mechanism for adjusting said disk to and from the friction-roller G, substantially as described.

4. The combination of the saw-mandrel B, having pulley *c*, the adjustable friction-disk H, having belt-rim *d*, the shaft F, carrying friction-roller G, and pinion E, the feed-shaft C, having gear D, and means for adjusting the roller G and shaft F independent of the pinion E, substantially as described.

299,195. PLOW. JOHN A. BILS, Pleasanton, Cal. Filed Mar. 5, 1884. (No model.)



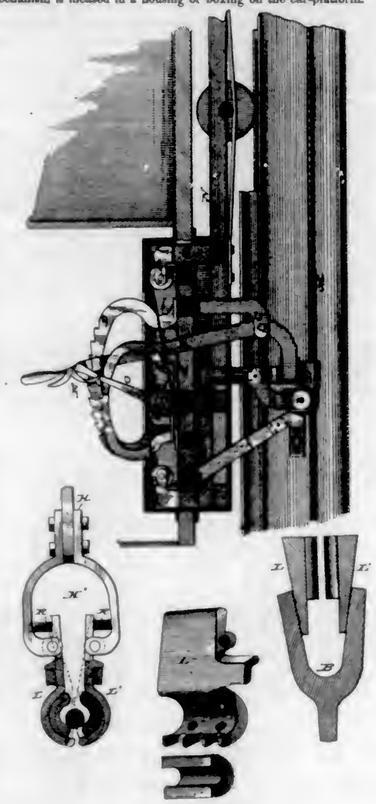
Claim.—1. In a plow, the mold-board A, provided with a slotted arm, E, extending laterally from its inner side, its outer end terminating in a bearing for the beam D, in combination with the handles I, curved arm H, secured by flanges and bolt to a projecting lug formed on the piece G, secured between the mold-board and a standard, C, which extends upward and terminates in a bearing for the beam, a collar, F, and set-screw *f*, all constructed to operate as and for the purpose herein set forth.

2. In a plow, and in combination with an adjustable beam, as shown, the whiffletree J, provided on its rear with guides L and lugs M, for securing the traces, the said whiffletree having squared ends recessed, as shown, for the reception of the rubber cushion K, which is provided with flanges, between which the traces pass, and a squared extension adapted to fit the recess or socket formed in the ends of the said whiffletree, all constructed to operate substantially as and for the purpose set forth.

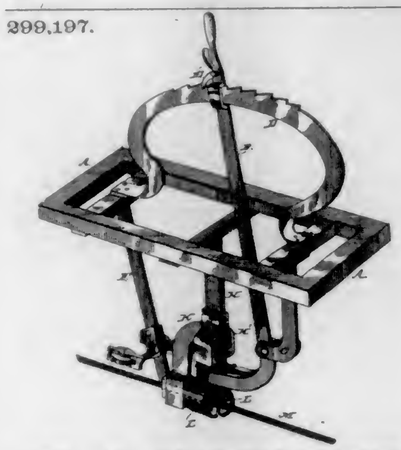
3. In a plow, the mold-board A, having bar E, with socket-bearing *e*, and the standard C, having socket-bearing *c* in its top, in combination with the bent or curved beam D, journaled in said bearings, the nut *d'* on its end, and the adjustable collar F, substantially as herein described.

4. In a plow, the mold-board A, having the slotted bar E, with a socket-bearing, *e*, formed in its end, the standard C, having socket-bearing *c* in its end, and the bent or curved beam D, journaled and secured in said bearings, in combination with the handles I, having arm H, pivoted to a bearing, G, and guided on bar E by a bolt, A, through its slot, substantially as herein described.

299,196. BOOT-BRUSH. CHARLES BOEHME, Toronto, Ontario, Canada. Filed Sept. 14, 1883. (No model.) Patented in Canada Oct. 10, 1883, No. 17,845.



Claim.—1. A boot-brush having its back longitudinally divided in the center, one half carrying the polishing-brush and blacking-tin and the other half having attached thereto the blacking and mud brushes, and provided with a central recess having a cover, F, designed to fit over the blacking-tin, whereby the two halves may be detachably connected, substantially as and for the purposes set forth.



2. A boot-brush having the polishing-brush attached to one side of its back and the mud and blacking brushes attached to its other side, the back being divided in the center and detachably connected together by the blacking-tin, as specified, jointly with an open-ended tin case, H, arranged to hold the two parts of the brush together, substantially as and for the purpose specified.

299,197. GRIP DEVICE FOR THE PROPULSION OF CARS BY CABLE. ZACCUR PRALL BOYER, Philadelphia, Pa. Filed Apr. 23, 1884. (No model.)

Brief.—The grip is carried by beams supported upon the car-axles and extending under the car-platform at either or both ends of the car. It is secured in a vertically-adjustable frame in an opening in the platform and is supported from the framing of the main beams. An inclined draw-bar supports the grip when the cable is engaged. Spring clamping-jaws are made to grasp the cable by wedge-jaws upon a pivoted starting bar or lever. The framing carrying the grip and its operating mechanism is incased in a housing or boxing on the car-platform.

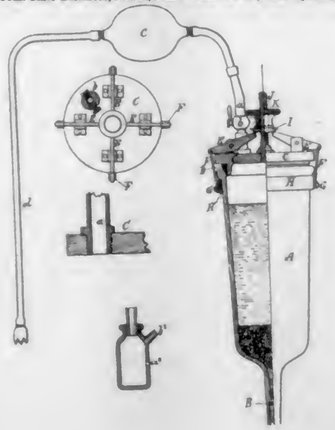
299,197.

Claim.—1. In a grip for a cable road, the combination, with the grip-shank and the supporting-frame, of the inclined brace-bar F, adapted to support the said shank when under the drawing-strain of the cable.

2. The combination of the grip with the beams or sills resting on the axles of the car, and extending longitudinally under the platform at either or both ends of the car, as described.

3. The combination, with the car-platform having the opening, as described, of the beams or sills mounted on the car-axles, and extended beneath said opening, and the grip mounted in said opening, as described.

4. The combination, with the pivoted gripping-jaws, of the pivoted starting bar or lever, having the wedging jaws, and adapted to compress the gripping-jaws upon the cable, substantially as described.

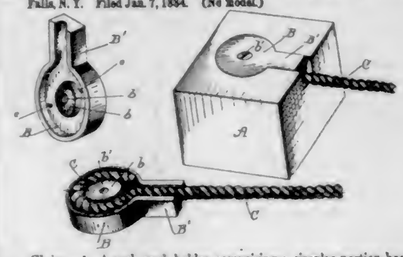


5. In a car for cable railways, a grip therefor mounted in an opening of the platform at the end of the car upon a frame independent of the car-body, and unaffected by vertical oscillations of the same, as described.

6. The combination, with the sub-frame and the supports thereon, of the movable frame, the drum, its lever, and the raising and lowering chains, substantially as set forth.

7. The combination, with the car and its grip mounted upon framing at the end thereof, as described, of the case inclosing the said framing, and the operating mechanism, as set forth.

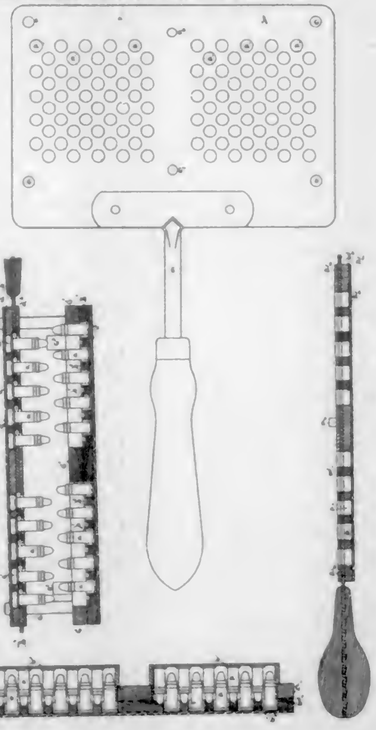
8. In a car for cable railways, the platform having the opening, the sub-frame mounted on the car-axles and independent of the car-body, and a movable frame suspended from supports on the sub-frame by adjustable connections, and the grip mounted upon the secondary frame, all combined and operating substantially as described.



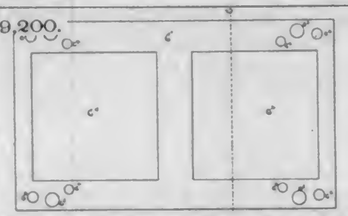
299,198. PERCOLATOR. CHARLES KEMPTON BRADFORD, Lynnfield, and JOHN GANO BENEDICT, Boston, Mass. Filed Oct. 22, 1883. (No model.)

Claim.—1. A drug-percolator consisting of vessel A, provided with detachable cover C, in combination with an air-forcing device attached to said cover, and clamping mechanism for holding said cover in place on said vessel, substantially as set forth.

2. In a drug-percolator, the combination, with the vessel and its cover, of the levers E, mounted on said cover, the screw-threaded rod and nut whereby the inner ends of said levers are acted on, and the links F, connecting the outer ends of said levers with said vessel, substantially as set forth.



299,199. SASH-CORD FASTENER. ROSWELL N. BROWN, Hoosick Falls, N. Y. Filed Jan. 7, 1884. (No model.)



Claim.—1. A sash-cord holder comprising a circular portion having a circular groove and a central boss therein, and a rectangular portion, grooved also, for the reception of a cord, substantially as described.

2. A sash-cord holder having a rectangular grooved part, B', a circular part, B, provided with a circular groove, and points *c*, projecting therein, and a central boss, *b*, provided with a central perforation for the passage of a screw, whereby the device is secured to a window-stile, substantially as described.

299,200. MECHANISM FOR PACKING CARTRIDGES. PAUL BUTLER, Lowell, Mass. Filed Mar. 1, 1884. (No model.)

299,200.

Claim.—1. The greasing-plate A, provided with the holes *a'*, fitting the body of the cartridges and arranged regularly in alternating rows, and in position with relation to each other substantially the same as the cartridges placed in said holes occupy in the packing-box when packed with their heads adjacent to each other, substantially as described.

2. The plate A, provided with holes *a'*, fitting the body of the cartridge and arranged regularly in alternating rows, and with guide-holes *c* placed between the rows of holes *a'* and the margin of the plate, substantially as described.

3. The plate A, provided with holes *a'*, fitting the body of the cartridge and arranged regularly in alternate rows, and with guide-holes c^2 placed between the rows of holes *a'* and the margin of the plate, substantially as described.

4. The cartridge-holding plate B', provided with cavities *b'*, adapted to fit the cartridge-heads and hold a series of cartridges with their bullets in one direction in the alternating rows in which they are to be packed in the box and form one course or layer therein, adjusted to alternate with another course, substantially as described.

5. The holder B', provided with cavities *b'*, for holding a series of cartridges with their bullets in one direction, and the cavities b^2, for holding an alternate series of cartridges with their bullets in the opposite direction, substantially as described.

6. The cartridge-holder B', provided with the series of cavities *b'* and the guide studs or rods *c'*, substantially as described.

7. The cartridge-holder B', having the series of cartridge-holding cavities *b'* and the guide-holes c^2, situated and adapted to receive the studs c^1 of the frame C', substantially as described.

8. The frame C', provided with holes C^2 of the size to receive and guide the cartridge-packing box around the cartridges, and guide-holes c^2, corresponding to guide-studs *c'* of holder B', substantially as described.

9. The frame C', provided with holes C^2, adapted to receive and guide the cartridge-box around the cartridges, guide-holes c^2, and studs c^1, substantially as described.

10. The combination of the holder B', provided with cavities *b'* of proper size to receive the cartridge-head, and the plate A, provided with corresponding holes, *a'*, of proper size to receive and fit the cartridge-body, substantially as described.

11. The combination of the plate B', provided with cavities *b'* and intermediate cavities, b^2, with the plate A, provided with one or more series of holes corresponding with the series of cavities *b'*, substantially as described.

12. The combination of the plate B', provided with cavities *b'* and guide-rods *c'*, with the plate A, provided with corresponding holes *a'* and corresponding guide-holes *c*, substantially as described.

13. The combination of the plates d^2 d^3, provided with holes or cavities *c'*, with the sliding plate D^2, placed between them, substantially as described.

14. In combination with the holder D', provided with a series of holes or cavities, *c'*, the guide-holes c^2, and the guide-studs c^3, the sliding plate D^2, substantially as described.

15. The combination, with the holder B', provided with a series of holes, *b'*, adapted to receive cartridges, of the surrounding packing-box guide-frame C', substantially as described.

16. The combination, with the holder B', provided with the series of cavities *b'* and the series of intermediate cavities, b^2, of the surrounding packing-box guide-frame C', substantially as described.

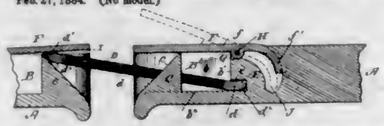
17. In combination with the holder B', provided with the series of cavities *b'* and intermediate series of cavities, b^2, the inclosing-frame C', provided with posts c^3, substantially as described.

18. The combination of the holder B', provided with a series of cavities, *b'*, and the guide-studs *c'*, with the inclosing-frame C', provided with guide-holes c^2, sliding on said guide-studs *c'*, substantially as described.

19. The combination of the holder B', carrying and supporting a series of cartridges heads downward and points upward, with the holder D', carrying and supporting its series of cartridges heads upward and points downward, in such position that the latter shall be deposited alternately between the upwardly-projecting cartridges of holder B', substantially as described.

20. The combination of the holder B', provided with a series of cavities, *b'*, with the holder D', provided with a series of alternate cavities, *c'*, substantially as described.

21. The combination of the holder B', provided with cavities *b'* and alternate cavities b^2, with the holder D', provided with cavities *c'*, coming opposite to the cavities b^2, substantially as described.



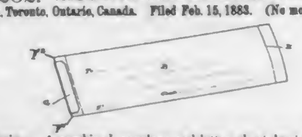
22. The combination of the holder B', provided with a series of cavities, *b'*, and guide-studs *c'*, with the holder D', provided with an alternate series of cavities, *c'*, and the guide-holes c^2, fitting said guide-studs *c'*, substantially as described.

23. The combination of the holder B', provided with the series of cavities *b'*, with the surrounding frame C' and the holder D', provided with the series of alternate cavities *c'*, substantially as described.

24. The combination of the holder B', adapted to receive and hold a series of cartridges points upward, and provided with guide-studs *c'*, with the surrounding frame C', provided with guide-holes c^2, fitting said studs, and the holder D', adapted to receive and hold a series of alternate cartridges points downward, and provided with guide-holes c^2, fitting said guide-studs, substantially as described.

25. The method of accomplishing the greasing and packing of ball-cartridges in boxes, which consists in arranging the cartridges of each layer in the greasing-plate in the position relative to each other which they are to occupy in the packing-box, and in holding and retaining them in such relative position while being transferred by a suitable perforated plate or plates into the packing-box, and deposited therein in two layers, heads and points, substantially as described.

299,201. CAR-COUPLING. EDWIN S. CLARK, The Plains, Va. Filed Feb. 27, 1884. (No model.)



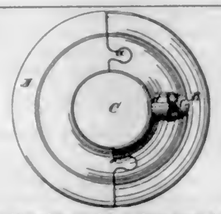
Claim.—1. The herein-described improved draw-head, provided at its front end with the recess comprising the side and rear walls and the horizontal bottom, and having the auxiliary recess formed in the rear wall at its bottom and extending transversely between the said walls, the auxiliary recess being adapted to receive the corresponding end of the coupling-link to retain the same elevated and from displacement, substantially as set forth.

2. As an improvement in car-couplings, the combination, with the draw-head provided at its front end with the recess comprising the side and rear walls, the auxiliary recess formed in the rear wall at its bottom and extending transversely between said side walls, and of the central projection extending up between the said side walls, of the coupling-link beveled across one side of its ends, substantially as set forth.

3. The combination, with the draw-head comprising the open recess at its front portion, the projection extending from the bottom of this recess, and provided with a segmental or curved recess formed in its top in rear of the link-recess, of a spring-plate having a curved or segmental rear end seated in the curved recess and fulcrumed to the draw-head in front of this curved end, substantially as and for the purpose set forth.

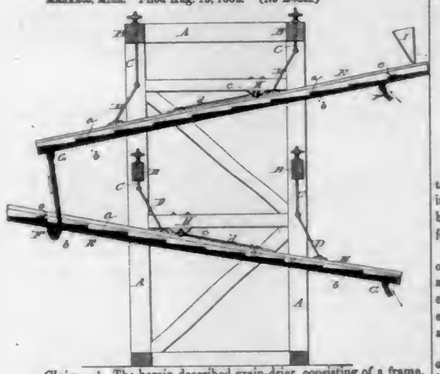
4. The combination, with the draw-head having the open recess at its front portion, the projection extending from the bottom of this recess, the recesses I I, and the curved recess formed in its top in rear of the link-recess, of the spring-plate comprising the flat main portion having the lateral extensions at its front end, and formed with the curved or segmental rear end, the said plate being fulcrumed to the top of the draw-head at the rear wall of the link-recess, substantially as set forth.

299,202. COMBINED ENVELOPE AND LETTER-SHEET. ARTHUR COX, Toronto, Ontario, Canada. Filed Feb. 15, 1883. (No model.)



Claim.—A combined envelope and letter-sheet having a row of perforations down each side, and arranged to fold so as to hide the communication from view, in combination with an adhesive seal folded to embrace and adhere to both sides of the letter outside of the perforations when the sheet is folded, whereby the seal may be torn off without injuring the body of the letter, substantially as and for the purpose specified.

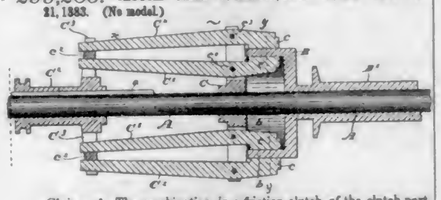
299,203. CEILING-PLATE. RICHARD T. CRANE, Chicago, Ill. Filed Apr. 22, 1884. (No model.)



Brief.—A two-part ceiling-plate, one part provided with holding-projections and the other with corresponding recesses.

299,203.

Claim.—A ceiling-plate consisting of two parts, A B, one provided with projections *a*, the other with recesses *b*, substantially as and for the purpose specified.



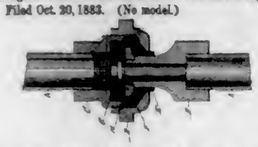
299,204. MACHINE FOR DRYING GRAIN. BENTLEY S. CULLEN, Mankato, Minn. Filed Aug. 18, 1882. (No model.)

Claim.—1. The herein-described grain-drier, consisting of a frame, adjustable rods C, links D, pan E, having corrugated steam-jacketed bottom, and means, substantially such as shown and described, for imparting a reciprocating motion to the pan.

2. In combination with the frame and with a pan or grain table of a grain-drying apparatus, suspending-links for said pan, and vertically-adjustable rods carrying said links, whereby the pan may be inclined as required.

299,205. CLUTCH. JAMES W. DAWSON, Rushville, Ind. Filed Dec. 21, 1883. (No model.)

Claim.—1. The combination, in a friction-clutch, of the clutch part B, loosely mounted on the shaft A, and the clutch part C, rigidly mounted on said shaft, and having pairs of arms C', bearing friction-plates *c* on one end, pivoted thereto, with means for operating the same, substantially as described, and for the purposes specified.



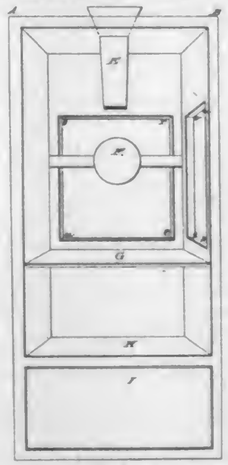
2. In a friction-clutch, the combination of the clutch part B, loosely mounted on the shaft A, and provided with a circular flange or rim, *b*, the clutch part C, having pairs of arms C', pivoted thereto, said arms having friction-plates *c* on the end next the clutch part B, the friction-plate of one arm of each pair being adapted to engage with the inside surface of the flange *b*, and the friction-plate of the other arm being adapted to engage with the outside surface of said flange, and a shifter, C^3, which engages with the other ends of the pairs of arms C', and operates to throw the friction-plates into or out of contact with the flange *b* of the clutch part B, substantially as set forth.

3. The combination, in a friction-clutch, of the clutch part B, loosely mounted on the shaft A, the clutch part C, rigidly mounted on said shaft, provided with pairs of arms C', each arm bearing a friction-plate, *c*, on one end, and one arm of each pair being pivoted at the periphery of the part C, and the other near its center, whereby the friction-plate on one arm of each pair is adapted to engage with the outside surface of the clutch part B, and the other with its inside surface, and the shifter C^3, as a means for operating said arms, substantially as set forth.

4. In a friction-clutch, the combination of the clutch part B, loosely mounted on the shaft A, the clutch part C, rigidly mounted on said shaft, having pairs of arms C', pivoted in a disk bearing friction-plates on their short ends, and the shifter C^3, provided with arms C^3, which extend outward, one on each side of the ends of each pair of arms C', and are provided with a wedge-block, c^3, between the ends of said arms C', whereby said arms are operated, substantially as set forth.

5. The combination, in a friction-clutch, of the shaft therefor, a clutch part rigid with said shaft, a clutch part revoluble on said shaft, and a shifter, one of said clutch parts having a flange and the other having pairs of expansible and contractible friction-plates adapted to be forced into contact with said flange, or to be freed therefrom, by the operation of said shifter without moving either of said clutch parts longitudinally of said shaft, substantially as set forth.

299,206. INSULATING PIPE-UNION. CHARLES DRAVE, New York, N. Y., assignor to the Archer & Pancoast Manufacturing Company, same place. Filed Oct. 20, 1883. (No model.)



Claim.—1. The herein-described insulating pipe-union composed of the end pieces for receiving the pipe-sections, the coupling-nut for drawing said pieces together, the non-conducting disks or plates interposed between the parts, and the securing-ring, substantially in the manner and for the purposes set forth.

2. In an insulating pipe-union, the coupling-nut, the two end pieces, one of which projects through the nut, the perforated non-conducting disk, and the non-conducting shell interposed between the nut and projecting end piece, said shell being held in place by the ring upon said projecting end piece, these parts being combined and arranged substantially as shown and described.

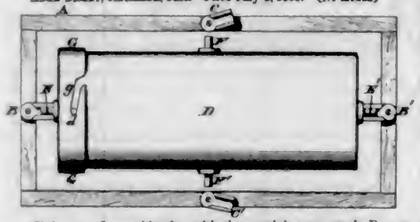
3. In an insulating pipe-union, the combination, as before set forth, of the end pieces, the coupling-nut, the non-conducting disks, and the holding-ring having a flat bearing-face, arranged substantially as shown and described.

4. In a pipe-union of the character herein set forth, the end pieces, the removable disks, the holding-ring having a flat bearing-surface, the perforated compressible disk, and the coupling-nut, arranged and combined substantially as shown and described.

299,207. STREET-CAR FARE-BOX. GUSTAVE S. DE BLANC, New Orleans, La. Filed Mar. 5, 1884. (No model.)

Claim.—The combination, with a fare-box having an orifice or chute for the introduction of the fare, of a bell or gong placed beneath the discharge of said chute or opening to be struck by the fare as it drops from the chute, as and for the purpose described.

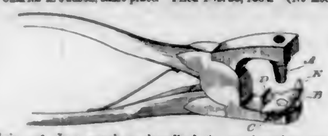
299,208. LAYING AND SECURING RAILS IN ROAD-BEDS OF RAILWAYS. JEANTY DESCHAUD, Sr., San Francisco, Cal. Filed Dec. 17, 1883. (No model.)



Brief.—A reversible rail with a projecting flange on one or both treads is combined with a brace-block conforming to the outer surface of the rail, said rail and block being embedded in the ties.

Claim.—1. In the road-bed of a railway having cross-ties B, the rail A, having a flange, *a'*, the base of said rail and its flange being embedded in the cross-tie, in combination with the L-shaped brace or clamp C, having a curvilinear or bulging face, *d*, fitting the outer groove of the rail, said clamp being bolted to the rail, and having its base embedded in the cross-tie and spiked thereto, substantially as herein described.

2. In the road-bed of a railway having cross-ties B, the rail A, having the lateral flanges *a a'*, and side grooves, in combination with the L-shaped clamp or brace having a curvilinear or bulging lug *d* on its face, fitting the outer groove of the rail, and a means for securing the clamp to the rail and the rail and clamp to the cross-tie, substantially as herein described.



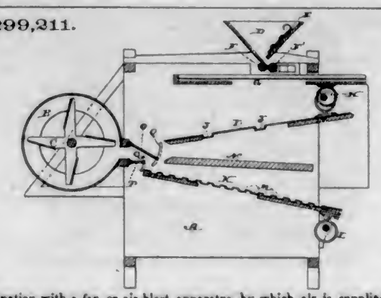
299,209. MIXING-MACHINE FOR DRUGS AND CHEMICALS. ADAM DICKEY, Cincinnati, Ohio. Filed July 2, 1883. (No model.)

Claim.—1. In combination with the revolving receptacle D, a series of blades, K, fixed to the interior of said receptacle, the blades of one rank being set in an opposite oblique manner with reference to the blades of the other rank, as herein described.

2. In combination with the cylinder D, having two pairs of gudgeons, E E' and F F', located as herein described, the frame A, provided with two distinct sets of swinging journal-bearings, B B' and C C', for the purpose specified.

299,210. PUNCH. ISAAC M. DUNCKLEBURG, Rochester, N. Y., assignor to Charles K. Judson, same place. Filed Feb. 25, 1884. (No model.)

Claim.—1. In a punch, as described, the spacing-plate attached to one jaw thereof and provided with projections, as shown, whereby the holes cut by the punch may be accurately spaced, both from the edge of the material and from one another.

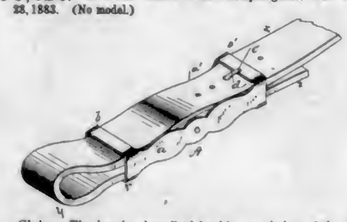


2. In a punch, an attachable spacing-plate provided with two projections turned up at an angle from the face of the plate, in combination with the jaw of the punch, and means for attaching it thereto, substantially as set forth.

3. The combination, with a punch, of the plate B, having upward projections D and E, and attached to the jaw of the punch by the rivet or screw C, substantially as described, and for the purpose set forth.

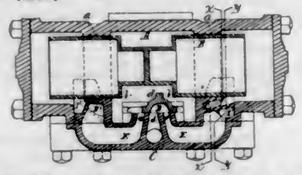
299,211. DRY SEPARATOR AND AMALGAMATOR. HERBERT EARHART, Santa Maria, assignor of two-thirds to H. D. Livingston and Joseph Kaiser, both of San Francisco, Cal. Filed Feb. 21, 1884. (No model.)

Claim.—1. An apparatus for separating gold from sand or earthy material, consisting of a sieve or screen upon which the material is distributed and agitated, two or more inclined shaking-tables situated one below the other beneath the screen, and so placed that the uppermost one discharges upon the one next below, said tables having mercury-containing troughs or channels extending across their surfaces, in combination with a fan or air-blast apparatus, by which air is supplied to separate the dust from the gold, substantially as herein described.



299,211.

2. An apparatus for separating gold from sand or earthy material, consisting of a series of inclined superposed tables with transverse troughs for mercury, a screen upon which the material is first delivered, and a fan or blast apparatus, in combination with a feed-hopper with an extended transverse outlet and regulating-gate, and self-adjusting rollers, between which the material may pass before falling upon the screen, substantially as herein described.

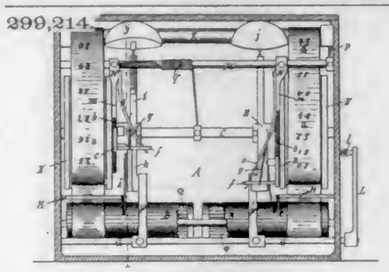


3. An apparatus for separating gold from sand or earthy material, consisting of the inclined amalgamating-surfaces, screen, and feed-hopper, arranged with relation to each other as shown, in combination with a fan or blast apparatus, the wind-board N, and the adjustable direction-boards O P, substantially as herein described.

299,212. BUCKLE. LEWIS P. EDWIN, Springdale, Wis. Filed Nov. 23, 1883. (No model.)

Claim.—The herein-described buckle, consisting of the sides *a a'*, connected at their ends by transverse bars *b b' b^2 b^3*, forming tack-loops at each end of the said frame, a tongue-bar, B, and tongues C C', mounted thereon, substantially as set forth.

299,213. WATER-METER. BENAIAH FITTS, Worcester, Mass., assignor to the Union Water Meter Company, same place. Filed Aug. 25, 1881. (Model.)

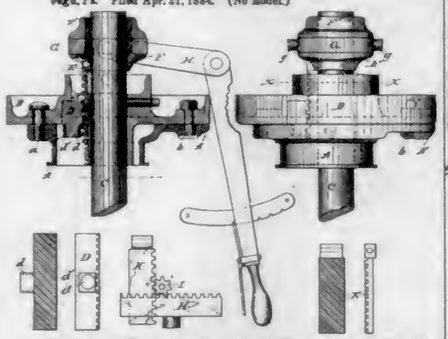


Claim.—The combination of the cylinders A A', having internal bearing-surfaces, *a a*, said cylinders being separated below by a triangular shaped space, the pistons B B', provided with shoulders *b b*, the removable valve-seat plate C, having guideways *c c* and ports *e e' i i''*, and the valves D D, provided with projections *d*, the valve-seat ports being connected with the ends of the cylinders by straight parallel passages E I, located in the ends of the valve-seat plate, and spirally-crossed passages E' I', located in the triangular space beneath the cylinders, substantially as shown and described.

299,214. DEVICE FOR REGISTERING FARES. CHARLES SIDNEY FOSS, Boston, Mass. Filed Dec. 5, 1883. (No model.)

Claim.—1. In a railway-registering device, the rod *l*, in combination with the shaft G, provided with its two oppositely-disposed levers F F', the printed ribbons, and the three-armed lever E and its connecting mechanism to feed the printed ribbons *a a'* forward at every movement of said rod, and thereby register a fare.

299,214.

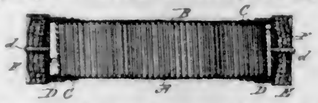


2. The combination of the spring-rollers B B and receiving-drums B' B', provided with the ratchet-wheel *b b*, the spring-actuated lever E and its attendant mechanism, as herein described, the operating-lever F, rocking-shaft G, and rod *l*, substantially as and for purposes described.

3. In a railway-registering device, the combination, with the spring-actuated rollers and receiving-drums for storing the printed ribbons, of the releasing mechanism, as herein described, whereby the strip is restored to its normal position upon the rollers, substantially as and for purposes set forth.

4. In a railway-registering device, the combination of the rollers B, the shaft G, arms F F', and pawl and ratchet mechanism, and the receiving-drums B', with the spring-actuated shaft M, pawls *w*, and trip-levers *o*, actuating the studs *f*, as and for purposes herein described.

299,215. VARIABLE ECCENTRIC. ABRAHAM O. FREE, Waynesborough, Pa. Filed Apr. 21, 1884. (No model.)



Claim.—1. The combination, substantially as before set forth, of the fixed disk on the crank-shaft, the eccentric pivoted to said disk, and the cross-sliding rack for shifting the eccentric, said rack being mounted in a rectilinear cross-guideway of the fixed disk.

2. The combination, substantially as before set forth, of the fixed disk on the crank-shaft, the eccentric pivoted to said disk, the cross-sliding rack for shifting the eccentric, and the toothed shifting-bar fitted in a longitudinal guideway in the hub of the fixed disk.

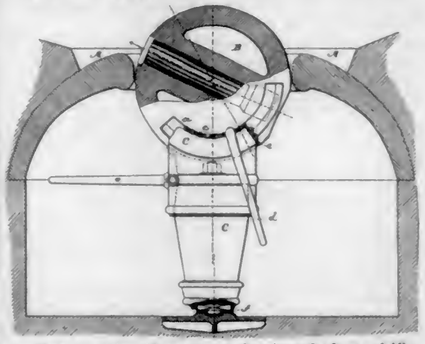
299,216. FLEXIBLE CARRIER FOR PNEUMATIC TUBES. RICHARD J. P. GOODWIN, Manchester, N. H. Filed Nov. 20, 1883. (No model.)

Brief.—A flexible carrier for use in curved pneumatic dispatch-tubes, the carrier consisting of a spiral spring having an elastic fibrous covering, and provided with collars, detachable caps, and washers.

Claim.—1. In a flexible cash box or carrier for pneumatic tubes or transmitters, the combination of a spiral spring, a fibrous covering or envelope inclosing said spring, a metallic collar secured to each end of the spring, and a cap detachably connected to each of said collars, substantially as described.

2. The combination, with a cash box or carrier for pneumatic tubes or transmitters, of a metallic cap, D, provided with felt, cloth, or leather washers E, and a metallic washer, F, substantially as described.

3. In a flexible cash box or carrier for pneumatic tubes or transmitters, the combination of the spiral spring A, envelope B, collars C C, caps D D, and washers E F, substantially as described.



299,217. SASH-HOLDER. GEORGE E. GORHAM, Albany, N. Y. Filed Feb. 16, 1884. (No model.)

Claim.—1. In devices for producing friction between the meeting-rails of window-sashes when closed and between the parting-strips and sashes when open, the combination of the springs *a*, having upper and lower bulges, and secured at their outer ends to the stiles, as described, and pins extending from the frame across the springs, against which the bulges bear, substantially as and for the purpose set forth.

2. The combination, with the sashes and frame of a window, of the spring secured at its outer ends to the sash, and having upper and lower bulges, and formed with the semicircular bend *f*, the staple *g*, and pins extending from the sides of the frame against which the bulges of the spring bear, substantially as and in the manner described.

299,218. MORTAR AND GLOBULAR SHIELD FOR THE SAME. HERMANN GRUSON, Buckau, near Magdeburg, Prussia, Germany. Filed Dec. 21, 1883. (No model.)

Claim.—1. A barrel for mortars or other pieces of ordnance, rigidly secured within and completely closing an opening in a spherical or nearly spherical shell or casing whereby it is carried, in combination with suitable means for supporting said shell or casing, substantially as and for the purpose set forth.

2. A barrel for mortars or other pieces of ordnance, rigidly secured within and completely closing an opening in a spherical or nearly spherical shell or casing, in combination with a covered place or turret for the gunner, having a circular opening, within which said shell fits and turns, as set forth.

3. A barrel for mortars, &c., located within a spherical or nearly spherical shell or casing, in combination with suitable means for turning said shell on an imaginary horizontal axis drawn through it at right angles to the axis of the bore, as and for the purpose set forth.

4. The combination, with a barrel rigidly secured within and completely closing an opening in a spherical or nearly spherical shell or casing, of means for revolving said shell horizontally, as and for the purpose set forth.

5. The combination, with a barrel rigidly secured within a spherical or nearly spherical shell or casing, and means for turning said shell to change the inclination of the barrel, of means for revolving said shell horizontally, as and for the purpose set forth.

6. The combination, with a globular shell or casing carrying a barrel, and formed on its lower side with circular tracks or ways, and a supporting-base having corresponding tracks, of anti-friction rollers located between the tracks on the respective sides of the shell, as set forth.

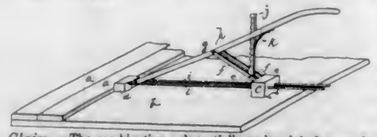
7. The combination, with a globular shell or casing carrying a barrel, and formed on its lower side with circular tracks or ways, and a supporting-base having corresponding tracks, of a series of anti-friction rollers coupled together and located between the tracks on the respective sides of the shell, as set forth.

8. The combination, with the globular shell or casing B, carrying the barrel, and the base-piece C, of the anti-friction balls *k*, annular bearing-ring *l*, and support D, as and for the purpose set forth.

9. The combination, with the barrel of a gun, having a suitable carriage, of a universally-swinging weight depending therefrom, and a suitable frame for supporting said carriage, so constructed as to allow free lateral movement to said weight to compensate for the rolling of the vessel or to take up the recoil of the gun, or both, substantially as set forth.

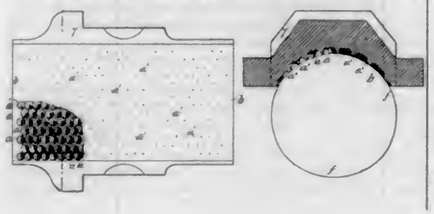
10. The combination, with the shell B, carrying the barrel, and the pillar C, having weight G depending therefrom, of the support D and anti-friction balls *k*, located between said support and the pillar C, substantially in the manner and for the purpose set forth.

299,219. FOUNTAIN-PEN. JAMES R. HAIGHT, Adrian, Mich. Filed Oct. 1, 1883. (No model.)



Claim.—1. The combination of the cylinder-reservoir closed at the top, the porous material or sponge in the chamber formed by the pen, and a shoe or cap, a central plug with an orifice and slot affording communication between said reservoir and such porous material, said slot also opening to the air through coincident openings in the cap or shoe, substantially as and for the purposes set forth.

2. The cylindrical ink-reservoir, open at its lower end only, in combination with a detachable holder inclosing a central plug, slotted and bored to afford communication between such fountain and the pen, the shoe or cap and pen, by means of which a chamber is formed to receive the porous material, the parts being constructed and operating substantially as described and shown.

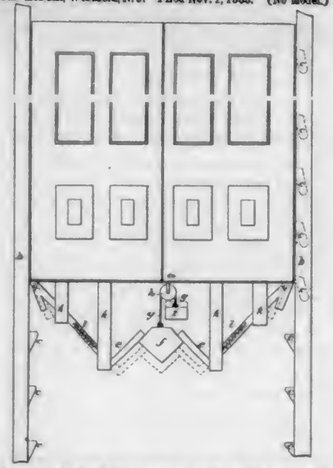


3. In a fountain-pen, the reservoir, pen, shoe, or cap, such pen and shoe inclosing the porous material, with a central plug slotted and bored as described, and adapted to furnish the requisite atmospheric pressure at a point between such porous material and the fountain, substantially as set forth.

299,220. FLOOR-CLAMP. HIRAM E. HATCH, Dexter, Me. Filed Jan. 11, 1884. (No model.)

Claim.—The combination, substantially as hereinbefore set forth, of the block *c*, provided with teeth adapted to hold it in position, the sliding block *d*, the rods *i i*, secured to said block *d*, and sliding in openings in the block *c*, the lever *g*, pivoted to block *d*, the straps *f f*, pivoted both to the block *c* and lever *g*, the ratchet *j*, operating to hold the lever in position, and the spring *k*, serving to hold said ratchet in place.

299,221. JOURNAL-BEARING. HERBERT H. HEWITT, New York, N. Y. Filed Feb. 19, 1884. (No model.)

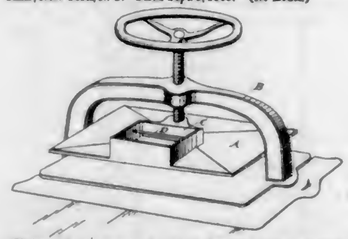


Claim.—1. A journal-bearing of brass or hard metal, the bearing side of which consists of taper projections integral therewith, in combination with a soft-metal lining surrounding the said projections, substantially as and for the purpose set forth.

2. A journal-bearing of hard and soft metal, the bearing-surface of which is composed of the soft metal and projecting points or edges forming parts of and extending from the hard metal entirely through the soft metal, substantially as and for the purpose set forth.

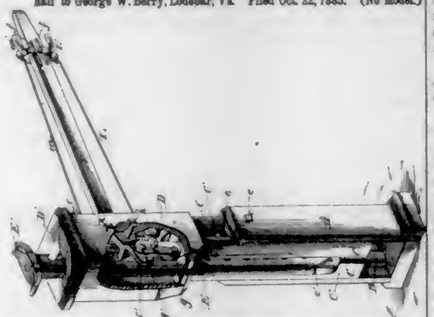
3. In a journal-bearing, a hard-metal bearing-block provided on its bearing side with a series of conical projections integral therewith, in combination with a soft-metal lining covering the said conical projections, substantially as described.

299,222. AUTOMATIC SAFETY APPLIANCE FOR ELEVATORS. JOHN HODGES, Westfield, N. J. Filed Nov. 1, 1883. (No model.)



Claim.—1. Projections adapted to arrest an elevator-car, in combination with mechanism to engage the projections and throw them out of the way of the elevator-car as it descends, and a spring or springs operating to withdraw said mechanism which engages the projections, so as to allow the projections to stop the descending car, and mechanism adapted to hold the mechanism engaging the projections in the position which engages the projections, except in case of accident, substantially as described.

2. The projections *c*, the beveled piece *d*, the spring *l*, and the weight *i*, or its equivalent, arranged and operating substantially as described.



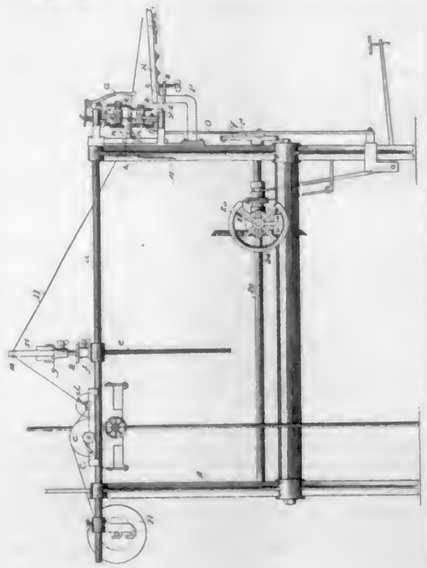
3. The projections *c*, the pieces *d e*, the piece *f*, the spring *l*, the rope *g*, with suitable pulley or support, and the weight *i*, arranged and operating substantially as described.

299,223. UPPER PLATE OF COPYING-PRESSES. HENRY N. HUBBARD, New York, N. Y. Filed Sept. 5, 1883. (No model.)

Claim.—As an improved article of manufacture, the upper movable plate, A, of a copying-press, provided with the water-receptacle C on its upper face, arranged at the middle of the length of the plate A, and having its outer side flush with one of the longitudinal edges of said plate, the inner longitudinal side of said water-receptacle C having a central boss-socket, E, formed on it, and the upper plate, A, water-receptacle, and boss-socket being integral with each other, as set forth, whereby the socket is strengthened by the inner side of the water-receptacle, as specified.

299,224. LIFTING-JACK. JAMES H. HUBBERT, OMAR, assignor of one-half to George W. Berry, Lodebar, Va. Filed Oct. 22, 1883. (No model.)

Claim.—1. In a lifting-jack, the combination of the frame A and sliding frame D, the bar E, having ratchets *s*, the lever F, lug G, and spring *i*, the connecting-rods L *m*, and pawl J, all substantially as shown and described.



2. In a jack, the frame or pedestal A and adjustable sliding frame D, having the projection C, forming grooves C' C' C', the notched bar E, and inclined slots *d'*, in combination with the forked lever F, slots *f f*, the depending lug G, pawl J, and springs *i J'*, adapted to engage with the ratchet *s*, the rods *m* L, and pawl *m'* L, connected to the slots *f f*, substantially as shown and described.

3. In combination, the stationary and adjustable frames having a notched bar adapted to be raised and held in position by a lever and pawl connected by rod to the lever-arm and held in position by a pin or bolt, all substantially as shown, and for the purpose described.

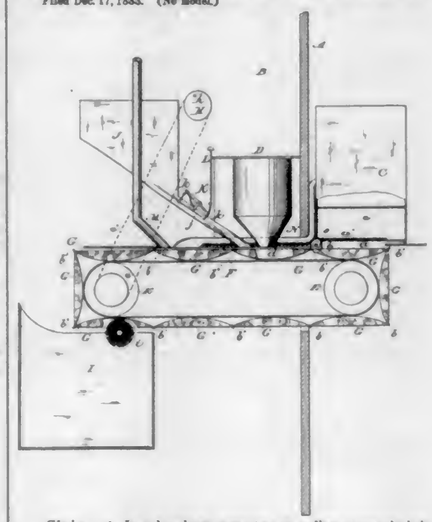
4. In a lifting-jack, the pedestal having tongues B B, adjustable frame having downwardly-extending arms forming grooves, in combination with a lever-arm provided with a depending lug connected to an operating-rod, pawls J, and connecting-rod, whereby the bar is held in a rigid position, substantially as described, and for the purposes set forth.

5. In a lifting-jack, the vertically-adjustable notched bar E, provided with the downwardly-inclined portion *d'*, adapted to receive a hook, the lever F, lug G, and pawl J, connected to said lever by operating-rod *m* L, all substantially as described, and for the purposes set forth.

299,225. MACHINE FOR LABELING OR COVERING THE TOPS OF BOXES. HORACE INMAN, Amsterdam, N. Y. Filed May 12, 1883. (No model.)

Claim.—1. A machine for labeling or covering the tops and bottoms of boxes, consisting of a suitable supporting-frame having bearings for the roll of paper, of paste or glue applying devices, non-revolving box, supporting devices, and mechanisms for supporting and cutting the web, all substantially as described.

2. The combination of the bracket, the box-form pivoted therein, and the adjusting devices, substantially as described, whereby the inclination of the box may be varied, substantially as described.



3. In the described machine, the positively-operated cutters *k k*, adapted to move transversely across the web, substantially as described.

4. The transversely-moving carriage having rotary cutters, and pinions on the journals of said cutters, said pinions being connected to rack-bars by intermediate loose pinions, whereby the cutters are made to revolve as the carriage moves, substantially as described.

5. The laterally-moving carriage having positively-revolving cutters, and a lever and suitable connections to a crank, in combination with devices, substantially as described, for stopping and starting the cutting mechanism, substantially as described.

6. In combination with the web-cutting devices, the frame F, and mechanism, substantially as described, to actuate the same, said mechanism being operated by the treadle-lever to throw the said frame forward and return the same, substantially as described.

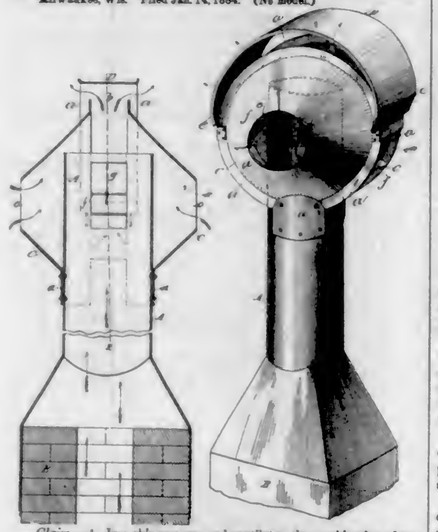
299,226. DRY-CLOSET. THOMAS W. JACKSON, San Francisco, Cal. Filed Dec. 17, 1883. (No model.)

Claim.—1. In a dry-closet apparatus, an endless-receptacle belt mounted under and adapted to receive the excrement or feces from a closet, means for depositing therein a charge of ashes, sand, earth, or other suitable or similar substances, means for introducing hot air upon the contents of the receptacle to dry it, and a mechanism for causing the movement of said endless receptacle to carry off and discharge its contents, substantially as and for the purpose herein described.

2. In a dry-closet apparatus, a stove or other fuel-consuming device and an adjoining closet, in combination with an endless-receptacle belt mounted under said stove and closet, and adapted to receive the ashes from the former and the excrement or feces from the latter, and a mechanism for causing the movement of said endless receptacle to carry off and discharge its contents, substantially as herein described.

3. In a dry-closet apparatus, a stove or other fuel-consuming device and an adjoining closet, in combination with an endless-receptacle belt mounted under said stove and closet, and adapted to receive the ashes from the former and the excrement or feces from the latter, a hot-air pipe communicating with the stove and with the receptacle-belt to dry its contents, and a mechanism for causing the movement of the belt to carry off and discharge its dried contents, substantially as herein described.

4. In a dry-closet apparatus, the stove C, having ash-pit *c*, and the closet-seat D, in combination with the underlying endless belt F, mounted on drums E, the succession of separate pans G on said belt, and adapted by its movement to be brought successively under the ash-pit of the stove and under the discharge of the closet-seat, a means automatically depositing a charge of ashes in each pan when under the ash-pit, and a mechanism for causing a periodic movement of said belt to carry a pan from under the closet and substitute a fresh one, substantially as herein described.



5. In a dry-closet apparatus, the stove C, having an ash-pit, *c*, with a grated double bottom consisting of a stationary plate, *a*, and sliding plate *a'*, having arm *b*, and returning-spring *s*, in combination with the endless periodically-moving belt F, having pans G, each pan having a raised cam portion, *b'*, for engaging with the arm *b* of the sliding grate-plate *a'*, to cause a discharge of ashes into the pan, substantially as and for the purpose herein described.

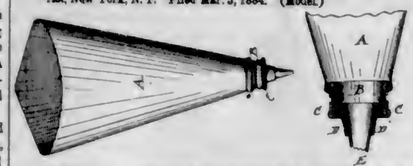
6. In a dry-closet apparatus, the stove C, having an ash-pit, *c*, and the closet-seat D, in combination with the underlying endless belt F, mounted on drums E, the succession of separate pans G on said belt, and adapted by its movement to be brought successively under the ash-pit of the stove and under the discharge of the closet-seat, and the means for causing the periodic movement of the belt and pans, consisting of the pulley *e* on drum E, the crank-pulley H, and the belt *e'*, arranged to operate substantially as and for the purpose herein described.

7. In a dry-closet apparatus, the stove C, having ash-pit *c*, and the closet-seat D, in combination with the periodically-moving endless belt F, having pans G, arranged with relation to the stove and closet, as described, the hot-air pipe N, communicating with the stove and pans, and the vent-pipe M, substantially as and for the purpose herein described.

8. In a dry-closet apparatus, the endless belt F, adapted to be rotated, and having pans G, for the purpose described, in combination with the brush *i*, over which the returning inverted pans pass, whereby they are cleaned, substantially as herein described.

299,227. CHIMNEY CAP AND VENTILATOR. WILLIAM J. KAYSER, Milwaukee, Wis. Filed Jan. 14, 1884. (No model.)

Claim.—1. In a chimney cap and ventilator, the combination of two open cone-frustums attached opposite each other close to the top of the chimney-pipe, and adapted to direct forced drafts upward toward the top of said pipe, with a sheet-metal band fastened to the base of said opposing cones and adapted to cover the upper half of the open space left between them, to protect the chimney-pipe against return-drafts and rain or snow, substantially as set forth.

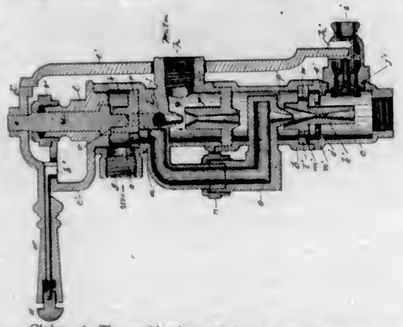


2. In a chimney cap and ventilator, the cone-frustums C C, having a flange, *a*, around their open base, and top openings, *c*, in combination with the protecting-band D and the chimney-pipe A, substantially as shown and described, and for the purpose set forth.

3. In a chimney cap and ventilator, the cone-frustums C C, having the dividing-strips *f f*, in combination with the pipe A, having the band D and the slots *g g* and strips A A, substantially as shown and described, and for the purpose set forth.

4. In a chimney cap and ventilator, a pipe having side openings and cone-frustums secured opposite each other, and having open tops located alternately with and midway between the openings in the pipe, to create a blast-draft straight out through the top of the pipe, substantially as set forth.

5. A combined ventilator and chimney cap consisting of a pipe having side openings and top opening protected by a weather-band, and open cone-frustums, as described, whereby a straight forced upward draft is insured, irrespective of the direction of the wind, substantially as set forth.



299,228. CONFECTIONER'S ORNAMENTING-TUBE. JULIUS KIRSTEN, New York, N. Y. Filed Mar. 3, 1884. (Model.)

Claim.—1. A confectioner's ornamenting-tube consisting of a flexible water-proof funnel or receiver, A, a tubular socket, B, applied to the lower end of the receiver A, a detachable collar, C, and a flanged and conically-tapering socket D, retained between flanges of the socket B and collar C, substantially as set forth.

2. The combination of a funnel or receiver, A, a socket, B, having a flange, *b*, at its lower end, means to attach the socket to the lower end of the receiver, a flanged detachable collar, C, applied to the socket B, a flanged conically-tapering socket, D, and an interchangeable ornamenting-tube E, substantially as set forth.

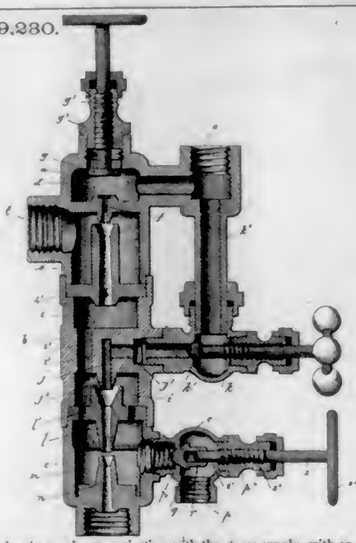
299,229. INJECTOR. FRANKLIN W. KREMER, Wadsworth, Ohio. Filed Sept. 21, 1883. (Model.)

Claim.—1. The combination, with the steam inlet and valve, of an operating-lever provided with a spring push-piece and a toothed or notched segmental rack, with which said lever engages to govern the position of the valve, substantially as described.

2. The combination, with the steam-inlet, the valve therefor, an operating-lever provided with a spring-catch and a cam, and a toothed segment engaged by said spring-catch, of the overflow, a check-valve therein, and a lever for said check-valve under the control of the cam of the steam-inlet-controlling valve-lever, substantially as and for the purpose described.

3. The combination, in an injector, of a perforated or ported base or diaphragm for the combining or mixing tube, and an annular valve or plate automatically opening or closing such perforations or ports, substantially as shown and described.

4. The combination, with the overflow, of an automatically-seated check-valve, a lever to unseat or open the same, and the live-steam-valve-actuating lever operating in connection with said check-valve lever, substantially as described.

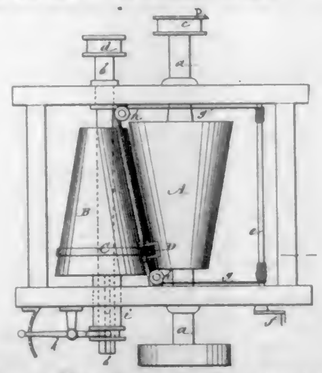


5. The combination, with the steam inlets and ports *j m* and the lifting and forcing tubes *i* and *p'*, respectively, of the steam-valve *r*, having the single opening *s* for ports *j m*, controlling such ports independently of one another, and operable with relation thereto to admit of the grading of the water-supply, and also the conversion of the machine from a lifting to a non-lifting injector, and vice versa, substantially as shown and described.

299,230. INJECTOR. FRANKLIN W. KREMER, Wadsworth, Ohio. Filed Nov. 19, 1883. (Model.)

Claim.—1. In an injector, the steam-chamber *d*, the valve *g* therein, the suction-chamber *e*, with which the steam-chamber communicates through the lifting jet-tube *f*, under control of the said valve, the combining-tube *h*, aligned with the said lifting jet-tube, the overflow-chamber *m*, the overflow-cock *o* therein, provided with the valve *q*, having automatic play on its stem, and also by said stem adapted to be positively operated to close said overflow, all combined and arranged to operate substantially as shown and described.

2. In an injector, the steam-chamber *d*, the valve *g* therein, the suction-chamber *e*, with which the steam-chamber communicates through the lifting jet-tube *f*, under control of the said valve, the combining-tube *h*, aligned with the said lifting jet-tube, the forcing jet-tube *f*² in the sup-



299,230.

ply-chamber, and communicating with the steam-supply, with an interposed valve, *k'*, the combining-tube *l*, having ports *l'* in its base or flange to open independent communication between the suction and overflow or exhaust chambers, and the overflow-valve *q*, having an automatic and also a positive operation, all combined and arranged to operate substantially as shown and described.

3. In an injector, the steam-chamber *d*, the valve *g* therein, the suction-chamber *e*, with which the steam-chamber communicates through the lifting jet-tube *f*, under control of the said valve, the combining-tube *h*, aligned with the said lifting jet-tube, the forcing jet-tube *j''* in the supply-chamber, and communicating with the steam-supply, with an interposed valve, *k'*, the combining-tube *l*, having ports *l'* in its base or flange to open independent communication between the suction and overflow or exhaust chambers, the discharge-tube *n* in the suction or exhaust chamber *m*, aligned with the force-combining tube, and the overflow-valve *q*, having an automatic and also a positive operation, all combined and arranged to operate substantially as shown and described.

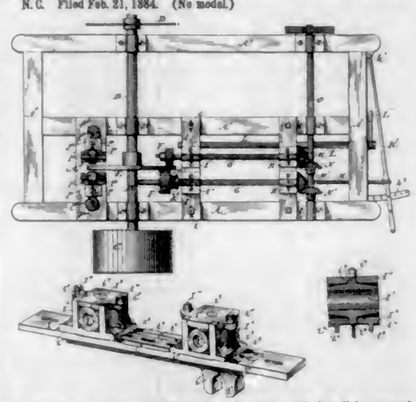
299,231. DEVICE FOR TRANSMITTING MOTION. WESLEY R. LAIRD, East Calais, Vt. Filed Apr. 4, 1884. (No model.)

Claim.—1. The combination of the reversely conical or tapering pulleys A B, fitted on shafts parallel with one another, arranged at such a distance apart as to bring the surfaces of said pulleys in close proximity to but free from contact with each other, and an endless belt or band, C, arranged to freely receive the one pulley through it, and capable of adjustment thereon or along, and of being gripped by the two pulleys between which it passes, substantially as and for the purposes specified.

2. The combination of the belt shifter or carrier D and means for operating the same with the reversely-conical pulleys A B and the endless belt or band C, arranged to freely receive through it the one pulley and to pass between both pulleys, essentially as shown and described.

3. In a device for transmitting motion from one conical or tapering pulley to another by pressure of said pulleys upon a belt or band arranged to pass in between them, as described, the one of said pulleys made adjustable in direction of its length, and means for so adjusting the same, whereby the grip of the pulleys on the band may be increased or diminished, or the driven pulley may have its motion arrested without affecting the movement of the driver, substantially as specified.

299,232. BASE-PLATE FOR THE TEETH OF ORE-WASHER SHAFTS. GEORGE LAUDER, Pittsburg, Pa. Filed Nov. 26, 1883. (No model.)



Claim.—1. A base-plate for ore-washer shafts, having a spirally-curved projecting flange to which the teeth may be secured, substantially as and for the purposes specified.

2. A base-plate for ore-washer shafts, having a spirally-curved vertically-slotted flange projecting at right angles from the base-plate, substantially as and for the purposes specified.

3. A base-plate for ore-washer teeth, having a flange which projects at right angles from the base-plate, said flange having a transverse tooth slot or groove at right angles to and extending into the base-plate, substantially as and for the purposes specified.

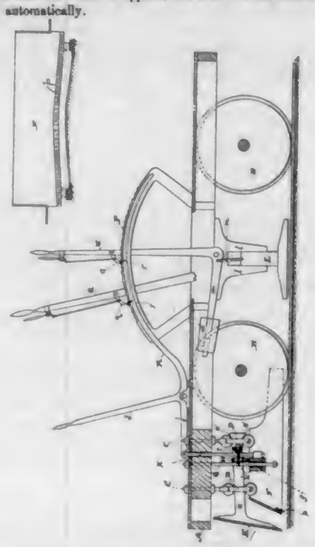
4. A base-plate for ore-washer shafts, having a spiral curve and of T form in cross-section, substantially as and for the purposes specified.

299,233. CIRCULAR-SAW MILL. WALTER J. F. LIDDELL, Charlotte, N. C. Filed Feb. 21, 1884. (No model.)

Claim.—1. In a saw-mill feed mechanism, a friction-disk secured to the saw-mandrel, in combination with friction-wheels arranged to bear upon the opposite faces of said disk in such manner that one only of said wheels shall bear upon the friction-disk at a time, said friction-wheels being secured to parallel shafts geared to and actuating the saw-mill carriage and mounted in movable bearings and connected by bevel-gears with the shaft actuating the saw-mill carriage, substantially as described.

2. In a saw-mill feed mechanism, a friction-disk secured to the saw-mandrel, in combination with parallel shafts carrying friction-wheels arranged upon opposite sides of said disk, but at such a distance apart as will adapt them to be brought one only at a time into operative contact with said friction-disk, movable bearings for adjusting said friction-wheels relatively to the friction-disk, and beveled pinions mounted upon said parallel shafts, and meshing with corresponding pinions on a shaft substantially at right angles thereto, for actuating the saw-mill carriage, substantially as described.

3. The combination, in a saw-mill feed mechanism, of a friction-disk secured to or actuated by the saw-mandrel, friction-wheels arranged to bear upon the opposite faces of said disk, and secured to shafts geared to and actuating the saw-mill carriage, and friction-rollers secured to the



4. The combination, in a saw-mill feed mechanism, of a friction-disk secured to or actuated by the saw-mandrel, the shafts provided with friction-wheels arranged to bear upon the opposite faces of said disk, the friction-rollers arranged diametrically opposite the friction-wheels, to bear against the opposite faces of the friction-disk and supported in adjustable bearings secured to the frame.

5. In a saw-carriage feed mechanism, the combination, with the movable ends of the parallel friction-wheel shafts, of the adjustable bearings consisting of the longitudinally-adjustable bed-plate I, formed with elevated side flanges, and a longitudinally-slotted bottom, bearing-boxes formed with serrations to engage with the corresponding serrations of the bed-plate, and clamping-bolts for securing the boxes adjustably to the bed-plate, substantially as described.

6. In a saw-mill feed mechanism, a longitudinally-adjustable bearing-block, in combination with a bearing-box adjustable longitudinally upon said bearing-block, and a sleeve-bearing pivoted within said box by means of trunnion-hubs journaled therein, substantially as and for the purpose specified.

299,234. SAFETY-GUARD FOR CARS. FRANK P. H. LOFTIS, San Francisco, Cal. Filed Nov. 17, 1883. (No model.)

Brief.—A track-clearer in which a vertically-adjustable shield is suspended under the car, which, when tripped by the sliding guard, falls and completely incloses the space in front of and at the sides of the forward wheels. A brake-lever is connected to the shield, whereby when the shield falls the brake is applied, and if on a cable road the grip is released automatically.

Claim.—1. A safety-guard or fender for cars, consisting of a shield suspended under the car, and adapted, when dropped, to rest on the road-bed and tracks, inclosing the space in front of the forward wheels, and a tripping mechanism, operated by the impact or contact of the obstructing body, to trip the shield to allow it to fall, substantially as herein described.

2. A safety-guard or fender for cars, consisting of a shield having a front and sides suspended under the car, and adapted, when dropped, to rest its lower edge on the road-bed and tracks, inclosing the space in front and on each side of the forward wheels, and a means, operated by the impact or contact of the obstructing body, to trip the shield to allow it to fall, substantially as herein described.

3. A safety-guard or fender for cars, consisting of a shield suspended under the car, and adapted, when dropped, to rest its lower edge on the road-bed and tracks, inclosing the space in front of the forward wheels, a means, operated by the impact or contact of the obstructing body, to trip the shield to allow it to fall, and a mechanism, operated by the falling shield, to apply the brakes to check the car, substantially as herein described.

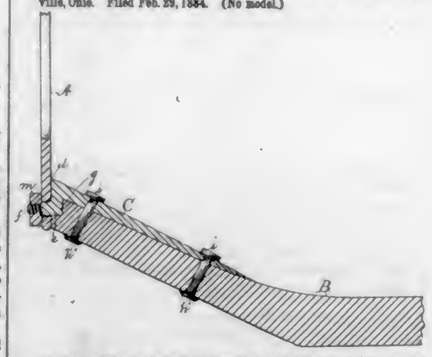
4. A safety-guard or fender for cars, consisting of a shield suspended under the car, and adapted, when dropped, to rest its lower edge on the road-bed and tracks, inclosing the space in front of the forward wheels, a means, operated by the impact or contact of the obstructing body, to trip the shield to allow it to fall, and a mechanism, operated by the falling shield, to apply the brakes to check the car, and to release the gripping device by which, through the traveling cable, the car derives its motion, substantially as herein described.

5. The outer or forward guard, E, mounted under or in front of the car, and having backwardly-extending arms *e*, passing through roller-guides D, by which it is suspended, and adapted to be forced back by an obstructing body, in combination with the shield F under the car and between the guard E and the forward wheels, and a trip-connection between said shield and the arms of the guard E, whereby said shield is suspended above the road-bed and dropped to rest its lower edge on the road-bed and tracks when the guard E is forced back, substantially as herein described.

6. The guard E, having arms *e*, cross-bar I, and adjustable pin *i*, and the roller-guides D, in which the arms are fitted and adapted to move, the rear guides being higher than the forward ones, to permit the guard to move forward to position by gravitation, in combination with the shield F, having cross-bar *f* and slotted arm H, with which the pin *i* engages to suspend the shield, and from which it withdraws to drop it when the guard is forced back, substantially as herein described.

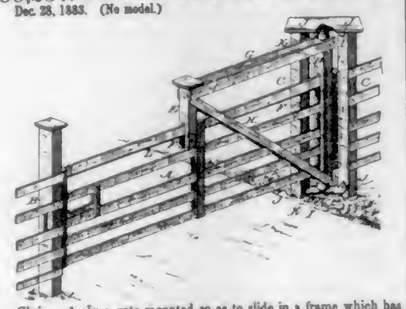
7. The guard E, having arms *e*, cross-bar I, and adjustable pin *i*, and the roller-guides D, arranged as shown, to support the arms and provide for its movement, in combination with the shield F, having a cross-bar, *f*, guided on rods G, a slotted arm, H, for engagement with the pin, and the means for raising the shield after being dropped, consisting of the lever J, arm *j*, and connecting-bar K, substantially as herein described.

8. In a safety-guard for cars, the sliding trip-guard E and the drop-shield F, arranged to operate as shown and described, and the lever J, with its arm *j*, and connecting-rod K, in combination with vertically-moving brakes L, the lever M, having weighted arm *m*, the rod *n*, the rack P, and pawl *o* on the lever M, and the long arm R of lever J, having a side pin, *r*, under the pawl *o*, substantially as herein described.



9. In a safety-guard for cars, the sliding trip-guard E and the drop-shield F, arranged to operate as shown and described, and the lever J, with its arm *j*, and connecting bar or rod K, in combination with the grip-lever Q, having pawl *q*, the rack P, and the arm R of lever J, having side pin, *r*, under said pawl, substantially as herein described.

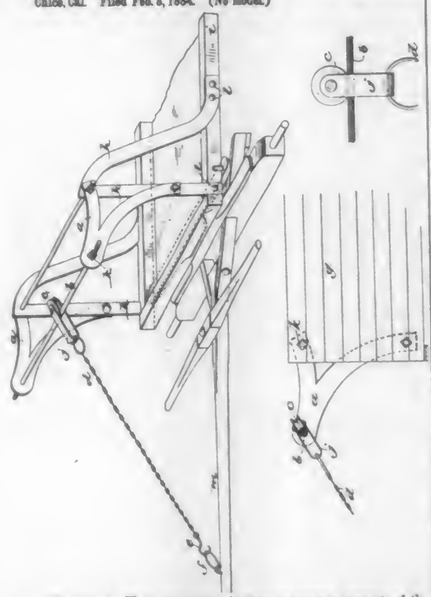
299,235. ORE-CONCENTRATOR. JOHN LEWIS LOOMIS, Leadville, Colo. Filed Sept. 14, 1883. (No model.)



Claim.—In an ore-concentrator, the combination, with the inclined sluices constructed to abruptly change the course of the current at numerous intervals down them, of water-pipes provided with jet orifices or tubes to increase the volume of water in the sluices, and to disturb the pulp in the current, essentially as and for the purposes specified.

299,236. VEHICLE DASH-BOARD. THEODORE H. MADER, Zanesville, Ohio. Filed Feb. 29, 1884. (No model.)

Claim.—The dash-foot C, provided with the shoulder to abut against the dash-frame, and the screw-threaded projection *e*, extending through a slot in the dash-frame, in combination with the body, mortised, as shown, to receive said projection, substantially as described.

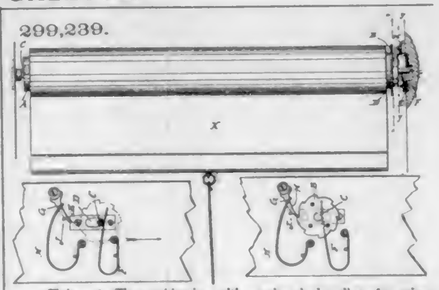


299,237. FARM-GATE. CHARLES W. MANN, Hayward, Cal. Filed Dec. 28, 1883. (No model.)

Claim.—1. In a gate mounted so as to slide in a frame which has its pivot-post standing between two diagonally-fixed posts, C, the braces I, having flanges J turned up on their ends, so as to clasp two sides of the posts to which they are secured, substantially as herein described.

2. The combination, in a gate mounted so as to slide in a frame which has a pivot journaled between two diagonally-fixed posts, C, of pivot-pins turning in horizontal braces I, having flanges J, with the tapering or conical washers K, surrounding the pivots of the slotted post D, all constructed to operate substantially as and for the purpose set forth.

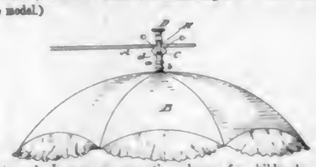
299,238. WAGON-TONGUE SUPPORT. WILLIAM PENN MARTIN, Chico, Cal. Filed Feb. 8, 1884. (No model.)



Claim.—1. The combination, in a wagon-tongue support, of the brackets *a*, rod *b*, sheave *c*, chain *d*, and hook *e*, said brackets *a* being adapted to connect with the sides of a box, *g*, uprights *h*, or other parts of a wagon-body, substantially as described.

2. The combination, in a wagon-tongue support, of the brackets *a*, uprights *h*, rod *b*, sheave *c*, chain *d*, and hook *e*, said uprights being adapted to connect with the sides of a wagon-bed, *i*, substantially as described.

3. The combination, with the box or other supporting part of a wagon-body and with the tongue *m*, of the brackets *a*, rod *b*, sheave *c*, chain *d*, hook *e*, and ring *f*, substantially as described.

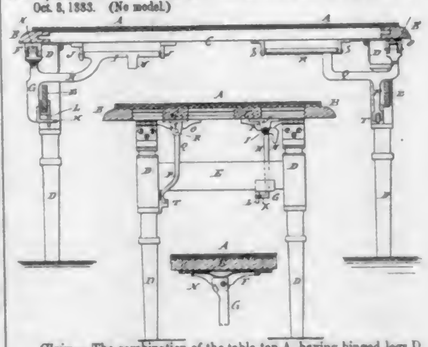


299,239. SPRING SHADE-ROLLER. GIDEON B. MASKEY, Mount Vernon, N. Y. Filed Oct. 23, 1883. (No model.)

Claim.—1. The combination, with a spring shade-roller, of a spring for pressing the end provided with a ratchet-wheel upward, a pawl adapted to engage with the ratchet-wheel, and a spring for holding the pawl raised to a certain position, substantially as herein shown and described.

2. The combination, with a spring shade-roller, of a spring for pressing the end provided with a ratchet-wheel upward, the pawl G, adapted to engage with the ratchet-wheel, the check-stud J, and the spring H, for drawing the pawl against the stud J, substantially as herein shown and described.

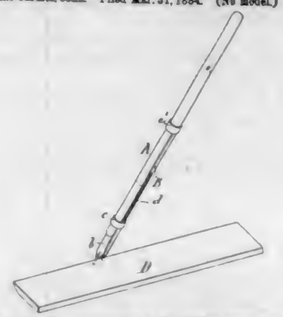
299,240. TOP FOR CHILDREN'S CARRIAGES. URIAH MCCLINCHIE, New York, and JAY F. BUTLER, Williamsburg, N. Y. Filed Nov. 15, 1883. (No model.)



Claim.—1. In canopy-supporting clamps for children's carriages, the combination of the canopy attachment C, constructed with two or more bearing sides or surfaces, *c*, arranged to occupy different angular positions, as described, and the attached locking-screw D, essentially as specified.

2. The polygonal-shaped clamping attachment C, in combination with the strap E, pivoted thereto, and the locking-screw D, substantially as specified.

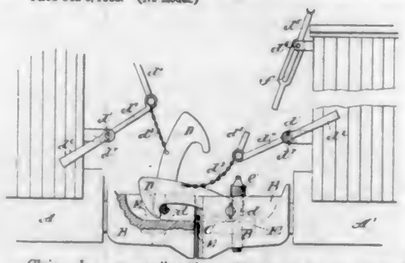
3. The canopy attachment portion C of the clamp, constructed to present different angular bearing surfaces or sides *c c*, of a grooved shape in direction of their length, essentially as and for the purposes herein set forth.



4. The combination of the canopy portion C of the clamp, of grooved polygonal shape on its bearing-surfaces *c c*, and constructed with a lower socket, *a*, the locking-screw D, and the pivoted strap or saddle E, substantially as shown and described.

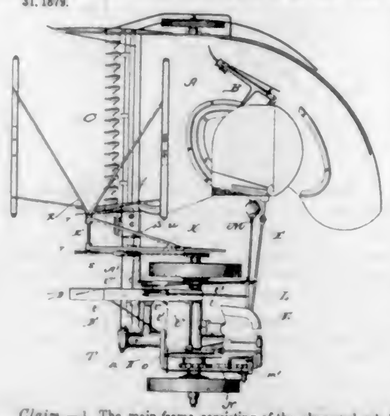
299,241. FOLDING TABLE. JOHN MCGRATH, New York, N. Y. Filed Oct. 8, 1883. (No model.)

Claim.—The combination of the table-top A, having hinged legs D, cross-bars E, and lugs L on said cross-bars, with the folding brackets G H I, bearings F J, springs N, and the catches K M for engaging said lugs L to hold the hinged legs either in their folded or unfolded positions, substantially as set forth.



299,242. ATTACHMENT FOR PEN-HOLDERS. EDWIN P. MCLANE, Mount Carmel, Conn. Filed Mar. 31, 1884. (No model.)

Claim.—1. The combination of the sliding protector B with a pen-holder, A, loops or bands *c c'*, and pen *b*, substantially as and for the purpose described.

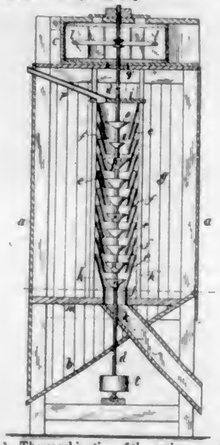


2. The sliding protector B, having a roughened surface, *d*, and arranged upon a pen-holder so as to come in contact with the thumb of the person holding the same in position for ruling and writing, substantially as described.

299,243. CAR-COUPLING. JOHN MEALEY, Prescott, Ontario, Canada. Filed Oct. 6, 1883. (No model.)

Claim.—In a car-coupling, the combination of the draw-heads B, each having a socket, E, and two deep grooves, *b*, one arranged on each side of the socket, and having a transverse pin, *d*, passing through its grooves, said pin having a pivoted hook, D, and said hooks being connected to a crank-arm, d^4, of a shaft, *d'*, having a second crank-arm, d^3, and said crank-arm *d* being connected to a slotted lever, d^5, substantially as and for the purpose set forth.

299,244. HARVESTER. LEWIS MILLER, Akron, Ohio. Filed Dec. 31, 1879.

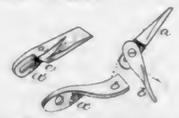


Claim.—1. The main frame consisting of the elongated tubular portion to accommodate the crank-shaft, the transverse tubular portion by which it is pivoted on the main axle, and the lateral extension or arm provided with a head to be attached to the casting which supports or guides the tongue, substantially as described.

2. In a harvester, the combination, with the main frame of the machine and its platform, of the front and rear coupling-bars, connected, respectively, to the front and rear of the frame and platform, the lever mounted in the main frame, and the connections between said lever and the front and rear coupling-bars, whereby both coupling-bars are either raised or lowered by the operation of the lever, substantially as described.

3. In a harvester, the combination, with the main frame, of the removable hanger supported at the rear of the main frame, and the tumbling-rod, sprocket-wheel, clutch, and lever for operating the clutch, all mounted upon the hanger, whereby the attachment or detachment of the hanger to or from the main frame will effect the attachment or detachment of all the parts carried by it, substantially as described, for the purpose specified.

299,245. FLOUR-REFINER. ISAAC MORGAN, St. Louis, Mo., assignor of one-fourth to Carol H. Coggeshall, same place. Filed Oct. 4, 1882. Renewed Jan. 26, 1884. (No model.)

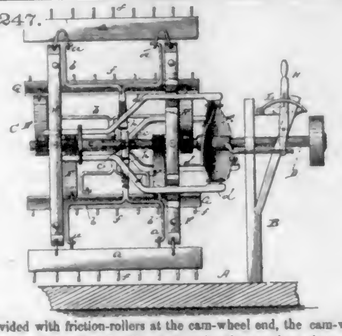


Claim.—1. The combination of the casing *a*, rotary shaft *d*, suction-fan and chamber *c l*, distributers *n o*, feed-pipe *p*, and funnels *e*, the uppermost of said funnels having a closed top, as described.

2. In a flour-refiner, the combination of a fan, a feed-spout, a vertical row of funnels, and a cover, *i*, arranged over the top funnel, and the latter communicating by an aperture at one side of the cover with the feed-spout, as shown and described.

3. In a flour-refiner, the combination of a fan, a succession of vertically-arranged funnels, a central revolving shaft, a series of agitators, and a conical feeder, *p'*, arranged on said shaft at a point below one or more of the agitators *o*, and made larger in diameter at its upper end than the lower end of the funnel which surrounds it, as shown and described.

299,246. SASH-FASTENER. ROBERT T. MURPHY, Westminster, S. C. Filed Mar. 12, 1884. (No model.)

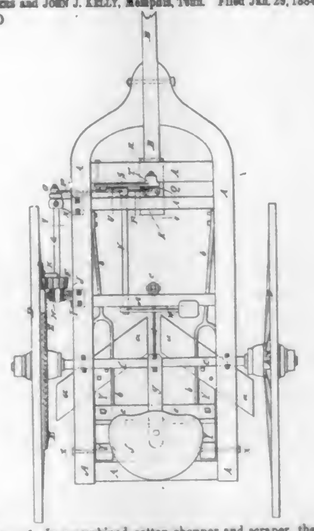


Claim.—In sash-holders, the combination, with button *a*, provided with the elongated hole in its shank and formed with the shoulder *c*, of the button *b*, formed with the elliptical shank, on which the shoulder *c* turns and rests, each of said buttons being on a pivot in the frame that is common to both.

299,247. HARVESTER-REEL. GEO. T. MURRAY and DANL. MURRAY, Waseca, MINN. Filed Apr. 20, 1883. (No model.)

Claim.—1. In a harvester-reel, the combination of the hinged rake-heads, adapted to swing at any angle to the arms, with the forks *b*, slotted to receive the rods *d*, which move the rake-heads, and which said rods

299,247.



are provided with friction-rollers at the cam-wheel end, the cam-wheel E, lever H, and lock-bar L, all constructed and operating substantially as described.

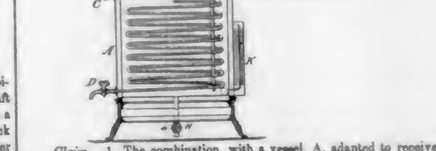
2. The combination, with the platform of a harvester, of the standard B, the reel-shaft D, provided with keepers *c* and sleeve *a*, the cam-wheel E, the rods *d*, having fingers and friction-rollers, the forks *b*, the reel-arms F, and the rake-heads G, provided with teeth *f*, all as described.

3. The combination, in a harvester-reel, as described, of the reel-shaft D, adjustable cam-wheel E, lever H, rods *d*, slotted forks *b*, reel-arms F, and hinged rake-heads G, all substantially as shown and described.

299,248. COMBINED COTTON CHOPPER AND SCRAPER. SAMUEL A. MYERS and JOHN J. KELLY, Memphis, Tenn. Filed Jan. 29, 1884. (No model.)

Claim.—1. In a combined cotton chopper and scraper, the combination, with the chopper-standard and the connecting-rod, of the shaft connected by a crank to said rod, and having a pinion gearing with a cog or gear wheel on the driving-wheel, said pinion carrying a block sliding on smooth-faced segments disposed at intervals along the outer edge of the gear-wheel, substantially as and for the purpose set forth.

2. In a combined cotton chopper and scraper, the combination, with the chopper-standard Q and the frame A, of the pivoted and slotted bar S and the shaft V, having crank-arms U W, substantially as herein shown and described, whereby the chopper can be readily raised from the ground, as set forth.



299,249. NEWSPAPER-FILE. GEO. V. NAUERTH, Cincinnati, Ohio, assignor to the Globe Files Company, same place. Filed Nov. 15, 1883. (No model.)

Claim.—In a newspaper-file, the combination, with spring-clamp C *c* and grooved staff A *a*, of the slotted locking-sleeve F *f* and the stud G, substantially as set forth.

299,250. HILLSIDE-PLOW. JOHN NEFF, Jr., Pultney, N. Y. Filed Sept. 15, 1881. (Model.)

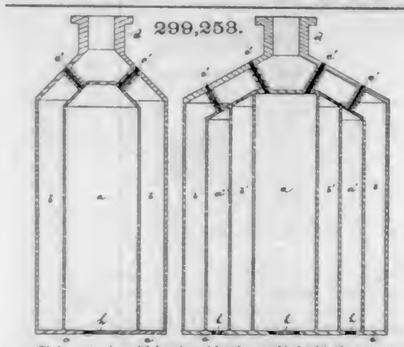
Brief.—A spring between standard and beam; pivoted handles to sit straight with the beam or adjust obliquely on either side; a clevis with friction-roller to slide right or left as the plow is reversed.

Claim.—The combination of the handle F and beam C, clasp H, bolt G, and pin I, with the bolt E, having spring D, and the slot in the landside A, to allow said bolt E to move up and down, as and for the purpose herein specified.

299,251. PORTABLE APPARATUS FOR HEATING MINERAL WATER IN BOTTLES OR FLASKS. EDWIN D. NEWTON, New York, N. Y. Filed June 25, 1883. (No model.)

Claim.—A portable apparatus for heating mineral water in bottles or flasks to a certain temperature, consisting of the elevated hot-water vessel F, having suitable heating means, the receiving-tank A, having non-conducting walls, a valved discharge-pipe leading from the bottom, a tight cover, and an attached thermometer, and the valved pipe G, connecting the hot-water vessel and the receiving-tank, the whole arranged to permit the maintenance at the desired temperature of the water in the receiving-tank by the proper manipulation of the hot-water supply and cold-water-discharge valves, substantially as specified.

299,252. THERMO-RESERVOIR. EDWIN D. NEWTON, New York, N. Y. Filed June 25, 1883. (No model.)

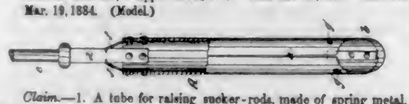


Claim.—1. The combination, with a vessel, A, adapted to receive and contain hot water, of the vessel B, having a coil, P, extending through the vessel A, substantially as herein shown and described.

2. The combination, with a vessel, A, adapted to receive and contain hot water, of the vessel B, provided with a coil, P, extending through vessel A, the vessel E, and the pipe F, extending from the bottom of the vessel E to the bottom of the vessel A, substantially as herein shown and described.

3. The combination, with the vessel A, the vessel B, and the coil P, extending through vessel A, of the vessel E, pipe F, outlet-pipe H, and thermometer K, substantially as shown and described.

299,253. MULTICHAMBERED BOTTLE. EDWIN D. NEWTON, New York, N. Y. Filed Dec. 20, 1883. (No model.)

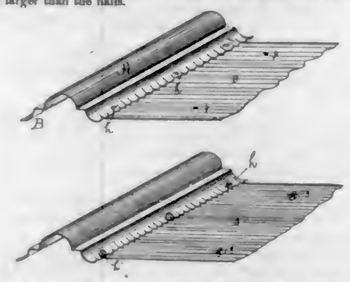


299,253.

Claim.—1. A multichambered bottle provided with thermic chambers open at their lower ends and closed at their upper ends, and having air-vent tubes extending from the thermic chambers through the exterior walls of the bottle, whereby the filling-opening of the bottle is unobstructed and the liability of the ingress of the liquid to be warmed into the thermic chambers is avoided, as set forth.

2. A multichambered bottle provided with thermic chambers open at their lower ends and closed at their upper ends, and having air-vent tubes extending from the thermic chambers through the exterior walls of the bottle, and provided with a bottom, *c*, formed of one piece, and having orifices *h*, each leading to a thermic chamber, as set forth.

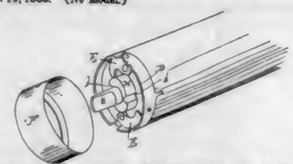
299,254. TOOL FOR RAISING SUCKER-RODS FROM WELLS. MARVIN NEWTON, Knapp's Creek, N. Y. Filed Dec. 12, 1882. Renewed Mar. 19, 1884. (Model.)



Claim.—1. A tube for raising sucker-rods, made of spring metal, and with the slit *a*, whereby the lower end of the metal will spring outwardly when passing a joint, as described.

2. A tube for raising the sucker-rods of a pump, provided with the holes *g* and spring *c*, arranged with respect to each other to allow the insertion of a rod for releasing the spring from the pump-rod, as described.

299,255. METALLIC CEILING. ALBERT NORTHROP, Pittsburg, Pa. Filed Sept. 19, 1883. (No model.)

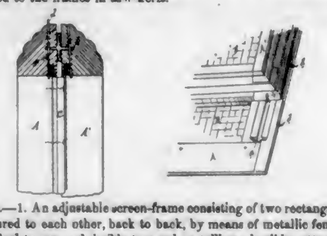


Brief.—A metallic cap having corrugated edges, said edges being provided with openings for the reception of nails. Said cap overlaps the edge of a corrugated plate provided on its edge with openings adapted to register with the openings in said cap, said cap and plate openings being larger than the nails.

Claim.—1. The cap or molding A, the edges B of which are provided with corrugations or crimps C, in combination with a sheet of metal having corrugations or crimps, substantially as hereinbefore described, and for the purpose set forth.

2. In a metallic ceiling, a cap having corrugated edges, said edges being provided with openings for the reception of nails, in combination with a corrugated plate provided on its edge with openings adapted to register with the openings in the corrugated cap, said plate and cap openings being larger than the nails, whereby the parts may expand and contract without displacing the nails, substantially as described, and for the purposes set forth.

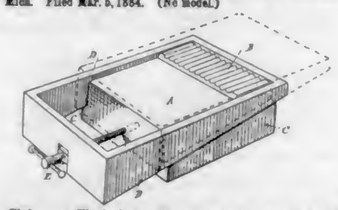
299,256. SPRING CURTAIN-ROLLER. WALTER B. NOYES, Detroit, assignor to the Saginaw Manufacturing Company, Saginaw, Mich. Filed Dec. 19, 1883. (No model.)



Claim.—1. In a spring-roller, the pivot-spindle G, cast in one piece, and provided with a notched annular flange, in combination with a disk, D, arranged between the flange and the roller, carrying pivoted dogs E, substantially as and for the purposes described.

2. In a spring-roller, the disk D, carrying dogs E, and provided with an outwardly-projecting flange, *a*, and a central depression, *g*, in combination with the ferrule F, roller A, and pivot-spindle G, provided with a notched annular flange, H, substantially as and for the purposes specified.

299,257. WINDOW-SCREEN. S. EUGENE PARRISH, Lowell, Mich. Filed Dec. 19, 1883. (No model.)



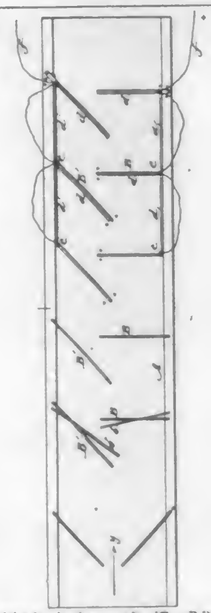
Brief.—A window-screen consisting of two frames secured back to back by means of the double female and double male metallic slides, both secured to the frames in saw-kerfs.

Claim.—1. An adjustable screen-frame consisting of two rectangular frames secured to each other, back to back, by means of metallic female slides attached to one and double-tongued metallic male slides attached to the other, whereby a continuous bearing is obtained in adjusting the relative position of such two parts of the frame, substantially as described.

2. An adjustable screen-frame consisting of two rectangular frames secured to each other, back to back, by means of metallic female slides secured in a saw-kerf in one and double-tongued metallic slides secured in a saw-kerf in the other, substantially as and for the purpose specified.

299,258. PILL-MAKING DEVICE. EDWARD B. PATTERSON, Detroit, Mich. Filed Mar. 5, 1884. (No model.)

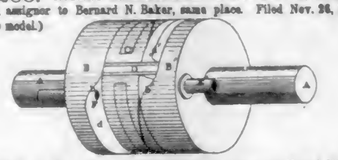
Claim.—1. The bed of a pill-making device, provided with inclined ways upon which guideways can be adjusted to varying heights with relation to such bed, substantially as described.



2. In combination with the bed of a pill-making device, provided with inclined ways upon its sides, the guide-bars herein described, substantially as and for the purposes specified.

3. In combination with the bed and guideways of a pill-making device, constructed substantially as described, means for adjusting said guideways with relation to the plane of the bed, substantially as and for the purposes set forth.

299,259. AMALGAMATOR. EDWARD PIKE, Salt Lake City, Utah. Filed Oct. 10, 1883. (No model.)



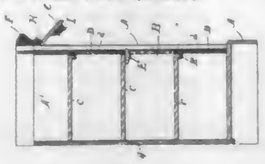
299,259.

Claim.—A sluice-box having opposite riffles, B B', faced with amalgamated plates *d*, and connected with wires *f*, leading to a generator of electricity, as shown and described.

299,260. ROTARY STEAM-ENGINE. GEORGE W. PRICE, Baltimore Md., assignor to Bernard N. Baker, same place. Filed Nov. 26, 1883. (No model.)

Claim.—1. In a rotary steam-engine, the abutments B and B', provided with the ring K, in combination with the packing-ring L, provided with means for adjusting said ring, substantially as described, and for the purposes set forth.

2. In a rotary steam-engine, the sliding piston D, operated as set forth, formed of two plates bolted together, in combination with an interior packing device, substantially as described.



3. In a rotary steam-engine, the sliding piston D, containing the internal packing device, consisting of the parts 4 4 4 4, the wedges 2 2, the slots 3 3 3 3, and the spring 5, inclosed within the piston-plates and secured together, substantially as described.

4. In a rotary steam-engine, the piston D, provided with the internal packing, and means to prevent the outer plates from bearing upon the packing and preventing its proper action, substantially as described.

5. In a rotary steam-engine, the hub *c*, having exterior circumferential grooves, and the slots *f*, in combination with the packing-rings, formed as shown, and arranged upon the hub, substantially as described.

6. In a rotary steam-engine, the hub *c*, provided with sockets O, in combination with the packing-rings R and R', substantially as described, and for the purposes set forth.

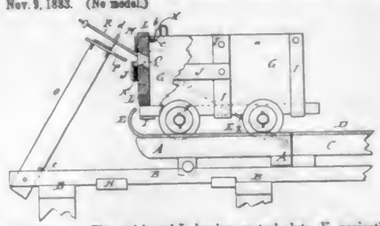
299,261. PIGEON-HOLES. HARRY D. PURSELL, Washington Court-House, Ohio. Filed Mar. 26, 1884. (No model.)

299,261.

Claim.—1. A nest of pigeon-holes whose inclosing vertical walls and partitions project slightly in front of the horizontal partitions, and have vertical grooves on each side containing sliding shutters resting edge upon edge, in combination with a door, substantially as set forth.

2. A nest of pigeon-holes whose inclosing vertical walls and partitions project slightly in front of the horizontal partitions, and whose vertical grooves contain sliding shutters resting edgewise upon one another, in combination with a hinged door provided with a rear lug or projection, as and for the purpose set forth.

3. A nest of pigeon-holes whose inclosing vertical walls and partitions project slightly in front of the horizontal partitions, and are grooved for sliding shutters, which rest upon one another edgewise, in combination with a hinged door provided with a rear lug or projection and a lock, substantially as and for the purpose set forth.



4. In a nest of pigeon-holes, the combination of a case, A, forwardly-projecting and grooved vertical walls and partitions B, horizontal partitions C, slides D, buttons E, and hinged door G, having the rear lugs, I, lock J, and prop L, substantially as set forth.

299,262. COMPOUND FOR CALCIMINING AND FRESCOING WALLS, &c. JAMES QUINN, Jr., Grand Rapids, Mich. Filed Feb. 14, 1884. (No specimens.)

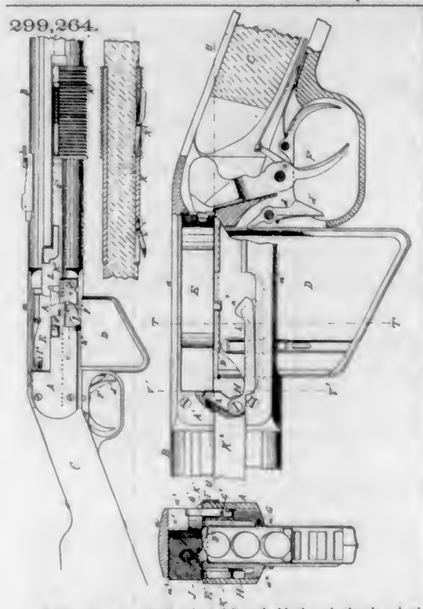
Claim.—1. The herein-described compound to be used for finishing or coating walls, ceilings, &c., consisting of a mixture of sulphate of barium for a base and body, finely-pulverized calcined gypsum, pulverized glue, rock-salt, gum-arabic, and alum, in the proportions substantially as described.

2. In a coating for walls, the ingredients herein specified, or their equivalents, in combination with the sulphate of barium as a base or body, substantially as described.

299,263. DUMPING-CAR. TERRENCE REYNOLDS, Atalla, Ala. Filed Nov. 9, 1883. (No model.)

Claim.—1. The end-board L, having central plate, K, projecting past the edges of the board, and provided near its upper end with arms *b* and rod N, in combination with the car-body G, notched, as at *c*, and provided with the holding-plates J, substantially as and for the purposes described.

2. The car-body G, provided with the bent straps J, in combination with the end-board L, provided with the plate K, substantially as and for the purposes set forth.

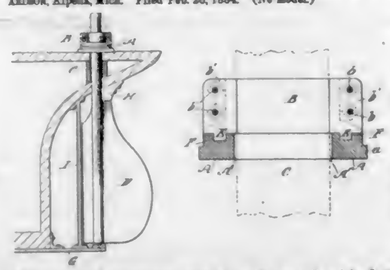


3. The lifter O, pivoted to the frame B, and provided with the point P, and attached to tilting platform A by rod R, substantially as and for the purposes set forth.

4. The lifter O, attached to tilting platform A, and provided with point P, in combination with the end-board L, provided with opening Q, substantially as and for the purposes set forth.

5. The lifter O, pivoted to frame B, and provided with stop-pin *c*, to limit its angle of inclination, substantially as described.

299,264. MAGAZINE FIRE-ARM. RICHD. RIDDEN, Hartford, Conn., assignor to the Spencer Arms Company, New York, N. Y. Filed July 31, 1883. (No model.)



299,264.

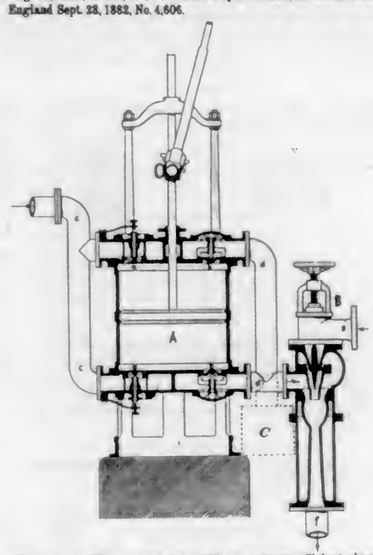
Claim.—1. A vertically-pivoted breech-block swinging in a horizontal plane at the top of the receiver, and means for actuating the same, as set forth, and a magazine inserted in the bottom of the receiver for containing a supply of cartridges superposed sidewise, in combination with a magazine-check and means for automatically releasing the said check at the proper time, and afterward moving it into the path through which the cartridges are fed upward from the magazine, for the purpose of holding down the uppermost cartridge in the magazine out of the way of the breech-block when the breech-block is swinging inward into the firing position.

2. The receiver A and the magazine or cartridge-box D, for containing a supply of cartridges superposed sidewise, in combination with the check G, provided with the ear G^2, and the sliding arm K', provided upon a portion of its inner side with the longitudinal groove G^4, for receiving the ear G^2, and thus at the proper time allowing the check G to swing outward and release the uppermost cartridge in the magazine, substantially as and for the purposes set forth.

299,265. RUDDER HOLDER AND SUPPORT. CHARLES A. RICHARDSON, Alpena, Mich. Filed Feb. 20, 1884. (No model.)

Claim.—1. The combination, with the rudder-post C and its fixed collar B, of the bed-plate A, fixed to the vessel, tongued and grooved to the collar to enable the collar to turn upon it, and having an aperture, A', of such diameter as to isolate said plate or support from the rudder-post, substantially as and for the purpose set forth.

2. The combination, with the rudder-post C and its fixed collar B, of the bed-plate A, fixed to the vessel, and tongued and grooved to the collar to enable the collar to turn upon it, said plate also having an aperture, A', of such diameter as to isolate it from the rudder-post, and the collar having a flange covering the upper surface of the plate, substantially as and for the purpose set forth.



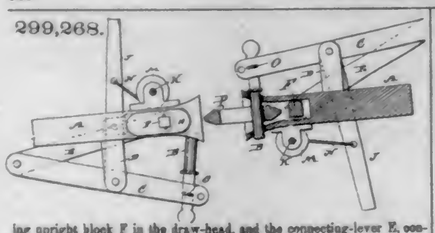
3. The combination of the rudder-post C, collar B, fixed to the latter, the bed-plate A, fixed to the vessel, and tongued and grooved to the plate to enable the collar to turn upon it, said plate having an aperture, A', of such diameter as to isolate it from the rudder-post, the shoe G, and block H, substantially as and for the purpose set forth.

299,266. BASIN OR BOWL. JOHN S. RICHARDSON, Lowell, Mass. Filed Oct. 5, 1883. (No model.)

Claim.—As a new article of manufacture, a circular sheet-metal basin having a segment of its body corrugated to form a wash-board, and provided with a handle at its corrugated side, substantially as and for the purpose set forth.

299,267. COMPOUND VACUUM-PUMP. WILHELM RICHTER, Berlin, Germany, assignor to the Internationaler Vacuum-Eismaschinen-Verein, same place. Filed June 6, 1883. (No model.) Patented in Germany Aug. 24, 1882, No. 22,208; in France Sept. 27, 1882, No. 151,286, and in England Sept. 23, 1882, No. 4,606.

Claim.—1. The combination, with an ordinary efficient air-pump provided with suitable valves, of an ejector of any suitable construction, in the manner and for the purpose described.



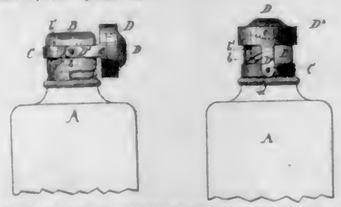
2. The combination of a vacuum-pump having an ordinary efficient air-pump provided with suitable valves, and an ejector operating by means of a jet of water and adapted to remove condensable vapors, substantially as specified.

299,268. CAR-COUPLING. WILLIAM M. ROBINSON, New Franklin, Mo. Filed Mar. 31, 1884. (No model.)

Claim.—1. The combination, with the draw-head A, of the vertical block or bar F, held to slide in the draw-head in the direction of the length of the draw-head, the pivoted lever C, the laterally-movable pin connected with the front end of the lever C, a connecting-bar connecting the rear end of the lever C with the bar or block F, and means for moving the bar or block toward the front or rear of the draw-head, substantially as herein shown and described.

2. The combination, with the draw-head A, having side openings for the coupling-pin, of the lever C, pivoted on the side of the draw-head, a coupling-pin held detachably in the front end of the lever C, the slid-

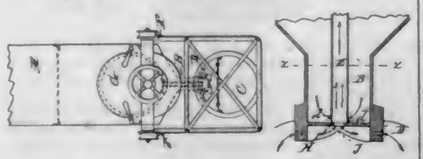
299,268.



ing upright block F in the draw-head, and the connecting-lever E, connecting the inner end of the lever C with the block or bar F, substantially as herein shown and described.

3. The combination, with the draw-head A, of the lever C, pivoted at the side of the same, the sliding upright block or bar F, the top and bottom plates, H and G, the bar E, connecting the inner end of the lever C with the bottom plate, G, the coupling-pin B in the outer end of the lever C, and of means for moving the bar F in the direction of the length of the draw-head, substantially as herein shown and described.

4. The combination, with the draw-head A, of the pivoted lever C, the coupling-pin B, held in the front end of the said lever, the sliding bar F, the bar E, connecting the bar F with the lever C, and the lever J, pivoted on the draw-head and connected with the bar F, substantially as herein shown and described.



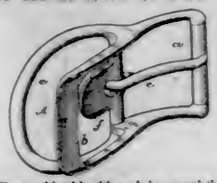
5. The combination, with the draw-head A, of the pivoted lever C, the coupling-pin B, held on the front end of the same, the sliding bar F, the bar E, connecting the bar F with the inner end of the lever C, the lever J, pivoted on the draw-head, and connected with the bar F, the upright shaft K, held in the draw-head, the pulley M on the lower end of the same, and the rope or chain N, secured on the pulley M and connected with the lever J, substantially as herein shown and described.

299,269. BOTTLE-STOPPER. MAX RUBIN, Philadelphia, Pa. Filed Mar. 17, 1884. (No model.)

Claim.—In a bottle-stopper, the combination of a bottle-neck, B, having spiral grooves *b b* and vertical grooves *b' b'* at intermediate points of the spiral grooves, a neck-band, C, a bottle-cap, D, having arms D' pivoted to said neck-band, and an interior elastic packing, D^2, the pivot-pins of the cap projecting into and being guided in said grooves, substantially as set forth.

299,270. SAND-BLAST APPARATUS. JOSEPH JULIUS SACHS, London, England. Filed July 17, 1883. (No model.)

Claim.—1. In a sand-blast apparatus, the combination of a sand-trunk inclosing the air-jet and connecting therewith by perforations, as specified.



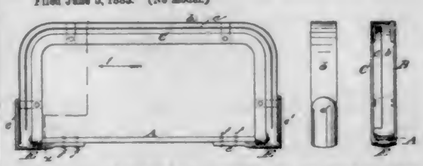
2. In a sand-blast apparatus, the combination of the sand-trunk inclosing the air-jet connecting therewith by perforations, and the baffle-plate below the said perforations, substantially as specified and set forth.

3. In a sand-blast apparatus, the combination of a sand-trunk inclosing the air-jet connecting with perforations, and a deflecting-plate beneath the same, substantially as specified.

4. In a sand-blast apparatus, the combination of a sand-trunk inclosing the air-jet connecting with perforations, a baffle-plate, and deflecting-plate, as specified.

5. The carriage consisting of a frame having two sides and only one end piece, and a door, G, substantially as specified and set forth.

299,271. COMBINED BUCKLE AND RING. JAMES BENJAMIN SAYER, Sacramento, Cal. Filed Mar. 13, 1884. (No model.)



Claim.—1. The combined buckle and ring, consisting of the buckle-frame *a* and the tongue *s* on the base-bar of said frame, and the keeper *b* and ring *c*, extending from the base of the buckle-frame and diverging or separating from each other, and a plate, *f*, substantially as herein described.

2. The combined buckle and ring, consisting of the buckle-frame *a*, tongue *s*, and the keeper *b* and ring *c*, extending from the base of the buckle-frame and diverging or separating from each other, and the guide lip or plate *f*, extending and lying between said keeper and ring, substantially as herein described.

3. The combined buckle and ring, consisting of the concaved face or bent buckle-frame *a*, having tongue *s*, the upwardly-inclined keeper *b*, and the straight ring *c*, substantially as herein described.

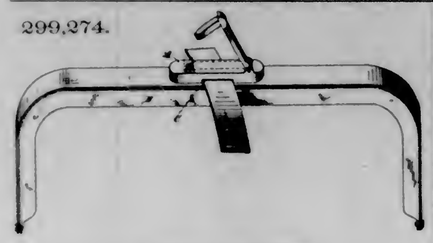
299,272. TRAVELING-BAG. MATTHÄUS SCHMEKEL, New York, N. Y. Filed June 5, 1883. (No model.)

Claim.—1. In the frame of a traveling-bag, the hinge-joint hereinbefore described, formed by pivoting the loops *b' c'* of the frames B C upon separate studs or pivots *a a'* upon the bottom bar, A, for the purpose specified.

2. In the frame of a traveling-bag, the combination of the bottom bar, A, having at either end two pivots, *a a'*, with the hinge-loops *b' c'* of the frames B C, and the plate D, having holes for receiving and securing it upon the inside of the said pivots *a a'*, substantially as specified.

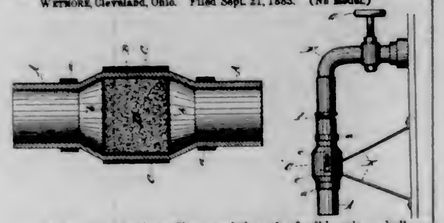
3. The frame of a traveling-bag herein described, consisting of the flat bottom bar, A, bifurcated at each end to form pivots *a a'*, the frames B C, the ends of which form hinge loops *b' c'*, the plate D outside of said loops, and against which the pivots *a a'* are riveted, and the guard-plate E, the arm *e* of which is secured to the bottom bar, A, and its vertical arm *e'* free from the folding frame, the parts being constructed, arranged, and operating substantially as and for the purposes specified.

299,273. PUNCH AND DIE FOR EYELETING-MACHINES. GEO. O. SCHNELLER, Ansonia, Conn. Filed Feb. 23, 1884. (No model.)



Claim.—1. As an article of manufacture, the herein-described die for eyelet-setting machines, consisting of the tubular die, its face corresponding in shape substantially to the flange of the eyelet, the body of the die enlarged from a point below its face, and so as to form a shoulder, *f*, substantially as described.

2. As an article of manufacture, the herein-described punch for eyelet-setting machines, consisting of the punch in diameter corresponding substantially to the internal diameter of the eyelet, having its point of lancet shape, and constructed with the shoulder *a*, corresponding substantially to the shape of the flange of the eyelet, substantially as described.



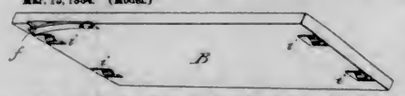
299,274. COMBINED BAG-CATCH AND STRAP-LOOP. MORRIS SCHWERIN, New York, N. Y. Filed Mar. 28, 1884. (No model.)

Claim.—The combination, with the bag-frame, of a frame for a spring-catch, provided with an opening through it for the strap D to pass through, substantially as shown.

299,274.

299,275. HYDRANT-FILTER. GEORGE W. SHAWK and ALBERT S. WITMORE, Cleveland, Ohio. Filed Sept. 21, 1883. (No model.)

Claim.—1. A hydrant-filter consisting of a flexible tube, a hollow cylinder adapted to inclose the filtering material and forced into said tube, and means for holding the same therein against displacement, substantially as set forth.

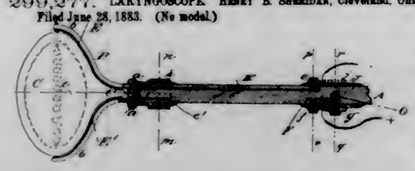


2. In a hydrant-filter, a flexible tube distended by an inclosed hollow cylinder, in combination with an outside band adapted to press the said tube upon the inclosed cylinder, substantially as described, and for the purpose set forth.

3. In a hydrant-filter, the combination, with a flexible tube, a cylinder provided with filtering material and inserted in said tube, and means for holding the same therein against displacement, of a movable band, *d*, encircling said tube, and adapted to hold it in position on the hydrant-nozzle, substantially as set forth.

4. The combination, with cylinder B, provided with the gauze ends, of the flexible tube A and the band C, substantially as and for the purpose set forth.

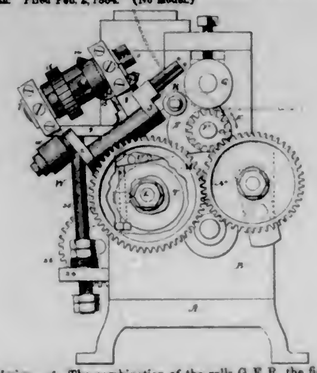
5. The bracket E, provided with the trunnions *e*, in combination with the band C, provided with the slotted bosses *c*, substantially as described, and for the purpose specified.



299,276. MEANS FOR SECURING BOX-COVERS. HENRY ALLEN SHAW and EDWARD DEACON CHIDLEY, Toronto, Ontario, Canada. Filed Mar. 15, 1884. (Model.)

Claim.—1. The box A, provided with headed pins *h* on its upper edges, and formed with an offset, *e*, at the upper edge of one of its side pieces, in combination with the cover B, provided with plates *i*, having open slots therein, and the locking-spring *f* on the under side of the lid, and arranged to engage the offset *e* when the cover is in place, substantially as set forth.

2. The box A, the end pieces of which are cut away on their upper edges at *b*, headed screws or pins *h* within said cut-away portions, and the offset *e*, formed between the end piece and side of the box, as shown, in combination with the cover provided with plates *i*, having flaring open slots beveled on their under edges, and the plate-spring *f* on the under side of the cover at the corner, and constructed to engage the offset when the cover is in place, substantially as set forth.



299,277. LARYNGOSCOPE. HENRY B. SHERIDAN, Cleveland, Ohio. Filed June 28, 1883. (No model.)

Claim.—1. A laryngoscope or similar optic instrument, consisting of a transparent hollow or concave lens, C, a handle supporting the said lens, an electro-incandescent substance, *c*, arranged inside of the said hollow lens, and means, substantially as described, for placing the said substance in a circuit, for the purpose set forth.

2. The combination of the hollow reflector-lens C, arranged on forks *b* in a handle, A, the platinum wire or its equivalent *c*, arranged inside of the said hollow lens, the conductors E E', arranged in or about the handle A, a circuit-breaker, H G, and means for forming connection with an electric source, substantially as and for the purpose set forth.

299,278. MACHINE FOR BENDING HAT-WIRES. GEORGE B. SHERMAN and JOSEPH NUTT, Danbury, Conn.; said Nutt assignor to said Sherman. Filed Feb. 2, 1884. (No model.)

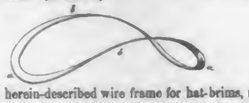
Claim.—1. The combination of the rolls G E R, the fingers 4 4, arranged with their axes in a plane at right angles to the axes of the rolls G E R, and mechanism, substantially such as described, for imparting rotation to said rolls G E and a rocking movement to said fingers 4 4, said rocking movement being across the plane of said rolls G E R, substantially as specified.

2. The combination of the rolls G E and mechanism, substantially such as described, for imparting rotation to said rolls G E, the roll R, arranged upon an axis parallel with the rolls G E, and mechanism, substantially such as described, to automatically impart a movement to said roll R toward and from the rolls G E, the rocking fingers 4 4, and mechanism, substantially such as described, for imparting rocking movement to said rolls across the plane of the rolls G E R, substantially as specified.

3. The combination of the rolls G E, mechanism, substantially such as described, for imparting rotation thereto, the lever S, hung loose upon the axis of the roll E, the roll R, hung upon said lever S, with its axis parallel with the axis of the rolls G E, an eccentric, T, arranged to act upon said lever S, and the adjustable stop V, substantially as described.

4. The combination of the rolls G E R, mechanism, substantially such as described, for imparting rotation thereto, the lever S, hung loose upon the axis of the roll E, the roll R, hung upon said lever S, with its axis parallel with the axis of the rolls G E, an eccentric, T, arranged to act upon said lever S, and the adjustable stop V, the fingers 4 4, arranged in a plane at right angles to the axis of the rolls G E, and mechanism, substantially such as described, to impart a rocking movement to said fingers 4 4 across the plane of the rolls G E, substantially as described.

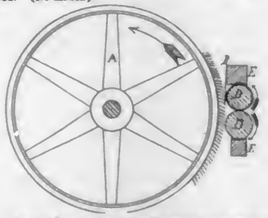
5. The combination of a feeding device for wire, consisting of a pair of continuously-revolving rolls and a pair of revolving cutters, their axis of rotation being substantially at right angles to the axis of the feeding-rolls, the edge of the cutters substantially parallel with their axis of rotation, whereby at a predetermined time said revolving cutters will cut the wire without interrupting the feed of the wire, substantially as described.



6. The combination of a feeding device for wire, consisting of a pair of continuously-revolving rolls and a pair of revolving cutters, their axis of rotation being substantially at right angles to the axis of the feeding-rolls, the edge of the cutters substantially parallel with their axis of rotation, said revolving cutters arranged in a frame movable to present the cutters into the line of the wire at predetermined times, to cut the wire and then take them out of the line of the wire, with mechanism, substantially such as described, to impart the said movement to the said frame, substantially as described.

7. The combination of the rolls G E R, the fingers 4 4, and the continuously-revolving cutters 9 9, the said revolving cutters arranged in a frame movable to present the cutters into the line of the wire at predetermined times to cut the wire, and then take them out of the line of the wire, with mechanism, substantially such as described, to impart the said movement to the said frame, substantially as described.

8. The combination of the rolls G E, mechanism, substantially such as described, for imparting rotation thereto, the frame 8, arranged to swing upon an axis substantially parallel with the axis of said rolls G E, a pair of revolving cutters arranged in said frame, with their axes at substantially right angles to the axis of the said rolls G E, the edge of the cutters substantially parallel with their axis of rotation, mechanism, substantially such as described, to impart constant rotation to said cutters, a revolving cam, 22, arranged to bear upon said frame and impart to it a swinging movement, whereby at predetermined times the said cutters are advanced to their active position and then permitted to retreat, substantially as described.



9. The combination of the rolls G E, mechanism, substantially such as described, for imparting rotation thereto, the frame 8, arranged to swing upon an axis substantially parallel with the said rolls G E, a pair of revolving cutters arranged in said frame, with their axes at substantially right angles to the axis of the said rolls G E, the edge of the cutters substantially parallel with their axis of rotation, mechanism, substantially such as described, to impart constant rotation to said cutters, a revolving cam, 22, adjustable bearing 23 on said frame, and against which said cam operates to impart a swinging movement to said frame, substantially as described.

299,279. **WIRE FRAME FOR HAT-BRIMS.** GEORGE H. SHERMAN and JOSEPH NUTT, Danbury, Conn.; said Nutt assignor to said Sherman. Filed Mar. 17, 1884. (No model.)

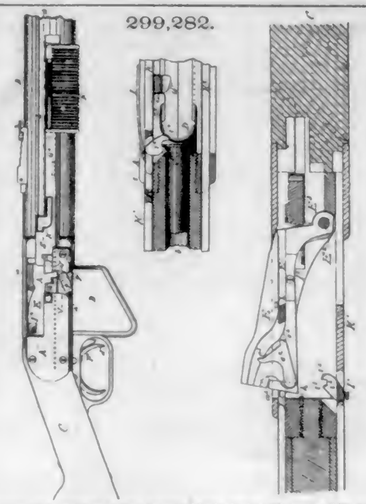
Claim.—The herein-described wire frame for hat-brims, made from flat wire bent edgewise into hoop shape and curved flatwise from the center sides downward to the front and rear, the plane of the wire being horizontal at all points radially, substantially as specified.

299,280. **CARDING-MACHINE.** JOHN SHIDY, Philadelphia, Pa. Filed June 25, 1883. (No model.)

Claim.—1. In a doffing device for a fiber-carding machine, the combination of a doffer-cylinder, A, stationary comb B, rollers D D, and cleaners E E, substantially as set forth.

2. In a doffing device for a fiber-carding machine, the combination of a doffer-cylinder, A, stationary comb B, and rollers D D, substantially as described.

299,281. **ORNAMENTAL CHAIN.** ROBT. F. SIMMONS, Attleborough Falls, Mass. Filed Mar. 18, 1884. (No model.)



Claim.—1. An improved ornamental chain composed of a series of plate-links formed of stamped metal, as described, secured together by tubular links inserted into openings formed in the plate-links, as described.

2. The combination, with the links A, having a slot, *a*, at each end, and plated only on one side, of the tubular links B, also plated only on one side, said links being arranged as described.

299,282. **MAGAZINE-GUN.** CHRISTOPHER M. SPENCER and RICHARD RHODES, Windsor, Conn. Filed Feb. 23, 1884. (No model.) Patented in England July 23, 1883, No. 3,616; in France July 25, 1883, No. 156,732, and in Belgium July 26, 1883, No. 62,137.

Claim.—1. In a magazine-gun, a breech-block oscillating upon a vertical axis at its rear end in a plane at the rear of the chamber, in combination with an actuating-slide situated forward of the receiver and reciprocating in a path parallel with the axial line of the barrel, and a connection between the said actuating-slide and the said breech-block,

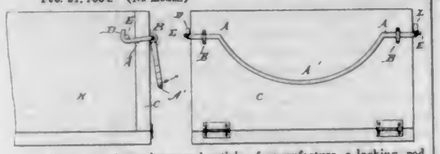
299,282.

whereby the position of the breech-block during all parts of its movement in either direction is controlled by the position of the said actuating-slide, substantially as specified.

2. A breech-block swinging in a horizontal plane in the rear of the chamber and provided upon one of its horizontal sides with a suitably-shaped cam-groove, in combination with a cam-pin working in said groove, connected with an actuating-slide situated forward of the receiver and reciprocating in a path parallel with the axial line of the barrel, whereby the laterally-outward swing of the breech-block is effected by the first portion of the backward excursion of the actuating-slide, and the return movement of the breech-block to its firing position is effected by the last portion of the forward excursion of the actuating-slide, substantially as shown and described.

3. A breech-block in the rear of the receiver, swinging upon a vertical axis, an actuating-slide situated forward of the receiver, and an arm carried by said actuating-slide, engaging with said breech-block for rocking the said breech-block outward to permit the withdrawal of the shell from the chamber, in combination with a magazine for successively delivering cartridges into the lower part of the receiver, a spring for thrusting such cartridges upward, and an inserter provided with a shoulder adapted to bear upon the base of the cartridge which has been so thrust upward, and connected with and partaking of the motion of the actuating-slide for the purpose of pushing the said cartridge into the chamber during the first portion of the forward excursion of the actuating-slide, substantially as described.

4. A plate upon the forward end of the breech-block adjustable toward and from said breech-block, in combination with a cam for forcing the said plate forward and holding it against the base of a cartridge in the chamber when the breech-block is in firing position, a lever on said breech-block for operating the said cam, and an actuating-slide adapted to impart motion to said lever, substantially as and for the purposes set forth.



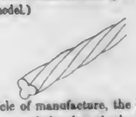
5. The hinged plate *a*, the cam *a'*, the bifurcated lever a^2, the spring a^3, all arranged upon the forward end of the breech-block, and the groove E' in said breech-block, in combination with the ear *k'*, working in said groove and connected with and partaking of the reciprocating motion of the actuating-slide K, as and for the purposes set forth.

299,283. **PEN.** CHRISTIAN G. SPENGLER, Hoboken, N. J., assignor to James Dickie, Brooklyn, N. Y. Filed Aug. 16, 1883. (No model.)

Claim.—In a pen, the combination of a tube of rigid material and a tubular point-section made of india-rubber, slightly smaller internally than the exterior of the end portion of the rigid tube and slipped over the same, and having an elliptical or ellipsoidal lower end, substantially as herein described.

299,284. **LOCK FOR WAGON END-GATES.** ANDREW SPROUL, Hannibal, Mo., assignor to himself and Fred C. Stevens, Attica, N. Y. Filed Feb. 21, 1884. (No model.)

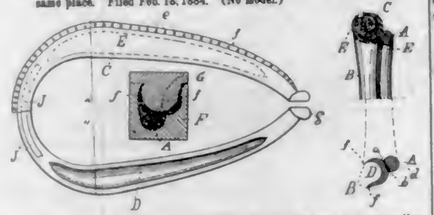
Claim.—1. As an improved article of manufacture, a locking-rod for wagon end-gates, consisting of the rod A, provided with the bent hooked ends D and the bend A' between said bent ends, as set forth.



2. The combination, with a wagon end-gate and studs on the body, of a rod pivoted on the outer surface of the end-gate, and provided with bent ends to engage the said studs, and with a bend between said bent ends, substantially as herein shown and described.

3. The combination, with a wagon end-gate, C, and studs E on the body, of the pivoted rod A, having the bend A', and the bent hooked ends D, substantially as herein shown and described.

4. The combination, with a wagon end-gate, of a rod held to turn on the same, which rod has its ends bent over the ends of the gate, and of projections on the outer surfaces of the side boards, substantially as herein shown and described.



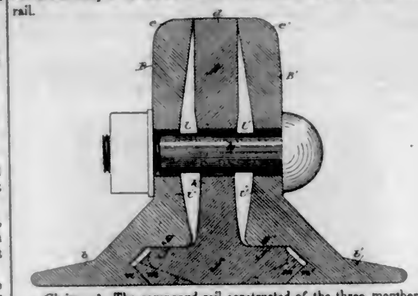
5. The combination, with a wagon end-gate, of a rod pivoted to the outer surface of the gate, and provided with a central bend and bent ends, the said rod being made in two sections adjustably connected together, substantially as herein shown and described.

299,285. **IMITATION TWISTED WIRE.** JAMES SPRUCE, Waterbury, Conn., assignor to the Scovill Manufacturing Company, same place. Filed Dec. 17, 1883. (No model.)

Claim.—As an article of manufacture, the herein-described wire in imitation of twisted wires, consisting in a single or solid wire the surface of which represents two or more round wires laid together, the said wire twisted to give to it the appearance of several round wires twisted together, substantially as described.

299,286. **HORSE-COLLAR.** JAMES STANLEY and THEODORE F. LEISENA, Newark, N. J., assignors to the Stanley Horse Collar Company, same place. Filed Feb. 18, 1884. (No model.)

Claim.—1. As an improved article of manufacture, a horse-collar formed of scraps of leather united by suitable cement, and having a recess formed in the front side, and provided with means, substantially as described, for securing a pad in such recess, as and for the purpose set forth.



2. As an improved article of manufacture, a horse-collar formed of scraps of leather united by suitable cement, and having a recess formed in the front side and covered by flaps integral with the back of the collar.

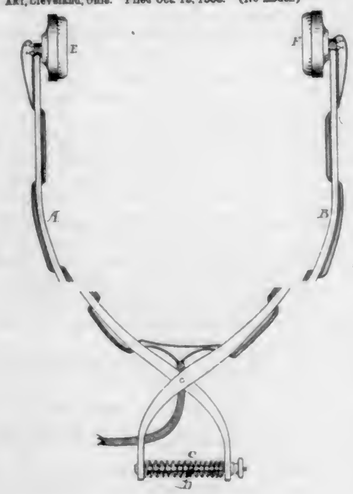
3. The process of forming a hollow collar, consisting in first pressing or molding the collar with flaps at the sides of the intended hollow, then pasting down the flaps to cover the hollow, and then drying and finally pressing the pasted flaps to the finished or desired form.

4. The combination, with a collar molded of scraps of leather, as described, of a strip or strips of rawhide inserted in the bottom of the collar, substantially as and for the purpose set forth.

299,287. **RAILWAY-RAIL.** FRANCIS BOWES STEVENS, Hoboken, N. J. Filed Sept. 13, 1883. (No model.)

Brief.—In a compound rail having a three-part tread, the portions having the outer treads have recessed flanges which rest upon and fit over the base upon the central tread. To connect this rail to the ordinary T, the sides of the treads and portions of the flanges of the latter are so cut away as to match with the outer sections of the compound rail.

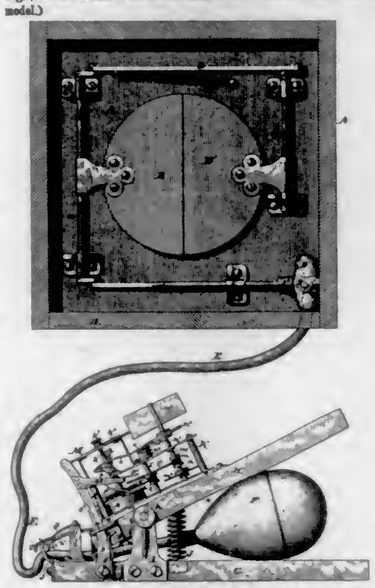
Claim.—1. The compound rail constructed of the three members, substantially as described.



2. The compound rail constructed, substantially as described, of a central member having a narrow tread and a flanged base, combined with two side members, each of which has a narrow tread and a flanged base, the three when combined forming a compound rail with a three-part tread and a three-part base.

3. The combination, substantially as before set forth, of the central member of the rail having a narrow tread, a flanged base, side bearings for the side members of the rail, and inclined shoulders, with two side members, each having a narrow tread, a flanged base, a bearing to rest upon the flanged base of the central member, and an inclined ledge to sustain the inclined shoulders of the central member, the said three members when combined forming a central and side member supporting compound rail, having a three-part tread and a three-part base, with the central member sustained by the side members and the side members sustained by the central member.

4. The combination, substantially as before set forth, of the central member of the rail having a narrow tread, a flanged base, side bearings for the side members of the rail, and inclined shoulders, with two side members, each having a narrow tread, a flanged base, a concave inner side, a bearing to rest upon the flanged base of the central member, and an inclined ledge to sustain the inclined shoulders of the central member, the said three members when combined forming a central and side member supporting elastic compound rail, having a three-part tread and a three-part base, with the central member sustained by the side members and the side members sustained by the central member.



5. The combination of the compound rail constructed of three members, substantially as described, with an ordinary T-rail having portions of each side of its head and of each side of its base removed, as described.

299,288. **HOLDER FOR TELEPHONE-RECEIVERS.** JOHN N. STEWART, Cleveland, Ohio. Filed Oct. 15, 1883. (No model.)

Claim.—In double telephonic receivers, two levers, A B, crossed and pivoted together and provided with spring C and adjusting screw-rod D, said levers supporting two receivers connected in the electrical circuit by wire, combined and operating as and for the purpose specified.

299,289. PHOTOGRAPHIC CAMERA. CHARLES W. STIFF, Foxborough, and NATHANIEL C. BOGSLEY, Salem, Mass. Filed Aug. 27, 1883. (No model.)

Claim.—1. In combination with a photographic camera, a mechanism to be worked by the operator, and arranged and adapted to open the lids or shutters of the lens-tube, a device for automatically locking and retaining said lids or shutters in their open positions, and a timing mechanism arranged to be set in motion by the operation of the shutter-opening mechanism, and to release said locking device and permit the closing of said lids or shutters at the end of any predetermined interval of exposure.

2. A pneumatic device adapted to open the lids or shutters of a photographic camera, and at the same time set in motion a timing mechanism, which will automatically close the same at the end of any predetermined interval of exposure.

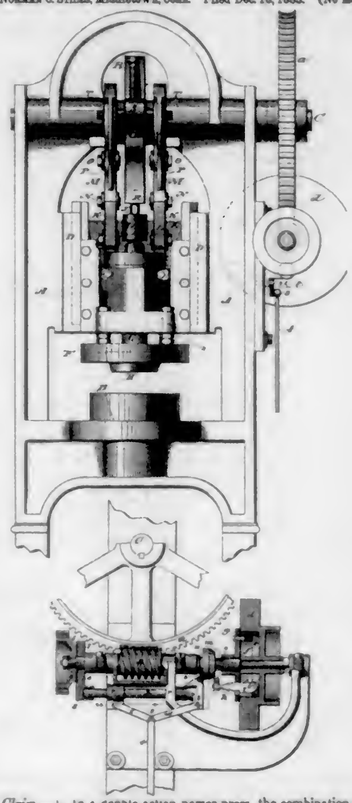
3. A presser adapted to open the shutters of a photographic camera by forcing air into an expanding-chamber, to keep said shutters open by preventing the return of the air by any suitable mechanism, and at the same time to set in motion a mechanism that will automatically release the air from said chamber at the end of any predetermined interval of exposure, thus allowing the lids to close.

4. The combination of the lever H, pivoted to the frame G in any suitable way, the bracket r', with its slotted horizontal projection r, the spring-actuated lever s, provided with the notch s^2, the bulb F, the tube E, and the bulb D, in conjunction with a suitable mechanism for operating the lids or shutters of a photographic camera, substantially as and for the purposes specified.

5. The combination of the spring-actuated nipper-lever i', the forked bracket j, the spring-actuated hook j'', all attached to the frame G, and the projection u and plate z, secured to the shorter arm of the lever H, all adapted to operate substantially as and for the purposes described.

6. The combination of the presser G H, spring J, the projection r, the lever s, provided with the notch s^2 and bent arm s^3, and the arm w, attached securely to the shaft k of the clock-work, all adapted to operate substantially as and for the purposes described.

7. The combination of the dial M, the pointer k^2, the ratchet-wheel k^3, the pawl k^4, the gear k^5, and the spring k', all adapted to operate substantially as and for the purposes described.



8. The combination of the friction-disk n^2, mounted upon the shaft n' of the clock-work, the spring-actuated lever o, the bent lever p, and the bent stationary arm p', all adapted to operate substantially as and for the purposes described.

9. The combination of friction-disk n^2, mounted upon the shaft n' of the clock-work, the spring-actuated brake-lever o, the bent lever p, the spring-actuated dog q, the arm v, securely fastened to the shaft k, and means for operating the lever p, substantially as and for the purposes specified.

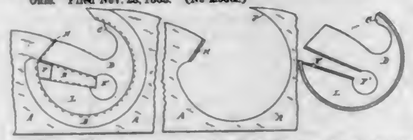
10. The combination of the lids or shutters B B', adapted to close the inner end of the lens-tube of a photographic camera, the shafts a a', the rocker-arms c c', the connecting-rod d, and means for operating the same, substantially as and for the purposes specified.

11. The combination of the lids or shutters B B', adapted to close the inner end of the lens-tube of a photographic camera, the shafts a a', the rocker-arms c c', the connecting-rod d, and the spring d'', all substantially as and for the purposes described.

299,290. PRESS FOR HOLDING AND CUTTING SHEET METAL. NORMAN C. STILES, Middletown, Conn. Filed Dec. 10, 1883. (No model.)

Claim.—1. In a double-action power-press, the combination of the vertical slide carrying the movable holding-surface, a vertical movable slide carrying the punch, mechanism, substantially such as described, to impart reciprocating movement to the punch-slide, a toggle or toggles, one link of which is hinged to the slide which carries the holding-surface, the other link hinged to a fixed point in the frame, and mechanism, substantially such as described, between the links and the driving-shaft, whereby said links are forced into line to bring the holding-slide to its grasping position in advance of the punch, and retain said links in line during the operation of the punch, and then to turn said links out of line to withdraw the holding-slide, substantially as described.

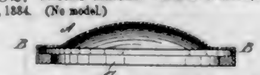
2. In a double-action power-press, the combination of the vertical slide carrying the movable holding-surface, a vertical movable slide carrying the punch, mechanism, substantially such as described, to impart reciprocating movement to the punch-carrying slide, a toggle or toggles, one link of which is hinged to the slide which carries the holding-surface, the other link hinged to the frame, an arm extending from one of the links, and mechanism, substantially such as described, to operate upon said arm, whereby the reciprocating movement is imparted to said holding device, substantially as described.



3. In a double-action power-press, the combination of the two vertical reciprocating slides, the one carrying the blank-holding device, the other the punch, a revolving driving-shaft, an eccentric thereon, a ring upon said eccentric and within which the eccentric revolves, the said ring in connection with the punch-carrying slide, whereby in the rotation of the eccentric a reciprocating movement is imparted to said punch-carrying slide, and a toggle or toggles, one link of which is hinged to the blank-holding slide, the other link hinged to the frame, one of said links provided with an arm extending therefrom toward the eccentric-ring, the said ring provided with a stud arranged to operate upon said arm to impart to it a swinging movement, whereby the eccentric-ring in imparting reciprocating movement to the punch-carrying slide also imparts a vibratory movement through said arm to the toggles, and thence a reciprocating movement to the blank-holding slide, substantially as described.

4. In a double-action power-press, the combination of the two vertical reciprocating slides, the one carrying the blank-holding device and the other the punch, a revolving driving-shaft, an eccentric thereon, a ring on said eccentric and within which said eccentric revolves, said eccentric-ring connected to the punch-carrying slide, and whereby reciprocating movement is imparted to said punch-carrying slide, a toggle or toggles, one link of which is hinged to the blank-holding slide, the other to the frame, one of the links constructed with an arm extending therefrom toward the eccentric, and constructed with a cam-shaped slot, and a stud on the eccentric-ring working in said cam-shaped slot, whereby through said arm and toggles reciprocating movement is imparted to said blank-holding slide, substantially as described.

5. The combination of the shaft c, the driving-pulleys loose thereon, a frictional clutch between said pulleys and shaft, the collar m, longitudinally movable on said shaft, the sliding bar p, in connection with said collar, and the toggle t w, one link hinged to the frame, the other to the bar p, and a connection from the toggle, whereby reciprocating movement may be imparted to said slide, substantially as described.

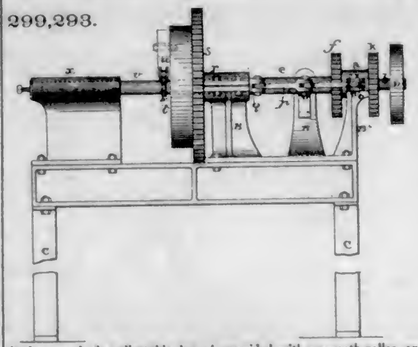


6. The combination of the shaft c, the driving-pulleys loose thereon, a frictional clutch between said pulleys and shaft, the collar m, longitudinally movable on said shaft, the sliding bar p, in connection with said collar, and the toggle t w, one link hinged to the frame, the other to the bar p, and a connection from the toggle, whereby reciprocating movement may be imparted to said slide, the frictional plate 5, fixed to the shaft, and the frictional plate 6, loose upon the shaft, but prevented from rotation, substantially as described.

299,291. ADJUSTABLE SAW-TOOTH. GEO. W. STINEERING, Shreve, Ohio. Filed Nov. 23, 1883. (No model.)

Claim.—The segmental-shaped tooth B, the saw-plate A, having opening J, of a form to closely embrace the outer contour of the tooth, and provided with a tongue, H, the expansive fastener of shape approaching a complete circle, having a point, C, parts D I, partly separated by the tapered slot F, and circular opening F', adapted to receive a wrench, K, in combination with wedge E, as shown and described, and for the purposes set forth.

299,292. FLYING TARGET. CHARLES F. STOCK, Peoria, Ill. Filed Feb. 1, 1884. (No model.)



Claim.—1. The combination of the fragile target A, formed with an imperforate flange, B, with an irrefragable re-enforcing strip firmly secured to the said flange, whereby the flange will be strengthened at that part to be grasped by the fingers of the target-throwing arm, substantially as set forth.

2. The fragile target A, formed with a flange, B, and a separate re-enforcing strip, C, extending around the inner periphery of said flange, and formed of an irrefragable material.

299,293. MACHINE FOR BENDING NUT-LOCKS. JOHN B. SUTCH, Pittsburg, Pa. Filed Feb. 17, 1883. (Model.)

Claim.—1. In a machine for bending metal, the combination of the wheel s and a suitable operating mechanism, with the disk which is attached to the wheel, the adjustable bars u u', attached to the disk, the plunger q, and the mandrel v, substantially as shown.

2. The combination of the wheel s and a suitable operating mechanism therefor, the plunger q, and the mechanism for reciprocating it, with the disk t, the adjustable bar u, provided with a grooved roller at its inner end, the adjustable bar u', provided with a smooth roller, and the mandrel v, substantially as described.

3. The combination of the driving-shaft b, having upon one end the pinion d, and the wheel s, which is driven by the pinion, and which carries the disk t, provided with the adjustable arms u u', with the cam a^3, which is operated by a mechanism of its own, a yoke, m, which operates the toggle-joint connected with the plunger q, and the mandrel v, the parts being constructed and arranged to operate substantially as specified.

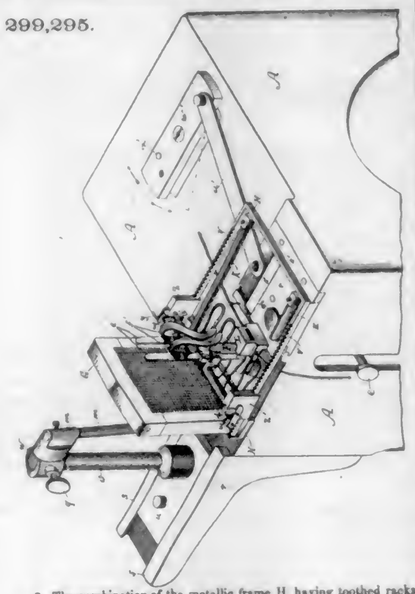
299,294. DUST-PAN. SALATHIEL C. SWERTSON, Island Falls, Me. Filed Apr. 10, 1884. (No model.)

Claim.—1. A dust-pan made substantially as herein shown and described, and consisting of sheet-metal plate A, having two side flanges, B and B', of which the former is higher than the latter, substantially as herein shown and described.

2. A dust-pan made of a sheet-metal plate having two side flanges, B B', of which the latter has its upper edge inclined from the back of the pan down to the front, substantially as herein shown and described.

3. A dust-pan made of a sheet-metal plate having two side flanges, B and B', of which the former is curved, as shown, and the other flange, B', has its upper edge inclined from the back down to the front, substantially as herein shown and described.

4. In a dust-pan, the combination, with a plate, A, having a flange at each side edge, of the cross-piece C, having a handle, D, substantially as herein shown and described.

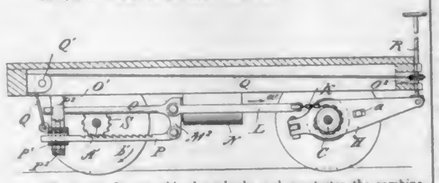


299,295. MACHINE FOR KNITTING RATTAN CHAIR-BACKS. EDWARD LOVELL TAFT, Gardner, and HENRY MURDOCK RICH, Athol, Mass. Filed Oct. 9, 1883. (No model.)

Brief.—The invention comprises (*a*) a looper or loop-former and its operative mechanism; (*b*) mechanism for supporting each loop, in order for the looper, in the formation of another loop, to pass with its loop through the loop so supported; (*c*) mechanism for turning each range of loops, after its formation, downward, for the reception of the looper while making each loop of the next succeeding range of loops; and (*d*) mechanism for retracting the work after the range of loops may have been so turned down, such retraction of the work being to carry the said range of loops into a position for each loop of it to receive at the proper time the looper and a loop in the process of being made thereby.

Claim.—1. The combination of the stationary strand-guide K, and the looper F, the series of standards e', sliders g', U-shaped tongues h', the series of springs f'', the movable loop-holding abutment I, and the strand-coverer M, provided with mechanism for operating them, substantially as set forth.

2. The combination of the wedge-pointed stud R, having mechanism for operating it, substantially as described, with the stationary strand-guide K, and the movable looper F, the series of U-shaped tongues, their carrying-slides, and the furcated sustaining-bars e' thereof, the springs f'', the movable loop-holding abutment I, and the strand-coverer M, provided with mechanism for operating them, essentially as represented.



299,295.

3. The combination of the metallic frame H, having toothed racks, as set forth, and the carriage I, having a cranked shaft, *x*, and pinions *w w*, to operate with the said racks, as described, with the stationary strand-guide K, and with the series of slides *b'*, standards *c'*, curved springs *f*, sliders *g'*, U-shaped tongues *h'*, the movable looper F, loop-holding abutment L, and strand-coverer M, having mechanism for operating them, substantially as set forth.

4. The combination of the chair-seat and post-supporting and operating mechanism, substantially as described, (consisting of the spider, the pendulous arm, the vertical slide, and adjustable post, arranged and adapted as set forth,) with mechanism substantially as represented, for knitting work or a chair-back between the posts of a chair, as explained.

299,296. CAR BRAKE AND STARTER. FRANK TOMPKINS, New York, N. Y. Filed Nov. 24, 1883. (No model.)

Claim.—1. In a combined car-brake and car-starter, the combination, with a ribbed wheel mounted on the front axle, of sliding sleeves provided with ribbed disks adapted to engage with the ribbed wheel, means for engaging the ribbed disks with the ribbed wheel, a plunger or piston connected with the said sleeves and adapted to compress air in a cylinder, a ratchet-wheel mounted on the rear axle, a rack connected with the piston and adapted to be engaged with the ratchet-wheel on the rear axle, and of means for engaging the rack with the said ratchet-wheel, substantially as herein shown and described.

2. In a combined car-brake and car-starter, the combination, with a ribbed wheel mounted on the front axle, of sliding sleeves mounted on the front axle and provided with ribbed disks adapted to engage with the ribbed wheel, two pivoted levers through which the sleeves pass, a brake-shaft for drawing the outer ends of the levers together and pressing the ribbed disks against the outer faces of the ribbed wheel, springs for drawing the ribbed disks from the ribbed wheel, chains secured on the sleeves, a piston connected with the said chains, a cylinder in which the piston works, a ratchet-wheel mounted on the rear axle, a rack adapted to engage with the said ratchet-wheel, and means for engaging the ratchet-wheel and rack, substantially as herein shown and described.

3. In a combined car-brake and car-starter, the combination, with a front axle, of a ribbed wheel mounted on the same, sliding sleeves mounted on the axle and provided with ribbed disks adapted to engage with the ribbed wheel, means for engaging the ribbed disks with the ribbed wheel, chains secured on the sleeves and connected with the piston M contained in the cylinder N, guide-rods O, projecting from the piston, the ratchet-wheel S on the rear axle, the rack P, hinged to the head of the piston, and of means for engaging the said rack with the ratchet-wheel S, substantially as herein shown and described.

4. In a combined car-brake and car-starter, the combination, with the front axle, of a ribbed wheel mounted on the same, sliding sleeves mounted on the axle and provided with ribbed disks adapted to engage with the ribbed wheel, means for engaging the ribbed disks with the ribbed wheel, chains secured on the sleeves and connected with the piston M contained in the cylinder N, guide-rods O, projecting from the piston, the ratchet-wheel S on the rear axle, the rack P, hinged to the head of the piston, the rope or chain Q, secured to the free end of the brake-shaft, the pulley Q', and the shaft R, on which the free end of the rope is fastened, substantially as herein shown and described.

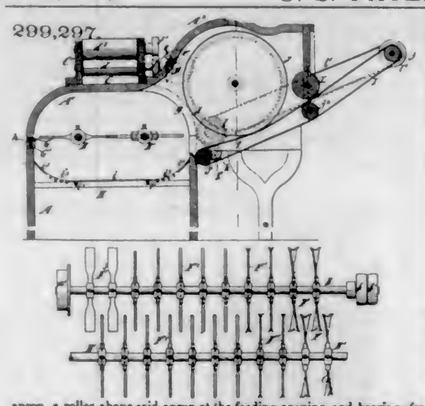
5. In a combined car-brake and car-starter, the combination, with the front axle, A, of the ribbed wheel B on the same, the sliding sleeves C, provided with ribbed disks adapted to engage with the ribbed wheel B, the levers H, pivoted to each other, the chains I, fastened to the outer ends of the levers H, the shaft J', the wheel J, mounted on the shaft J', to which wheel the ends of the chains I are fastened, the chains K, secured on the sleeves C, a piston connected with the chains and working in a cylinder, and means for revolving the rear axle from the said piston, substantially as herein shown and described.

6. In a combined car-brake and car-starter, the combination, with the front axle, A, of the ribbed wheel B, mounted on the same, the sliding sleeve C, provided with ribbed disks adapted to engage with the wheel B, the pivoted levers H, the chains I, the shaft J', the forked levers D, pivoted to the car-bottom and passing into grooves in the sleeves C, and of springs D', for withdrawing the sleeves from the ribbed wheel, chains K, secured on the sleeves C, and of the piston connected with the chain and working in a cylinder, and means for revolving the rear axle from the said piston, substantially as herein shown and described.

7. In a combined car-brake and car-starter, the combination, with the axle A, of the ribbed wheel B, mounted on the same, the sliding sleeves C, having end disks, F, the ribbed plates G, secured to the end disks, and means for engaging the ribbed plates G with the ribbed wheel B, means for operating an air-compressing piston contained in a cylinder, and means for operating the rear axle from the said piston, substantially as herein shown and described.

8. In a combined car-brake and car-starter, the combination, with the axle A, of the ribbed wheel B, mounted on the same, the sliding sleeve C, having ribbed end disks, the disks E', held in the sleeves, the springs E for pressing the end disks against the ribbed wheel, and of means for engaging the ribbed disks with the ribbed wheel, means for operating an air-compressing piston contained in a cylinder from the sleeves on its front axle, and means for revolving the rear axle from the said piston, substantially as herein shown and described.

9. In a combined car-brake and car-starter, the combination, with the front axle, of a ribbed wheel mounted on the same, sliding sleeves mounted on the axle and provided with ribbed disks adapted to engage with the ribbed wheel, friction-disks held in the inner ends of the sleeves, springs for pressing the friction-disks against the middle of the ribbed wheel before the ribbed disks engage with the ribbed wheel, means for operating an air-compressing piston from the said sleeves, and means for operating the rear wheel from the said piston, substantially as herein shown and described.

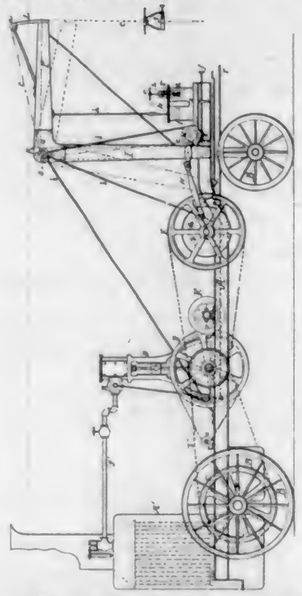


10. In a combined car-brake and car-starter, the combination, with a cylinder and air-compressing piston therein, of means for operating the piston, the rack P, pivotally connected with the piston, the ratchet-wheel S on the rear axle, the vertical guides I^2, secured to the under side of the car, the box or loop P', sliding on the same, through which box or loop the rack P is passed, and of means for raising the said box or loop to engage the rack with the ratchet-wheel S on the rear axle, substantially as herein shown and described.

11. In a combined car brake and starter, the combination, with a cylinder and air-compressing piston therein, of means for operating the piston, the guide-rods O of the piston passing through perforations in the upper part of guides I^2, the rack P, pivoted to arm M^3 of the piston, the ratchet-wheel S on the rear axle, the vertical guides I^2, the box or loop P', sliding within the same, through which box or loop the rack P is passed, and of means for raising the said loop to engage the rack with the ratchet-wheel S on the rear axle, substantially as set forth.

299,297. OPENER AND CLEANER FOR FIBROUS MATERIALS. JOHN E. VAN WINKLE, Paterson, N. J. Filed Jan. 2, 1883. (No model.)

Claim.—1. The combination, with the casing provided with a feed-opening in the top at one end and a delivery-opening at the other end, of beater-shafts and beaters arranged in said casing, mechanism for rotating said beater-shafts, a feeding trough or receptacle arranged on top of said casing lengthwise thereof and parallel with the beater-shafts, a feeding-apron in said trough or receptacle, and means for operating said

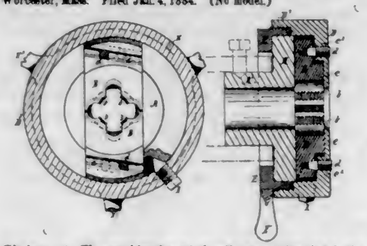


299,297.

apron, a roller above said apron at the feeding-opening, and bearings for said roller, which permit of its rising and falling as the quantity of material on the feeding-apron varies, substantially as herein described.

2. The combination, with the casing provided with a feeding-opening at one end and a delivery-opening at the other end, of the beater-shafts B B', mechanism for rotating said shafts, the beaters F F' F^2 F^3 on the shaft B, and the beaters F F' F^2 on the shaft B', substantially as herein described.

299,298. WELL-BORING MACHINE. WILLIAM VELTE, Pittsburg, Pa. Filed Dec. 7, 1883. (No model.)



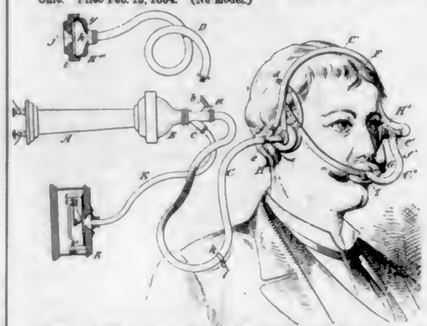
Claim.—1. The combination of the vibrating beam I with piston-rod *h*, secured thereto, with the air-pump, provided with two chambers and two pistons, one of the pistons being provided with a screw-handle and spring, substantially as shown.

2. The combination of the vibrating beam I with the air-pump N, substantially as shown and described.

3. The vibrating beam I, with the bent arm P, fulcrumed at K, and supported by braces *b*, in combination with the rod H, substantially as set forth.

4. The combination of the vibrating beam I, and a mechanism for operating it, with an air-pump, which is operated by the downstroke of the beam, the compressed air in the pump serving to assist on the upstroke, substantially as specified.

299,299. DEVICE FOR THREADING BOLTS. WM. F. WALKER, Worcester, MASS. Filed Jan. 4, 1884. (No model.)



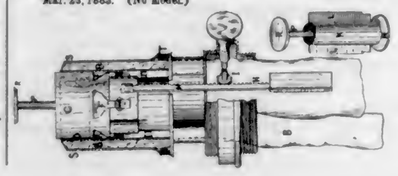
Claim.—1. The combination of the die-supporting head, the radially-moving dies having inclined slots in their surface, a face-plate provided with studs which enter said slots, adapted for moving the dies by rotative action of said plate, and a screw-threaded ring for clamping said dies at positions of adjustment between the head and plate, substantially as set forth.

2. The combination of the head-piece A, the dies B, guided and supported in said head, the face-plate D, having studs *d d* engaging with inclined slots in said dies, and the ring E, screw-threaded to said face-plate and bearing against said head-piece, substantially as and for the purpose set forth.

3. A conically-pointed screw-stud, as I, in combination with the dies and die-supporting head, having a recess, as *a*, and the rotative face-plate D, substantially as and for the purpose set forth.

4. The combination, with the head A and dies B and die-operating studs *d d*, of a face-plate having a thin central portion, *e*, and annular re-enforce or thicker portion *e'*, substantially as and for the purpose stated.

299,300. TELEPHONE-SUPPORT. NATHANIEL G. WARTH, Canton, Ohio. Filed Feb. 13, 1884. (No model.)



Claim.—1. The combination, with the receiving-telephone A, of two ear-pieces, H H', the curved spring F, for holding the said ear-pieces to the ears, and the tubes C C', connecting the ear-pieces and receiver, as described.

2. The combination of the ear-pieces H H' and mouth-piece I with the frame composed of the curved springs F G and brace *d*, as described.

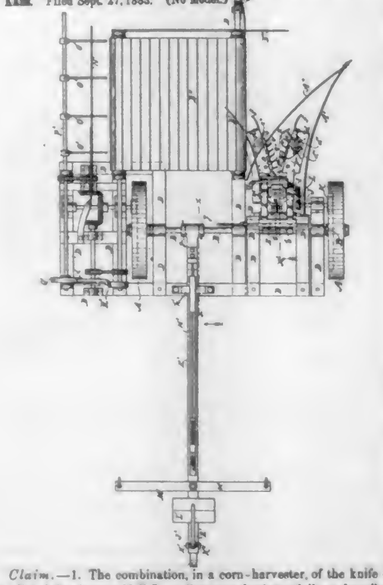
3. The combination, with the receiving-telephone A and transmitting-telephone K, of the ear-pieces H H', mouth-piece I, and the connecting-tubes C, C', C'', and E, as described.

4. The combination, with the receiving-telephone A, provided with the extension B, having branches *a b c*, and the transmitting-telephone K, of the ear-pieces H H' H''', the ear-piece H''' being provided with the diaphragm *j*, the mouth-piece I, and the connecting-tubes C C' C'' D E, substantially as herein shown and described.

299,301. LAMP-BURNER. NEWMAN S. WAX, Boston, Mass. Filed Mar. 29, 1883. (No model.)

Claim.—1. The combination, in an Argand lamp-burner having a cylindric draft-tube, E, of the air-tube K, provided with an annular flange, N, and deflecting-button R, secured to the vertical rod P, and the flanges L, constructed and arranged substantially as described, as and for the purposes set forth.

2. In an Argand lamp-burner, the combination, with the draft-tube E, of the auxiliary wick B, combustion-wick C, and conical tube S, having an inward-projecting flange at its upper end and a screw-thread at its lower end, by which it is connected to the socket-ring T, substantially as described, as and for the purposes set forth.



3. In an Argand lamp-burner, the combination, with the draft-tube E, of the auxiliary wick B, combustion-wick C, adjusting-clamp F, skeleton frame tube D, adjusting-tube G, vertical rack-bar H, and toothed adjusting-wheel I, whereby the said combustion-wick may be raised or lowered independent of the said auxiliary wick, as and for the purposes set forth.

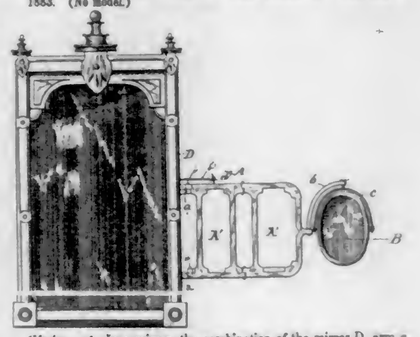
299,302. SHELL-EXTRACTOR FOR FIRE-ARMS. NORRIS O. WAYMIRE, Garfield, Kans. Filed Dec. 12, 1883. (No model.)

Claim.—An improved cartridge-extractor, consisting of the stem a and a head, b, connected together by the brace c, which extends along the upper surface of the stem and flush with the top of the head, the said brace being beveled at c', and serving as a guide as well as a brace, substantially as set forth.

299,303. CORN-HARVESTER. SOLOMON F. WEAVER, near Portis, Kans. Filed Sept. 27, 1883. (No model.)

Claim.—1. The combination, in a corn-harvester, of the knife or cutter F and the elevator H H I c c, all arranged substantially as described with relation to each other, for the purposes set forth.

2. The combination, in a corn-harvester, of the knife or cutter F, an elevator-belt I c, arranged behind the said knife, and the inclined guard U, arranged in front of the said elevator, substantially as and for the purposes set forth.

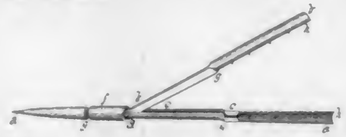


3. The combination, in a corn-harvester, of the inclined spring-guide A' A'', the guard or guide B', and the guide or arm B''', all arranged substantially as shown and described with relation to each other, the cutter and the delivery belt or apron, for the purpose of laying the tops of the cut stalks on the delivery-belt.

4. The combination, in a corn-harvester, of the knife or cutter F, the elevator I c, the guard A' A'', the inclined guide or guard U, the guard or arm B', the guard or arm B''', and the delivery belt or apron B'', substantially as and for the purposes specified.

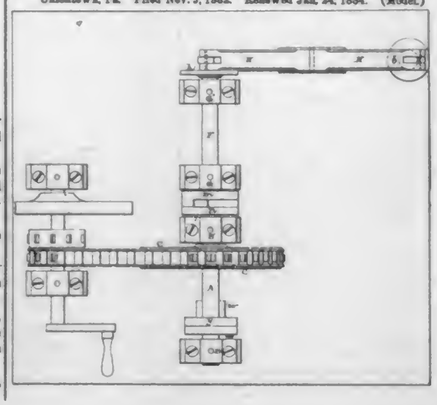
5. The combination, in a corn-harvester, of the knife or cutter F, the rollers *e e*, the endless belts *d' d'*, the fingers *d'' d''*, the ratchets *d''' d'''*, the pawls *d'''' d''''*, and the bearings *d d*, substantially as and for the purposes specified.

6. The combination of the vertically-sliding frame E, the knife or cutter F, attached to the said frame, an endless elevator-belt arranged behind the said knife and running on rollers mounted in the said frame, the drive-wheel L, the pulleys M M, the driving cord or belt N, arranged as specified with relation to the said drive-wheel and pulleys, and the main frame of a corn-harvester, substantially as and for the purposes specified.



299,304. MIRROR. FRANK F. WEBER, Atlanta, Ill. Filed Aug. 21, 1883. (No model.)

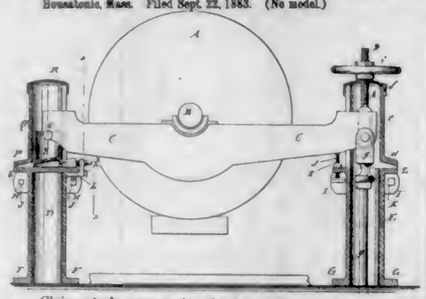
Claim.—1. In a mirror, the combination of the mirror D, arm a, plate a^2, having eye a^3, hook d', for holding the bracket-sections in an extended position, bracket A, arm b, and mirror B, having frame C, substantially as shown, and for the purpose described.



2. The combination of the mirror D, the bracket mechanism for adjustably connecting it with mirror B, and the hook for holding the bracket-sections in an extended position, substantially as shown, and for the purpose described.

299,305. NEEDLE. JOHN W. WEED, Flushing, N. Y. Filed Dec. 18, 1883. (No model.)

Claim.—A needle consisting of a pointed stem having an arm pivoted thereto, said stem and arm each concaved at their outer ends, and a sleeve to bind the stem and arm together to secure the cord, substantially as set forth.



299,306. WELL-DRILLING MACHINE. LEBBEUS C. WEAVER, Uniontown, Pa. Filed Nov. 9, 1882. Renewed Jan. 24, 1884. (Model.)

Claim.—1. In a machine for drilling wells, the two independent shafts A and F, carrying at their ends the clutches *m n*, operating substantially as described.

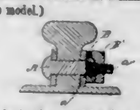
2. The combination of the shafts A F, driving-wheel C, weighted rod D, clutches *m n*, and crank A, all arranged substantially as described.

299,307. RAG-ENGINE FOR PAPER-MAKING. WILLIAM WHITELY, Housatonic, Mass. Filed Sept. 22, 1883. (No model.)

Claim.—1. In a rag-engine, the lighter-supporting posts made in two parts, flanged at their adjacent ends to receive the connecting-bolts, the upper parts being slotted to receive the ends of the lighters, and provided at their upper ends with caps, substantially as herein shown and described, whereby the lighters can be readily removed, as set forth.

2. In the lighter-supporting posts of rag-engines, the combination, with the top flange of the lower part provided with slots parallel with the side of the tub, of the base-flange of the upper part having slots at right angles with the side of the tub, and the fastening-bolts, substantially as herein shown and described, whereby the upper parts of the posts can be readily adjusted to adjust the roll, as set forth.

3. In a rag-engine, the combination, with the lower part, D, of the post, having a close top, and the slotted upper part, Q, of the slotted shell S, having slot-bearings T, substantially as herein shown and described, to provide a movable fulcrum for the lighters, as set forth.



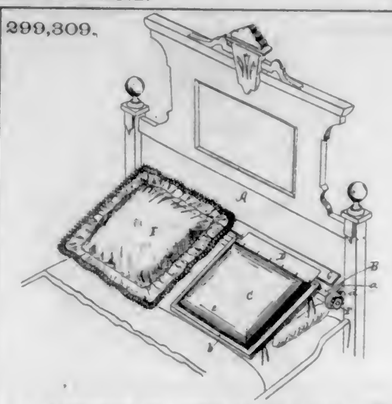
4. In a rag-engine, the combination, with the lower part, D, of the post having closed upper end, the slotted upper part, Q, and the bearing-shell S, having an inclined groove, V, in its bottom, of the wedge W, the adjusting-screw X, and the slotted lug Y, substantially as herein shown and described, whereby the said shell-bearing can be readily adjusted, as set forth.

5. In a rag-engine, the combination, with the post made in two parts, E *e*, and the lighter C, of the lifting-rod *g*, placed within the post, substantially as herein shown and described, whereby the machine is made more compact, as set forth.

6. In a rag-engine, the combination, with the post E *e*, the perforated cap *f*, the lighter C, and the lifting-rod *g*, of the screw A and the hand-nut *i*, substantially as herein shown and described, whereby the lighter can be readily raised and lowered, as set forth.

7. In a rag-engine, the combination, with the flange Z of the lower part, E, of the post, and the lighter C, of the stop-screw *j*, substantially as herein shown and described, whereby the lighter will be caught in case of breakage, to prevent the roll from dropping upon and injuring the bed-plate, as set forth.

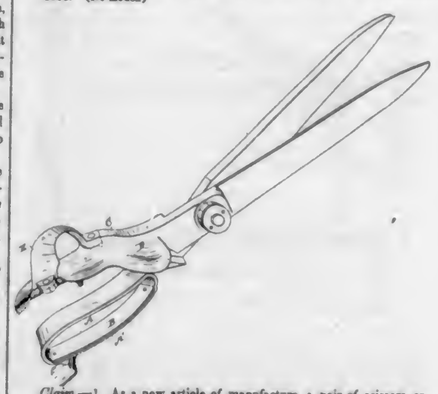
299,308. NUT-LOCK. CHARLES A. WILLIAMS, Lawsonham, Pa. Filed Feb. 25, 1884. (No model.)



Claim.—In a nut-lock, the combination, with the bolt having the right and left hand screw-threads offset from each other, of the notched nuts, any one or more of the tongues of one of which nuts, formed by notching said nut, entering the coincident notch or notches of the other nut, substantially as and for the purpose set forth.

299,309. PILLOW-SHAM AND HOLDER. DAVID R. WILSON, Fenton, Mich. Filed Apr. 26, 1883. (No model.)

Claim.—1. A pillow-sham holder consisting of the pillow-form C, supported on a frame, *b*, attached to the bar B, in combination with such bar B and means, substantially as described, for holding the forms in any desired position, as and for the purpose set forth.



2. The combination of a bedstead, the bar B, pillow-forms C, the frame *b*, attached to said bar and supporting the forms C, with the brackets *a*, the ratchet-wheel E, and dog *d*, as set forth.

299,309.

3. In combination with a bedstead, the bar B, brackets *a*, pillow-forms C, and shams F, the fly D, resting against a projection on the head of the bedstead, all constructed, arranged, and operating substantially in the manner and for the purposes specified.

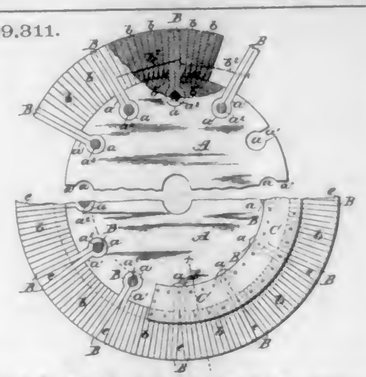
299,310. SHEARS. KARL WITTE, Hartford, Conn. Filed Oct. 24, 1883. (No model.)

Claim.—1. As a new article of manufacture, a pair of scissors or shears the upper handle of which is provided with a flaring thumb-loop, the lower half of which is formed integral with its blade, and the upper half of which is formed of india-rubber and riveted to the lower portion, and the lower handle formed with the usual hand-loop having a rubber lining in the lower portion thereof, whereby the back of the thumb and fingers will be afforded a contact-surface not liable to chafe or harden the skin, substantially as set forth.

2. Hand-shears having a lining of soft rubber or analogous material on one handle-loop and having a hard-rubber bow secured to the other handle, substantially as herein shown and described.

299,311. POLISHING-WHEEL. DANIEL W. ABBOTT, Leelonia, Ohio. Filed Oct. 25, 1883. (No model.)

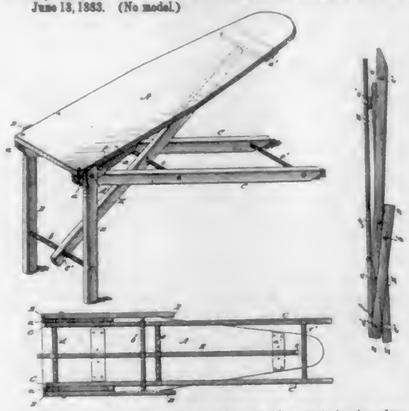
Claim.—1. In a polishing-wheel, the key-pieces B of the leather facing, secured in the holes *a* and slits *a'*, in combination with the filling-pieces *b*, toe-nailed to the face of the disk, and also nailed to the key-pieces, substantially as described.



2. The key-pieces B of the leather facing, having wedge-pieces *c*, and being secured in the holes *a* and slots *a'*, in combination with the filling-pieces *b*, substantially as described.

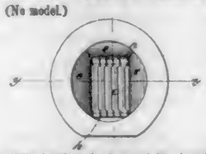
3. The doubled key-pieces B, having an eye in the bend, and being secured in the holes *a* and slits *a'* by a pin or key, a^2, in combination with the filling-pieces *b*, substantially as described.

4. The combination of the metal rings C with the disk A, the keys *c*, and intermediate filling-pieces, *b*, and the leather facing B *b*, substantially as described.



5. The improved polishing-wheel, consisting of the wood disk A and leather facing composed of key-pieces B and intermediate pieces, *b*,

299,311.

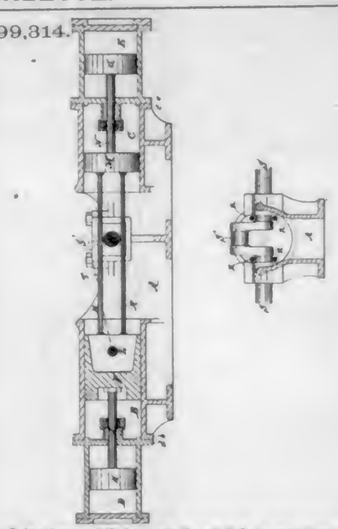


secured to the disk, as described, and re-enforced by the metal rings C, substantially as described.

299,312. IRONING-TABLE. FRANKLIN F. ADAMS, Erie, Pa. Filed June 13, 1883. (No model.)

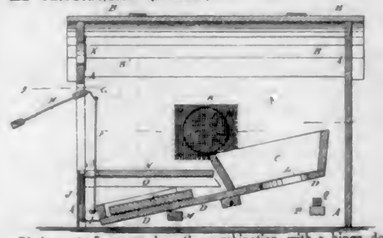
Claim.—An ironing-table consisting of the top A, having cleat *a'* and ears *a*, legs B, pivoted to the ears *a*, and having round *b*, brace C, pivoted to the ears *a*, and having round *c'*, and a swinging brace, E, attached at or near its middle to the round *c*, and having notch *d'* to slip over round *b*, all arranged and combined substantially as described.

299,313. LIMEKILN. BERNHARD ALDERS, Conception, Mo. Filed Mar. 4, 1884. (No model.)



Claim.—The kiln having the base of its chamber provided with rounded convergent shoulders *c*, said chamber being provided below the outer edges of said shoulders with ledges *h*, upon which is supported a fire-grate, *f*, substantially as shown and described, and for the purpose set forth.

299,314. AIR-COMPRESSOR. JOHN F. ALLEN, Brooklyn, N. Y. Filed Apr. 16, 1883. (No model.)



Claim.—1. In an air-compressor having the steam-cylinder and the air-compressing cylinder placed in one line, the steam-cylinder E and the air-compressing cylinder D, attached to the ends of the main frame A, and overhanging the same, substantially as described.

2. In an air-compressing machine having the steam-cylinder and the air-compressing cylinder placed in the same line, with the crank-shaft between said cylinders, the combination of the steam-cylinder piston G, its piston-rod N, the block M, rods R R, passing above and below the crank-shaft S, the block F, piston-rod J, and air-compressing piston H, with connecting-rod T and crank-shaft S, substantially in the manner and for the purpose herein set forth.

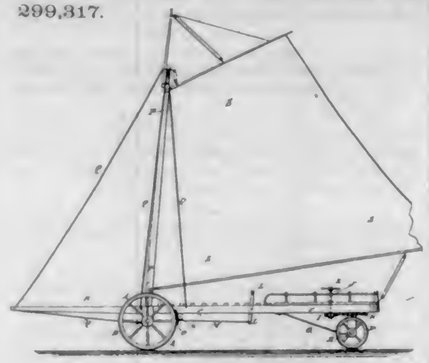
299,314.

299,315. NEST-BOX FOR FOWLS. WILLIAM ENOS ALLEN, Monrovia, Ind. Filed Dec. 8, 1883. (No model.)

Claim.—1. In a nest-box, the combination, with a hinge-door, of a balanced nest connected to and operating said door, and a vertically-sliding locking-bolt connected to and operated by said nest, substantially as herein shown and described.

2. In a nest-box, the combination, with the box A, provided with the platform N, of the balancing-board D, provided with the nest C, the hinged door H, the arm G, the connecting-rod F, and the locking-bolt J, substantially as herein shown and described.

3. In a nest-box, the combination, with the balancing-board D and the hinged door H, of the arm I and the bolt J, substantially as herein shown and described, whereby the said door will be fastened and released by the movements of the said board, as set forth.

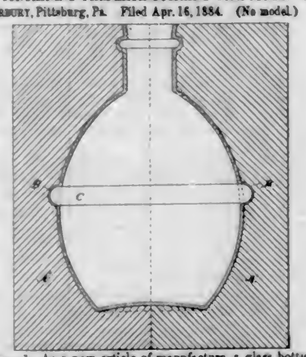


299,316. SHEET-METAL CAN. FRIEDRICH HELVIG ARND, Weimar, Germany. Filed Apr. 2, 1883. (No model.)

Claim.—The combination of the body of a can or similar package having an inward overlap, A, flanged at C, with a ripping-wire, B, held between the overlap and body of the package, and a lid, E, adapted to be applied and soldered over the flange C, substantially as set forth.

299,317. SAIL-WAGON. JOHN A. ASPINWALL, Bay Ridge, N. Y. Filed Mar. 24, 1884. (No model.)

299,317.



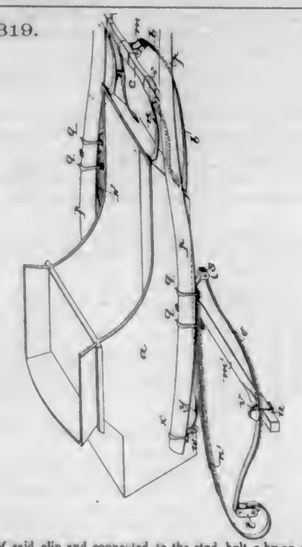
Claim.—1. In a sail-wagon, the combination, with the triangular frame C, provided with mast P and sails S, and the forward axle, B, provided with wheels A, of the short rear axle, E, pivoted to the rear end of said frame and provided with the wheels D, and means for turning the said short axle on its pivot for guiding the wagon, substantially as herein shown and described.

2. In a sail-wagon, the combination, with the triangular frame C, of the forward axle, B, attached to the wide forward end of the said frame, the wheels A, the pivoted rear axle, E, the wheels D, the gear-wheel H on the rear axle, the gear-wheel I, and the upright shaft J, substantially as herein shown and described.

3. In a sail-wagon, the combination, with the triangular frame C, mounted on wheels A D, of the lever L, pivoted in a slot of the said frame, the levers N, pivoted to the under side of the frame and provided with brake-shoes O on the outer ends, and the rods M, connected to the inner ends of the brake-levers and to the operating-lever, substantially as herein shown and described.

299,318. MANUFACTURE OF GLASS BOTTLES AND VESSELS FOR CONTAINING FIRE-EXTINGUISHING COMPOUNDS. THOMAS B. ATTERBURY, Pittsburg, Pa. Filed Apr. 16, 1884. (No model.)

Claim.—1. As a new article of manufacture, a glass bottle or vessel for containing a fire-extinguishing chemical, consisting of frangible sections 1 2, connected by the homogeneous and more fragile sections or ribs C, as set forth.



2. As a new article of manufacture, a glass bottle or vessel for containing a fire-extinguishing compound or chemical, consisting of upper or lower sections having ribs or corrugations *a*, connected by the thinner and more fragile rib C, as set forth.

299,319. TWO-WHEELED VEHICLE. JOHN C. BACK, Hillsdale, Mich., assignor to himself and Henry Allen, same place. Filed Jan. 17, 1884. (Model.)

Claim.—1. In a road-cart, having the front portion of the body suspended from the front cross-bar, *c*, by a bow-spring, *b*, the said spring connected to the bottom of the body at the bow *d* by a clip, *e*, and extended forward of said clip and connected to the stud-bolt *g*, substantially as described.

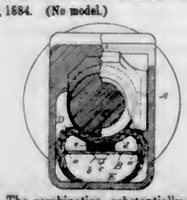
2. In a road-cart, having the front portion of the body suspended from the front cross-bar, *c*, by the bow-spring *b*, the said spring connected to the bottom of the body at the bow *d* by a clip, *e*, and extended

299,319.

forward of said clip and connected to the stud-bolt *g* by an eye in the spring and adjusting-nuts *f* on the bolt, enabling the body to be adjusted with relation to the supporting-frame, substantially as described.

3. The body suspended at its forward end from the front cross-bar, *c*, of the shafts by the longitudinal center spring, *b*, and suspended at its back end from the rear ends of the shafts by transverse flexibly-jointed devices for allowing side-play of the body, substantially as described.

4. In a road-cart, the shafts *p*, mounted on the axle *m'* by the side springs, *n' o*, and the body suspended from the shafts by the center spring, *b*, at the fore end, and by the flexibly-jointed suspending devices at the hind end, substantially as described.



5. In a road-cart, having the shafts mounted on the axle by side springs, *n' o*, and the hind end of the body suspended from the shafts by flexibly-jointed devices, the hind ends *o'* the shafts bent inward for clearance of the suspending devices and springs, substantially as described.

6. In a road-cart, having the shafts mounted on the axle by elliptic side springs, the shafts clipped to the upper members of the side springs near the front end, and the springs clipped to the axle near the hind ends of the springs, substantially as described.

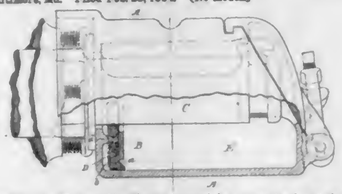
7. In a road-cart, having the shafts mounted on the axle by elliptic side springs, the shafts clipped to the upper members of the side springs near the front end, and the springs clipped to the axle near the hind end of the springs, and the two members of the springs connected by an ear and pivot joint at the front end and by a link-joint at the hind end, substantially as described.

8. In a road-cart, having the front end of the body suspended from the cross-bar *c* by a spring, *b*, the flexible safety-straps *n* secured to the front of the body at their free ends and connected at their bends to the cross-bar by clips or plates n^2, substantially as described.

299,320. CAR-AXLE BOX. WILLIAM S. G. BAKER, Baltimore, Md. Filed Feb. 23, 1884. (No model.)

Claim.—1. The combination, substantially as set forth, of the box, the partition, which extends horizontally entirely across the box at its rear end, and is formed with side openings or recesses, and the lubricating-pad, which extends up through one of said openings, under the journal, and down through the other opening, so as to present an extended lubricating-surface to the journal.

2. The combination, substantially as set forth, of the box, the partition, which extends through the box from end to end and horizontally entirely across the box at both ends, and is formed with side openings or



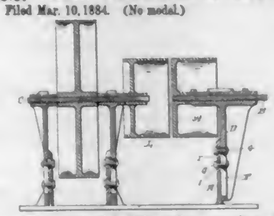
recesses, and the lubricating-pad, which extends through the openings, so as to completely fill the same from end to end, and which presents an extended lubricating-surface to the journal.

3. The combination, substantially as set forth, of the box, the lubricant-chamber, the partition located over the lubricant-chamber, and the concave pad-holder mounted on the partition.

4. The combination, substantially as set forth, of the box, the lubricant-chamber, the partition located over the lubricant-chamber, and the pad-holder yieldingly mounted on the partition.

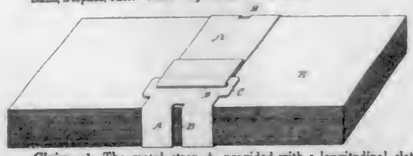
5. The combination, substantially as set forth, of the box, the partition, the dowel-sockets formed therein, the pad-holder, and the dowels connected thereto that work in the sockets in the partition.

299,321. CAR-AXLE-LUBRICATING DEVICE. WILLIAM S. G. BAKER, Baltimore, Md. Filed Feb. 25, 1884. (No model.)



Claim.—1. The combination, substantially as set forth, of the box, the transverse partition located near the rear end of the box, an opening formed in the partition below the level of the lubricant in the box, whereby a communication is established between the front and rear chambers formed in the box by said partition, and the absorbent pad located between the partition and the rear end of the box, which lubricates the journal at that point and returns to the main receptacle or cellar any excess of lubricant.

2. The combination, substantially as set forth, of the box, the journal, the pad applied to the journal at the rear end of the box, and the lug formed on the box for holding the pad away from the rear end of the box.

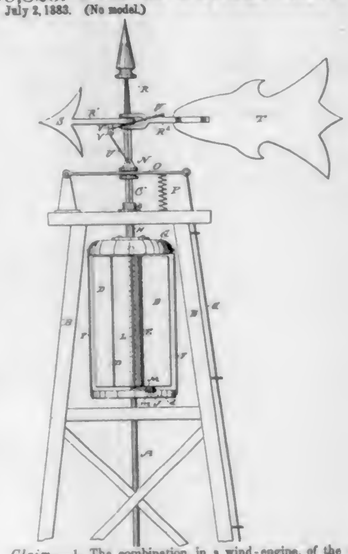


3. The combination, substantially as set forth, of the box, the journal, the pad, the spring which holds the pad against the journal and permits the pad to be compressed to allow for the play of the journal, the lug formed on the box, which holds the pad away from the rear wall of the box, the chamber in which the pad works, and a communication between said chamber and the front of the box.

299,322. PULLEY. WILLIAM T. BAKER and JOHN H. SHULL, Findlay, Ohio. Filed Mar. 10, 1884. (No model.)

Claim.—The combination of the pulley secured to a short shaft and the bearing in which the shaft is journaled, and which is provided with a vertical slot, with a base or hanger provided with transverse slots, and the clamping-bolts for securing the bearing in position, substantially as shown and described.

299,323. ENVELOPE FOR CURRENCY, CHECKS, &c. CHARLES A. BALL, Delphos, Ohio. Filed July 23, 1883. (Model.)



Claim.—1. The metal strap A, provided with a longitudinal slot, B, and at one end with a cross-piece, C, having a longitudinal slot, D, at right angles to the slot B, substantially as herein shown and described.

2. The combination, with a series of bank-notes, bills, &c., forming a pack, of a slotted strap for holding them together, and of a covering or wrapper for the pack, which wrapper has an opening over the slotted part of the strap to expose part of the edges of all the bills, &c., in the pack, substantially as herein shown and described.

299,324. PROCESS OF PURIFYING OR REFINING PETROLEUM AND OTHER DISTILLABLE OILS. RICHARD HATNES and JOHN PEARSMORE, Jr., Liverpool, County of Lancaster, England. Filed Nov. 14, 1883. (No specimens.)

Claim.—The process of bleaching and purifying dark-colored distillable oils, which consists in adding to the oil pulverized dry coke or charcoal impregnated with anhydrous chloride of zinc, such as described, till it arrives at the consistency of mud, subjecting it to distillation, and then condensing the distillate, substantially as described.

299,325. WIND-ENGINE. DAVID H. BAUSMAN, Lancaster, Pa. Filed July 2, 1883. (No model.)

Claim.—1. The combination, in a wind-engine, of the shaft A, carrying the horizontal wheel D E, with the shield F, secured to the disk G and ring J, the said disk G being supported by the shaft H and its collar, and provided on its under side with a bearing for the upper end of the shaft A.

2. In a wind-engine, the combination, with a horizontal wind-wheel, of an independent semi-cylindrical shield partly surrounding it, and of an adjustable regulator-wing pivoted in the frame of the shield and opposite the shield proper, substantially as shown and described.

3. In a wind-engine, the combination, with a horizontal wind-wheel, of the shield F, partly surrounding it, the disk G, the ring J, and the vertical adjustable wing L, pivoted in the ring J and in the disk G, substantially as herein shown and described.

4. In a wind-engine, the combination, with a horizontal wind-wheel, of a semi-cylindrical shield, F, partly surrounding it, the disk G, the ring J, the vertical wing L, the arm M, the arm *m*, provided with apertures *b*, and of the pin *d*, substantially as herein shown and described.

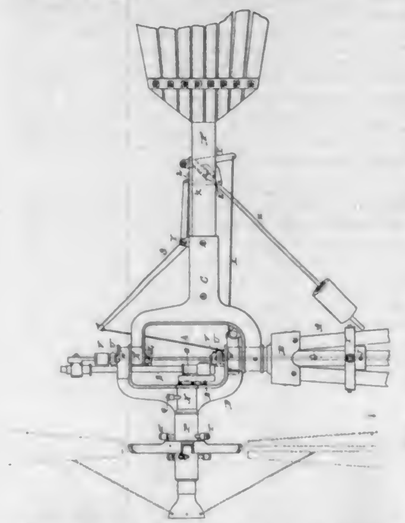
5. In a wind-engine, the combination, with a horizontal wind-wheel, of an independent shield partly surrounding it, a vane connected with the shield and provided with a joint between the ends, and of devices for giving the two parts of the vane the desired inclination to each other, substantially as herein shown and described.

6. In a wind-engine, the combination, with a horizontal wind-wheel and an independent shield partly surrounding it, of the shaft C, connected with the shield, a jointed vane, R, on the shaft C, the lever O, and the chain U, fastened to the vane-section R^2 and to the lever O, and passing over a pulley, V, on the vane-section R', substantially as herein shown and described.

7. In a wind-engine, the combination, with a horizontal wind-wheel and an independent shield partly surrounding it, of the shaft C, the jointed vane R, the lever O, the spring P, the rod or wire Q, the sleeve N, and the chain U, secured to the sleeve N and to the vane-section R^2, and passing over a pulley on the vane-section R', substantially as herein shown and described.

8. In a wind-engine, the combination, with a horizontal wind-wheel and an independent shield, of the shaft C, the jointed vane R, the spring

I, fastened to the vane part R^2 and the arm W of the part R', and of devices for inclining the vane part R^2 to the vane part R', substantially as herein shown and described.

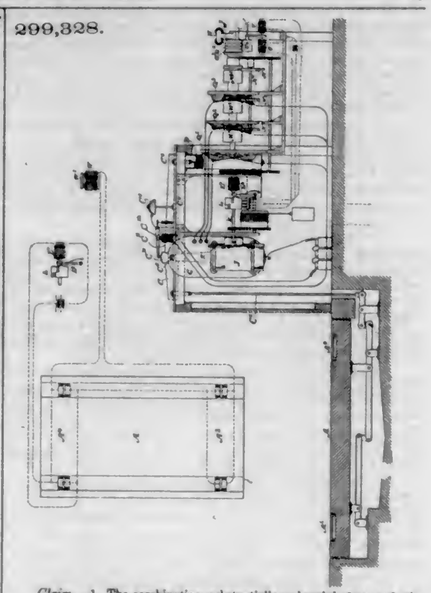


299,326. CORSET-STEEL FASTENING. THEODORE C. BATES, North Brookfield, Mass. Filed Sept. 3, 1883. (No model.)

Claim.—1. In a corset-steel fastening, the steel A and its attached headed stud, combined with steel B, and attached lock-clasp, composed of upper and lower plates and having two spring-arms, the free ends of which are made to enter the space between the said plates, the said spring-arms being guarded by the said plates and prevented from being sprung or bent up or down with relation to the face of the said steel, and being movable at right angles to the length of the slot in the said plate, whereby the arms are adapted to yield laterally to the movement of the stud in the slot, and to then spring behind the said stud, substantially as described.

2. In a corset-steel fastening, the spring-arms having the large opening and the contracted space between them, combined with a plate above and below them, between which the said arms may move in a direction parallel with the broad side of the steel to which the said fastening is attached, substantially as described.

299,327. WINDMILL. GEORGE M. BEARD, Auburn, Ind. Filed Sept. 7, 1883. (No model.)



Claim.—1. In a windmill, the combination of the two castings C D and tube G, the casting C being provided with the bearing E, and having the end of the tube G to project above the top of its lower portion, and the casting D being provided with an opening in its lower end to catch over the top of the tube G, and having a tubular portion for passing down through the bearing E, substantially as shown.

2. The combination of the guides and the slotted adjusting-plates, which are made to bear against opposite sides of the pump-rod, substantially as described.

3. The combination of the vane and the triangular-shaped lever, which is connected with the casting D by means of a connecting-rod, and with an operating-lever, and which triangular-shaped lever has the weighted rod clamped to it, substantially as specified.

299,328. ELECTRIC AUTOMATIC RECORDING APPARATUS FOR WEIGHING-MACHINES. WILLIAM H. BECKLER, Newport, R. I. Filed Sept. 20, 1881. (No model.)

299,328.

Claim.—1. The combination, substantially as hereinbefore set forth, of a weighing-platform, a pendulum or suspended weight swinging on an axis turning in bearings attached to said platform, a treadle projecting above the surface of said platform and adapted to swing said pendulum in either direction from its normal position of rest, a contact-point depending from said axis and moving with said pendulum, a stationary contact-point, and an electric circuit closed by the contact of said contact-points.

2. The combination, substantially as hereinbefore set forth, of a platform, two treadles upon said platform, constructed substantially as described, so that one actuates a circuit-closer only when depressed by a vehicle passing over the platform in one direction, while the other actuates a like circuit-closer only when depressed by a vehicle in the opposite direction, and an electric circuit which is completed by the action of either of said circuit-closers.

3. The combination, substantially as hereinbefore set forth, of a platform, a balanced lever, an antagonistic spring, a toothed segment actuated by the movements of said lever upon its fulcrum, a train of multiplying wheel-work actuated by said segment, and a circuit-closing arm actuated by said wheel-work and moving over a series of contact-points, but normally not in contact therewith.

4. The combination, substantially as hereinbefore set forth, of a platform, a balanced lever, an antagonistic spring, a toothed segment actuated by the movements of said lever upon its fulcrum, a train of multiplying wheel-work actuated by said segment, and two or more circuit-closing arms moved by dependent arbors in said train of wheel-work, but at different angular velocities, over a series of contact-points, but normally out of contact therewith.

5. The combination, substantially as hereinbefore set forth, of the movable arm, the spring push-button and contact-roller mounted thereupon, and the insulated contact-points.

6. The combination, substantially as hereinbefore set forth, of the movable arm, the spring push-button and contact-roller mounted thereupon, the laterally-flexible supports of said contact-roller upon the arm, the insulated contact-points, and the inclined guides for insuring the contact of said roller with the insulated contact-points.

7. The combination, substantially as hereinbefore set forth, of a disk or dial having a series of pairs of electrical contact-points upon its face, inclined guides between each pair of contact-points, a rotating arm moving over the face of said disk or dial, and a contact-roller mounted upon said arm by means of yielding supports, substantially such as described whereby said roller is capable of a lateral movement with reference to its supporting-arm when deflected by the inclined guides.

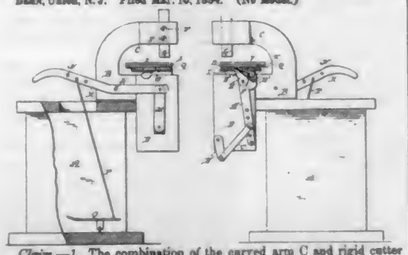
8. The combination, substantially as hereinbefore set forth, of a platform, a balanced lever, an antagonistic spring, one or more circuit-closing arms actuated through suitable intermediate mechanism by the movements of said balanced lever, and moving over but not normally in contact with a series of contact-points, and independent mechanism actuated by a time-train for closing an electric circuit by pressing the said circuit-closing arm or arms against the opposite contact-points.

9. The combination, substantially as hereinbefore set forth, of a series of contact-points, a movable circuit-closer passing in front of said series of contact-points, but not normally in contact therewith, a platen for pressing said circuit-closer against the contact-points confronted thereby, a shaft driven by a time-train, and a system of compound levers actuated by said shaft for bringing said platen into contact with the circuit-closing devices and then returning it to its normal position.

10. The combination, substantially as hereinbefore set forth, of a shaft driven by a time-train, a detent for arresting said shaft at a determinate point in its revolution, an electro-magnet for withdrawing said detent and releasing the shaft and time-train, devices actuated by said shaft for closing an electric circuit, printing or recording mechanism, and an electro-magnet included in said electric circuit for actuating said printing or recording mechanism.

11. The combination, substantially as hereinbefore set forth, of a type-wheel driven by friction from a constant motor, a stop mechanically attached to and revolving with said type-wheel, a series of detents equal in number to the characters or divisions upon said type-wheel, and a series of electro-magnets for actuating said detents, each one of which, when vitalized, throws its associate detent into the path of the revolving stop upon the type-wheel, and thereby arrests the latter at a determinate and corresponding point in its revolution.

12. The combination, substantially as hereinbefore set forth, of a type-wheel and drum rotating upon a common axis, a series of stationary electro-magnets placed circumferentially around said drum, with their armature-levers extending toward the periphery of the drum in a direction tangential thereto, and a stop projecting from the periphery of the drum which takes against any one of said levers when it has been moved in a direction parallel to the axis of the drum.



13. The combination, substantially as hereinbefore set forth, of one or more type-wheels, a platen, an armature attached to said platen, a paper-feeding roller, and two electro-magnets acting independently upon the same armature, one to impel said platen toward the type-wheel, and the other to withdraw said platen from the type-wheel, and simultaneously to throw the paper-feeding roller into gear with a constant motor.

14. The combination, substantially as hereinbefore set forth, of a platform, two treadles upon said platform, constructed substantially as described, so that one actuates a circuit-closer only when depressed by a vehicle passing over said platform in one direction, while the other actuates a like circuit-closer only when depressed by a vehicle passing in the opposite direction, an electric circuit which is divided into two branches, one of said circuit-closers being included in each branch, an electro-magnet included in the undivided portion of the circuit, a printing or recording mechanism actuated by said electro-magnet, an independent electro-magnet included in one of said branches, and an independent recording mechanism actuated thereby.

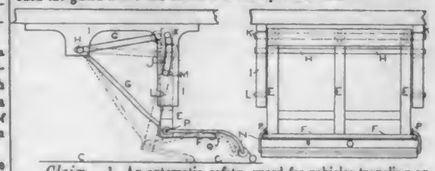
15. The combination, substantially as hereinbefore set forth, of one or more type-wheels, one or more electro-magnets for controlling the position of said type-wheels, a platen, an independent printing, stamping, or recording device and an independent electro-magnet for bringing said device into line with said type wheel or wheels and facing said platen.

16. The combination, substantially as hereinbefore set forth, of a main platform, an electric circuit-closer actuated by the depression of a treadle mounted upon said platform, an electro-magnet, a detent actuated thereby, a time-train, printing or recording mechanism actuated by said time-train, one or more supplementary platforms, and one or more circuit-breakers actuated thereby, whereby the action of the time-train is prevented by the depression of the supplementary platform or platforms.

299,329. MACHINE FOR CUTTING BUTTON-HOLES. HENRY A. BEEN, Union, N. J. Filed Mar. 10, 1884. (No model.)

Claim.—1. The combination of the curved arm C and rigid cutter G with a vertically-moving table and an operating mechanism, substantially as shown, for both raising the table and revolving it, substantially as described.

2. The combination of the rigid cutter, a vertically moving and revolving table, a standard on which the table is placed, an operating-lever, and a mechanism for revolving the table, substantially as shown.



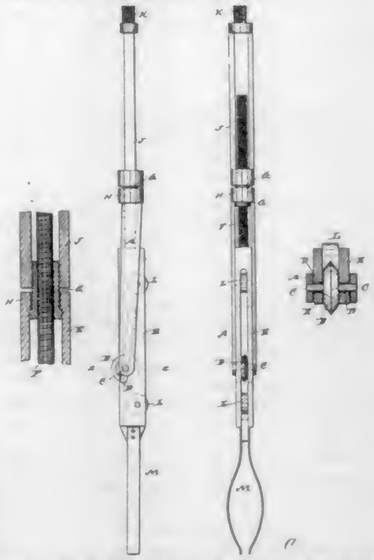
3. The combination of the table, the two extensions C D, the standard I, which is moved vertically by the operating-lever, the revolving table, the pawl-and-ratchet mechanism for causing the table to revolve, and the stationary cutter, substantially as set forth.

4. The combination of the vertically moving and revolving table, the standard I, lever K, and link M with levers A' B', connecting-rod C', and spring-pawls and a stationary cutter, substantially as specified.

5. The combination of the bracket B, having extensions C D and grooves or ways E H, with the cutting-blade G, standard H, standard I, disk S, (having teeth T,) pivoted thereon, lever K, link M, lever D', link C', and pawl E', substantially as shown and described.

299,330. PILOT OR WHEEL-GUARD. GEORGE W. BENNETT and THADDEUS S. FITCH, San Francisco, Cal. Filed Nov. 7, 1883. (No model.)

Brief.—A frame forming a guard in front of the wheels is hung up out of the way when not in use, and a light trigger-frame extends in front of it, which, when struck by an obstruction on the track, pushes back the guard-frame and allows it to fall upon the track.

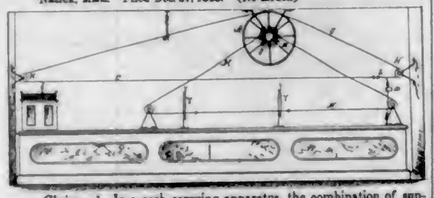


Claim.—1. An automatic safety-guard for vehicles traveling on rails, consisting of the combination of a frame to form the guard, hung up above the track upon supports when out of service, and a light trigger-frame attached thereto, capable of running close to or upon the track, but not in itself acting as a wheel-guard, which, upon striking an obstacle, will push back the guard to release it from its supports to fall upon the rails, substantially as and for the purpose described.

2. The combination of the drop-frame E, shelf F, trigger-frame N, hangers I I, braces G, and fulcrum-rod H, all arranged and operating together substantially as and for the purpose described.

3. The light trigger-frame N, not being in itself a wheel-guard, passing close to or upon the track, and acting, immediately upon striking an obstacle, to bring into operation any suitable wheel-guard, substantially as and for the purpose described.

299,331. WELL-PIPE CUTTER. ALFRED WILLARD BENSON, San Bernardino, Cal. Filed Mar. 3, 1884. (No model.)



Claim.—1. In a well-pipe cutter, the combination, with the forked part A, of the forked part E within it, the cutter-roller B, pivoted in the lower part of the part A, the pintle C, passing through diagonal slots D in the part E, and of means for adjusting the part E higher or lower in the part A, substantially as herein shown and described.

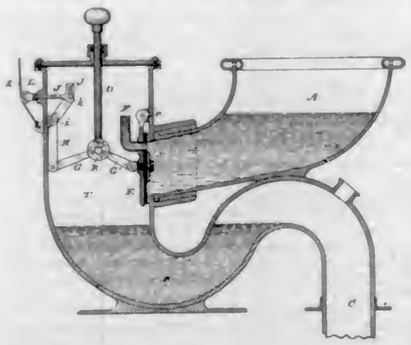
2. In a well-pipe cutter, the combination, with the forked part A, of the forked part E within it, the cutter-roller B in the lower end of the part A, the pintle of the roller passing through diagonal slots D in the part E, means for adjusting the part E higher or lower in the part A, and of the springs M on the lower end of the part E, substantially as herein shown and described.

3. In a well-pipe cutter, the combination, with the forked part A, of the forked part E, having diagonal slots D, the cutter-roller B, held in the part A, the springs M on the lower end of the part E, and the rollers L on the part E, substantially as herein shown and described.

4. In a well-pipe cutter, the combination, with the forked part A, of the forked part E within the same, and provided with diagonal slots D, the cutter-roller B in the lower end of the part A, the internally-threaded sleeve G, held to turn in the upper end of the part A, and of the swivel J, secured to the sleeve G, substantially as herein shown and described.

299,332. CASE AND PARCEL CARRIER. WILLIAM P. BIGELOW, Natick, Mass. Filed Dec. 27, 1883. (No model.)

Claim.—1. In a cash-carrying apparatus, the combination of supporting and driving wheels carrying a moving belt, and a cash-receptacle borne thereon, with multiplying-wheels and means of actuating them, so as to give increased speed to the belt-driving wheel, substantially as set forth.



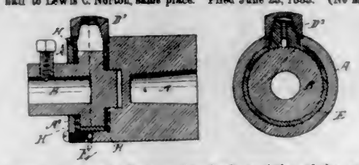
2. In a carrying apparatus, supporting and driving wheels and a moving carrying-belt and receptacle traveling thereon, in combination with means of accelerating the speed of said parts, and a spring for effecting a return movement, substantially as set forth.

3. In a cash or parcel carrying apparatus, two or more supporting and driving wheels upholding and giving a traveling motion to an endless carrying-belt and a suitable receptacle carried thereon, in combination with a band-belt or equivalent device for actuating the apparatus, when desired, at a speed and to a distance beyond that of the actuating device, a spring serving to return the receptacle when desired, and a suitable catch to prevent its premature return, substantially as set forth.

4. In a carrying apparatus, a carrying-belt mounted on a driving-wheel and on one or more supporting-wheels, in combination with an accelerating-spring secured at one end to a stationary casing, which incloses it, and at the other end to a part of the driving-wheel, for the purpose set forth.

5. The driving-wheel A, supporting-wheel H, and carrying-belt C, in combination with the multiplying-wheel E, pulley F, and hand-belt G, substantially as set forth.

299,333. WATER-CLOSET ATTACHMENT. JAMES W. BURKETT, Brooklyn, N. Y. Filed Jan. 14, 1884. (No model.)

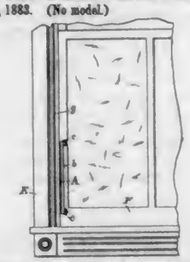


Claim.—1. In a water-closet, a toggle-lever having vertically-moving connecting-link, and the outer ends of its arms pivoted to and supported, respectively, by the exit-valve and the water-supply-operating lever, as set forth.

2. In a water-closet, the pull-handle D, push-rod J, pivoted bent lever H, and suitable connecting mechanism, in combination with a valve-controlling cord fixed at one end and adapted to be drawn downward by the thrust of said push-rod, substantially as described.

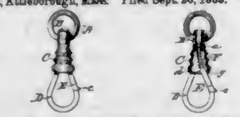
3. In a water-closet, the combination of exit-valve E, provided with suitable overflow, the toggle-levers G G', and connecting-link R, interposed between said toggle-levers and the pivoted bent lever H, said lever H also being connected to and operating the water-supply-controlling devices, substantially as shown and described.

299,334. CHUCK. JOHN G. BLOUNT, Boston, Mass., assignor of one-half to Lewis C. Norton, same place. Filed June 23, 1883. (No model.)



Claim.—1. The chuck above described, consisting of the parts A and B, the one adapted to be attached to and form a part of the lathe-spindle and the other to carry the work or tool, the two being held together by means of one or more friction-clamps, each provided with suitable means of adjustment, all substantially as and for the purposes set forth.

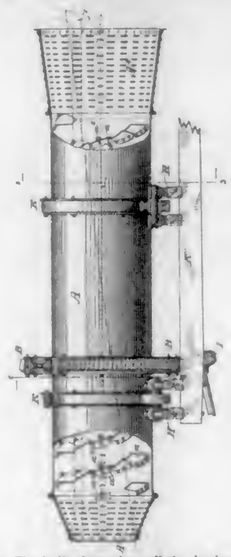
2. In a chuck, the combination of the piece A, forming a part of the lathe-spindle, and the piece B, adapted to hold the work or tool with a suitable clamp and one or more set-screws, the said pieces abutting against each other, and the said clamp and set-screws serving to hold said pieces together and regulate the friction between said abutting surfaces, all substantially as described.



3. In a chuck, the combination of the piece A, forming a part of the lathe-spindle, and the piece B, adapted to hold the work or tool, with a suitable clamp and one or more set-screws, the said pieces being suitably connected, as described, and free to rotate independently of each other, and the said clamp and set-screws serving to regulate the friction between said pieces, all as set forth.

299,335. SASH-HOLDER. GILBERT C. BOLGIANO, Baltimore, Md. Filed Sept. 22, 1883. (No model.)

Claim.—A sash-holder consisting of a vertical bar pivoted to the window-case, and provided with two rollers—one above and one below the pivot—the said rollers turning upon axes at right angles with the front side of the bar, whereby the rollers may bear against the front face of the sash, as set forth.



299,336. SWIVEL-HOOK FOR ORNAMENTAL CHAINS. DANIEL F. BRIGGS, Attleborough, Mass. Filed Sept. 20, 1883. (No model.)

Claim.—1. In a swivel-hook for ornamental chains, the combination of the barrel, the swivel-ring, and the fixed hook, the end of which serves to form a stop for a spring-bolt, with the spring and bolt provided with a safety-stop adapted to prevent the loss of the bolt in case of the accidental bending of the hook, substantially as described.

2. In a swivel-hook for ornamental chains, the combination of the barrel C, provided with the lip *d*, swivel-ring A, and fixed hook D, with the spring F and bolt E, provided with the shoulder *d*, adapted to form a safety-stop, substantially as described.

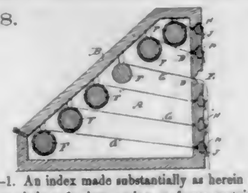
299,337. APPARATUS FOR WASHING PHOSPHATE ROCK, ORES, &c. FRED BROTHERHOOD, Charleston, S. C. Filed Jan. 23, 1884. (No model.)

Claim.—1. The inclined rotating cylinder having the inwardly-flaring perforated lower section, the outwardly-flaring perforated upper section, and spirally-arranged rib-sections, substantially as and for the purpose hereinbefore set forth.

2. The combination of the inclined rotating washing-cylinder imperforate for the greater portion of its length, and having the rib-sections, the perforated outwardly-flaring outer section of the cylinder, and the chute by which refuse material passing through the perforations of said outer section is conveyed away beneath the imperforate portion of the cylinder and toward its lower end, substantially as and for the purpose hereinbefore set forth.

3. The combination of the cylinder, the ring C', having the peripheral edge-flange *c'*, the ring-gear constructed independently of said ring, and the securing bolts and nuts by which the ring and ring-gear are detachably connected with each other, and these parts secured to the cylinder, substantially as and for the purpose hereinbefore set forth.

4. The combination of the cylinder, the ring F, the flanged ring-wheel, and the bolts and nuts by which it is secured in place, substantially as and for the purpose hereinbefore set forth.

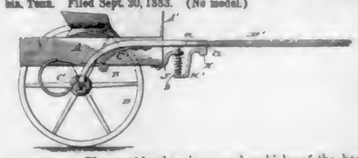


5. The combination of the cylinder, the ring C', secured thereto, and having inner and outer flanges, *b' c*, and the peripheral flange *c'*, the ring-gear, and the securing bolts and nuts by which it is detachably secured about the ring and against its peripheral flange, substantially as and for the purpose hereinbefore set forth.

6. The combination of the cylinder, the band C, the ring C', bolted to the cylinder with the band, and having the inner and outer flanges, *b' c*, and the peripheral flange *c'*, the ring-gear, and its securing bolts and nuts, substantially as and for the purpose hereinbefore set forth.

7. The combination of the cylinder, the ring F, secured thereto, and having the shouldered flange G, and shorter flange *g* upon its opposite edges, the flanged ring-wheel, and the securing bolts and nuts by which the ring-wheel is secured in place, substantially as and for the purpose hereinbefore set forth.

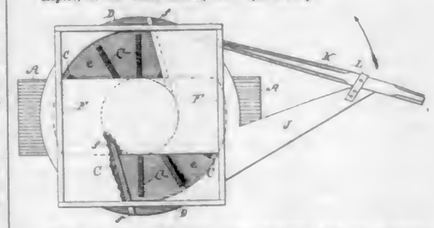
8. The combination of the cylinder, the band E, the ring F, bolted to the cylinder with the band, and formed with the cross-ribs *n*, the shouldered flange G, and the shorter flange *g*, the flanged ring-wheel, and the bolts and nuts by which the ring-wheel is secured in place, substantially as and for the purpose hereinbefore set forth.



299,338. INDEX. THOMAS C. BROWN, Norborne, Mo. Filed Aug. 29, 1883. (No model.)

Claim.—1. An index made substantially as herein shown and described, and consisting of a box, casing, or frame containing a series of spring-rollers to which the index-sheets are fastened and on which they are wound, as set forth.

2. In an index, the combination, with a box having its front slotted and grooved longitudinally, of spring-rollers journaled in the said box, index-sheets secured to the said rollers and passing through the slots, and slats secured on the outer ends of the sheets, substantially as herein shown and described.



299,339. TWO-WHEELED VEHICLE. WILLIAM M. BUCHNAN, Columbia, Tenn. Filed Sept. 20, 1883. (No model.)

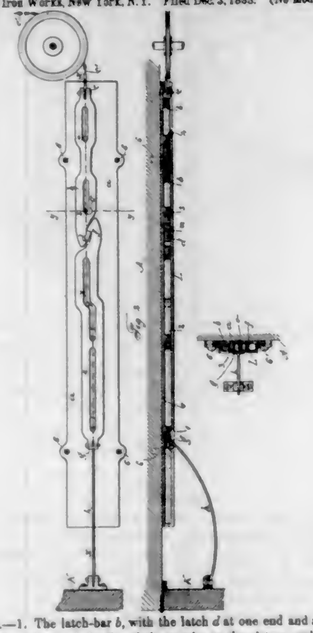
Claim.—1. The combination, in a road-vehicle, of the body A, mounted on a transverse bar, B, forward of the axle C, to which the thills are rigidly attached, and the springs C C', to which the ends of the cross-bar are pivotally attached, substantially as and for the purposes specified.

2. The combination, in a road-wagon, of the body A, mounted on a transverse bar, B, the axle C, and thills D', the springs C' C, goose-necks J, the springs S, and the pins *a*, and supporting angle-irons H', all arranged substantially as specified.

299,340. GRINDING-MILL. CHARLES CAMERON BURNER, Traveller's Repose, W. Va. Filed Mar. 23, 1884. (No model.)

Claim.—1. The combination, with a stationary hub and grinding-surfaces projecting beyond the hub and supported thereon, of a wheel journaled to revolve on said hub, cogs loosely fitted in said wheel, and means, substantially as described, for raising and lowering the cogs, for the purpose specified.

2. The combination, with the stationary hub B and the spiral flanges *a*, fixed thereon, of the radially-slotted wheel D and the cogs C, fitted to slide in said slots, and notched to ride upon the flanges *a*, as and for the purpose specified.



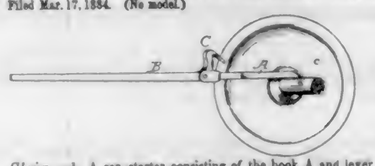
3. The combination, with the stationary hub B, the slotted wheel D, fitted to revolve thereon, cogs C, loosely fitted in said slots, and means, substantially as described, for raising and lowering the cogs, of the radial teeth *d*, fixed upon the hub B, substantially as shown and described.

4. The combination, with a slotted wheel, cogs fitted therein, and means, substantially as described, for raising and lowering said cogs, of a series of teeth gradually decreasing in height, radially fixed relatively to the said cogged wheel, as and for the purpose specified.

5. The combination, with the stationary hub B, the slotted wheel D, the cogs C, loosely fitted therein, means for raising or falling said cogs, and means for opposing them with a stationary grinding device, of the hopper F, having two inlets, *e*, to the mill, said hopper resting on the wheel D, and provided with the scraping-edges *f*, as and for the purpose specified.

6. The combination, with the slotted wheel D, of the cogs C, fitted therein, and means, substantially as described, for operating the same, the walls of said slots being recessed, as and for the purpose specified.

299,341. ATTACHMENT FOR OPERATING CISTERN-VALVES FOR WATER-CLOSETS. DANIEL BURROWS, Brooklyn, assignor to the J. L. Mott Iron Works, New York, N.Y. Filed Dec. 3, 1883. (No model.)



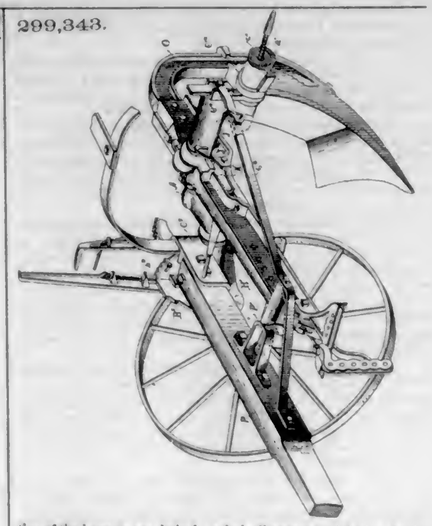
Claim.—1. The latch-bar *b*, with the latch *d* at one end and a connection at the other end for the chain or wire to the cistern-valve, in combination with the slide-bar *e*, latch *f*, and link A, or connection to the door or moving device, for the purposes and substantially as set forth.

2. The slotted latch-bar *b*, latch *d*, plate *a*, and studs 3 and 4, in combination with the slide-bar *e*, slotted longitudinally and zigzag, and the studs 1 and 2 on the plate *a*, and the cover or case L, substantially as set forth.

3. The latch-bar *b*, slotted and having the end of the slot widened at *o*, in combination with the plate *a*, studs 3 and 4, the slide-bar *e*, with the latch *f*, the zigzag or offset at the slot in said bar *e*, and the studs 1 and 2, substantially as set forth.

299,342. CAR-STARTER. WALLER JAMES CALDWELL, Rives, Tenn. Filed Mar. 17, 1884. (No model.)

Claim.—1. A car-starter consisting of the hook A and lever B, having a long arm, as shown, and a short arm, C, extending at right angles therefrom, and having its end curved, as shown.



2. The combination, with the attaching-hook A, of the lever B, having a long arm, and having a short arm, C, extending at right angles therefrom, and having its end provided with a V-cut, whereby it is enabled to straddle the flange of a car-wheel, substantially as set forth.

299,343. SULKY-PLOW. WILLIAM L. CASADAY, South Bend, Ind., assignor of one-half to the South Bend Iron Works, same place. Filed Feb. 12, 1884. (No model.)

Claim.—1. In a sulky-plow, the combination, with the supporting-wheels, of a crank having a jointed plow-beam journaled thereon, and devices for detachably locking the crank to one of the supporting-wheels for elevating the plow by the draft of the team, substantially as set forth.

2. In a sulky-plow, the combination, with the supporting-wheels and tongue, of a crank-axle, and a jointed plow-beam journaled at its jointed portion on the crank-axle, means for securing the forward section of the beam to any desired vertical adjustment, and devices for detachably locking the crank to one of the supporting-wheels, substantially as set forth.

299,343.

3. In a sulky-plow, the combination, with the supporting-wheels, a crank-axle, one end of which is journaled in a sleeve, and a tongue secured to said sleeve, of a hinged plow-beam constructed to be locked to form a rigid beam, and devices for locking the crank-axle to one of the supporting-wheels for raising the plow, substantially as set forth.

4. In a sulky-plow, the combination, with a crank-axle, a plow-beam journaled on the crank-axle, and supporting-wheels, one of which is provided with an annular series of pockets or recesses, of a sliding dog supported in the hollow spindle of the crank-axle, and devices for moving the dog into and out of engagement with the pockets or recesses on the supporting-wheel, substantially as set forth.

5. The combination, with a cranked axle supported on wheels and a jointed plow-beam journaled on the axle, of devices for rigidly locking the two parts of the beam together, and devices for locking the axle to one of the wheels, substantially as set forth.

6. The combination, with a cranked axle, wheels supporting the axle, a jointed plow-beam journaled to the said axle, and devices for locking the axle to one of the wheels, of a device for locking the two parts of the jointed beam, and a lever for simultaneously unlocking the two parts of the beam and locking the axle to one of the ground-wheels.

7. The combination, with a cranked axle, a jointed plow-beam journaled on said axle, wheels supporting the axle, and devices for locking one of the wheels to the axle, of a sliding tongue for locking the two parts of the jointed beam, a spring-actuated dog indirectly connected to said tongue, and a lever for simultaneously moving the tongue and dog.

8. The combination, with a cranked axle having spindles formed on the opposite ends thereof, sleeves in which the said spindles rest, and wheel-spindles connected to the sleeves, of a sector secured to the axle-spindle on one side of the machine, and a hand-lever connected to the sleeve on the same side of the machine and provided with a dog for engaging the sector, and a hand-lever connected to the axle-spindle on the opposite side of the machine, and provided with a dog for engaging a sector secured to the sleeve on the same side of the machine.

9. The combination, with a cranked axle supported in sleeves and wheel-spindles connected to the sleeves and forming cranks, of a jointed plow-beam, tongue for locking the two parts of the beam, a sliding dog for locking the axle to one of the wheels, and mechanism connecting the tongue and dog, whereby they are operated simultaneously, substantially as set forth.

10. The combination, with the cranked axle provided with the spring-actuated dog, the wheels, one of which is provided with a recessed plate, and a jointed plow-beam journaled to the axle, of a tongue for locking the two parts of the jointed beam, and provided with a plate having a cam-slot formed therein, a bell-crank lever, one end of which is connected to the dog, while the opposite end rests within the cam-slot, and a lever for operating the tongue and dog simultaneously.

11. The combination, with the cranked axle and spring-actuated sliding dog seated within the axle, wheels, one of which is provided with a recessed ring or plate, and a jointed plow-beam journaled on the axle,

of a spring-actuated sliding tongue for locking the two parts of the beam, and intermediate devices connecting the dog and tongue, whereby both are operated simultaneously.

12. The combination, with a cranked axle and supporting-wheels, of a jointed plow-beam made up in sections and embracing the axle at the joint, the said sections being provided with lips or projections for holding the two portions of the beam in the same plane.

13. The combination, with a cranked axle and supporting-wheels, of a jointed plow-beam consisting, essentially, of two rear sections secured together and embracing the axle, and two front sections secured together and embracing the rear section, one or more of the said sections being provided with projections for holding the parts of the beam in the same plane, substantially as set forth.

14. The combination, with a cranked axle and supporting-wheels, of a jointed plow-beam consisting, essentially, of two rear sections secured together, each of which is provided with a semicircular bearing for embracing the axle, and a rearward extension and two front sections secured together and provided with bearings for embracing the bearings of the rear sections, one or more of the said sections being provided with lips for holding the two parts of the beam in the same plane, and a plow-standard secured between the rearward extensions of the rear sections, substantially as set forth.

15. The combination, with a crank-axle having spindles on opposite ends, a spring-actuated dog seated in one of the said spindles, devices for operating the dog, and a spindle-sleeve having a wheel-spindle formed integral therewith, of a sector secured to the axle-spindle, a hand-lever secured to the sleeve and provided with a spring-actuated dog, and a land-wheel provided with a recessed ring, with which the spring-actuated dog engages.

16. The combination, with an axle having spindles formed on opposite ends thereof, of a sleeve rigidly secured to the draft-tongue, a wheel-spindle pivotally secured to the sleeve, and a lever for moving the spindle horizontally.

17. The combination, with an axle having a spindle on one end thereof, of a sleeve, C, rigidly secured to the draft-tongue and provided with a sector, a lever, B^4, loosely secured to the spindle, and provided with a dog for engaging the sector, and a plate, B^3, rigidly secured to the spindle and connected to the lever B^4.

18. The combination, with an axle having a spindle on one end thereof, of the sleeve C, rigidly secured to the draft-tongue and supporting said spindle, the levers B^4 and B^3, and the sector for engaging the dog on the lever B^4, all of the above parts constructed as described.

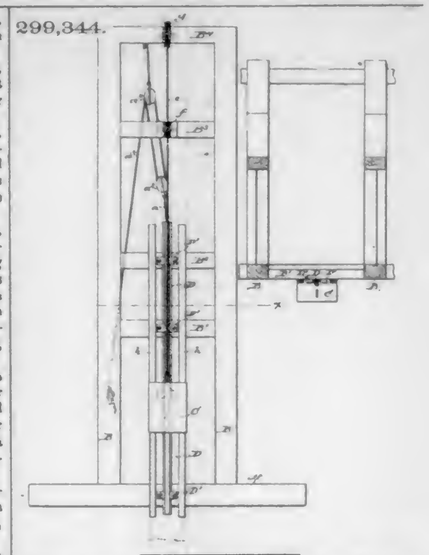
19. The combination, with the axle having spindles on opposite ends, of the sleeve C, rigidly secured to the draft-tongue and supporting one end of the axle, the pivoted block secured to the under side of the sleeve, devices for turning the block, and a wheel-spindle secured to the block, substantially as set forth.

20. The combination, with the sleeve C, supporting one end of the axle, and provided with a two-part sector, one part of which is adjustable on the other, of a hand-lever rigidly secured to the axle, and provided with a dog for engaging the two-part sector.

21. The combination, with the sleeve C, supporting one end of the axle, and provided with a two-part sector, one part of which is provided with ordinary pinion-teeth and adjustably secured to the other, which is provided with ratchet-teeth, of the hand-lever rigidly secured to the axle, and provided with a dog for engaging the sector, substantially as set forth.

22. The combination, with a sulky-frame having a tongue, a laterally-projecting bracket secured to the tongue, and a plow-beam situated under the bracket, of a sleeve loosely journaled to the bracket, and provided with an extensible arm, the lower end of which is loosely secured to the front end of the beam, substantially as set forth.

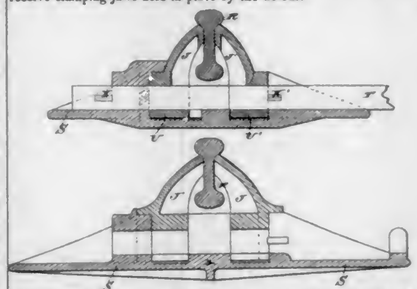
23. The combination, with a plow-standard provided at its lower end with a transverse slot, of a plow provided on its rear face with a block, R', the arm R^3, bolt r^3, for clamping the standard between the arm and block, and a bolt for securing the lower end of the standard to the plow, substantially as set forth.



24. In a sulky-plow, the combination, with the supporting-wheels, of a crank-axle journaled at its opposite ends in sleeves connected with short axles, on which the supporting-wheels are mounted, a jointed plow-beam journaled on said crank-axle, said jointed beam being adapted to be locked together and form a rigid beam, and devices for detachably locking the crank-axle to one of the supporting-wheels, substantially as set forth.

299,344. PILE-DRIVER. GEORGE H. CAVANAGH, Boston, Mass. Filed Jan. 23, 1884. (No model.)

Brief.—A pile-driver provided with a vertically-adjustable track running in guides to guide the hammer below the level of the pile-driving machine.



Claim.—In an apparatus for driving piles or plank, a frame-work, track guides or chairs on the outer side of said frame, a vertically-adjustable track placed in said guides or chairs, and means to move and retain said track in proper position, combined with a hammer arranged to slide upon said track, substantially as described.

299,344.

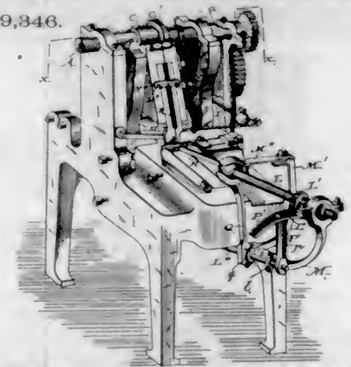
299,345. RAILWAY SLEEPER AND CHAIR COMBINED. JOSEPH CRATER, Seetarampore, Burdwan, Bengal, India. Filed Mar. 24, 1884. (No model.) Patented in India Dec. 8, 1883, No. 203; in England Jan. 18, 1884, No. 1,722; in France Feb. 1, 1884, and in Germany Feb. 7, 1884.

Brief.—Railway-sleepers consisting of recessed chair-plates which receive clamping-jaws held in place by the tie-bar.

Claim.—A combined railway sleeper and chair, consisting of a sleeper in recesses of which jaws holding the rail are fixed by a tie-bar passed through them and secured by keys, substantially as herein described.

299,346. TACK-MACHINE. HARVEY B. CHESS, Pittsburg, Pa. Filed Nov. 8, 1883. (Model.)

Claim.—1. In a tack and nail machine, the shaft A, having a prolongation, *a*, and spherical wrist-pin B, in combination with the pitman H and heading-lever G, substantially as and for the purpose set forth.



2. In a tack-machine, the shaft A, having an extension, *a*, and spherical wrist-pin B, and provided with cutter-cams C C', of unequal width, and a haul-off cam, C'', cast solid with the said shaft, in combination with the cutter-jaws, the leader D, and logy D', and the spring-lever V, all constructed to operate substantially as and for the purpose herein set forth.

3. The rear adjusting-screws, E, threaded at the point *s* in the base of the arch, in combination with the cutter-jaws and cutters, substantially as and for the purpose set forth.

4. The moving die F and gripping-lever F', in combination with the L-shaped piece F''' and reversed wedge-like plate F'''' and set-screw *f'''*, all constructed to operate substantially as and for the purpose set forth.

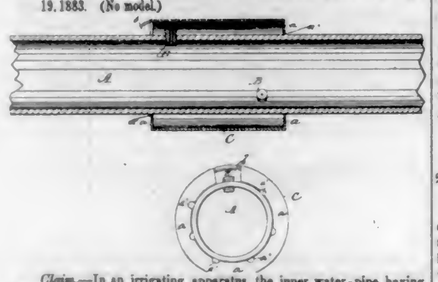
5. The bearer I and the herein-described means for moving the bearer in or out, in combination with the stop K and haul-off spring-lever V, substantially as and for the purpose set forth.

299,346.

6. The bearer I and stem J, in combination with the adjustable clamp I' and leader-jaw, all constructed to operate substantially as and for the purpose set forth.

7. The feeder-barrel L, provided with the pinion L' and the rock-shaft L''', in combination with the arc-rack L'', the arc P, the arm P', and spring-latch *p*, all constructed to operate substantially as and for the purpose set forth.

8. The rock-shaft L''', having bearings *l l*, attached to the rest M, the arm P', provided with the spring-latch *p*, the arc-rack L'', pinion L', and the arc P, in combination with the feeder-barrel L and barrel-rest M, all constructed to operate substantially as and for the purpose set forth.



9. The barrel-rest M, provided with the slots *m* and screws *n*, and adjusting-screw *l'*, in combination with the feeder-barrel L, provided with the pinion L', the rock-shaft L''', carrying the arm P', the arc P, and arc-rack L'', the arm M', and the barrel-spring M'', all constructed to operate substantially as and for the purpose set forth.

10. The rock-shaft L''', provided with the crank or lever *l''* on its end, and provided with a spherical wrist, in combination with the pitman N and counter-shaft N', substantially as and for the purpose described.

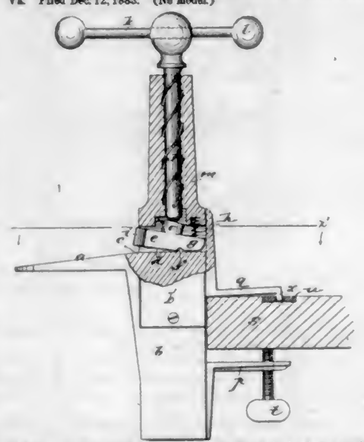
11. The rock-shaft L''', provided with the cam *q*, arm P', arc P, and arc-rack L'', in combination with the lifting device Q and feeder-barrel L, provided with the pinion L', substantially as and for the purpose described.

12. The nose-piece R, provided with the perforated shank *r*, in combination with the feeder-barrel L, provided with the stud *r'*, and ball-ferrule S, provided with a recess to receive the shank and the screw *r''*, substantially as herein described, and for the purpose set forth.

299,347. IRRIGATING APPARATUS. WILLIAM R. CHISHOLM, Laredo, Tex., assignor of one-half to Albert L. McLane, same place. Filed Sept. 19, 1883. (No model.)

Claim.—In an irrigating apparatus, the inner water-pipe having the nozzles projecting from the inner and outer surfaces of said pipe, in combination with the outer pipe or casing inclosing the outer ends of the nozzles, said outer pipe or casing having water passages or apertures in its ends, substantially as shown and described, and for the purpose set forth.

299,348. METHOD OF MAKING ROTARY CUTTERS. DUANE H. CHURCH, Waltham, Mass. Filed Dec. 29, 1883. (No model.)



Claim.—1. The improved method of making rotary cutters herein described, the same consisting in slotting a disk to form the front edges of the cutting-teeth, then slotting the disk at the rear portions of the teeth, and then bending the rear portions of the teeth inwardly, as set forth.

299,348.

2. The improved rotary cutter, having the transverse slots at *b b*, forming the front surfaces of the teeth, and the slots *c c* at the rear portions of said teeth, whereby the backs of the teeth are enabled to be bent, and thus given the requisite clearance, as set forth.

299,349. SAW-SET. GEORGE ALBERT FRANCIS CLAYTON, Masonville, Va. Filed Dec. 12, 1883. (No model.)

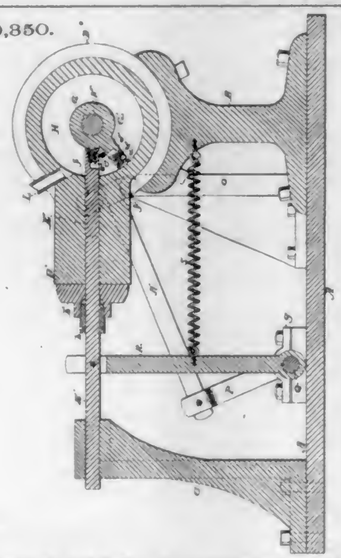
Claim.—1. The stock *b*, having the inclined bed-plate *a*, with its inner upper surface forming an angle, *c*, with the floor of the mortise in said stock, in combination with the pivoted die *e*, press-screw *j*, and the spring *h*, substantially as described.

2. In a saw-set, a press-screw, *j*, having a quick or sharp pitch, and the weighted lever-handle *k l*, combined with a pivoted setting-die, *e*, and the stock *b*, having the inclined bed-plate *a*, with its inner upper surface forming an angle, *c*, with the floor of the mortise in said stock, substantially as and for the purpose set forth.

3. In a saw-set, a setting-die, *e*, pivoted on a rib, *f*, of the floor of the mortise in the stock, and having a press-screw, *j*, and spring *h* for operating it, in combination with the stock *b*, having the inclined bed-plate *a*, with its inner upper surface forming an angle, *c*, with the floor of said mortise, substantially as and for the purpose set forth.

4. The combination, in a saw-set, with the stock *b*, having the inclined bed-plate *a*, with its inner upper surface forming an angle, *c*, with the floor of the mortise in said stock, and also having chambered extension-stock *m*, of the setting-die *e*, spring *h*, press-screw *j*, and weighted lever-handle *k l*, said stock having the attaching-clamp *p q* and screw *t*, substantially as and for the purpose set forth.

299,350. ROTARY ENGINE. IRA LOCHIS CLOUGH, Williamsport, Pa. Filed Dec. 1, 1883. (No model.)



Claim.—1. In a rotary engine, a revolving spool mounted in the center of a stationary cylinder, and carrying a radial wing or piston, and two beveled heads provided each with a steam-port opening into the cylinder, and a groove extending from said port about seven-twelfths of the distance around the outer face of the head, substantially as and for the purpose set forth.

2. In a rotary engine, the combination of a revolving spool carrying a radial wing or piston and two beveled heads, a beveled ring fitting over each of said heads, and a head-plate fitting within each of said rings, and having steam-ports corresponding with those in the spool and cylinder heads, substantially as and for the purpose set forth.

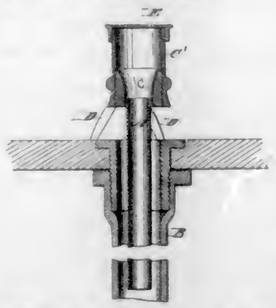
3. In a rotary engine, a stationary cylinder having a radial extension inclosing a horizontally-sliding valve operating in and out of the cylinder at regular intervals, and provided with ports *c'* and chambers *d*, inclosing a packing, *c*, with shoulders *d'*, substantially as and for the purpose set forth.

4. In a rotary engine, a horizontally-sliding valve moved at regular intervals during the revolution of the piston by a cam mounted on the piston-shaft, and operating a rod supported between friction-rollers and

299,350.

connecting with a rock-shaft carrying an arm connecting with the valve-stem, substantially as and for the purpose set forth.

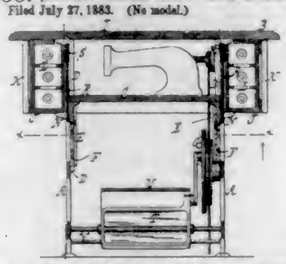
5. In a rotary engine, the combination of the cam M on shaft F, cam-rod N, rock-arm P, rock-shaft Q, connecting with the valve-stem E', and spring S, connecting with the cylinder-support, substantially as described and shown.



6. In a rotary engine, the combination, with the stationary cylinder and revolving spool mounted therein, of a steam-pipe branching and entering the opposite ends of said cylinder, and terminating in head-plates located next to the spool-heads and covering the grooved parts therein, substantially as and for the purpose set forth.

7. In the rotary engine described, the combination of the beveled packing-rings, head-plates, and cylinder-heads, held together and rendered adjustable by means of set-screws, substantially as described.

299,351. COMPOUND FOR CLEANING PAINT. ANTHONY SANDBERT CLOFF, Cincinnati, Ohio. Filed Nov. 7, 1883. (No specimens.)

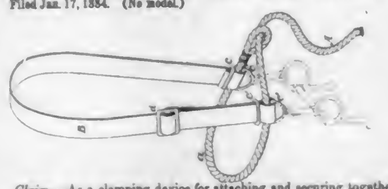


Claim.—A compound for cleaning painted surfaces of wood, iron, &c., consisting of lime, borax, sal-soda, sapolio, Georgia clay, whiting, ammonia, oil of vitriol, and water, substantially in and about the proportions herein described.

299,352. DEVICE FOR THAWING OUT SINK-SPOUTS. JOHN G. COBURN, South Carthage, assignor of one-half to James Ross Kittredge, Carthage, Me. Filed July 7, 1883. (No model.)

Claim.—The combination, with the hot-water pipe, end-threaded on the outside, of the cup C and the internally-threaded case C', having legs D, the cup screwing on the pipe, and the case on the cup, as shown and described.

299,353. SEWING-MACHINE TABLE. DAVID H. COLES, New York, N. Y. Filed July 27, 1883. (No model.)



Claim.—1. The combination, substantially as hereinbefore set forth, of the drop-platform supporting the sewing-machine, the pendent slides of the platform arranged in pairs at its opposite ends, the fly-wheel and its supporting-shaft, the arched web connecting each pair of slides, and the sewing-machine stand comprising the legs, having vertical ways for the platform-slides, substantially as described.

2. A sewing-machine stand consisting of the drop-platform C, carrying the sewing-machine, the legs A, having lateral lugs N, the table B, having an opening to receive the drop-platform, the drawer-cases L, arranged on the outer sides of the legs and resting on and secured to the lateral lugs, the stationary back board secured to the rear ends of the drawer-cases, and the doors K, hinged to the drawer-cases, substantially as and for the purpose described.

3. The combination, with a sewing-machine table, of the drop-platform, the cams, the ropes connecting the cams with the platform, the guide-pulleys for the ropes, the cam-shaft, and the coiled springs connected to the cam-shaft to counterbalance the platform, substantially as described.

4. The combination, with a sewing-machine stand and the treadle thereof, of a cover hinged at its rear to a part of the machine-stand, substantially as described, to swing forward over and backward from the treadle, substantially as and for the purpose described.

299,354. HARNESS-FITTING. JAMES C. COVERT, West Troy, N. Y. Filed Jan. 17, 1884. (No model.)

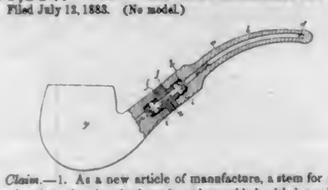
Claim.—As a clamping device for attaching and securing together flexible bands or straps composing halters, bridles, and other parts of a harness, the clamp-loops *c c'*, and in combination therewith the adjusting-buckle *d* and pendent rings *e e'*, respectively, for the adjustment and connection of said parts, all substantially as herein shown and described.

299,355. SPITTOON. PHILIP H. DEM, Canal Dover, Ohio. Filed Apr. 14, 1884. (No model.)

Claim.—1. A cuspidor provided with a discharge-opening, and a slotted tube projected upward around said opening and closed at its upper end, substantially as set forth.

2. The herein-described cuspidor having a slotted tube projected upward around its discharge-opening, and a tube slipped over and removable from said slotted tube, and having its lower end held above the lower end of said tube, substantially as set forth.

3. The combination, with the receptacle having discharge-opening, and provided with a slotted tube projected up around said opening, of the grating supported on said receptacle, and provided with a depending tube fitting over and having its lower end arranged above the base of the slotted tube, substantially as set forth.



4. The combination of the receptacle A, slotted tube projected upward around the discharge-opening thereof, and a tube supported on the receptacle and depending over and having its end arranged above the base of the slotted tube, substantially as set forth.

299,356. CARPET-FASTENER. JAMES DENTON, Amsterdam, N. Y. Filed Mar. 19, 1884. (No model.)

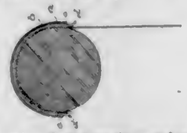
Claim.—A carpet-fastener consisting of a metal plate having one end adapted to pass under the base-board, the opposite end provided with downward-projecting spurs or prongs, and the center provided with an upward-projecting hook, substantially as described and shown.

299,357. TOBACCO-PIPE. MYER DITTENHOEFER, New York, N. Y. Filed July 12, 1883. (No model.)

Claim.—1. As a new article of manufacture, a stem for pipes, having a chamber closed at both ends and provided with lateral openings, and having its lower end cut away or grooved exteriorly to form the flue or passage to the pipe, as and for the purpose set forth.

2. The combination, with a pipe, of a stem provided with a closed screw-threaded end, having side openings communicating by a side flue or passage with the central chamber of the pipe, as set forth.

3. The combination, with the stem *a*, provided with side openings, *d*, of the union *f*, having a central chamber opening at the side, and having its engaging ends cut away or grooved to form the connecting flue or passage with the smoke-aperture in the pipe, as set forth.

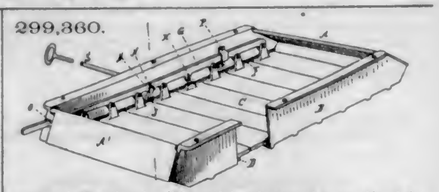


299,358. ENVELOPE. JAMES F. DODD, Delaware, Ohio, assignor to Otis F. Presbrey and Frank M. Green, both of Washington, D. C. Filed Apr. 4, 1883. (No model.)

Claim.—A combined letter-sheet and envelope, consisting of a rectangular body portion capable of being folded upon itself and having gum upon its outer side, a narrow perforated end flap adapted to be folded upon the back of the body, and side flaps adapted to be folded upon the perforated end flap and body of the sheet, whereby the envelope is securely sealed, as set forth.

299,359. CURTAIN-FIXTURE. JOHN C. DOTY, Mount Vernon, Ohio, assignor to Frank L. Bear, Walter L. Vance, and Theodore Seymour, all of same place. Filed Jan. 12, 1884. (No model.)

Brief.—The interior of the metal clip is lined with felt or rubber to act as a cushion for the fabric over which it is placed and prevent any abrasion thereof. It has also a frictional effect upon the curtain, and in no case can it slip from beneath the clip.



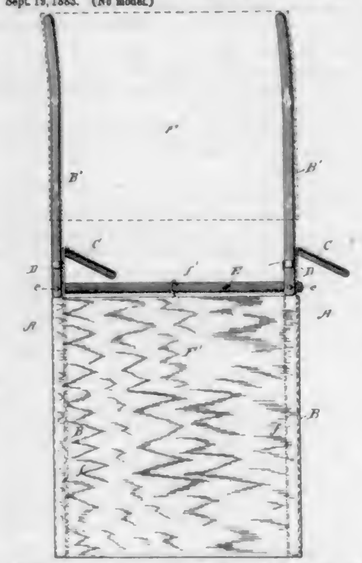
Claim.—1. A spring-clip for securing curtains to their rollers, provided with a lining, substantially as described, and for the purpose set forth.

2. The described fastening for curtains, consisting of the clip *a* and the lining *b*, having the extension *d*, substantially as described, and for the purpose set forth.

299,360. ASH-PAN FOR LOCOMOTIVES. SAMUEL H. EDGERLY, Jackson, Mich. Filed Mar. 14, 1884. (No model.)

Claim.—1. A locomotive ash-pan consisting of a frame, a series of slats hung on pintles journaled in the lower edges of said frame, and each having at one end a perpendicular arm carrying a pin near the

299,360.



upper end thereof, and a sliding rod loosely secured to one side of the frame, and having therein slots open at their lower ends, and adapted to engage with said pins, substantially as shown and described.

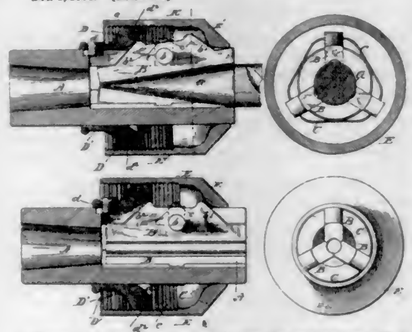
2. In a locomotive ash-pan, the combination, with a supporting-frame, of the bottom slat, and the pintles arranged in line with the longitudinal central line of the slat, said slat having a counter-weight at one side of the central line of the slat for restoring the latter to its normal position to make a close joint with the adjoining slat, substantially as described.

3. The combination, with the frame B, having dampers A A' secured thereto, of the slats C, having arms F and pins I, rod G, adapted to slide in slot O, and keeper P, and slots H, open at their lower ends, substantially as shown and described.

4. In combination with the sliding rod G, connected with the tilting slats C, the rock-shaft L, having on one end thereof the lever K and on the other end the arm J, adapted to engage with a slot, N, in said rod G, substantially as shown and described.

299,361. HEAD-REST. THADDEUS B. EITER, Baltimore, Md. Filed Sept. 19, 1883. (No model.)

Claim.—1. The combination, with a frame whose sides each consist of upper and lower folding sections, of arms for securing the device to the top edge of a seat, stops for supporting the upper sections of the sides, a transverse brace securing the sides together, and flexible covers, substantially as set forth.



2. The combination, with a folding frame whose sides each consist of sections pivoted together and formed with extensions and stops, substantially as described, of a transverse brace pivotally secured to the side sections, and transverse flexible strips or covering connecting said sections, substantially as set forth.

3. The combination of the sides of the folding frame, each consisting of a lower section formed with a rearward extension and a stop, substantially as described, and a top section pivoted to the lower section, a transverse brace pivotally secured to the pivot of the side sections, and transverse flexible strips or coverings connecting the said top and lower sections, substantially as set forth.

4. The combination of the lower side sections, each formed with a rearward extension and a forwardly-projecting stop at its top, the top sections pivotally secured to the lower sections below said stops and en-

gaging the same, as set forth, the transverse brace, a transverse flexible removable strip or covering connecting the top sections, and a corresponding removable strip or covering connecting the lower sections, substantially as set forth.

299,362. CHUCK. AUGUSTUS E. ELLENWOOD, Akron, Ohio, assignor of two-thirds to Lewis Miller and Henry Young, both of same place. Filed Dec. 1, 1883. (No model.)

Claim.—1. In a chuck or tool-holder, the combination, with the mandrel and its clamping jaws or dies, of two sleeves or collars, one mounted and adjustable upon the mandrel, and the other adjustable upon and covering the former and the spaces surrounding the mandrel in which the jaws move.

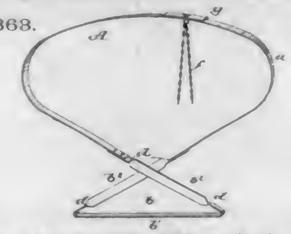
2. The combination, with the mandrel and its jaws or dies, of two sleeves or collars, one mounted and adjustable upon the mandrel and the other adjustable upon and covering the former and operating to adjust the jaws, substantially as described.

3. The combination, with the slotted mandrel, of the radially-moving jaws B, provided with centrally-located guiding-pins *b*, working within grooves in the side walls of the radial slots in the mandrel, substantially as specified.

4. The combination, with the slotted mandrel and the radially-moving jaws provided with guiding-pins working in grooves in the side walls of the radial slots in the mandrel, of the spring or springs in angular form surrounding said mandrel and jaws, and adapted by the inward movement of the jaws to approximate an annular form, substantially as shown and specified.

5. The combination, with the slotted mandrel, of the radially-moving jaws, the spring surrounding said mandrel and jaws, and the two threaded sleeves surrounding said mandrel and jaws, one mounted upon the mandrel and adapted to be adjusted lengthwise thereon, and the other working over and covering and protecting the former, substantially as described.

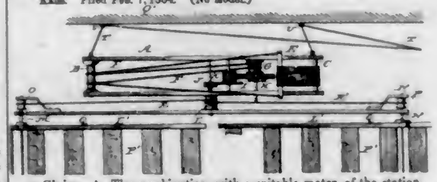
6. The slotted cylindrical mandrel, in combination with the jaws provided with centrally-located guiding-pins and outwardly-converging inclines, and two sleeves, one mounted and adjustable upon the said mandrel and the other adjustable upon and covering the former, for the purpose and substantially as described.



7. The combination, with the smooth cylindrical mandrel provided with jaws, having centrally-located guiding-pins working in grooves in the side walls of the radial slots in the mandrel, and having inclines upon their outer edges, of two moving sleeves, one adjustable lengthwise upon the mandrel and the other adjustable upon the former for adjusting the jaws, substantially as described.

8. The combination, with the mandrel and the clamping-jaws provided with the guiding-pins *b*, located centrally thereof and working in grooves in the side walls of the radial slots in the mandrel, of two sleeves having internal inclines working over and upon the correspondingly-inclined outer edges of said jaws, said sleeves being provided, one with an external and the other with an internal screw-thread, the one working over the other for effecting the adjustment of the jaws, substantially as described.

9. The longitudinally-slotted mandrel and the clamping-jaws working loosely therein, and provided with pins or spurs working in grooves in the side walls of the radial slots in the mandrel, and projecting inclines, in combination with two sleeves or collars, both adjustable upon the mandrel and provided with intermeshing screw-threads, adapting them to be simultaneously moved endwise upon the mandrel, one over the other, for effecting the adjustment of the jaws, substantially as specified.

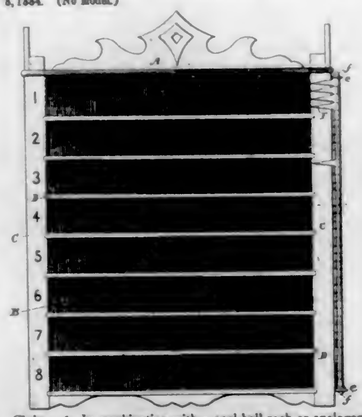


299,363. VEHICLE-SPRING. WILLARD S. EVERETT, Hyde Park, Mass. Filed Jan. 12, 1884. (No model.)

299,363.

Claim.—The spring A, composed of the curved portion *a* and base *b*, in combination with the chains *f* or equivalent means for supporting the load within the interior of the spring part *a*, substantially as described.

299,364. AUTOMATIC FAN. LOGAN WALLACE EVERHART, Parsons, Kans. Filed Feb. 7, 1884. (No model.)

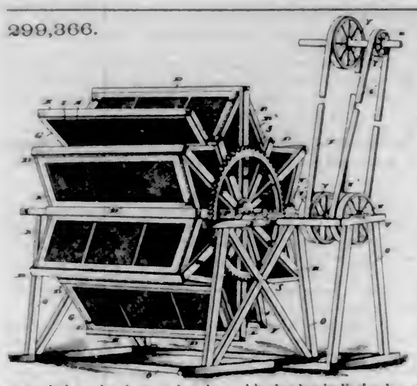


Claim.—1. The combination, with a suitable motor, of the stationary pulley L, rotary shaft J, carrying cross-bar L', rotary brush holders Q, and pulleys O P, supported at the ends of bar L', and the endless bands R R', connecting pulleys O P with the stationary pulley L, substantially as shown and described.

2. The combination of the rotary fans, the train of gears and the rubber spring and cord, and the pulley and drum for winding the cord to put the spring under tension, substantially as shown and described.

3. The combination of the rotary fans, the clock-work for operating the same, and the cord having branches T T, attached to opposite ends of the fan-case, and supports for suspending the same adjustably from a ceiling, substantially as shown and described.

299,365. POOL-RACK. JACOB FELDEL, New York, N. Y. Filed Apr. 8, 1884. (No model.)



Claim.—1. In combination with a pool-ball rack or analogous implement, a series of devices adapted to indicate the marks or forfeiture-scores of the players, substantially as set forth.

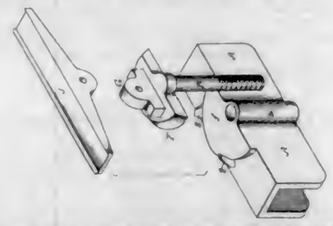
2. In combination with a pool-rack, marking fingers or devices adapted to be held in either one of the two positions in which they may be set against causal displacement, as set forth.

299,366. RAG AND SCRAP DUSTER. THOS. FERRY, Wilmington, Del. Filed Feb. 25, 1884. (No model.)

Claim.—1. A rag and paper scrap duster consisting of the cage or drum having its periphery formed with a series of panels extending alternately inward and outward, each panel having longitudinal rods and a covering of netting, substantially as shown and described.

299,366.

2. A rag and paper scrap dusting drum consisting of a cage having open ends covered with netting, and its periphery formed of alternately inwardly and outwardly extending panels provided with longitudinal rods, and a covering of netting outside of the rods, substantially as and for the purpose described.



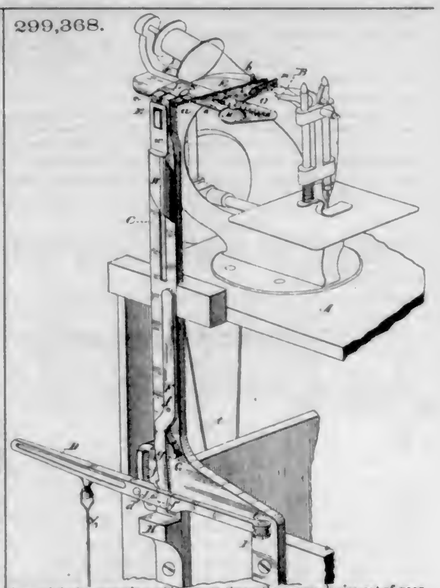
3. A rag and paper scrap dusting drum consisting of a cage having open ends covered with netting, and a periphery formed of alternately inwardly and outwardly extending panels provided with a covering of netting, substantially as shown and described.

4. In a rag and paper scrap dusting machine, a drum or cage having its periphery formed of panels extending alternately forward and inward and forward and outward, and discharge-doors situated in or forming one or more of the forward and outwardly extending panels, substantially as and for the purpose described.

5. In a rag and paper scrap dusting machine, a revolving drum or cage having its periphery formed of alternately forward and inwardly and forward and outwardly extending panels, one or more feed-doors situated in the forward and inwardly extending panels, and one or more discharge-doors situated in the forward and outwardly extending panels, substantially as shown and described.

6. In a rag and paper scrap dusting machine, a drum or cage having its periphery formed of alternately forward and inwardly and forward and outwardly extending panels, one or more discharge-doors situated in or forming one or more of the latter panels, in combination with means for revolving the drum to dust the contained scrap, and means for revolving it at a slower rate of speed to allow the dusted scrap to discharge itself through the discharge-doors, substantially as shown and described.

299,367. COMBINED KING-BOLT AND CIRCLE FOR VEHICLES. NICHOLAS FINK, Edmore, Mich. Filed Mar. 17, 1884. (No model.)



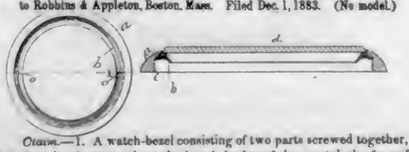
Claim.—The combination of the box A, having a tubular projection, *b*, and bearing *f*, and the king-bolt B, having a segmental head, F, with the guiding and retaining lugs *g*, as set forth.

299,368. SEWING-MACHINE. ALFRED A. FISHER and ALBERT HART, San Francisco, Cal., assignors to the Pacific Tucking and Manufacturing Company, same place. Filed June 26, 1883. (No model.)

Claim.—1. In a sewing-machine, a lever by the operation of which a power device is thrown in and out of gear with said sewing-machine, in combination with an arm held in position by the thread of the sewing-machine, a weight sliding in guides and tripped by the release of said arm upon the breaking of the thread, and a means affected by the falling weight for operating said lever to throw the power device out of gear with the sewing-machine, substantially as herein described.

299,368.

2. In a sewing-machine, a lever by the operation of which a power device is thrown in and out of gear with said sewing-machine, in combination with an arm held in position by the thread of the sewing-machine, a vertically-sliding weight tripped by the release of said arm upon the breaking of the thread, and a swinging ratchet-lever engaging with the power-lever and operated by the falling weight to disengage and release said power-lever to throw the power device out of gear with the sewing-machine, substantially as described.



3. In a sewing-machine, the pivoted lever D, having a pin, *d'*, and connected with the power device, and operating to throw said power device in and out of gear with the sewing-machine, in combination with the standard C, the arm E, pivoted in its top, and having one end extending under the thread of the machine, the sliding weight W in the standard, adapted to be suspended from the other end of said arm, and having a beveled lower end, and the pivoted ratchet-lever F, adapted to receive the weight W upon its upper end and to engage with the pin *d'* of lever D with its lower end, substantially as and for the purpose herein described.

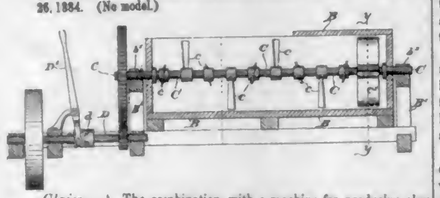
4. In a sewing-machine, the power-lever D and slotted standard C, having a pin, *c*, at its top, in combination with the pivoted arm E, the weight W, having a slotted spring-strip, *w*, whereby it is suspended from pin *c* or arm E at will, and the pivoted ratchet-lever F, all arranged and operating substantially as and for the purpose herein described.

5. In a sewing-machine, the standard C and the power-lever D, having pin *d'*, horizontal pivot I, and vertical pivot *i*, in combination with ratchet-lever F, substantially as and for the purpose herein described.

6. In a sewing-machine, the standard C, having slotted guide *j*, and the power-lever D, having pin *d'*, horizontal pivot I, and vertical pivot *i*, the bolt J, passing through said lever and slotted guide, and having a spring, K, in combination with the ratchet-lever F, having spring G and the stop *g*, substantially as and for the purpose herein described.

299,369. WATCH-CASE BEZEL. EZRA C. FITCH, Newton, assignor to Robbins & Appleton, Boston, Mass. Filed Dec. 1, 1883. (No model.)

Claim.—1. A watch-bezel consisting of two parts screwed together, and clamping between them the beveled edge of the crystal, the face of which is beyond the outer part of the bezel, substantially as described.



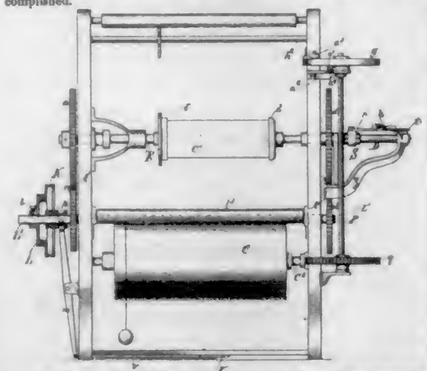
2. A watch-case bezel composed of two metallic parts detachably

connected, one of said parts having a flexible seat adapted to conform to inequalities in the margin of the glass, as set forth.

3. In a watch-case bezel, the outer portion or body, *a*, adapted to be applied to the case, and having a flexible seat for the margin of the glass, combined with a device for pressing and holding the glass against said seat, as set forth.

4. A watch-case bezel composed of the outer portion or body, *a*, internally threaded, and provided with a flexible seat, *a'*, for the margin of the glass, and the inner part or follower threaded to enter the threaded portion *c*, and provided with a shoulder adapted to bear against the inner surface of the glass, the arrangement being such that there is a space between the flexible seat and the shoulder, as set forth.

299,370. PUG-MILL. STEPHEN K. FLETCHER and ROBERT THOMAS, Indianapolis, Ind., assignors to Fletcher & Thomas, same place. Filed Feb. 26, 1884. (No model.)



Claim.—1. The combination, with a machine for producing clay manufactures, of a pug-mill for mixing and pulverizing the clay and delivering it to said machine, said pug-mill consisting, essentially, of a casing, a shaft extending horizontally through said casing, and wings mounted on said shaft, said casing having an orifice at or near one end, through which the clay can be discharged into the machine, and said wings being partly screw-shaped and partly straight in relation to the shaft, and thus adapted to pulverize said clay and force it through said orifice.

2. The combination, with a brick-machine, A, of a horizontal pug-mill, B, arranged to discharge into said brick-machine near the top, being provided with an orifice, *b*, for that purpose, said pug-mill having a horizontal shaft, C, provided with screw-shaped pulverizing and conveying-wings *c* and discharging-wings *c'*, straight in relation to the shaft, but curved in the direction of their own length, all substantially as shown and specified.

3. The combination of the brick-machine A, the pug-mill B, its shaft C, said shaft being provided with wings *c* and *c'*, the counter-shaft D, and water-supply pipe E, said several parts being constructed, arranged, and operating substantially as shown and described, and for the purposes specified.

299,371. CLOTH FOLDING AND MEASURING MACHINE. PHILIP H. FOWLER, Gloucester City, N. J. Filed Aug. 4, 1883. (No model.)

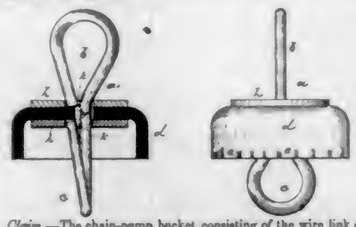
Brief.—A clutch-pulley upon the main driving-shaft can be thrown into and out of operation for stopping the rotation of the winding-shafts when necessary. A lever mechanism is attached to the frame and carries one of the shafts for clamping the folding-board, whereby the clamping and unclamping of said folding-board is easily and expeditiously accomplished.

Claim.—1. The cloth folding and measuring machine comprising frame A' with bracket *z*, shafts D and E with grooved heads *d d'*, adapted for supporting a folding-board, C', when the machine is in operation, the key-seat *y* in shaft D, the gears *a n*, *a' n'*, the key *y'* on gear *a'*, means for sliding the shaft D in and outward and locking it in position, the shaft L', and clutch-pulley, composed of beveled flanged portions K and L, substantially as and for the purpose described.

2. The cloth folding and measuring machine comprising frame A' with bracket *z*, the revolving clamping-shaft E, having a grooved head, *d'*, gearing *a n* for operating said shaft, sliding and revolving clamping-shaft D, having a grooved head, *d*, and a longitudinal groove or key-seat, *y*, wheel *a'*, for operating shaft D, having a key, *y'*, the lever F, with its connecting-collar S, rod *r*, fastening *u*, and arc *t*, and the shaft L', gear *n'*, and pulley K L, substantially as and for the purpose described.

3. In combination with two shafts, D and E, adapted to support a removable board, C', during the operation of the machine, the measuring-roller C, the registering-dial G and its indicator-hand and its operating mechanism, the shaft L', gearing for operating the shafts D and E, and the clutch-pulley contrivance and its adjuncts, comprising the portion K with beveled flange, and the portion L with a beveled flange, and means for engaging and disengaging the portions L and K, substantially as described.

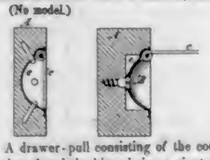
4. In combination with the frame A' and bracket *z* of a cloth-folding machine, the revolving and sliding clamping-shaft D, having a grooved head, the lever F, connected to the shaft D, the mechanism by which the lever is locked in a desired position, the revolving clamping-shaft E, having a grooved head, the gearing for operating the shafts D and E, and the shaft L', substantially as and for the purpose described.



5. The combination of the friction clutch-pulley K L, having beveled surfaces, with shaft L', sliding revolving clamping-shaft D, revolving clamping-shaft E, and gears *a n*, *a' n'*, substantially as and for the purpose described.

6. The combination of the friction clutch-pulley K L, having beveled surfaces, lever *m*, rod *v*, and lever V, with shaft L', revolving and sliding clamping-shaft D, revolving clamping-shaft E, and gearing *a n*, *a' n'*, substantially as and for the purpose described.

299,372. COMPOSITION OF MATTER FOR GIVING A METALLIC SURFACE TO PAPER. JULIUS FRANSECKY, East New York, N. Y. Filed Dec. 10, 1883. (Specimens.)

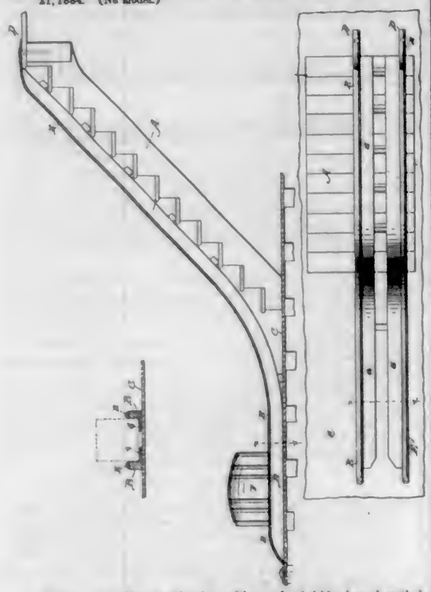


Claim.—The herein-described composition, consisting of argentine, vermilion, silver-bronze, glue, and water, in about the proportions stated.

299,373. PUMP. JOHN J. GARDNER, North Madison, Ind. Filed June 11, 1883. (No model.)

Claim.—The chain-pump bucket consisting of the wire link *a*, having a loop at opposite ends thereof twisted at right angles with relation to each other, the rubber or leather disk thereon between the loops, and the washers on each side of said disk, both washers and disk having central apertures of larger diameter than the link-wire to provide a drip-passage, substantially as specified.

299,374. DRAWER-PULL. OWEN F. GARVEY, Pawtucket, R. I. Filed May 14, 1883. (No model.)

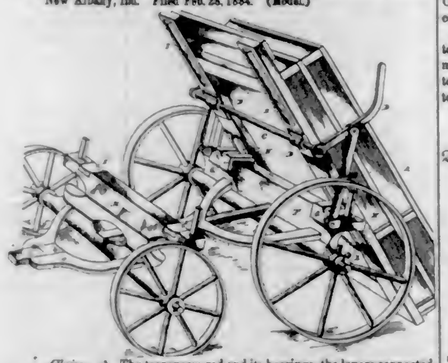


Claim.—1. A drawer-pull consisting of the concave *c*, provided with annular face-plate *d*, and the hinged ring *e*, pivoted to said plate so as to close into the same, substantially as set forth.

2. A drawer-pull consisting of the concave *c*, having suitable securing devices in its interior, and provided with annular face-plate *d*, and the hinged ring *e*, pivoted to said plate so as to close inside of the same, as shown and set forth.

299,375. METHOD OF REDUCING LOBATED GRAIN. LOUIS GATHMANN, Chicago, Ill. Filed Oct. 11, 1883. (No specimens.)

Claim.—The method hereinbefore described, which consists in splitting and dividing lobated grain through the crease and decorticating the half-kernels, then separating the impurities from the half-kernels, then reducing the half-kernels, and thereafter separating the inner bran-film from the product of reduction, whereby a large percentage of pure food substance is produced, substantially as set forth.



299,376. SKIDWAY. JOSHUA L. GIVEN, Philadelphia, Pa. Filed Apr. 21, 1884. (No model.)

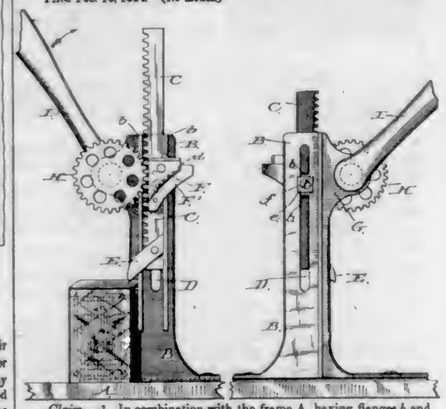
Claim.—1. The combination, with a pair of skids shaped at their lower ends to rest upon a floor parallel therewith, shaped at their upper ends to rest on a flight of stairs parallel therewith, and shaped midway in a curve to which the two ends are tangent, of a pair of shoes secured upon the upper sides of the said skids, conforming to their shape, as shown and described.

2. The combination, with a pair of skids shaped as described, of a pair of bottom strips secured between them near their bottoms at a little distance apart, as and for the purpose specified.

299,377. DUMPING-WAGON. FRANCIS A. GRAFF and LOUIS C. HIPPLE, New Albany, Ind. Filed Feb. 28, 1884. (Model.)

Claim.—1. The transverse rod and its bearings, the levers connected to the ends thereof, and the movable fulcrum pivotally connected and supported, all operating to tilt and replace a body of a wagon or other vehicle for the purpose of dumping the load, as specified.

2. In combination with the dumping devices, the rear V-grooved plates embracing and secured to the rear bolster of the running-gear, and the V-tongued plates secured to the body, the parts adapted to allow a longitudinal guided movement of the said body, and also forming the fulcrum-point of the same, substantially as described.



3. In combination with the dumping devices, the front grooved plates let into the front bolsters of the running-gear, and the convex plates secured to the wagon-body, and adapted to guide the longitudinal movement of the front of the said body before it tilts in dumping, substantially as described.

4. The combination, in a dumping wagon or vehicle, of the levers with their connecting-rod and its bearings, the pivoted fulcrum-rod, the rear grooved and tongued plates, and the forward grooved and convex plates, all operating as and for the purpose specified.

299,378. REMOVING FIBER FROM COTTON-SEED. JOSHUA J. GREEN, Jackson, Miss. Filed Mar. 12, 1884. (No specimens.)

Claim.—The described improvement in the art of removing lint from cotton-seed, consisting in subjecting the seed to the action of dilute sulphuric acid and heat, adding water to the heated mass to complete the carbonizing operation, and subsequently washing the seed free from the acid and burnt lint, all substantially as hereinbefore set forth.

299,379. CAN-OPENER. JEREMIAH GREENWOOD, Fitchburg, Mass. Filed Feb. 16, 1884. (No model.)

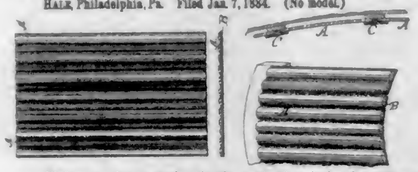
Claim.—1. In combination with the frame A, having flanges *b* and a slot, D, the vertical toothed bar C, provided with the knife F and guard F', and the means herein described for operating the said bar, consisting of the toothed wheel H and lever I, all constructed to operate substantially as and for the purpose herein set forth.

2. In a can-opener, the frame A, provided with a slot, D, and flanges *b*, and having an extension, G, in which is journaled a shaft on which is mounted the toothed wheel H and lever I, in combination with the bar C, constructed as shown, a pin, *d*, knives E or F, and a guard, F', all constructed to operate substantially as and for the purpose set forth.

3. In a can-opener, the knife E, rigidly secured to the side of a toothed bar and set at an angle thereto, the said bar having a vertical movement between flanges formed on an upright frame by means of a toothed wheel, H, mounted as described, and a lever, I, all constructed to operate substantially as herein set forth.

299,380. AUTOMATIC FIRE-EXTINGUISHER. EDWARD W. GRINNELL and FREDERICK GRINNELL, Providence, R. I. Filed Jan. 22, 1883. (No model.)

Claim.—The combination, with the extinguisher-body provided with one or more radial sockets, and the valve or valve-stem provided with a corresponding number of recesses, of one or more pins seated in the said sockets, and having tapered ends to enter the said recesses, the said valve or valve-stem and the pins being held by solder, substantially as described.



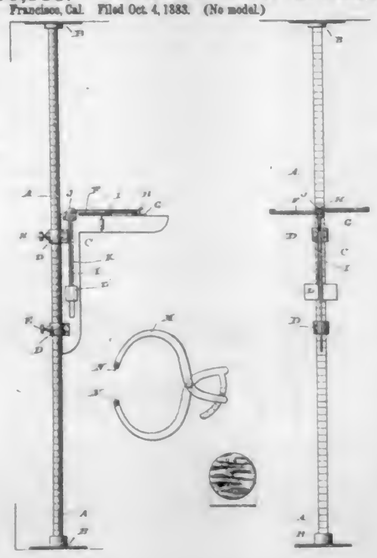
299,381. SAFE. J. ROSS GROVE, York, Pa. Filed Mar. 1, 1884. (No model.)

Claim.—1. The combination, with two metallic parallel plates, each formed with a dovetail recess, of a wedge-bar driven into said recesses to draw said plates together and secure them, substantially as set forth.

2. The combination, with two metallic plates, each formed with a dovetail recess, of a wedge-bar of double dovetail form, the beveled edges of said bar being at a less angle than the inclined walls of the recesses, substantially as set forth.

299,382. FABRIC FOR WALLS OF APARTMENTS. HENRY S. HALE, Philadelphia, Pa. Filed Jan. 7, 1884. (No model.)

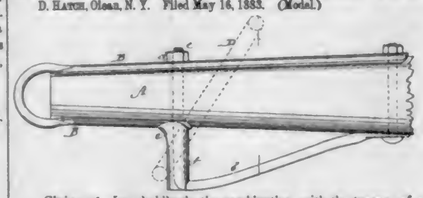
Claim.—1. As a covering for the walls of an inclosed apartment, the herein-described fabric, having narrow strips of wood which are flat upon one side, and having their opposite sides formed in curved or broken lines, in combination with a backing, and secured to the strips and forming a support therefor, substantially as set forth.



2. As a covering for the walls of an inclosed apartment, the herein-described fabric, having narrow wooden slats combined with and supported by a thin sheet of wood, substantially as set forth.

3. As the covering for the walls of an inclosed apartment, the herein-described fabric, having narrow strips of wood combined with and supported by a thin sheet of wood arranged with its grain transverse to the grain of the wooden strips, substantially as set forth.

4. As a covering for the walls of an inclosed apartment, the herein-described fabric, having thin strips of wood combined with and supported by a flexible backing, curved supports, and means for attaching the fabric to the curved supports, substantially as set forth.

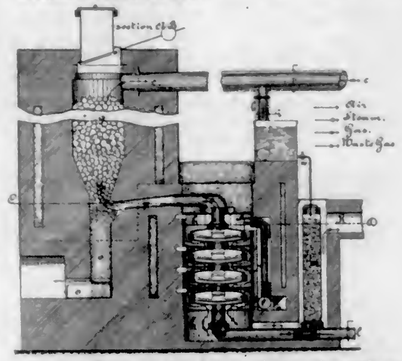


5. As a covering for the walls of an inclosed apartment, the herein-described fabric, having thin strips of wood combined with and supported by a flexible backing, means for attaching the fabric to the walls of the apartment, and a molding covering the joints which unite cut portions of the fabric, substantially as set forth.

299,383. TAILOR'S MEASURING DEVICE. JOHN S. HAMD, San Francisco, Cal. Filed Oct. 4, 1883. (No model.)

Claim.—A tailor's measuring device consisting of a fixed vertical graduated rod, upon which is adjustably secured the try-square C, for the purpose of obtaining vertical measurements, and the lazy-tongs F, pivoted upon said try-square, and provided with a weighted measuring-tape to determine the projection of the point of the lazy-tongs when taking horizontal measurements therewith, substantially as shown, and for the purpose set forth.

299,384. HOLDBACK FOR POLE-IRONS OF WAGONS. WILLIAM D. HATCH, Olean, N. Y. Filed May 16, 1883. (Model.)



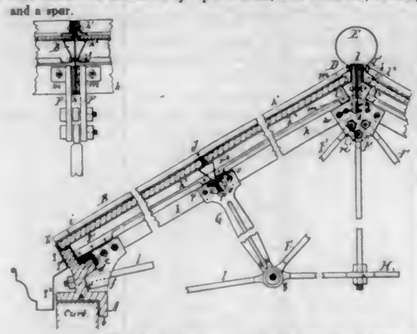
Claim.—1. In a holdback, the combination, with the tongue, of a longitudinally-apertured post or ferrule, *f*, and a holdback-rod, C, inserted through the post and bent to form a brace, substantially as described.

2. A holdback consisting of a brace-rod, C, and a post or ferrule, *f*, having its upper end concaved to abut against the tongue, whereby said post is restrained from rotation when secured in position, substantially as described.

3. A holdback consisting of a bent rod, C, and an apertured post or ferrule, *f*, having a notch at its bottom end straddling said rod, as and for the purpose described.

4. The holdback-rod C, having the brace *b* and bolt end *c* all constructed in one piece, in combination with the pole-iron B and the post or ferrule *f*, formed with the swell *s*, fitting against the pole-iron, the bolt of the holdback passing through the ferrule, and also through the pole-iron, substantially as shown and described.

299,385. PROCESS OF AND APPARATUS FOR PRODUCING HEATING-GAS. HERMANN HAUB, Dortmund, Prussia, Germany. Filed Mar. 1, 1883. (No model.) Patented in Germany Aug. 16, 1879, No. 13,733; in France Nov. 19, 1879, No. 133,733; in Belgium Nov. 26, 1879, No. 49,927, and Nov. 10, 1881, No. 56,196; in England July 19, 1881, No. 3,145, and in Austria Jan. 15, 1882, No. 33,269.



Claim.—1. The process of producing heating-gases from crude carbonaceous materials, which consists, first, in starting the production of gas by the partial combustion of the crude material with cold air; second, in starting the heating of the superheaters by the combustion of the resulting gas, as a minor product, with some air; third, in replacing part of the air for the combustion of the crude material by steam (or its equivalent, carbonic-acid gas) and carrying this mixture (or merely the steam) through the superheater in order to superheat it before its enters the crude material, to produce from it a gas containing more combustible matter than before; fourth, in continuing to use part of this purer gas now turning to be chief product within the combustion-chambers of the superheaters, whereby their temperature and the temperature of the converting material to be superheated in them will increase, and will allow of the admixture of an increasing amount of steam to a diminished amount of air, so as to give a still more concentrated heating-gas, whereby there results a circle of chemical and physico-mechanical actions in which the increase of the purity of the converting agent being at last pure steam,

(or carbonic acid, or mixtures of both,) the increase of the purity of the produced heating-gas, the increase of temperature of its flame within the superheaters, and the increase of temperature and degree of dissociation of the converting agent will react mutually until the maximum of effect as to purity of the heating-gas and as to the quantity of it available for external purposes be attained, the said steps being conducted in continuous operation, as described.

2. The combination of the following elements: the generator *g*, provided with pipe *c*, and branch pipe *b*, the continuously-acting counter-current steam-superheater *n*, opening at the top into the generator *g*, the surrounding chamber *h*, having communication with the branch pipe *b*, and air-inlets at the top, and the dry-steam generator *m*, placed in the smoke-stack, and provided with a water-supply above, and an air-injector below communicating with the interior of the steam-superheater *n*, substantially as and for the purpose described.

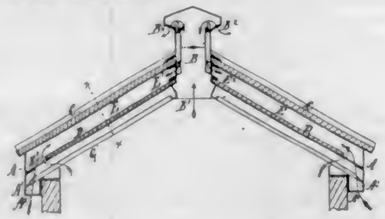
299,386. GLAZED METALLIC ROOF AND SKYLIGHT. GEORGE HAYES, New York, N. Y. Filed May 23, 1883. (No model.)

Brief.—Employs a shoe having a bed portion, a depending flange, a vertical portion, and a laterally-projecting flange. To the shoe is bolted an angle-iron base-plate, an inner gutter, and an outer gutter with a casing forming a base-frame. To a ridge-block is secured a ridge-plate, a ridge-bar, and cap. The main rafters and purlins and intermediate rafters are connected by a purlin-brace, main brace-rod, tie-rods, and a spur.

Claim.—1. The shoe A, constructed with bed portion *a*, flange *b*, vertical portion *c*, and flange *d*, all combined substantially as shown and described.

2. In combination with the shoe A, the angle-iron base-plate *e*, substantially as shown and described.

3. In combination with shoe A, the inner gutter, *g'*, outer gutter, *g²*, and casing comprising base-frame *g*, essentially as shown and described.



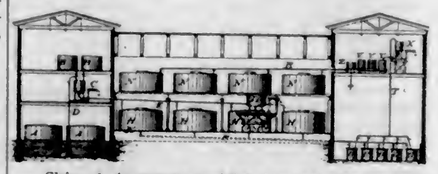
4. In combination with ridge-block F, constructed as shown, the ridge-plate *k*, and casing or ridge bar *l*, and cap E, all constructed, arranged, and combined substantially as shown and described.

5. In combination with ridge-block F and shoe A, the rafters B, purlin-brace G, main brace-rod H, and tie-rods I and I', all combined substantially as shown and described.

6. In combination with shoes A, base angle-iron *e*, ridge-block F, ridge-plate *k*, main rafters B, purlin-brace G, rods H and I, brace-rods I', rods L, purlins *o*, intermediate rafters, C, and spur K, all combined, constructed, and arranged substantially as shown and described.

299,387. SKYLIGHT. GEORGE HAYES, New York, N. Y. Filed July 27, 1883. (No model.)

Brief.—Sheet-metal skylight frame and rafters are made to hold upper panes of plain glass and under panes of ornamental glass. Inlet-apertures through the lower set of panes and outlet-apertures through the upper set of panes are provided for the space between such sets, the outlet-apertures being under cover.



Claim.—1. A double-glazed metallic skylight the skeleton of which consists of sheet-metal bars or rafters, sheet-metal ridge, and sheet-metal base-frame, the glazing consisting of exterior plates of plain or uncolored glass and interior plates or pieces of colored, stained, or ground glass, substantially as shown and described.

2. In a metallic skylight, the combination of outside plates of plain or uncolored glass, C, with inside plates or pieces of stained or ground glass, D, having between them air passage or chamber E, provided with inlet-aperture E' and outlet-aperture E², substantially as shown and described.

3. In a double-glazed metallic skylight, a flue space or chamber, E, between the upper and under sheets of glass, having inlet-aperture E' leading thereto, and protected outlet-aperture E² leading therefrom, for the purpose of ventilating apartments and halls in buildings, substantially as shown and described.

299,388. APPARATUS FOR THE MANUFACTURE OF NITRO-CELLULOSE. JOHN W. HYATT, FRANK V. POOL, JOHN EVERDING, JOHN H. STEVENS, and WILLIAM H. WOOD, Newark, N. J., assignors to the Celluloid Manufacturing Company, New York, N. Y. Filed Feb. 19, 1884. (No model.)

Claim.—1. An apparatus consisting of one or more storage-tanks, one or more settling-tanks, and a weighing or measuring tank, the weighing or measuring tank being connected with the storage-tanks and with the settling-tanks, for the uses and purposes substantially as described.

2. The weighing-tank L, in combination with a series of clarifying or settling tanks and storage-tanks, substantially as set forth.

3. The combination of the weighing-tank C and pipe E with the storage-tanks H, for the uses and purposes substantially as described.

4. The combination of the weighing-tank L, having the pipe P, with the settling-tanks having the pipe O, and with the storage-tanks, for the uses and purposes substantially as described.

5. The pipe P, connected with the weighing-tank, and the series of storage-tanks H, for the uses and purposes set forth.

6. An apparatus in which settling-tanks, storage-tanks, and a weighing tank or tanks are employed, substantially as set forth.

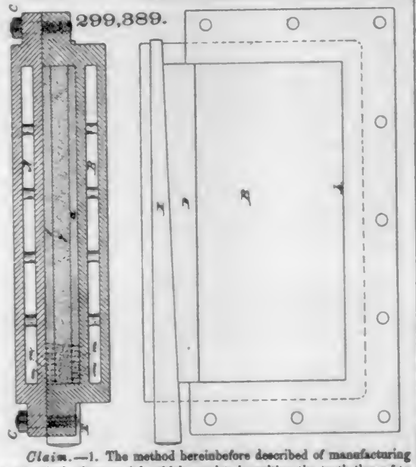
7. An apparatus in which a movable weighing-tank is used, in combination with a series of clarifying or settling and storage tanks, for the purpose of delivering a given quantity of spent acids into any particular storage-tank, substantially as set forth.

8. The combination of the tempering-pots U, pipe T, auxiliary weighing or measuring tank X, and the converting-pots V, substantially as set forth.

9. The arrangement of tanks and pipes by means of which the acids are conveyed from the pots V through the various processes until they reach the pots U, substantially as shown.

10. The arrangement of tanks and pipes by means of which the acids are conveyed by gravity from the pots V through the various processes until they reach the pots U, substantially as shown.

11. The arrangement of tanks and pipes by means of which the acids are conveyed by gravity from the settling-tanks N through the various processes until delivered into the pressure-pot W, substantially as shown.



12. The arrangement of tanks and pipes by means of which the acids are conveyed by gravity from the converting-pots V through the various processes until they reach the temperature-regulating pots U, and then returned to the pots V by air-pressure or other means which overcome the gravity, substantially as set forth.

13. The arrangement of tanks and pipes by means of which the acids are conveyed by gravity from the settling-tanks N through the various processes until they reach the pressure-pot W, and then returned to the settling-tanks N by air-pressure or other means that overcome the gravity.

14. An apparatus consisting of settling-tanks, storage-tanks, fresh-acid tanks, weighing or measuring tanks, temperature-regulating pots, converting-pots, centrifugal machine, and pipes for conveying acids, connected as described, and for the uses and purposes substantially as set forth.

299,389. MANUFACTURE OF COMBS FROM CELLULOID AND OTHER PLASTIC MATERIAL. JOHN W. HYATT, Newark, N. J., assignor to the Celluloid Manufacturing Company, New York, N. Y. Filed Apr. 23, 1884. (No model.)

299,389.

Claim.—1. The method hereinbefore described of manufacturing combs of plastic material, which consists in uniting the teeth thereof to the back by the application of heat and pressure.

2. The method hereinbefore described of manufacturing combs of plastic material, which consists in providing separate pieces for the back teeth and ends and uniting them by heat and pressure.

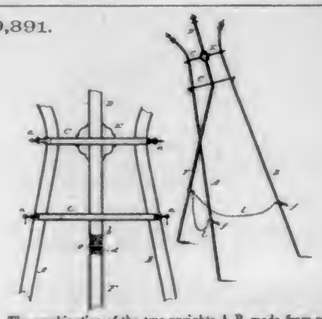
3. The method hereinbefore described of manufacturing combs of plastic material, which consists in welding into a block form pieces of the material appropriately arranged to constitute the teeth, ends, and back of the comb, and then cutting therefrom strips or pieces approximating to the contour of a comb.

4. The method hereinbefore described of manufacturing combs of plastic material, which consists, first, in preparing a form consisting of four outer walls of the material inclosing longitudinal alternating layers of the material and a foreign substance; second, cutting from said form transverse strips approximating to the contour of a comb; and, third, removing the pieces of foreign substance from the strips.

5. The apparatus hereinbefore described, consisting of the platen A, receptacle B, and follower D, the parts A B being in the nature of steam-tables.

299,390. MANUFACTURE OF COMBS FROM CELLULOID AND OTHER PLASTIC MATERIAL. JOHN W. HYATT, Newark, N. J., assignor to the Celluloid Manufacturing Company, New York, N. Y. Filed Apr. 23, 1884. (No model.)

Claim.—1. The method hereinbefore described of manufacturing combs of plastic material, which consists in providing strips approximating to the size of the teeth of the comb and welding them to a piece of the material of suitable dimensions to constitute the back of the comb, substantially as set forth.

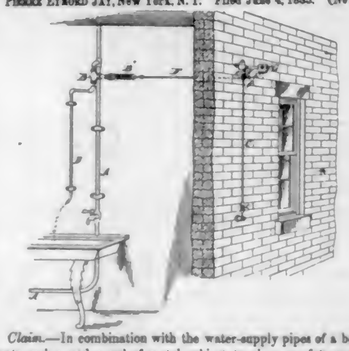


2. The method hereinbefore described of manufacturing combs of plastic material, which consists in providing strips approximating to the teeth and a rod approximating to the back of the comb, and welding the whole together at a single operation, substantially as set forth.

3. The apparatus hereinbefore described, composed of the recessed part A, having the groove *a*, and the corresponding parts, B C, in which are formed the matrices for the teeth of the comb, substantially as set forth.

299,391. EASEL. DAVID M. IRELAND, Waterbury, Conn., assignor of one-half to Henry A. Matthews, same place. Filed Mar. 22, 1884. (No model.)

Claim.—1. The herein-described easel, consisting of the two uprights A B, connected by cross-pieces C C, the vertical central piece, D, arranged upon said cross-pieces, and the brace F, hinged to said vertical piece D, the said uprights and brace made from tubing, all substantially as described.



299,391.

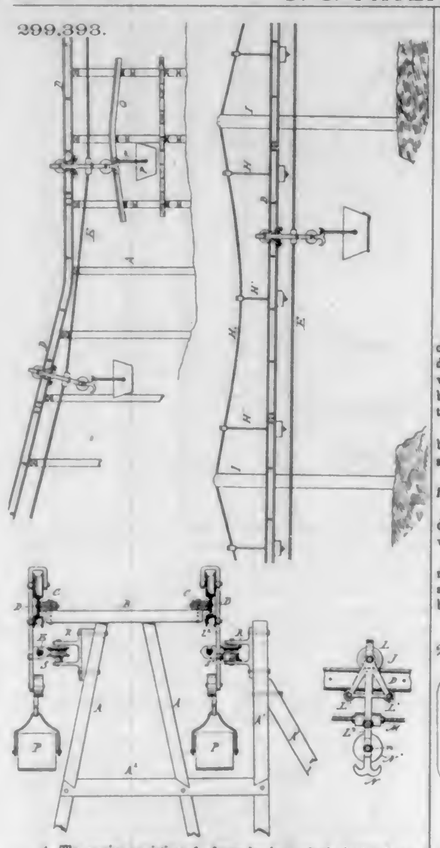
2. The combination of the two uprights A B, made from metal tubing, connected near their upper end by cross-pieces C C, the vertical central piece, D, and brace F, also made from tubing, the meeting ends of said brace and piece D provided with corresponding plugs *b d*, constructed to form the hinge, substantially as described.

3. The combination of two uprights, A B, made of metal tubing, connected near their upper end, the hinged brace F, also made of tubing, the holders *f f*, each constructed with a divided ring, *g*, to embrace the standard, the ends of the ring having ears, with a binding-screw, *i*, through said ears, whereby the holders may be clamped upon the uprights, substantially as described.

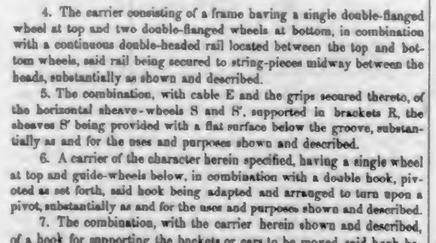
299,392. PROTECTOR FOR WATER-PIPES AGAINST FREEZING. PIERRE EYMORD JAY, New York, N. Y. Filed June 4, 1883. (No model.)

Claim.—In combination with the water-supply pipes of a building, a waste-valve and a rod of metal subject to changes of temperature, whereby it may contract or expand, constructed and arranged so that, upon the falling of the temperature below a predetermined point, the valve will be automatically opened, and automatically closed upon the restoration of the normal temperature, substantially as and for the purpose set forth.

299,393. CABLE TRAMWAY. SAML. H. JENKINS, New York, N. Y. Filed Jan. 9, 1884. (No model.)



Brief.—Double-headed rails the webs of which are secured to string-pieces which rest upon the ends of cross-beams supported by rods or chains suspended from cables. Cable-clips have cut-away portions to prevent injury to cable, and extended flexible thimbles between cable and clip-jaws, and projections which bear against sheaves, whereby to guide the load. The carriers have one supporting-wheel on top and two guide-wheels below, and a pivoted double hook for automatically dropping the buckets or cars.



Claim.—1. In a tramway of the character herein specified, the cross-beams held in place by vertical rods or cables engaging with supporting-cables, as set forth, in combination with string-pieces affixed to the extremities of said cross-beams, and double-headed rails secured to the outer faces of the string-pieces, substantially as and for the uses and purposes shown and described.

2. Suspending-cables H, piers I, vertical rods or cables H', cross-beams B, string-pieces C, and double-headed rails D, the whole combined and arranged substantially as shown and described.

3. In a tramway of the character herein specified, the cross-beams B, rigidly supported by uprights A, and bearing upon their extremities string-pieces C, in combination with the double-headed rail D, the heads of said rail projecting above and below the string-piece in close proximity thereto, substantially as shown and described.

299,393.

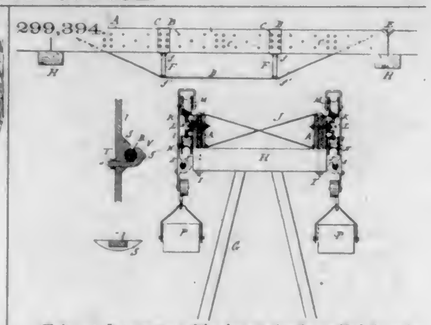
4. The carrier consisting of a frame having a single double-flanged wheel at top and two double-flanged wheels at bottom, in combination with a continuous double-headed rail located between the top and bottom wheels, said rail being secured to string-pieces midway between the heads, substantially as shown and described.

5. The combination, with cable E and the grips secured thereto, of the horizontal sheave-wheels S and S', supported in brackets R, the sheaves S' being provided with a flat surface below the groove, substantially as and for the uses and purposes shown and described.

6. A carrier of the character herein specified, having a single wheel at top and guide-wheels below, in combination with a double hook, pivoted as set forth, said hook being adapted and arranged to turn upon a pivot, substantially as and for the uses and purposes shown and described.

7. The combination, with the carrier herein shown and described, of a hook for supporting the buckets or cars to be moved, said hook being adapted and arranged to automatically release the buckets, substantially as shown and described.

8. The combination, with a carrier having a double hook, pivoted as set forth, of wheel N and rail Q, substantially as shown and described.



9. The combination, with the grip formed of parts K and K', of the rubber thimble M, extending beyond the grip, as set forth, and the cable E, the whole arranged substantially as shown and described.

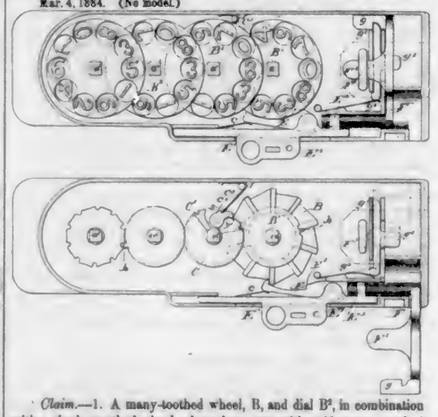
10. The grip consisting of two parts, K and K', the inner face of each part forming a segment of a circle, and curving in contrary directions to each other, substantially as shown and described.

299,394. CABLE TRAMWAY. SAML. H. JENKINS, New York, N. Y. Filed Feb. 18, 1884. (No model.)

Brief.—Double-headed rails having an offset web are secured to the sides of double truss-beams composed of planks upon edge secured together and trussed and cross-braced. The cable-clip has one of its bearings upon the carrier-arm and the other upon an adjustable arm passing through the former.

299,394.

Claim.—1. In a tramway of the character herein specified, the series of trusses, each consisting of two parallel beams formed of planks secured directly to each other, as set forth, and provided with longitudinal tie-wires, in combination with the braces located at right angles to the truss-beams and tie-wires, and the cross brace-wires extending between the truss-beams, substantially as shown and described.



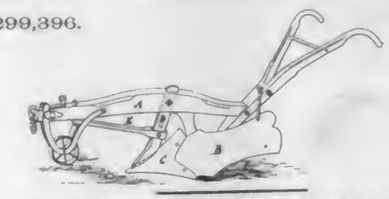
2. The trusses formed of planks A, united by means of plates B and bolts C, tie-wires D, secured to cleats E, and transversal braces F, substantially as shown and described.

3. A double-headed rail, K, having an offset, *k*, substantially as and for the uses and purposes shown and described.

4. The combination, with supporting-trusses or string-pieces, of a double-headed rail affixed to the outer face thereof, said rail being provided with an offset, *k*, substantially as shown and described.

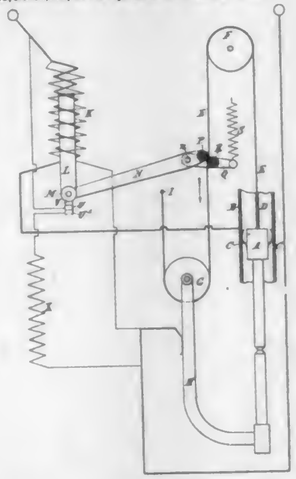
5. The grip consisting of the stationary jaw formed upon the carrier-bar, as set forth, in combination with the movable jaw bearing the screw-threaded shank adapted and arranged to pass through the carrier-bar and engage with a nut, substantially as shown and described.

299,395. INDICATOR-LOCK. FRANK A. JILLSON, Racine, Wis. Filed Mar. 4, 1884. (No model.)



Claim.—1. A many-toothed wheel, B, and dial B^3, in combination with a single-toothed wheel adapted to turn with said many-toothed wheel and dial, an interdental wheel, and another dial, the two latter revolving together, whereby the latter is jigged once at each revolution of wheel, the teeth of which have crowns that are concaved to conform to the periphery of the single-toothed wheel B', as described.

2. The wheel B, having raised teeth, in combination with the slide and its pawl, the latter having a rear dog, F^5, to aid the head of the pawl in locking the wheel B and preventing it from being turned except through the slide, as set forth.



299,396. PLOW-COLTER. JAMES JOHNSON, East Hampstead, N. H. Filed Apr. 23, 1883. (No model.)

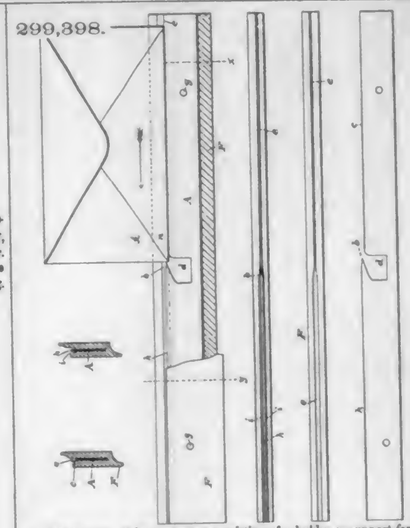
Claim.—The colter D, having a sharp edge, *d*, on the upper part of the lower portion, and a sharpened end, *e*, in combination with the beam A and brace E, and the reversible plow-point C and reversible mold-board B, whereby the lower end of the colter is made to bear against the land side of the plow-point at every reversion of the mold-board, as set forth.

299,396.

299,397. ELECTRIC-ARC LAMP. EDWARD JOHNS and ALBERT EDWARD JONES, Church Terrace, Queen's Road, Battersea, County of Surrey, England. Filed June 13, 1883. (No model.) Patented in England Mar. 6, 1883, No. 1,302; in France June 1, 1883, No. 155,798; in Germany June 23, 1883, No. 26,443; in Belgium July 23, 1883, No. 62,105; in Italy Aug. 10, 1883, No. 15,769, and in Spain Nov. 21, 1883, No. 3,573.

Claim.—1. In an electric-arc lamp, the combination, with two carbons and a tape, cord, or other flexible connection supporting them, of a gripping device consisting of a lever carrying one member of said gripping device and a yielding abutment forming the other member of said device, an electro-magnet or solenoid for actuating said lever, and cut-out studs controlled by said lever, whereby the electric current will be shunted around the lamp in case of the carbons breaking, substantially as herein described.

2. The variable-pressure gripping device above described, consisting of a lever, N, actuated by a solenoid or electro-magnet, yielding abutment Q, gripping surfaces or projections P R, adjustable spring S, attached at one end to a fixed point outside the lever N, and stop T, for the purpose set forth.

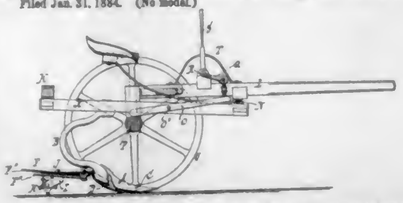


3. The combination, with the gripping-lever N, actuated by a solenoid or an electro-magnet, as described, of the yielding bearing or abutment Q, pivoted at one end and supported by means of a spring, S, attached to a part of the lamp which remains unaffected by the movements of the lever N, as and for the purpose set forth.

4. In an electric lamp, the combination, with the lever N, cord or tape E, core L, and differential solenoid K, of a hinged or pivoted link or arm, Q, upheld by a spring or an elastic support in such a manner as to coact with the lever N and grip the cord or tape when the said lever is actuated by a varying tension due to the expansion or contraction of the said spring or elastic support, as set forth.

5. The combination, with the central guide-tube, B, forming a backbone for an arc-lamp, and a cord or tape, E, serving to support the electrodes, of the automatic regulating-lever N, mounted upon the said tube B, pivoted abutment or bearing Q, upheld by an elastic support, S, attached to or supported by a non-movable part of the lamp, gripping projections or surfaces P and R, and means for limiting the movement of the abutment or bearing in one direction, all as and for the purpose set forth.

299,398. LETTER-OPENER. JACOB JOHNS, Baltimore, Md. Filed Mar. 13, 1884. (No model.)



299,398.

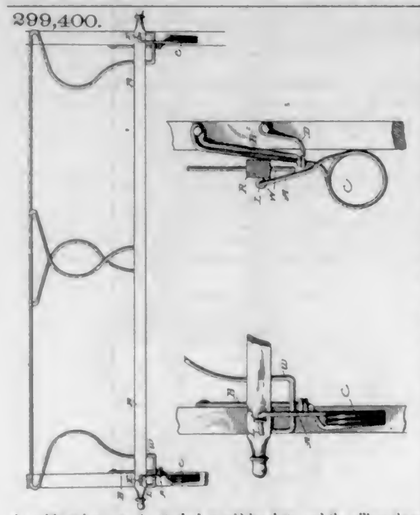
Claim.—1. A letter-opener consisting of a holder or support for the blade, as described, having a groove formed in it, and a straight blade occupying the groove, extending lengthwise thereof and having a cutter-prong projecting from its exposed edge, as set forth.

2. A letter-opener consisting of a holder or support for the blade, having a groove, and a blade occupying the groove, extending lengthwise thereof, and having an edge, *c*, on which to seat the edge of an envelope, and provided with a cutter-prong, *b*, projecting beyond said edge, as set forth.

299,399. POTATO-DIGGER. CHARLES W. KATTELL, New York, N. Y. Filed Jan. 31, 1884. (No model.)

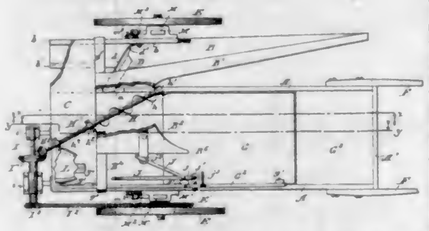
Claim.—1. The combination, in a potato-digger, of a wheeled frame, the plowshare A, the supporting-arms B B, the screen composed of the head F', pivoted to the rear of the share and provided with the rearward teeth, F'', and the spur-wheel H, journaled in a stock, I, swiveled directly to the pivoted head of the screen by the vertical pivot J, substantially as and for the purpose described.

2. The combination of the share-supporting frame, jointed at its forward end to the draft-pole of a wheeled truck, the lifting-levers resting on the axle and jointed intermediate of their ends to the said frame, the crank-shaft having two cranks connected to the lifting-levers, the pawl-arm fixed to the crank-shaft, and the toothed segment engaging with the pawl-arm, substantially as described.



3. The combination of the share-supporting frame jointed to the draft-pole and free to be raised from off the axle, the truck-axle bent upward at right angles within the sides of the frame, to serve as a guide for the latter in its vertical movement, and the levers resting on the axle and jointed to said frame, substantially as described.

299,400. PILLOW-SHAM HOLDER. JOS. J. KELSEY, Detroit, Mich. Filed July 23, 1883. (No model.)



Claim.—1. Supporting-brackets having arms B and D, provided with openings to receive the means for attaching them to a bedstead, in combination with spring-arms A, attached to said brackets, and the pillow-sham support having the angular bar R, said bar being pivoted to said spring-arms, as and for the purpose set forth.

2. Supporting-brackets having arms B and D, provided with openings to receive the means for attaching them to a bedstead, in combination with spring-arms A, attached to said brackets, and the pillow-sham support having a bar, R, with projections *u*, said bar being pivoted to said arms A, as and for the purpose set forth.

299,400.

299,401. CORN-HARVESTER. SAMUEL C. KINSAGA, Kankakee, Ill. Filed July 2, 1883. (No model.)

Claim.—1. The combination, with the frame of a corn-harvester and a stationary knife for cutting the stalks below the ears, of a second vertically-movable knife for severing the standing stubs supported from the machine-frame, and constructed to move vertically independently thereof, substantially as described.

2. The combination, with the frame of a corn-harvester, of a stationary knife for cutting the stalks below the ears, a second knife for severing the standing stubs, and a support for said second knife connected with the machine-frame, and constructed to permit said second knife to move vertically with reference to the said frame, and to sustain it at a uniform distance above the ground, substantially as described.

3. In a corn-harvester, the combination, with the longitudinal frame of the machine, a guide-piece, B, and a knife, D, located between said frame and said guide-piece, of a knife, K, a support, K', for said knife, flexibly connected at its front end to said guide-piece, and constructed to rest upon the ground at its rear end, and a vertical rod, K^3, attached to said rear end of the support K', and guided at its upper end in apertures in the guide-piece B, whereby lateral motion in said support is prevented, substantially as described.

4. In a corn-harvester, the combination, with the machine-frame and with the guide-piece B, of a knife, K, a support, K', flexibly attached at its front end to the said guide-piece, and a guide-rod, K^2, provided with an adjustable nut, K^4, for limiting the downward movement of said support, substantially as described.

5. In a corn-harvester, the combination, with the machine-frame and with the guide-piece B, of a knife, K, a support, K', flexibly connected at its front end to said guide-piece, a guide-rod, K^2, and a plate, K^3, attached to said support K', and constructed to afford attachment for said rod and said knife, substantially as described.

6. In a corn-harvester, the combination, with an inner guide-piece, A, and an outer guide-piece, B, of a backwardly-yielding knife having its end extended to a point inside of the outer face of the guide-piece A, substantially as and for the purpose set forth.

7. In a corn-harvester, the combination, with a longitudinal frame-piece, A, and an outer guide-piece, B, of a cutter-knife located between said frame and guide-piece, and having a spring-connection with the outer guide-piece, and having its free end extended past the outer face of the frame-piece, substantially as and for the purpose set forth.

8. In a corn-harvester, the combination of a longitudinal frame-piece, A, an outer guide-piece, B, and an upwardly rearward and inwardly inclined knife, D, attached by a spring-connection to the said guide-piece, said frame-piece A being provided with a notch, *a*, to admit the free end of the knife, substantially as described.

9. The combination, with a cutting-knife, a receptacle for the cut corn, and means constructed to direct the tops of the cut corn into the receptacle, of a spiral conveyer constructed to deliver the butts of the cut corn into said receptacle, and means for rotating said conveyer, substantially as shown and described.

10. In a corn-harvester, the combination, with a knife, a receptacle for the cut corn, and means for directing the tops of the corn forwardly into the receptacle, of a spiral conveyer arranged diagonally of the machine-frame, with its front end in advance of the knife and in position to engage the butts of the cut corn, and means for rotating said conveyer, substantially as described.

11. In a corn-harvester, the combination, with a longitudinal frame-piece, A, cross-piece C, and knife D, of the conveyer-shaft H', mounted at one of its ends in a bearing, A', supported upon the piece A in advance of the said knife, and at its opposite end in bearings A^2 upon the cross-piece C, and means for rotating the said shaft H', substantially as described.

12. In a corn-harvester, the combination, with the machine-frame, a knife, a tilting receptacle for the cut corn and means for directing the cut corn into the receptacle, of means for temporarily supporting the butts of the cut corn, operated by the movement of said tilting receptacle, substantially as described.

13. The combination, with the machine-frame and a knife for severing the standing corn, of a rearward-tilting platform to receive and discharge the corn-tops, means constructed to deposit the tops on said platform with their butts to the rear, and means for tilting the platform, substantially as described.

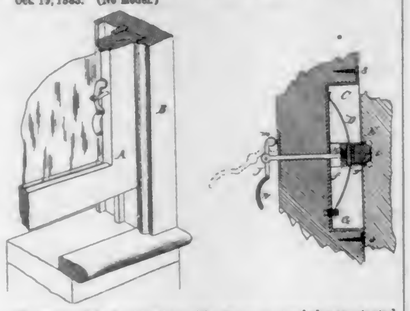
14. The combination, with the machine-frame and a knife for severing the standing corn, of a rearward-tilting platform for the reception and discharge of the corn-tops, arranged in advance of the knife, whereby the corn falls forward thereon with its butts to the rear, and means for tilting the platform, substantially as described.

15. The combination, with the machine-frame and a knife for severing the standing corn, of a rearward-tilting platform located with its rear edge in advance of the knife, means to cause the corn-tops to fall forwardly upon said platform, and means for tilting the platform, substantially as described.

16. In a corn-harvester, the combination, with the machine-frame, a knife, a tilting receptacle for the cut corn, and means for delivering the cut corn into the receptacle, of an arm, J, pivoted to a movable part attached to the said tilting receptacle, and constructed to engage a stationary part of the machine-frame, substantially as and for the purpose set forth.

17. In a corn-harvester, the combination, with the machine-frame, of a lever, G, pivoted to the frame, an eye, j^2, upon said frame, and an arm, J, pivoted by a universal joint to said lever, and provided with a projecting portion, J', constructed to engage the said eye j^2, substantially as described.

18. In a corn-harvester, the combination, with the machine-frame, of a tilting platform, G, a lever, G^2, rigidly secured thereto, and provided with an eye, j', an eye, j^2, secured upon a stationary part of the machine-frame, and an arm, J, having an eye, j, engaged with the eye j', and an upwardly-extended portion, J', constructed to engage the eye j^2, substantially as described.



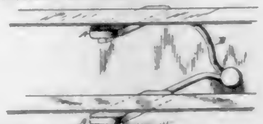
19. In a corn-harvester, the combination with the machine-frame, of a hand-lever, G^2, an eye, j^2, attached to a stationary portion of the frame, an arm, J, pivoted to the said hand-lever, and having a projecting portion, J', constructed to engage the said eye j^2, and a pin, j^3, upon the lever G^2, for limiting the forward motion of said arm J, substantially as described.

20. In a corn-harvester, the combination, with the knife, and with an upwardly and inwardly inclined guide, B', of a deflector, B^2, provided with a forwardly-projecting point, B^4, substantially as and for the purpose set forth.

21. In a corn-harvester, the combination, with the machine-frame, a guide-piece, B, and a knife located between the said frame and guide-piece, of an upwardly and inwardly inclined guide, B', a deflector, B^2, and standards B^3 and cross-piece B^4, for supporting said guide and deflector, substantially as described.

22. In a corn-harvester, the combination, with the horizontal frame-pieces A and cross-pieces A' and C, of the outer guide-piece, consisting of a horizontally-placed board, B, and side pieces, *b* and *b'*, substantially as described.

299,402. SASH-FASTENER. HENRY LEPPER, New York, N. Y. Filed Oct. 19, 1883. (No model.)

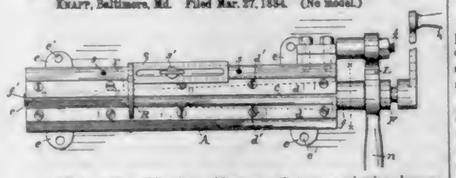


Claim.—1. The combination, with a narrow extended case adapted for insertion in the edge of a window-sash, of a stop-block moving transversely in the case, a semi-elliptic spring fitted therein to force out the stop-block, an actuating-rod extending from the stop-block through the bottom of the case, and lever J of the tip *e*, secured in the outer end of the stop-block, substantially in the manner and for the purpose herein set forth.

2. The combination, with a narrow extended case adapted for insertion in the edge of a window-sash, of a stop-block moving transversely in the case, a semi-elliptic spring fitted therein to force out the stop-block, and an actuating-rod extending from the stop-block through the bottom of the case, all substantially in the manner and for the purpose herein set forth.

3. The combination, with the case C, stop-block E, and semi-elliptic spring D, of a slot in either end of the spring engaging an annular groove in the outer end of an adjusting-screw, G, working in the bottom of the case, substantially in the manner as herein described.

299,403. BELT-CLEANER. ALBERT E. KINGSLEY, Saccarappa, Me. Filed Apr. 7, 1884. (No model.)

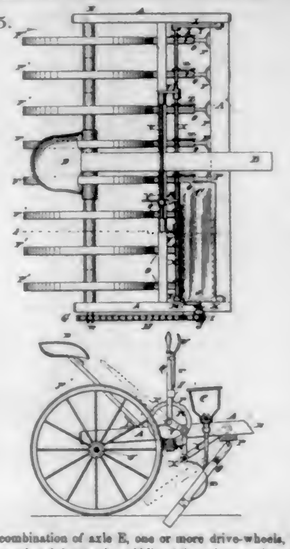


Claim.—1. An improved belt-cleaning device supported in proximity to the belt, and having a flexible portion contacting with said belt and extending diagonally across the same, substantially as set forth.

2. The improved belt-cleaner consisting of a suitable friction-section, A, attached rigidly to a suitable support for holding the cleaner or scraper stationary against the belt, substantially as set forth.

3. In a belt-cleaner, the friction-section A and support B, having one end attached to the section A, substantially as shown.

299,404. MACHINE FOR FORMING TAPER TUBES. GEORGE W. KNAPP, Baltimore, Md. Filed Mar. 27, 1884. (No model.)



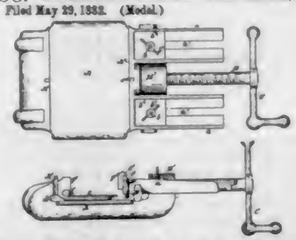
Claim.—A machine for making tapered sheet-metal tubes, having a block with a tapered bore, and provided with a slot opening into the said bore, a tapered grooved mandrel, and a guide projecting across the slot, as set forth.

299,405. GRAIN-DRILL. CHARLES F. KULP, Brussels, Ill. Filed Dec. 19, 1883. (No model.)

Claim.—1. A grain-drill having central wheels, F, fast to the axle, and wheels F' on each side of the central wheels loose upon the axle, substantially as set forth.

2. A grain-drill having one or more ground-wheels, F, fast upon the middle of the axle and wheels upon each side of the same, turning loose on the axle.

299,405.



3. The combination of axle E, one or more drive-wheels, F, turning on the ground and fast to the middle of the axle, sprocket-wheels G I, chain H, shaft J, and clutch-wheel K, substantially as and for the purpose set forth.

4. The combination, in a grain-drill, of lifting-arm Y, connected to the furrow-openers, bell-crank M, with toes *m m'*, slip-clutch wheel K, and drive-wheel I, turning loosely on seed-shaft J, substantially as and for the purpose set forth.

5. The combination, in a grain-drill, of furrow-openers O, flexible links Z, lifting-bar X, link or links W, arm or arms V', shaft V, and lever Q, substantially as set forth.

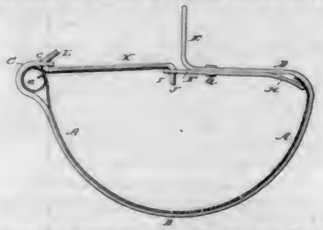
299,406. HARNESS-LOOP MACHINE. PETER LANDFRIT, Cincinnati, Ohio. Filed May 29, 1883. (Model.)

Claim.—1. The base or frame A, having jaw A', provided with projections *y*, and sliding jaw A^2, having projections X, adapted to receive interchangeable jaws or dies, in combination with arms *a*, having slots *a'*, and nuts *b*, and screw B, substantially as and for the purposes specified.

2. The body A, provided with stationary jaw A', and the bolts *b*, having thumb-nuts *b'*, in combination with the sliding jaw A^2, provided with arms *a*, having slots *a'*, to engage with said bolts, and means for advancing and retracting said sliding jaw, substantially as and for the purposes specified.

3. The body A, having stationary jaw A' and channel *d*, and the stationary nut B', in combination with the sliding jaw A^2, provided with the feet or lugs D, resting on the body A at or near the edge thereof, and means for advancing and retracting said sliding jaw, substantially as and for the purposes specified.

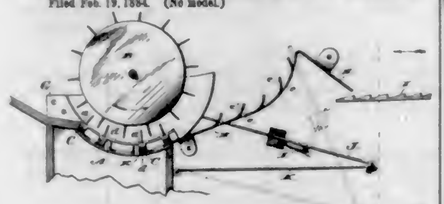
4. The herein-described clamp, in combination with the supplemental stationary jaw G, attached to the jaw A', and the supplemental sliding jaw J, connected to the jaw A^2, the jaw J consisting of the body *j* and the head or face *k*, an opening, H, being left between said body and head, substantially as and for the purposes specified.



5. The jaw J, provided with longitudinal slot, in combination with the jaw A^2 of the clamp, and the slotted arms *a*, and the clamping-bolts *b*, and thumb-nuts *b'*, and screw B, substantially as and for the purposes specified.

6. In combination with the jaw A^2 of the clamp, having dovetail projections X, the jaw J, provided with longitudinal slot, and with dovetail flanges *m*, fitting over the projections X, substantially as and for the purposes specified.

7. The jaw G, provided with feet G', and attached to the jaw A', in combination with the jaw J, attached to the jaw A^2, and consisting of a body and head, *k*, the head being raised above the body by the arches *k'*, substantially as and for the purposes specified.



299,407. EAVES-TROUGH HANGER. MILO R. LEE, Plymouth, Ohio. Filed Apr. 3, 1884. (No model.)

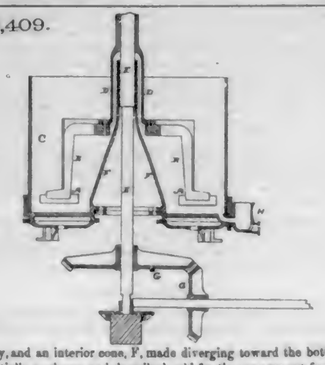
Brief.—The supporting-strap is formed with a perforated lip at one side and a right-angled arm at the other, to which is secured a strap with a lip at one end engaging the trough and an aperture at the other. A double-hooked bar connects said strap with the lip of the supporting-strap.

Claim.—The improved eaves-trough hanger herein shown and described, the same consisting of the strap B, bent to form the lip C, and right-angled arm D E, strap F, fixed to the under side of arm D, and having lip H at one end and aperture I at its projecting other end, and double hook J K L, adapted to connect the outer end of the part F to the lip C, the whole constructed and combined substantially as and for the purpose shown and set forth.

299,408. THRASHING-MACHINE. DAVID LIPPY, Mansfield, Ohio. Filed Feb. 19, 1884. (No model.)

Claim.—1. The combination, with a thrashing-machine cylinder, of a concave consisting, essentially, of a rectangular frame having an open center, the two sides of said frame being provided on their upper surfaces with transverse grooves and with teeth situated between the grooves, and a grate secured to the lower face of said frame, substantially as set forth.

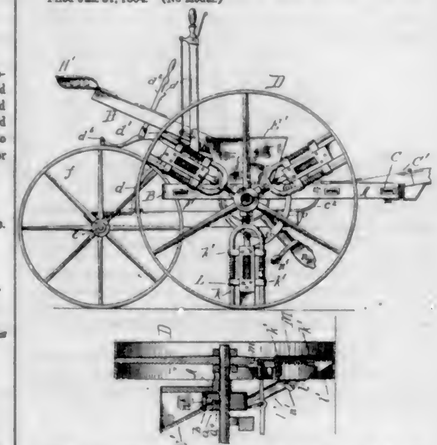
2. In a thrashing-machine, the combination, with a cylinder, of a concave composed of two small concaves and an intermediate grate, each small concave being provided with teeth, and with grooves or gutters between the teeth, open center, and a grate forming a bottom to the said open center, substantially as set forth.



3. The combination, with a cylinder and a concave, the latter provided with an extension having slots therein, and with steps for preventing the straw from moving back toward the cylinder, of a rake situated under said extension and provided with teeth, which latter enter the slots and carry the straw up and over said extension, substantially as set forth.

4. In a thrashing-machine, the combination, with a cylinder and concave, of the slotted extension H, provided with steps formed as described, and the rake and bar for holding the rake in position, all of the above parts operating as described.

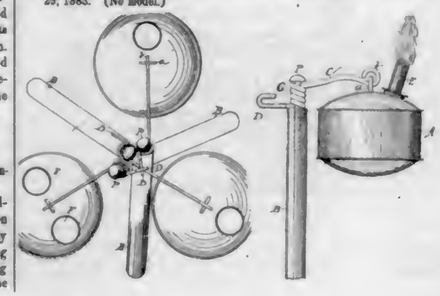
299,409. AMALGAMATING-PAN. GEORGE H. MALTBY, San Francisco, Cal. Filed Sept. 18, 1883. (No model.)



Claim.—In an amalgamating-pan, a series of radial arms extending outward from a central driving-shaft, E, and carrying shoes upon their lower ends to dip into a body of mercury in a receptacle formed by the bottom of the pan, in combination with a band or ring surrounding the arms and traveling in the same direction with the pulp, and forming a cylindrical diaphragm extending upward from near the surface of the

299,409.

mercury, and an interior cone, F, made diverging toward the bottom, all substantially as shown and described, and for the purpose set forth.

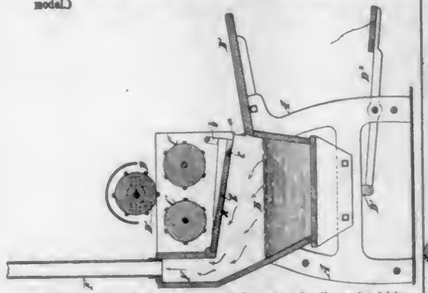


299,410. CORN-PLANTER. ALBERT R. MCMULLEN, What Cheer, Iowa. Filed Jan. 31, 1884. (No model.)

Claim.—1. The combination, in a corn-planter, of a feed-disk, inclined spout, and gravity-valve, arranged as described, a series of yokes located in the wheels, and carrying at their lower ends expanding drills, and a plunger playing on said yoke and adapted to expand said drills, substantially as specified.

2. The combination, in a corn-planter, of a feed-disk, inclined spout, and gravity-valve, arranged as described, a series of yokes located in the wheels, and carrying expanding drills at their lower ends, and plungers playing on said yokes, and devices for moving said drills and plungers, substantially as specified.

299,411. TORCH. JAS. A. MCPHERSON, Brunswick, N. Y. Filed Dec. 29, 1883. (No model.)



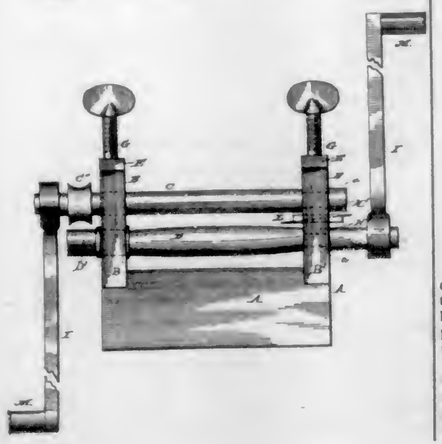
Claim.—1. In a torch, the combination of the staff, the single lamp-supporting arm projecting to one side of the staff and twisted to form an eye, the pin passing through the eye into the staff to form a swivel, and a lamp pendent from the projecting end of said arm, substantially as and for the purposes described.

2. A single torch-supporting arm, C, composed of wire bent to form the socket G and link D, both integral therewith, in combination with pin P and staff B, substantially as described, and for the purposes set forth.

3. A torch staff or handle having a lamp-support pivoted thereon, in combination with a torch-lamp and a connecting-link, by which two or more torches are linked together when stacked, substantially as described, and for the purposes set forth.

4. A torch-bowl provided with a central projecting link on its upper surface, by which it is suspended from a pivoted support, in combination with said support and the staff or handle upon which the support is pivoted, substantially as described, and for the purposes set forth.

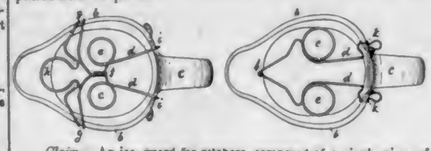
299,412. FELTING-MACHINE. CHARLES H. MERRITT, Danbury, Conn., assignor to John T. Waring, New York, N. Y. Filed Apr. 28, 1883. (No model.)



Claim.—1. The combination, with the vat and rollers of a felting-machine, of a board or shelf arranged over the vat and below the rollers, and a flue or escape-pipe leading from the vat below said board or shelf, substantially as and for the purpose described.

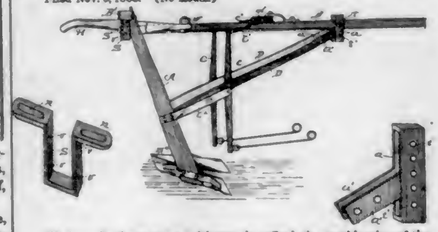
2. The combination, with the vat and rollers of a felting-machine, of a board or shelf arranged over the vat and below the rollers, and pitching from the back forward, and a flue or escape-pipe leading from the back of the vat upward behind the rollers, substantially as and for the purpose described.

3. The combination, with the vat and rollers of a felting-machine, of a board or shelf removably secured over the vat and below the rollers, and a flue or escape-pipe leading from the vat below said board or shelf, substantially as and for the purpose described.



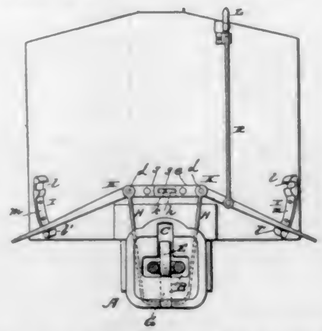
299,413. DEVICE FOR EXPANDING FINGER-RINGS, FERRULES, &c. JOHN GEORGE MESSMER, Lebanon, Ohio. Filed Dec. 6, 1883. (No model.)

Claim.—The combination, in a device for expanding finger-rings, ferrules, &c., of the shaft C, having a crank, I, and handle M, and provided with a removable roll, C'', shaft D, having crank I, handle M, and roll D', sliding blocks H H' H'', wedge-blocks L, and thumb-screws G, the rolls being outside the housings, as and for the purpose shown and set forth.



299,414. ICE-GUARD FOR PITCHERS. LEVERETT MESSER, Haverhill, Mass. Filed Nov. 1, 1883. (No model.)

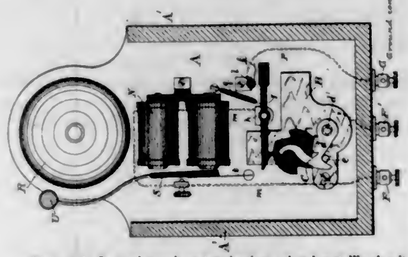
Brief.—A single piece of wire is so bent and curved as to be readily attached to and detached from a pitcher, and be securely held in position thereon to prevent the escape therefrom of ice when water is being poured from the pitcher.



Claim.—An ice-guard for pitchers, composed of a single piece of wire bent and curved, essentially as shown, and provided with loops or catches, whereby the device is detachably secured to the rim of the pitcher, substantially as shown and described.

299,415. SCRAPER-CULTIVATOR. HENRY L. MILLER, Morris, Ill. Filed Nov. 6, 1883. (No model.)

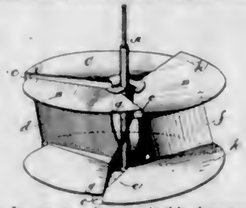
Claim.—In the scraper-cultivator described, the combination of the tongue B, frame B', clip S, having the slots *n n* for lateral adjustment, and vertical row of holes V, and clip *a*, having the vertical row of holes *t*, and arms *a' a'*, as and for the purpose set forth.



299,416. CAR-COUPLING. WILLIAM F. NIDE, Sulley, Iowa. Filed Mar. 31, 1884. (No model.)

Claim.—1. In a draw-bar having a central upward extension of its cavity, and a central slot through its floor at the back part of the throat, the drop-catch E, pivoted at its rear end to the sides of the draw-bar, and having the bearing lug or arm G, extending downward from its middle part through the slot of the draw-head, and engaging said slot by its convex front edge, substantially as specified.

2. The combination, with the draw-head and its pivoted drop-catch, having a bearing-lug, G, extending downward through a slot in its floor, of the compound uncoupling-lever consisting of the branch levers K K, connected by a slip-joint, the foot-lever at the top of the car, the vertical connecting-rod, and the lateral holding-racks, substantially as specified.

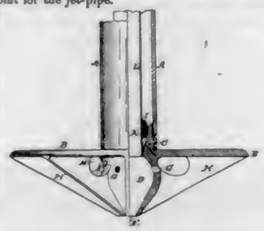


299,417. CALL-BOX FOR DISTRICT-TELEGRAPHS. MENAHEM J. O'SULLIVAN, Baltimore, Md., assignor of three-fourths to J. Frank Morrison, same place. Filed Aug. 24, 1883. (No model.)

Claim.—1. In a telegraph system having a closed metallic circuit-connection, the combination, with the circuit-breaking wheel, of a post having a ground-connection, and a vibrating finger centrally pivoted and adapted for one end to make contact with the circuit-breaking wheel, and the other end with the said ground-post, substantially as set forth.

2. In a telegraph system having a closed metallic circuit-connection, the combination, with the circuit-breaking wheel, of a post having a ground-connection, and provided with a plate-spring, *k*, and a vibrating finger centrally pivoted and adapted for one end to make contact with the circuit-breaking wheel, and the other end with the said plate-spring, as set forth.

299,418. REVOLVING DRUM FOR GAS-METERS AND LOW-PRESSURE WATER-METERS. WILLIAM COULSON PARKINSON, London, England. Filed Dec. 30, 1882. (No model.) Patented in England May 6, 1882, No. 2,134, and in France Sept. 20, 1882, No. 149,495.



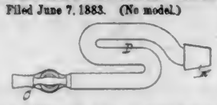
Claim.—1. In a meter, a drum or wheel having screw-shaped segmental blades connected by inclined partitions and forming an unobstructed opening or passage around the shaft, substantially as described.

2. In a meter, a drum or wheel provided with three or more compartments formed by screw-shaped segmental blades or vanes overlapping each other at their outer circumference and forming a central unobstructed passage and passages between their overlapping edges, substantially as described.

3. In a meter, a drum or wheel composed of an upper and a lower series of segmental plates, the plates of each series having angular inner edges and overlapping each other at their outer edges to form intervening passages, and inclined partitions connecting the plates of the upper and lower sections, as shown, in combination with a casing having inlet and outlet openings, substantially as described.

299,419. SINKING PILES. ROBERT E. PEARY, Cape Elizabeth, Me. Filed Jan. 17, 1884. (No model.)

Brief.—A pile having at its lower end a disk the downwardly-projecting part of which is provided with a distributing-chamber having a vertical and a series of lateral ports, the disk also having radially-arranged perforated ribs or vanes, and conical seat and packing-ring to form a tight joint for the jet-pipe.



Claim.—1. In combination with the pile, a disk provided with a central distributing-chamber having a vertical port and a series of lateral ports, substantially as and for the purpose described.

2. A disk having a central distributing-chamber provided with ports, substantially as described, and having also radially-arranged ribs or vanes provided with perforations M, in combination with a pile, A, as set forth.

3. A disk having a conical seat, in combination with a jet-pipe carrying a packing-ring on its exterior, and a pile, substantially as set forth.

4. In combination with a pile, a disk provided with a downwardly-projecting part having therein a vertical port, and a series of lateral ports, substantially as and for the purpose described.

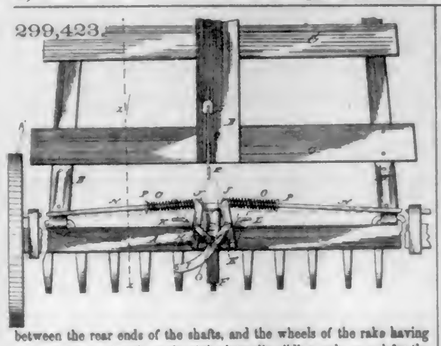
299,420. REFRIGERATING-FAUCET. FREDERICK A. PRESKO, New York, N. Y. Filed June 7, 1883. (No model.)

Claim.—As an improved article of manufacture, a beer-refrigerating faucet having its shank formed with a coil, D, and a tapering inner extremity, E, for insertion directly into the bung-hole of a barrel, substantially as described.

299,421. PROCESS OF MANUFACTURING SHOES. CHARLES W. REYNOLDS, Detroit, Mich., assignor of one-half to William H. Bartenshaw, same place. Filed Dec. 29, 1883. (No model.)

Claim.—The herein-described process in manufacturing a flexible shoe, consisting in placing upon the last a false insole, drawing the upper over the last, and tacking its edge to said false insole by a row of tacks, which first pass through a strip of rawhide or similar suitable material laid along the edge of said upper to the toe of the shoe, and thence doubled back and led to a point near the heel, then uniting the sole and upper in any usual manner, and then pulling out said false insole and said rawhide strip, substantially as shown and described.

299,422. PROCESS OF MAKING SHOES. CHARLES W. REYNOLDS, Detroit, Mich., assignor of one-half to William H. Bartenshaw, same place. Filed Feb. 29, 1884. (No model.)

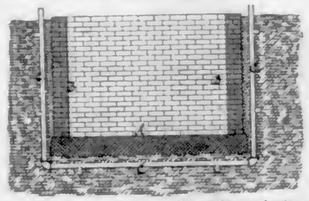


Claim.—The herein-described process in manufacturing a flexible shoe, consisting in placing upon the last an insole, drawing the upper over the last, and tacking its edge to said insole by a row of tacks, which first pass through a strip of rawhide or similar suitable material laid along the edge of said upper to the toe of the shoe, and thence doubled back to a point near the heel, then uniting the sole, upper, and insole in any usual manner, and then pulling out said rawhide strip, substantially as shown and described.

299,423. TRIP MECHANISM FOR HORSE HAY-RAKES. WM. M. SAUNDERS, Alfred Centre, N. Y. Filed Sept. 26, 1883. (No model.)

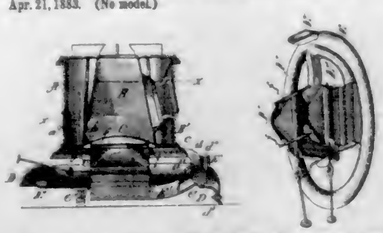
Claim.—In a self-dumping horse-rake, the combination of a rake-head having a plate upon its upper side provided with sliding bearings, a bolt sliding in said bearings, a long and a short toggle-arm pivoted upon a pin upon said bolt, the long toggle-arm being adapted to be drawn forward, two arms pivoted at one end and provided with horizontally-perforated lips at their forward ends, the toggle-arms pivoted upon the middle of said arms, a coiled spring having its ends also secured at the middle of said arms, two horizontal rods sliding in said perforated lips and in bearings upon the rake-head, and having pins or enlargements at their inner ends, spiral springs wrapped around the inner portions of said rods and bearing against the perforated lips of the pivoted arms and against enlargements upon the rods, a lever having a notched upwardly-turned inner or rear end, and pivoted upon the frame

299,423.



between the rear ends of the shafts, and the wheels of the rake having means for engaging the ends of the laterally-sliding rods, as and for the purpose shown and set forth.

299,424. TOOL-HOLDER. RUDOLPH J. SCHEMMEL, Wapakoneta, Ohio. Filed Apr. 5, 1884. (No model.)

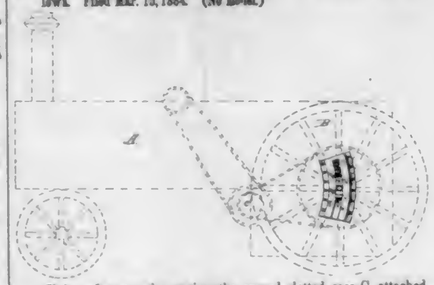


Claim.—The tool-holder herein described, consisting of the cylindrical tang-bearing A, having its outer end provided with the serrations C and its inner end provided with the prongs P, to engage the recessed handle, as shown, the rotary portion E, having its inner end provided with serrations to engage the serrations of the tang-bearing, and its outer end provided with a socket, F, carrying a set-screw, and the cylindrical socket-shank having at its inner end a stud, V, which is seated in the tang portion against a spring therein, the said shank having an annular recess, H, and the tang-bearing having a threaded perforation, D, for the reception of the stop-screw I, all adapted to operate substantially as specified.

299,425. WATERPROOFING CELLARS, &c. JOHN J. SCHILLINGER, New York, N. Y. Filed Apr. 24, 1884. (No model.)

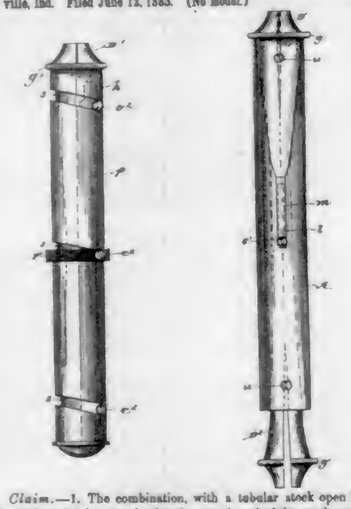
Claim.—The process of waterproofing cellars and other subterranean structures, which consists in providing such structures with a suitable floor and walls, and then charging the spaces beneath the floor and outside of the walls with bitumen or equivalent material for filling the crevices and cracks existing in said floor and walls from the outside, substantially as set forth.

299,426. OIL-STOVE. CHAS. O. SCHWARTZ, Milwaukee, Wis. Filed Apr. 21, 1883. (No model.)



Claim.—1. In combination with the base and reservoir of an oil-stove, a V-shaped pipe united at its apex with the reservoir, the branches thereof leading to the wick-tubes, as set forth.

2. In combination with the base and reservoir of an oil-stove, a V-shaped pipe united at its apex with said reservoir, the branches of said pipe inclined downwardly toward the wick-tubes, as set forth.

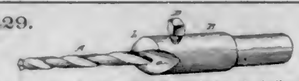


3. In combination with the base of an oil-stove, having an annular concave recess underneath the same, an annular reservoir secured in said recess by suitable mechanism, substantially as described, and a V-shaped pipe united to the reservoir at its apex and inclined downward toward the wick-tubes, substantially as described, and for the purpose stated.

299,427. TRACTION-ENGINE. WILLIAM L. SHEPHERD, Danville, Iowa. Filed Mar. 15, 1884. (No model.)

Claim.—In a traction-engine, the curved slotted case C, attached thereto and provided with a spring, and a sliding block, D, having a stub-axle, substantially as shown, and for the purpose set forth.

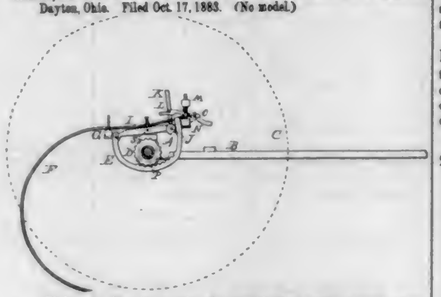
299,428. TOOL STOCK OR HANDLE. ROBERT A. SMALL, Jeffersonville, Ind. Filed June 12, 1883. (No model.)



Claim.—1. The combination, with a tubular stock open at both ends, of clamping-jaws projecting from each end of the stock, said jaws being connected together and of greater length than the stock, whereby when one pair of jaws are drawn into the stock and clamped the other pair are protruded from the opposite end and released, substantially as described.

2. The combination, with a hollow tubular stock, of two pairs of clamping-jaws set therein, and constructed so that when drawn into the end of the stock the jaws will be clamped, a pin rigid with said jaws and protruding through a slot in the stock, and means for actuating said pin within the slot to throw the jaws in and out, substantially as described.

3. The combination, with the tubular stock, of grasping-jaws set within its open end, a pin rigid with the jaws and traveling in a slot in the stock, and a stud rigid on the stock and projecting inwardly between the jaws, substantially as and for the purpose described.



299,429. COMBINED DRILL AND COUNTERSINK. ALBERT J. SMART, Greenfield, Mass., assignor to the Wiley & Russell Manufacturing Company, of Massachusetts. Filed July 10, 1883. (No model.)

299,429.

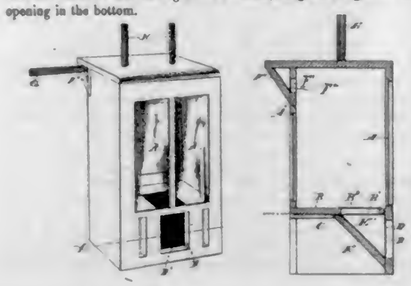
Claim.—The countersink metal drill consisting of a hollow supporting-cylinder, upon the end of which is formed a countersink, a drill-spindle capable of passing through the chamber of the cylinder, and a set-screw located near the countersink end of the cylinder, all combined as and for the purposes described.

299,430. HORSE HAY-RAKE. GEORGE H. SMITH and JOHN KENNARDY, Dayton, Ohio. Filed Oct. 17, 1883. (No model.)

Claim.—1. In a horse-rake, the combination of the ground-wheel provided with the cog-wheel D, the rocker-arm I, the curved bar E, provided with the segment-racks, and the segment-gear J, substantially as and for the purpose set forth.

2. The combination of the ground-wheel provided with the cog-wheel D, the rocker-arm I, the rack-bar E, segment-gear J, lever K, and pawl O, substantially as and for the purpose set forth.

299,431. DIE FOR FORMING AXLES. JAMES SMITH, Boston, Mass. Filed Dec. 1, 1883. (No model.)

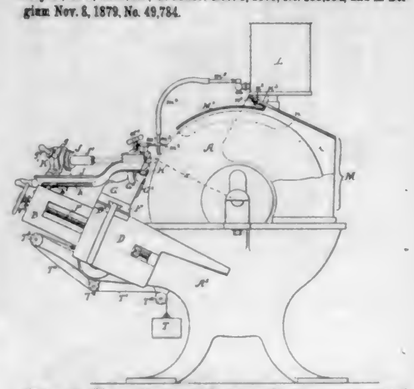


Claim.—1. As a means for forging the journals of car-axles, the dies *s e*, having faces *d' d'* of less than the length of the completed journal, jointly with the dies *f f*, having faces *f' f'* of substantially the same length as the completed journal, the hammering portions of said dies *f* forming arcs of a circle whose center is in the plane of the meeting faces of the die-blocks, whereby the journal is forged to a substantially perfect cylindrical form with a predetermined diameter, as set forth.

2. The dies *f f* in the blocks *a a'*, for forming the arms of axles, each die presenting a hammer-face that is a short arc only (less than the half) of a circle drawn from a point in the parting-line of the dies, and the two dies jointly having such configuration (indicated by *f*, *f'*, *f''*, and *f'''*) as would mold the axle-arm, its journal, shoulders, and wheel-seat to the finished form represented by Fig. 3 of the drawings.

299,432. WINDOW. WILLIAM D. SMITH, Chester, Pa. Filed Dec. 18, 1883. (No model.)

Brief.—A window provided with a lower air-inlet and upper air-exits, the latter connected with flues or chimneys. Said inlet, being covered with screens and having a valve running in guides, regulates the opening in the bottom.



Claim.—1. The window substantially as described and shown, provided in its lower end with an air-inlet, and in its upper end with an air exit or exits, communicating with the flues or chimneys, substantially as and for the purposes set forth.

2. The combination, with a box or show window, substantially as herein described, having an air-inlet in its lower end, of pipes, as G H, extended from its upper end and projected into flues or chimneys, substantially as described, and for the purposes set forth.

3. The improved box or show window, substantially as described and shown, having an opening, B', in its bottom, and provided in its front side, below said bottom, with an opening, D, connected by passage E E' with opening B', the hinged door A', the offset F at its upper rear side, and pipes G H, all arranged and operating substantially as and for the purposes set forth.

4. The combination, with the window provided with inlet-opening D in its outer side below its bottom B, and a bottom, B, provided with the grated opening B', connected by suitable passages with opening D, of the valve C, supported in suitable guides close to the under side of opening B', and adapted to be operated from the inner side of the window, substantially as set forth.

299,433. MACHINERY FOR GRINDING OR SHARPENING DRILLS. W. FORD SMITH and ARTHUR COVENTRY, Salford, Manchester, County of Lancaster, England. Filed July 5, 1881. (Model.) Patented in England July 13, 1879, No. 2,921; in France Nov. 5, 1879, No. 133,534, and in Belgium Nov. 8, 1879, No. 49,784.

Claim.—1. The combination of the stone, the transversely-guided slide F, having a bearing, G', the spindle H, adapted to said bearing, and the arm J, secured to the spindle and provided with means for clamping the drill, as set forth.

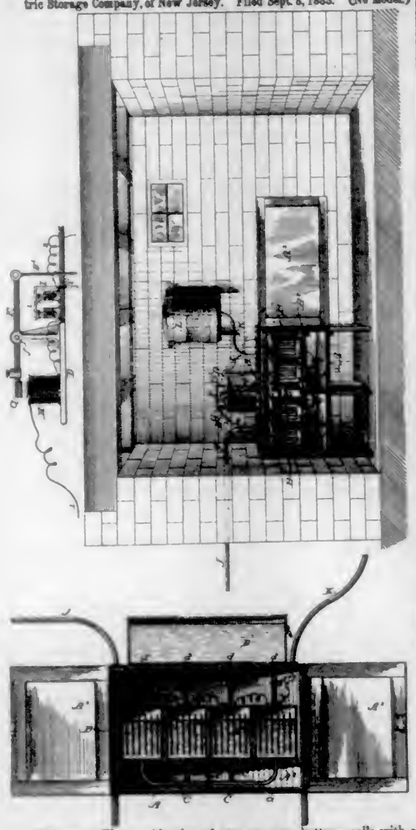
2. The combination of the stone, the transversely-guided slide F, having a bearing, G', the spindle H, adapted to said bearing, and the arm J, secured to the spindle and having clamping-jaws *d d'*, and a head-stock, K, with sleeve *f*, as set forth.

3. The combination of the arm J and its clamping-jaws *d d'* with the head-stock having a sleeve, *f*, and comprising a base, *k*, bolted to the arm, and an upper portion, *k'*, adjustable laterally on said base, as set forth.

4. The combination of the slide F and its bearing G', the spindle H, adapted to said bearing, and the arm J, having drill-holding jaws *d d'* and adjustable on the spindle at an angle in respect to the longitudinal axis of the clamping-jaws, as set forth.

5. The combination of the slide F and its bearing G', the spindle H, adapted to and projecting beyond said bearing, the drill-holding arm J, secured to the end of the spindle, and the coiled spring W, connected at one end to the spindle and at the other end to the bearing, and serving to counterbalance or partially counterbalance the weight of the arm J, as set forth.

6. The combination of the stone A, the slide F, and the pivoted drill-holder having clamps the axis of which is above the center of the stone, with the slide D, carrying the slide F, and guided at an angle parallel with a radial line, *x*, passing through the point at which the drill bears upon the stone, as set forth.



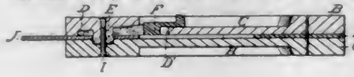
7. The combination of the inclined arm B, the screw P, adapted to bearings therein, the slide D, guided on the arm B, and having a nut, S, adapted to the screw P, and means for elevating the slide and nut and causing the same to have an upward thrust against the screw P, as set forth.

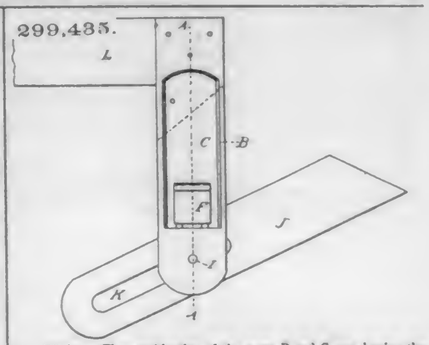
8. The combination of the arm B, the screw P, adapted to bearings therein, the slide D, guided on the arm and having a nut, S, the nut S' on the screw P, and the spring S'', interposed between the two nuts, as set forth.

9. The combination of the arm B, its screw P, the slide D, having a nut, S, the grooved nut S', locking-plate S^2, and the spring S^3, as set forth.

10. The combination of the stone with the hood comprising the rear portion, M, with inclined top *n* and the front segmental portion, M', adjustable on said inclined top *n*, as set forth.

299,434. SECONDARY ELECTRIC BATTERY. ELI T. STARR, Philadelphia, Pa., assignor, by direct and mesne assignments, to the Starr Electric Storage Company, of New Jersey. Filed Sept. 8, 1883. (No model.)

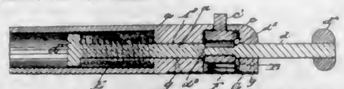




Claim.—1. The combination of two or more battery-cells with a pipe-connection between them, provided with an insulating cut-off, substantially as described.

2. The combination, with a battery, of a reservoir-tank, a feed-pipe connection between said battery and said tank, a valve or cock controlling the communication between said reservoir and said battery, an independent pipe-connection between the cells of said battery, and a cut-off in said independent pipe-connection, substantially as described.

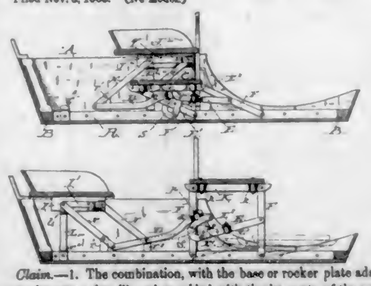
3. The combination, with a battery, of a reservoir-tank, a feed-connection between said tank and said battery, a valve or cock controlling the communication between said tank and said battery, an electro-magnetic device controlling the operation of said valve or cock, a contact device to make and break the circuit, including said electro-magnetic device, and a device controlled by the liquid of the battery to operate said contact device, substantially as described.



299,435. COMBINED CARPENTER'S SQUARE AND BEVEL. RANSOM STERLE, New Britain, Conn., assignor to the Russell & Erwin Manufacturing Company, same place. Filed Feb. 13, 1884. (No model.)

Claim.—The combination of the parts B and G, one having the boss E and the other having the recess for the reception of that boss, with the adjustable arm J and the bifurcated wedge F, all combined and operating together substantially as described.

299,436. TOY GUN. LAWRANCE STOCKMAN, Philadelphia, Pa. Filed Mar. 18, 1884. (No model.)



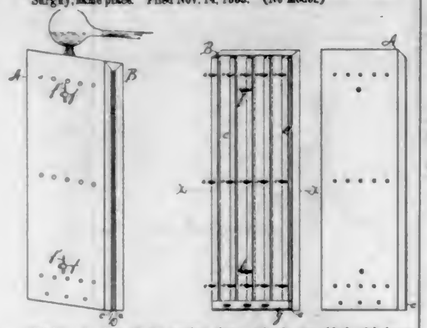
Claim.—1. In a toy gun substantially as described, a spring-plunger having an annular shoulder and working loosely through a trigger-block, combined with trigger-block, as C, having flat face and transverse passage, and the whole adapted to serve as set forth.

2. In combination with the spring-plunger, the pistol-body having transverse opening B *b*, the trigger-block, as described, trigger-spring F, and plate G, forming one side of the trigger-chamber, and affording a bearing for the spring, as set forth.

3. In a toy pistol, as described, the combination of the body A, as described, with the plunger, the trigger-block, and actuating-springs, the plunger operating loosely in and through an aperture formed in such block, as set forth.

4. In a toy pistol, the combination of the following-named elements, to wit: a body, A, having axial bores A' A^2 and transverse apertures B *b*, plunger D, having a rod, *d*, provided with annular groove d^2, plug *d'*, button d^4, normally held in a projected position by spring E, plug C, having body *c*, extension c^2, spring F, and plate G, arranged and combined substantially as described, and for the purpose set forth.

299,437. WAGON JUMP-SEAT. CHARLES H. STRATTON, Salem, Ohio. Filed Nov. 8, 1883. (No model.)

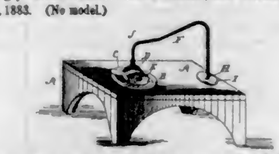


Claim.—1. The combination, with the base or rocker plate adapted for attachment to the sill, and provided with the leg-rests, of the swinging back seat having a leg, L, the front seat, and connecting mechanism, whereby when the front seat is shifted the back seat will be also shifted, and its leg changed from one rest to the other, substantially as described.

2. The combination, with the front and back seats, of the lever N and link N', pivoted at their upper ends to the back seat and below to permanent supports, the arms F F, pivotally connected with the front seat at the top and to permanent supports at their lower ends, the coupling-lever S, pivoted to the rear arm F, the link E', and locking-arm E, connecting the short arm of the coupling-lever with front arm F, and connecting-bar D, connecting the long arm of the coupling-lever with the short arm of the operating-lever N of the back seat, substantially as described.

3. The combination, with the front and back seats, lever N, link N', and arms F F, of the coupling-lever S, link E', locking-lever E, provided with toe *s*, the pin *p*, projecting from rear arm F, and the connecting-bar D, bowed upward at its front portion and having the indentation *s*, all connected and arranged for operation substantially as described.

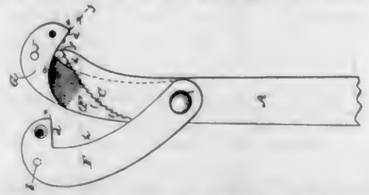
4. The front-seat supporting-bar K, having the bends *i k*, substantially as described, and for the purpose set forth.



299,438. MOLD FOR CASTING SLUGS AND LEADS FOR PRINTERS' USE. GEORGE W. SURGUY, Columbus, Ohio, assignor to Thomas N. Surguy, same place. Filed Nov. 14, 1883. (No model.)

Claim.—1. A mold for casting slugs or leads, provided with inner strips of wood, or of similar non-conducting material, substantially as and for the purposes herein described.

2. A mold for casting slugs or leads, comprising two plates lined with a non-conducting substance, in combination with inner strips of wood or similar non-conducting material, substantially as described.

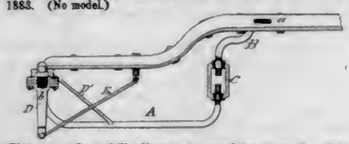


299,439. MEAT-CLAMP. JOS. H. TABONY, New Orleans, La. Filed Aug. 22, 1883. (No model.)

Claim.—1. The combination, with the curved bar F, having the straight shank H, and the concave corrugated jaw D, of the bench A, having a vertical hole somewhat larger than shank H, substantially as and for the purpose specified.

2. A meat-clamp consisting of the curved bar F, having the straight shank H, and the concave corrugated jaw D, substantially as and for the purpose specified.

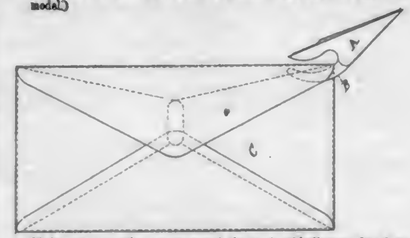
299,440. PIPE-WRENCH. CONRAD D. VOLKMANN and WILLIAM F. PEDDYCORD, Nappanee, Ind. Filed Jan. 18, 1884. (No model.)



Claim.—1. The combination, with bar A, having the curve provided with teeth C, of the two independent hooks F, each provided with the projection G, substantially as described, whereby each face *d* is extended in front of teeth C, for the purpose specified.

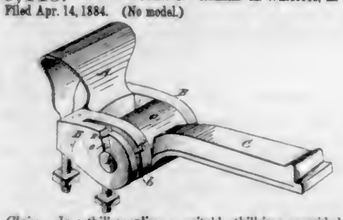
2. The combination, with the bar A, having teeth C, of the two independent hooks F, each provided with the projection G, the dowel J, and the removable screw K, as and for the purpose specified.

3. The combination, with the bar A, having teeth C, of the hooks F, pivoted thereto, having projections G, each extended at *c*, as shown and described, whereby the hooks are prevented from swinging past the point of the bar, for the purpose specified.



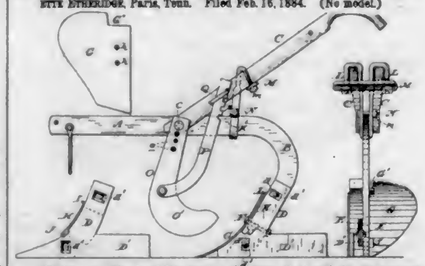
299,441. ROAD-CART. HENRY M. WALLIS, Racine, Wis., assignor to the Mitchell & Lewis Company, (Limited,) same place. Filed Aug. 27, 1883. (No model.)

Claim.—1. In a thill-adjuster, a curved bar secured and braced to the axle, and having its free end bent up and threaded, a bent hanger projecting from cross-bar, and having its threaded end in line with that of the first-mentioned bar, and a turn-buckle, which connects the ends of the two bars, substantially as described, and for the purpose set forth.



2. In a thill-adjuster, the combination, with the shafts and axle, of the curved adjuster-bar A and the curved hanger B, arranged as shown, and connected by turn-buckle, and the hanger D, having brace E, connecting to the shafts, substantially as shown and described.

299,442. ENVELOPE-OPENER. CHARLES S. WATSON, Philadelphia, Pa., assignor to James R. Bisser, same place. Filed Sept. 14, 1883. (No model.)



Claim.—An envelope opener and closer, A, of hollow wedge form, provided with the cotter B at one of its diverging sides, for severing the flap *a* from the body C of an envelope, substantially as described.

299,443. THILL-COUPLING. CHARLIE M. WESTCOTT, El Paso, Ill. Filed Apr. 14, 1884. (No model.)

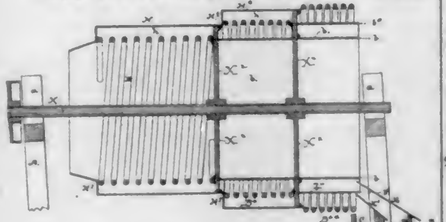
Claim.—In a thill-coupling, a suitable thill-iron provided with an eye, and a bolt having a pin thereon, in combination with a clip cast with ears, one of which is divided in sections by a slit extending through it, one of said sections having an open slot joining with the hole in the ear, substantially as and for the purpose set forth.

299,444. PLOW. THOMAS HARDEN WHITLOCK and CARROLL LAFAYETTE ETHERIDGE, Paris, Tenn. Filed Feb. 16, 1884. (No model.)

Claim.—1. The landside having the slots *d' d'* and the open recess E, combined with the plowshare G, the beam and the bolts *d d* and F, the said slots being arranged to allow the landside to be turned upon its securing-bolts, substantially as described, for the purpose specified.

2. The combination, with the plow-beam, of the adjustable land side D D', the plowshare G, the adjustable carrier H for the plowshare and means, substantially such as described, whereby the plowshare and its carrier are secured to the landside, and the latter to the standard, substantially as described.

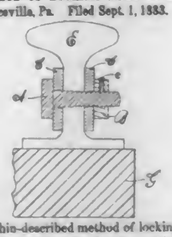
3. The colter curved at its lower end toward the plowshare, combined with the brace P, pivoted to the colter near its lower end, having its upper end adjustably confined in a loop, Q, of the handle, the said colter being pivoted to the beam, and adapted to be adjusted vertically and to bring its curved end nearer to the plowshare, as may be desired, substantially as shown and described.



4. In combination with the beam and the handles pivoted thereto, the yoke K, embracing the beam having screw ends L L bent over the handles, the clamping tie-bar M, connecting said ends beneath the handles, and the bolt N, clamping the yoke to the beam, the said yoke being adapted to be adjusted by sliding on the beam and upon the handles to adjust and hold them, as shown and described.

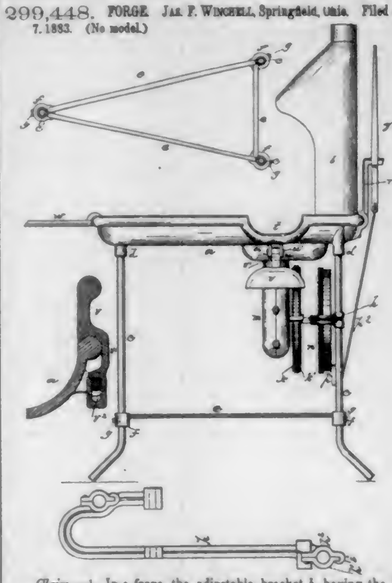
299,445. SALT-CELLAR. STEPHEN C. WILCOX, Dubuque, Iowa, assignor to Le Roy Delos Randall, same place. Filed Mar. 10, 1884. (No model.)

Claim.—The salt-cellar, as a new manufacture, comprising perforations in the cellar for the egress of salt, a cap, and the device for automatically closing the perforations to prevent the salt from caking, substantially as described.



299,446. MACHINE FOR SEPARATING, SORTING, AND GRADING GRAIN. WM. E. WILD, Loveland, Colo. Filed Aug. 17, 1883. (No model.)

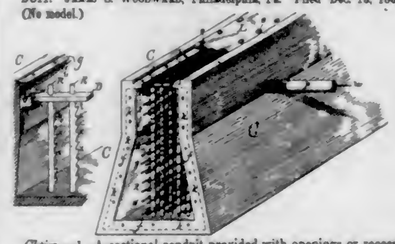
Claim.—1. The combination of the perforate cylinders B B*, having the imperforate extensions *b b**, with the casings H H*, arranged and combined so that the matter retained in each perforate cylinder shall be passed directly out of the machine over the imperforate extensions, and the matter passed through each perforate cylinder shall be conveyed by the casing surrounding the same to the front of the next cylinder, substantially as described.



2. The combination, with a series of screen-cylinders graduated in mesh or size of opening, of a series of casings surrounding said cylinders, perforated in reverse order to the screens, the coarsest-meshed screen having the finest-meshed casing, as set forth.

299,447. METHOD OF LOCKING NUTS TO BOLTS. BENJAMIN H. WILLIAMS, Lawrenceville, Pa. Filed Sept. 1, 1883. (No model.)

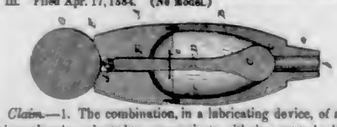
Claim.—The within-described method of locking nuts to bolts, consisting of perforating the nut, as at *c*, the inner side of said perforation being somewhat enlarged, screwing said nut firmly onto the bolt, inserting a prick-punch in *c*, and indenting the bolt or nut-seat, then inserting a pin whose outer end remains above the surface of said nut, and riveting said pin, thereby upsetting both its outer and inner ends and filling the prick-punched indentation, as and for the purpose specified.



299,448. FORGE. JAS. F. WINCHELL, Springfield, Ohio. Filed Sept. 7, 1883. (No model.)

Claim.—1. In a forge, the adjustable bracket A, having the half-sleeves A^2, secured to the legs *c c* by the half-sleeves A' and A^2, and securing-screws, nut-bolts, or the like, substantially as specified.

2. In a forge, the combination, with the top plate, *a*, having the depressions *t t* at the front and rear edges of the fire-pot, and the lug-bearings below the same, of the drop-doors *v*, connected by their slotted arms to their bearings, and provided in their edges with grooves to fit the molding along the depressions *t t*, substantially as specified.

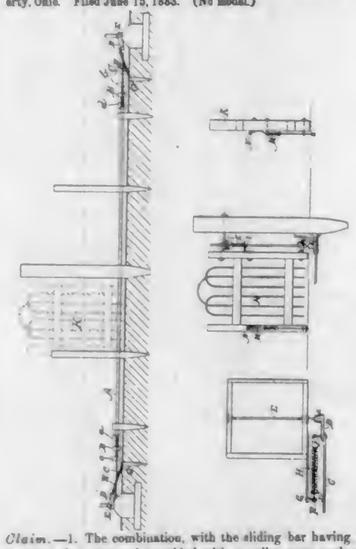


299,449. COMBINED CURBSTONE AND TELEGRAPH-WIRE CONDUIT. JAMES S. WOODWARD, Philadelphia, Pa. Filed Dec. 13, 1883. (No model.)

Claim.—1. A sectional conduit provided with openings or recesses in the floor thereof, and a transverse removable cross-bar provided with openings, in combination with rack-rods the ends of which are adapted to fit within the openings aforesaid, whereby the racks are maintained in an upright position for the support of the conductor-wires, as described and set forth.

2. A sectional conduit provided with openings or recesses in the floor thereof, the brackets *b*, and the removable cross-bar D, provided with openings, as specified, in combination with the rack-rods E, substantially as described, and for the purposes set forth.

299,450. LUBRICATING-CUP. WILBUR SARGENT YOUNG, Gillespie, Ill. Filed Apr. 17, 1884. (No model.)



Claim.—1. The combination, in a lubricating device, of an oil reservoir or chamber adapted to communicate with the part to be lubricated, a valve controlling such communication, and a sphere or light body connected to said valve, and adapted to be moved, as described, to raise the valve, substantially as set forth.

2. The combination, in a lubricating device, of two sections adjustably secured together, the lower section forming an oil reservoir or chamber adapted to communicate with the part to be lubricated, a valve controlling such communications, the upper section provided with a horizontal partition and top, a sphere bearing on said top and connected to the valve by a rod or connection playing through said top or partition, said sphere being adapted to be moved to lift the valve, substantially in the manner and for the purpose set forth.

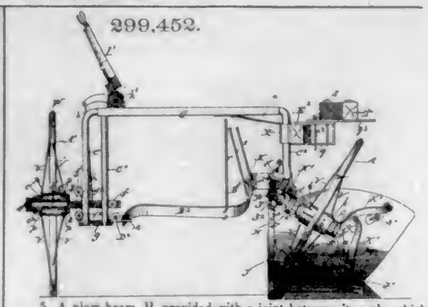
3. The combination, in a lubricating device, of an oil chamber or reservoir adapted to communicate with the part to be lubricated, a valve controlling such communication, a sphere or light body connected to said valve by a spindle having a stop or pin, adapted to contact with a transverse partition or support in said chamber, substantially as set forth.

299,451. GATE. JOSIAH AUSTIN and ROSSCO CHAMBERLAIN, East Liberty, Ohio. Filed June 15, 1883. (No model.)

Claim.—1. The combination, with the sliding bar having means for operating the gate, and provided with a collar near each end, of the two crank-shafts supported in bearings above the surface of the ground, and having each an arm, which is rigidly attached thereto and turned toward the gate, the pull-rods connected to the two arms, and having loops engaging with the collars on the ends of the sliding bar, and the returning-springs, substantially as shown and described, whereby either pull-rod shall be drawn in a direction from the gate, whether the crank-shaft to which it is connected be deflected toward or from the gate, and whereby the operation of one crank-shaft and pull-rod will leave the other unmoved.

2. The combination, with the sliding bar for operating the gate, of the crank-shafts having rigid arms turned toward the gate, the two pull-rods, one connecting each arm with the said bar, and the returning device consisting of the tubular case, sliding rod, and spring, arranged and adapted to operate substantially as shown and described.

299,452. SULKY-PLOW. NATHANIEL S. BARGER, Hampton, Iowa, assignor of one-half to T. B. Taylor and W. D. Evans, both of same place. Filed Dec. 31, 1883. (No model.)



Claim.—1. A plow-sulky having an arched support or axle-tree with a horizontal axle, *a'*, carrying vertical land-wheel A', an oblique axle, *a*, carrying an oblique wheel-landside, A, and a ball-and-socket-joint connection, whereby the axle *a* is adjustable to a horizontal position and the oblique wheel-landside A to a vertical position, both of said wheels at all times serving as the sulky-wheels and being in the rear of the plow proper, substantially as and for the purpose described.

2. The combination, with a plow, of an oblique wheel-landside having a periphery which is in cross-section curved, and is formed of a tube, substantially as and for the purpose described.

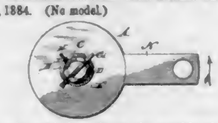
3. The bail B^2, with its pivot B^3, and hinge and pivot connection D *e*, in combination with the jointed beam and the arched support or frame, substantially as and for the purpose described.

4. The bail, in combination with the pivot *e* and hinge D, rods or bars *s s'*, and lever L, substantially as and for the purpose described.

299,452.

5. A plow-beam, H, provided with a joint between its ends, which is flexible in an upward direction and rigid in a downward direction, in combination with the arched support, wheels A A', and the bail B^2 and its lifting devices, substantially as and for the purpose described.

6. The combination, with the plow proper, M, of the oblique wheel-landside A, the two-part plow-beam H H', having a vertical joint at B^3, and the arm K, with braces K', bolted to the mold-board and forming, with the rear part of the plow-beam, bearing for the wheel-landside, substantially as and for the purpose described.

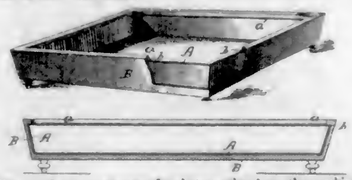


7. The three rollers *f' f' f'*, all attached to the movable axle or spindle *a'*, one being inside on the inner vertical leg, C^4, and two outside on the outer leg, C', of the arch-support, and the inside one being on a plane between the outer rollers, in combination with the arched support, its vertical legs C' C^4, plate *g*, movable axle arm or spindle *a'*, the connecting rods or bars A, and lever L', whereby either the upward or downward strains are caused to fall upon the rollers and binding avoided, substantially as described.

8. The combination, with a frame of a sulky-plow provided with wheels A A' in the rear of the plow proper, of a plow-beam having a joint, B^3, between its ends, and the bail B^2, provided with pivot *e* and hinge D, the rods or bars *s s'*, and lever L, substantially as and for the purpose described.

9. The tongue-extension E^2, in combination with its strap X, brace *u*, and beam-strap O, latch *r*, and tongue-supports *q q'*, substantially as and for the purpose described.

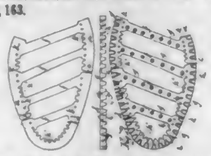
10. The combination of the arched support, the two wheels, one having a ball-and-socket-joint connection, the plow proper, the jointed beam, the bail having a pivot and hinge, and means for raising and lowering the plow proper, as well as adjusting the wheel-landside, substantially as and for the purpose described.



299,453. FRICTION-CLUTCH. JOHN WESLEY BLODGETT, Chicago, Ill. Filed Mar. 6, 1884. (No model.)

Claim.—1. In a friction-clutch, the combination of a cylindrical casing having a central perforation, an annular post, a sleeve or hub on this post, provided with notches, a feather or key adapted to enter a notch, I, in the sleeve D, applied to the cap F, a pawl, L, an arm, J, and a spring, all constructed and adapted to operate substantially in the manner and for the purposes described.

2. The combination of the casing, its cap F, an annular post, a sleeve or hub having notches, the feather H, and the spring-actuated dog or pawl, substantially in the manner and for the purposes described.



299,454. BATH-TRAY. EDWARD BLOOMFIELD, Chicago, Ill. Filed Feb. 12, 1884. (No model.)

Claim.—In a tray structure for photographers' use, the combination, with an inner tray, as described, of an outer inclosing companion tray, provided around the top with an inward projecting bead having a con-

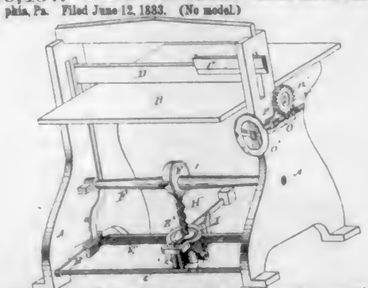
tinuous groove in the under side of the same for the engagement of the upper edge of the inside tray, whereby said trays are closely locked together to form a solid structure, substantially as and for the purpose set forth.

299,455. BOOT OR SHOE SOLE PROTECTING PLATE. JOSEPH BORRETT, London, England. Filed Nov. 17, 1883. (No model.) Patented in England Apr. 30, 1883, No. 2,177; in Germany June 7, 1883, No. 25,320; in France June 8, 1883, No. 155,929; in Belgium Nov. 8, 1883, No. 63,157; in Canada Nov. 24, 1883, No. 18,169, and in Italy Dec. 31, 1883, XVII, 16,123, XXXII, 163.

Claim.—1. The improved boot or shoe sole protector for protecting all or a part or parts of a sole, consisting of a metal frame having connecting cross-bars, and all in one piece, but cut through or reduced to a flexible thinness at suitable places, and having projecting pins, into the spaces between which a layer of leather or the like is forced by pressure, substantially as shown and described.

2. A sole-protecting plate having the cuts or reduced portions on the same, as set forth, the cross-bars, and the projections, the layer of leather forced into the spaces between the pins, and the spaces between the under sole or welt and the upper surface of the plate being filled in with cork or other suitable water-proof material, all substantially as and for the purposes shown and described.

3. A metallic boot or shoe sole plate having the reduced portions or cuts, the cross-bars, and the projections on both, as shown and described, and also having at the inner edge of the frame holes suitable for stitching or pegging the plate to the boot or shoe.

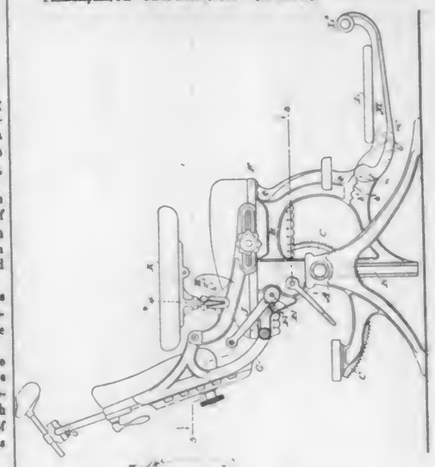


4. A boot or shoe having an outer sole composed of a metal frame made with cuts or reduced portions, as set forth, and with the projections on such frame and cross-bars, and with the spaces between such projections filled in with leather or the like, and with the spaces above such outer sole and between the cross-bars filled in with cork or water-proof material, such sole being stitched or nailed to the upper or shoe, all as set forth.

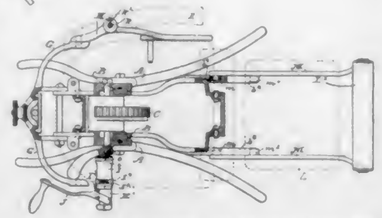
299,456. EXTENSION-KEY. JOHN BROUGHTON, Brooklyn, N. Y.; Mary Broughton Administratrix of said Broughton, deceased, assignor to Daniel H. Fitzgerald, Reading, Pa. Filed June 8, 1881. Renewed Oct. 10, 1883. (No model.)

Claim.—The extension-key herein described, comprising the barrel A, the wire stem B, provided with grooves *b c*, the shoulder *c* in the groove *b*, and the stop-pin *d* in the barrel, the spring D, fitting in the groove *c*, and having the shoulder *f* and projecting lip *g*, and the bow C, into which the stem and the spring are driven, all combined substantially as specified.

299,457. PAPER-CUTTING MACHINE. SAMUEL BROWN, Philadelphia, Pa. Filed June 12, 1883. (No model.)



Claim.—1. The combination, with shaft F, having eccentric F', and rocking frame E, of an intermediate swiveled worm and nut, substantially as shown and described.



2. The combination, in a paper-cutting machine, of a clamp-bar connected by bars or connecting-rods with a rocking frame, E, a shaft, F, having an eccentric, F', and a swiveled worm and rock-nut forming a connection between said shaft and rocking frame, whereby the rotation of said shaft will depress said frame and cause said worm to enter and withdraw from said nut, substantially as and for the purpose set forth.

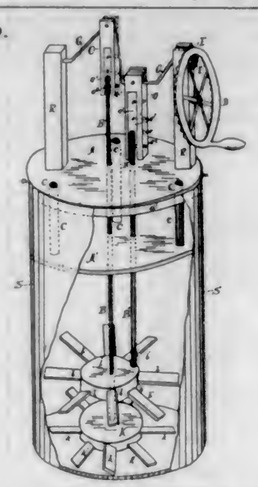
3. In combination with rocking frame E, having cross-bar E', with yoke E², the nut I, having trunnions and sustained on screws or centers, whereby said nut may rock during the movement of said frame, substantially as shown and described.

4. In combination with eccentric F', having strap *f*, the spindle or bolt G, having swiveled worm-collar H, adjustable split nut I, and rocking frame E, substantially as shown and described.

299,458. ADJUSTABLE CHAIR. ARTHUR W. BROWNE, Pleasant Plains, N. Y., assignor to the S. S. White Dental Manufacturing Company, Philadelphia, Pa. Filed Nov. 3, 1883. (No model.)

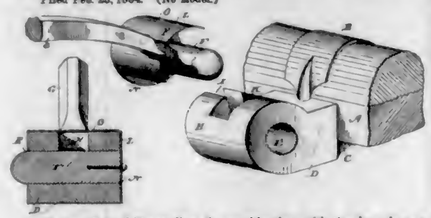
Claim.—1. The combination, with the turning crank-shaft and frame in which it is mounted, of a crank jointed to said shaft, clutch mechanism controlled by said crank, and a spring acting on said crank to throw it into a normal position, substantially as described.

2. The combination, with a turning crank-shaft and frame in which said shaft is mounted, having locking-surfaces thereon, of a sleeve movable on said shaft, and having locking-surfaces to engage the locking-surfaces of said frame, a spring acting on said sleeve, and a crank pivoted to said crank-shaft and connected with said sleeve to operate it, substantially as described.



3. The combination, with a chair-frame provided with locking-notches and inclined surfaces, of arms (carrying the foot-board of the chair) provided with lugs to engage said locking-notches, and with projections or shoulders to ride upon said inclined surfaces, substantially as described.

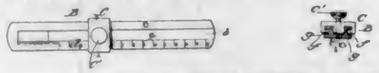
299,459. CHURN. JOHN BURI, Springfield, Me. Filed Dec. 27, 1883. (No model.)



Claim.—1. In a double-dash churn, the combination of a double head, A A', two dasher-heads, I K, having paddles *b b' k k'* placed in two rows in each head and in oblique positions, pinion E, crank-shaft G, drive-wheel D, and adjustable arms O O, having slots *o' o'*, bolts *o²*, and holes *o*, all substantially as shown and described, for the purpose set forth.

2. The combination, in a churn, of a vessel, S, having two heads, A A', with two dasher-rods, B B', having heads I K and paddles *b b' k k'*, adjustable arms O O, crank-shaft G, drive-wheel D, and pinion E, all substantially as shown and described, for the purpose set forth.

299,459.

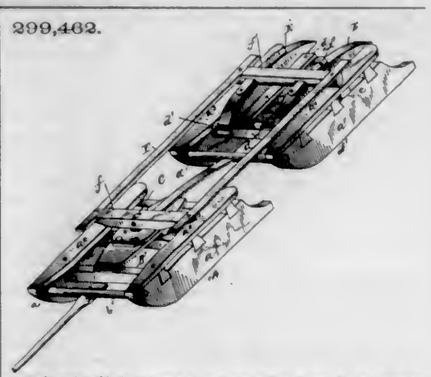


299,460. THILL-COUPLING. EDWIN S. BUSEY, Bordentown, N. J. Filed Feb. 23, 1884. (No model.)

Claim.—In a thill-coupling, the combination, with the draw bar or iron, of the thill fitted therein, and a metallic sheathing formed in one piece and secured to the end of the thill, and comprising a circular cap and a convex guard, said guard being provided with a slot to enable it to fit around the thill, for the purpose set forth.

299,461. CALCIMETER. LUCAS MAVIK CAMPI, Havana, Cuba. Filed Dec. 10, 1883. (No model.)

Claim.—1. As an improved article of manufacture, a calcimeter consisting of a bar having a longitudinal lime-receptacle, *b*, open at one end and graduated along one edge, as at *d*, and a slide, C, having a tongue, *c*, integral therewith, and adjustably held in said lime-receptacle, as set forth.

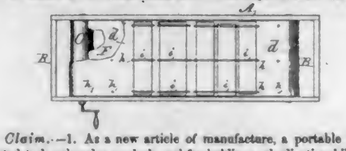


2. The measure B, formed with groove *b* and side grooves, *g g*, in combination with the slide C, having central projection, *e*, and lips *f f*, that run in the grooves *g g*, and provided with the screw C', for holding the slide at any desired position, substantially as described.

299,462. BOB-SLEIGH. WILLIAM CAMPBELL CASE, Limerick, N. Y. Filed Dec. 31, 1883. (No model.)

Claim.—1. The combination, with the sleds A A', the sled A being provided with a strip, *b'*, having an opening, *b²*, to receive the end of the king-bolt, and a metal plate, *c*, retaining said king-bolt in position, and the sled A' being provided with beams E, adapted to slide upon plates *d'*, and connected on their under sides by a beam, *e*, of a supporting-frame, F, the forward end of which is secured to the king-bolt, while the rear end is secured to the beams E, and a reach for connecting the sleds, substantially as set forth.

2. The combination, with the sleds A A', the sled A being provided with a strip, *b'*, having an opening, *b²*, to receive the end of the king-bolt, and a metal plate, *c*, retaining said king-bolt in position, and the sled A' provided with beams E, adapted to slide upon plates *d'*, said beams being provided upon their under side with rollers, and connected

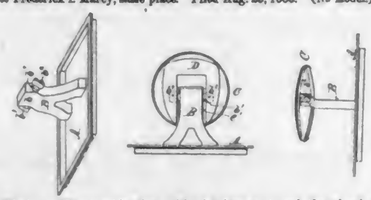


299,462.

on their under side by a beam, *e*, of a supporting-frame, F, the forward end of which is secured to the king-bolt, while the rear end is secured to the beams E, and a reach for connecting the sleds, substantially as set forth.

3. The herein-described bob-sled, consisting of the sleds A A', the sled A being provided with a king-bolt, as described, a reach for connecting the sleds, the same being secured to the king-bolt and to the forward end of the rear sled, the sled A' provided with beams E, adapted to slide upon plates *d'*, and connected upon their under side by a tie-beam, *e*, a supporting-frame, F, connected at its forward end to the king-bolt, and at its rear end to the beams E, substantially as set forth.

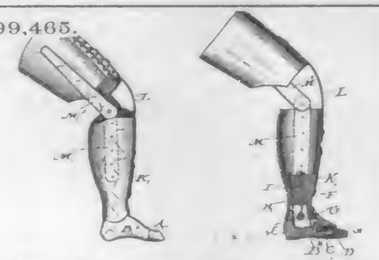
299,463. CABINET FOR HOLDING AND ADJUSTING BILL-HEADS, &c. HENRY A. CLOW, Des Moines, Iowa. Filed Sept. 17, 1883. (No model.)



Claim.—1. As a new article of manufacture, a portable cabinet adapted to be placed on a desk, and for holding and adjusting bill-heads and other blanks, composed of a case, an endless carrier on rollers, provided with paper-fastening devices, and a fixed tablet under the movable carrier, in the manner set forth.

2. In combination with a table or desk having an open section in its top surface, an endless carrier having paper-fastening devices on its outside surface, a pair of rollers placed in bearings underneath the top of the table or desk, and an auxiliary table or tablet fixed beneath the endless carrier, to operate in the manner set forth, for the purposes specified.

3. The rollers C C, an endless carrier, *d d*, having paper-fastening devices on its surface and edges, and a fixed tablet, F, arranged and combined relatively to each other within a portable case, table, or desk, to operate in the manner set forth, for the purposes specified.

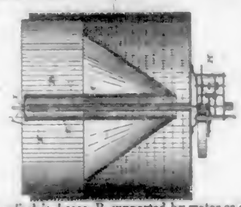


299,464. BUTTON. WILLIAM W. COVELL, Providence, R. I., assignor to Frederick I. Marcy, same place. Filed Aug. 25, 1883. (No model.)

Claim.—The combination, with the button A and the shank B, having the trunnions *b'* and cams *b²*, and also having the bend *b*, of the shoe C, the inner plate, E, having the slot *e* and the bearings *d' d'*, and the U-shaped spring D, all constructed and arranged to operate substantially as described.

299,465. ARTIFICIAL LEG. LYSANDER CROSBY and ALMON E. CROSBY, Albia, Iowa. Filed Nov. 23, 1883. (No model.)

299,465.

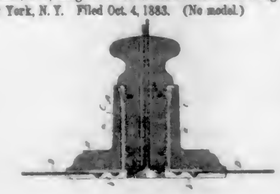


Claim.—1. The toe-joint A, provided with the transverse bar D, in combination with the hook C, rubber spring E, and block B, all constructed to operate substantially as and for the purpose set forth.

2. The toe-joint A, provided with the transverse bar D, in combination with the hook C, spring E, block B, elastic cord G, and ankle-block F, all constructed to operate substantially as and for the purpose set forth.

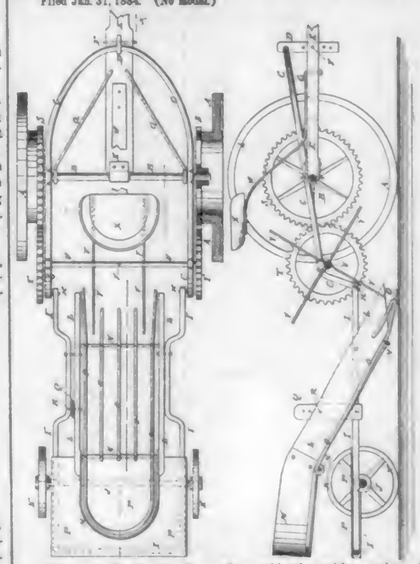
3. The block B, elastic cord G, and ankle-block F, provided with the transverse roll J, heel-cord H, and ankle-hook I, in combination with the toe-joint A, provided with the transverse bar D, the hook C, and spring E, all constructed to operate substantially as and for the purpose set forth.

299,466. REVOLVING SHOW-STAND. SAMUEL THADDEUS CULP, Toronto, and THOMAS TICKNOR, Arkona, Ontario, Canada; said TICKNOR assignor to said Culp. Filed Dec. 21, 1883. (No model.) Patented in Canada Jan. 15, 1884, No. 18,448.



Claim.—1. A cylindrical case, B, supported by water or other fluid, and having a hole centrally located in its bottom, and a tube, E, extending upwardly from the said hole, in combination with a tube, F, surrounding a hole in the bottom of the stand or vessel A, and extending upwardly into the tube E, the tube F inclosing and protecting the spindle G, for transferring the motion from the clock-work to the carrying device, substantially as and for the purpose specified.

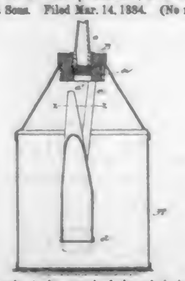
2. A cylindrical case, B, having a cone-shaped bottom, C, designed to extend below the surface of the fluid supporting the said case as a counter-balance to prevent tipping of the tray D, and contained within the vessel A, in combination with driving mechanism arranged to impart a rotary movement to the said case, substantially as and for the purpose specified.



3. A cylindrical case, B, supported by water or other fluid contained within a stand or vessel, A, the said vessel having a tube, F, extending upwardly from its bottom, to protect the spindle G of the driving mechanism, as specified, in combination with a head, I, adjustably fitted to the spindle and flexibly connected to the tube E, which encircles the tube F, which surrounds the spindle and is connected to the floating case, substantially as and for the purpose specified.

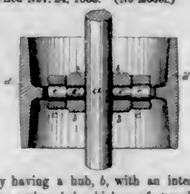
4. The spindle G, connected at its lower end with the clock-movement H, and provided with the head I, adjustably fitted onto the said spindle, in combination with the cords or wires J, arranged to flexibly connect the head I to the floating cylindrical case B, substantially as and for the purpose specified.

299,467. ELECTRIC-CIRCUIT CONNECTION. DAVID E. DRAKE, Newark, N. J., assignor to the United States Electric Lighting Company, New York, N. Y. Filed Oct. 4, 1883. (No model.)



299,468. POTATO-DIGGER. BALTUS FREEMAN, Factoryville, Pa. Filed Jan. 31, 1884. (No model.)

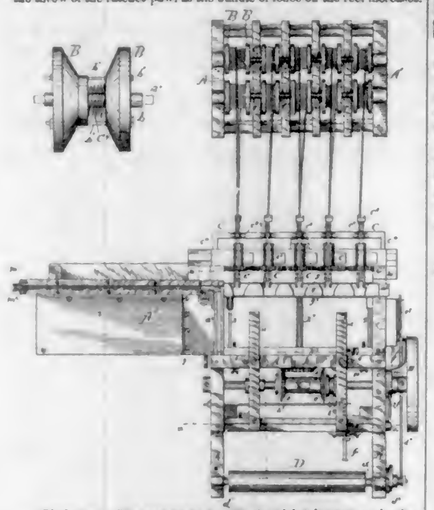
Claim.—1. In a potato-digger, the combination, with a carriage, A B C, of the carriage I J K, having a platform, P, and the pivoted frame L M and screen N O, substantially as herein shown and described, whereby the potatoes will be raised from the ground, separated from the soil, and delivered into a basket or bag, as set forth.



2. In a potato-digger, the combination, with the two carriages A B C and I J K and the frame L M and screen N O, of the gear-wheels S T and the shaft U, having radial rods V, substantially as herein shown and described, whereby the soil is loosened in advance of the said screen, as set forth.

299,469. OIL-CAN. SETH J. GETCHELL, Woonsocket, R. I., assignor to George Draper & Sons. Filed Mar. 14, 1884. (No model.)

Claim.—The body A, its attached threaded ring, and the threaded collar secured therein, and provided with the openings b b^2, combined with an induction and eduction pipes, constituting an air-chamber in connection with and made removable from the body A, with the said collar or neck, the air-chamber having a removable bottom-closing device, to operate substantially as described.



299,470. SELF-ADJUSTING PULLEY. WILHELM A. GRØNDAHL, Portland, Oreg. Filed Nov. 24, 1883. (No model.)

Claim.—A pulley having a hub, b, with an intermediate ring, c, fastened to b by taps or spokes c' c', which are fastened to the ring c by keys or pins or other suitable mechanism, and allowed to swing in the hub b, the taps or spokes c'' c'' fastened to d in a similar way as c' c' to c, and d allowed to swing on taps or spokes e'' e'', all substantially as set forth, and for the purposes specified.

299,471. MACHINE FOR MAKING WIRE-AND-PICKET FENCING. THOMAS B. HARRISON, Clinton, and JEROME W. MARTIN, Kirksville, Mo. Filed Mar. 11, 1884. (No model.)

Brief.—The pickets are pushed between the wires projecting through the twister-heads by an automatic device. After the beater has pushed a picket into the bight of the wire, the pivoted arms of the twisters are moved toward each other to twist the wires close to the picket by a sliding spindle operated from the beater-frame. As the beater-frame swings forward, its front plate slides downward, allowing the picket to pass. A sleeve on the main shaft carries two bevel-gears, and it is shifted along the shaft to bring first one gear and then the other into engagement with the gear that runs the twisters. The twisters are thereby run in one direction, then allowed to remain idle while a picket is fed, and then run in the other direction. The reel is moved by a ratchet, and a push-bar in front of the reel is connected to devices which decrease the throw of the ratchet-pawl as the bundle of fence on the reel increases.

Claim.—1. The combination, with the picket-inserter m, having spring-finger m^2, of the operating-cam, the lever, arranged, as described, to be moved by said cam, the cord attached to said lever and leading to the spring-bearing shaft, the spring for driving said shaft, and the endless belt and its driving-pulley, actuated by said spring to move the picket-inserter forward, all relatively arranged substantially as described.

2. The combination, with the beater G, of the sliding guard-plate g^3, and mechanism, substantially as described, whereby the guard-plate is raised or lowered with the movement of the beater.

3. The combination, with the swinging beater G, of the sliding plate g^3, bars g^4, supporting the same, links supporting said bars and pivoted to the beater-standards, and a lever and stop, arranged substantially as described, whereby the bars and plate are raised as the beater moves back, and permitted to fall as the beater moves forward.

4. The combination, with the sliding stops i i, of the swinging beater G, and mechanism, substantially as described, whereby the stops are held up while the beater swings forward, and depressed to permit the winding of the fencing, substantially as described.

5. The combination, with the shifting sleeve on the driving-shaft, a shaft and gears driven thereby alternately in one or the other direction, and the twisting-jaws driven from said shaft, of an arm on the shaft, and a sliding piece, k^3, bearing a stop which said arm engages alternately, substantially as described.

6. In a wire-and-picket-fence machine, and in combination with the picket-inserter and beater mechanism thereof, a series of wire-twisting jaws, and mechanism, substantially as described, whereby the jaws are closed to twist the wire in close proximity to the picket, as set forth.

7. The combination, with a series of rotating jaws, connected together so as to rotate in unison, of mechanism, substantially as described, whereby the jaws are opened or closed during the rotation, as set forth.

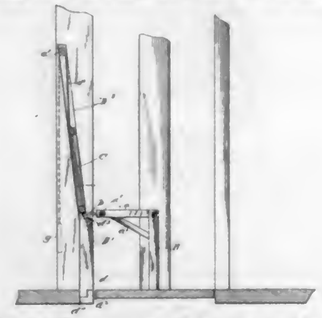
8. The combination, with the rotating gear C', of jaws c c', connected to said gear by pivoted links, and a spindle connected to the pivot of the jaws, whereby the jaws may be expanded and contracted by the movement of the spindle during the rotation of the gear.

9. The series of gears C', arranged for uniform rotation, substantially as described, expansible jaws carried by said gears, the spindles connected to said jaws, and connections, substantially as described, whereby all the spindles may be advanced or retracted together, as set forth.

10. In combination with a rotating spindle of wire-twisting jaws, a yielding spreader carried by said spindle, having perforations through which the wires pass.

11. The combination, with the pivoted jaws and the spindle connected to the pivot thereof, of a spreader mounted on said spindle, and a spring against which spreader bears, substantially as set forth.

299,472. NUT-LOCK. ARTHUR HERBERT, Montebello, and THOMAS PAGE BUTLER, Montreal, Quebec, Canada. Filed Jan. 15, 1884. (No model.)

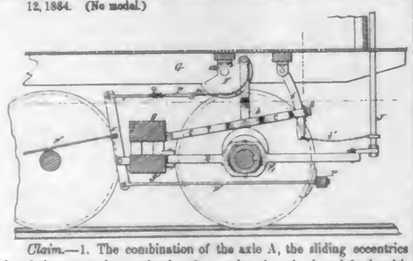


Claim.—1. The combination, in a railway-joint, of the fish-plates, the bolts, the nuts, a flat bar slotted or recessed to fit upon the nuts, and provided with a hook at one end and a key-hole at the other end, and a removable key adapted to be wedged between the web of the rail and one end of the fish-plate, and having a turn-button adapted to fit the key-hole in the lock-plate, substantially as set forth.

2. The combination, with the fish-plates and nuts of a railway-joint, of the lock-plate F, constructed as described, and the removable key L M N, adapted to interlock with the key-hole in the plate, substantially as set forth.

3. The key consisting of the stud L, wedge-shaped lip M at right angles to the stud, and turn-button N, substantially as described.

299,473. HATCHWAY-GATE FOR ELEVATORS. LELAND HERRON, Washington, D. C., assignor of two-thirds to Robert A. Tucker and Henry L. Strang, both of same place. Filed Dec. 4, 1883. (No model.)



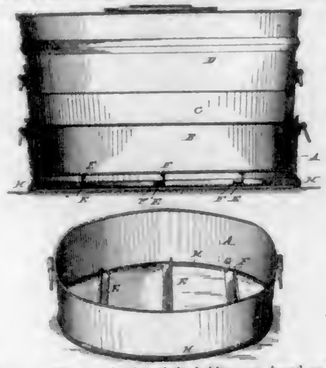
Claim.—1. The combination, with the platform-uprights having horizontal or outwardly-projecting arms, of the gate arranged to close the entrance to the hatchway-opening from the floor having said opening, and adapted to have perpendicular movement through the action of the arms, and be retained in its elevated or open position thereby, said gate being lowered to its closed position upon the descent of the platform, substantially as set forth.

2. The combination, with the elevator-platform having the armed uprights provided with spring-bolts, of the gate arranged to move in a perpendicular and in an oblique plane upwardly and downwardly through

the action of the arms of the platform-uprights, substantially as and for the purpose set forth.

3. The combination, with the elevator-platform uprights having arms provided with spring-bolts, of the gate sliding in grooves perpendicular a portion of their lengths, and extending obliquely the remainder of their lengths, said gate being elevated through the direct action of the bolts and retained in an elevated position at a certain height, but allowed to return or descend after passing said height, substantially as and for the purpose specified.

299,474. CAR-BRAKE. ADAM HOFFMANN, Allegheny, Pa. Filed Feb. 12, 1884. (No model.)



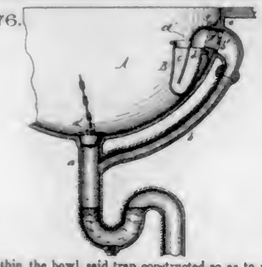
Claim.—1. The combination of the axle A, the sliding eccentrics placed thereon, and a mechanism for moving them back and forth, with a brake mechanism which is operated by the eccentrics, substantially as shown.

2. The combination of the axle A, the sliding eccentrics placed thereon, and an operating mechanism for moving them back and forth, with the lever *c*, rod *b*, wheel F, and the brake-connections, substantially as set forth.

3. The combination of the lever *c*, rod *b*, wheel F, and the brake-connections, with the hanger *i*, chain *i'*, and shaft J, substantially as described.

299,475. BAKING-PAN. PATRICK HOWARD, Piqua, Ohio, assignor of one-half to David Young, same place. Filed Oct. 9, 1883. (No model.)

Claim.—1. The combination of the baking-pan A and removable cleats E, consisting each of a strip of sheet metal bent at right angles, with its edges doubled upon itself, substantially as and for the purpose shown and set forth.



2. The combination of the baking-pan A, having a groove or channel, H, near its bottom, and removable cleats E, composed each of a strip of sheet metal bent at right angles, and having the ends cut off or beveled to adapt them to fit into the groove or channel H, substantially as and for the purpose shown and set forth.

299,476. OVERFLOW-TRAP FOR WASH-BASINS, BATH-TUBS, &c. WILLIAM T. JEBB, Buffalo, N. Y. Filed Mar. 24, 1884. (No model.)

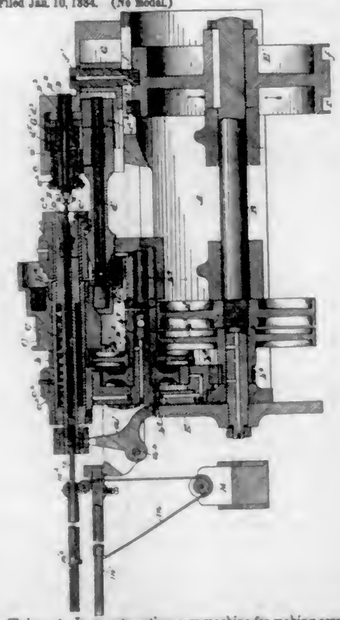
Claim.—1. As a new article of manufacture, a trap for application to the inlet end of overflow-pipes of wash-basins, sinks, and the like, provided with descending and ascending passages constructed to maintain a body of water at a permanent level within the trap, and with a fastening device at its discharge end, whereby it can be secured in position, substantially as set forth.

2. The bowl of a wash-basin or similar structure, provided with the usual overflow-pipe, combined with a trap attached to the overflow-

299,476.

opening within the bowl, said trap constructed so as to maintain a permanent water-level within its limbs, substantially as set forth.

3. A trap consisting of a bowl of the requisite depth, whose descending and ascending limbs, as well as its inlet and outlet openings, are formed by a division-plate which extends nearly to the bottom of the bowl and projects beyond its rim in a curve, substantially as set forth.



4. A trap consisting of a bowl of the requisite depth, whose descending and ascending limbs, as well as its inlet and outlet openings, are formed by a division-plate which extends nearly to the bottom of the bowl and projects beyond its rim in a curve, the outlet of the trap being provided with suitable means for securing it in position for use, substantially as set forth.

5. An overflow-trap composed of a receiving-bowl, *c*, open at the top, and a discharge-pipe, *d*, having its lower end arranged in the bowl *c* and its upper end adapted to cover the overflow-aperture, substantially as set forth.

6. The combination, with an overflow-trap, of a flanged discharge end adapted to be permanently secured to the basin or tub, to cover the overflow-aperture, and provided with a screw-joint, whereby the body of the trap is detachably connected with the flanged discharge end, substantially as set forth.

7. The combination, with the overflow-trap B, composed of a receiving bowl or pipe, *c*, and an ascending discharge-pipe, *d*, of a flanged discharge end, E, connected with the trap by a screw-joint, *g*, substantially as set forth.

299,477. SCREW-MACHINE. ALLEN JOHNSTON, Ottumwa, Iowa. Filed Jan. 10, 1884. (No model.)

Claim.—1. In an automatic screw-machine for making screws from a long rod or screw-stock, a chuck, a turning-down tool, and a threading-tool, combined, arranged, and operating substantially as described, so as

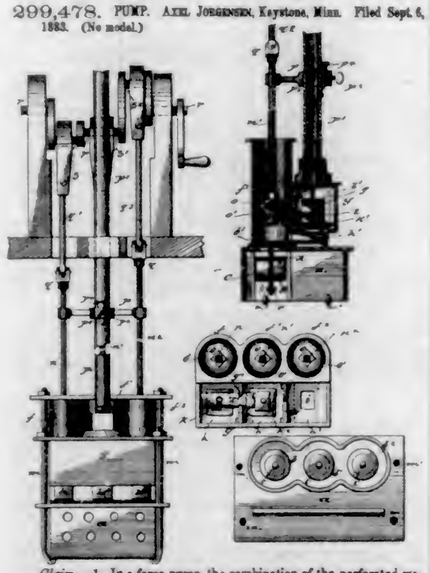
to thread the turned-down portion at the end of the rod or screw-stock, and simultaneously therewith to turn down the rod at a screw's length from the end in order to form the shank of a second screw, whereby the time heretofore consumed in threading after turning down is saved, as set forth.

2. The combination, with the chuck and the rotatory threading-tool, of the cutters arranged between said threading-tool and the chuck, the turning-down cutter on the side of the chuck, and the severing-cutter on the side of the threading-tool, said threading-tool being movable lengthwise of the screw-stock independently of the said cutters, substantially as described.

3. The combination of the machine-frame, the chuck, the cross-slide supported in ways of said frame, the turning-down and severing cutters carried by said cross-slide, the longitudinal slide, also supported in ways of said frame, and the rotatory threading-tool carried by said longitudinal slide, the cutter for turning down being arranged on the side of the chuck, and the cutter for severing on the side of the threading-tool, substantially as described.

4. The combination, with the chuck, the threading-tool, and the cutter for turning down the rod or screw-stock, arranged to act upon the same a screw's length from the end, of the mechanism for bringing the said tools into action, so that the turning down and threading proceed together, substantially as described.

5. The combination, with the chuck, the threading-tool, the cutter for turning down and the cutter for severing the rod or screw-stock, the former cutter arranged between the latter and the chuck, of the mechanism for bringing said tools into action so that the threading, severing, and turning-down operations proceed together, substantially as described.

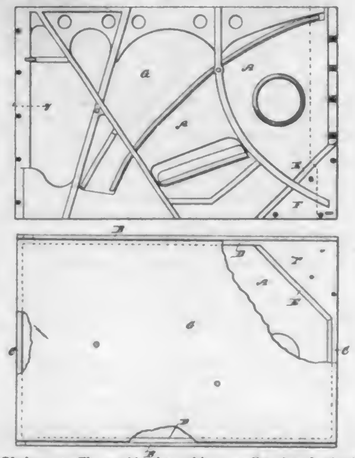


6. The combination, with the chuck, the threading-tool, and the cutter for severing the rod or screw-stock, of the mechanism for simultaneously moving said tools, the threading-tool lengthwise of the rod or screw-stock and the cutter across the same, so that the severing takes place partly during the threading operation or in the removal of the die, substantially as described.

7. The combination, with the chuck, the threading-tool, the cutter for turning down the rod or screw-stock, and the cutter for severing the same, of the longitudinal slide carrying the threading-tool, the transversely-moving carrier supporting the two cutters, and the operating mechanism, substantially as described.

8. The combination, with the chuck, one or more cutters, and the length-gage, of the transversely-moving carrier mounted on a stationary part of the machine, and supporting both the length-gage and the said cutters, substantially as described.

9. The combination, with the chuck, of the longitudinal slide, and the threading-tool carried thereby, the transversely-moving carrier, and the length-gage and cutters carried thereby, substantially as described.

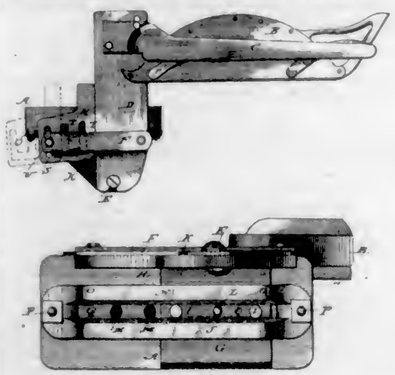


299,478. PUMP. AXEL JORGENSEN, Keystone, Minn. Filed Sept. 6, 1883. (No model.)

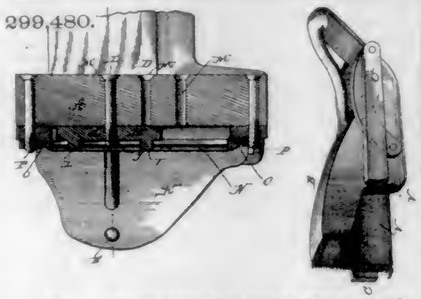
Claim.—1. In a force-pump, the combination of the perforated water-box *a*, provided in its top plate with the drop-valves *b b' b²*, and the cylinders *f f' f²*, water-chest *g*, and the water-ducts *h h' h²* connecting them, the loose drop-valves *k k' k²* in the water-chest, and the plungers *o* on the plunger-rods *n n' n²*, packed to fit loosely within the cylinders, whereby the pump may be submerged and the water caused to serve as an auxiliary packing for the plungers, substantially as specified.

2. In a submerged force-pump, the water-chest *g*, provided with the vertical strips *g'*, extending between the drop-valves *k k' k²* and the longitudinal strips *l l'*, and the valves *k k' k²*, having bearings in the strips *l l'*, in combination with the cylinders, water-ducts, and plunger-rods and plunger, substantially as specified.

299,479. PIANO-FORTE FRAME. HENRY KROMER, New York, N. Y. Filed Nov. 16, 1883. (Model.)



Claim.—1. The combination, with a sounding-board, of a frame provided on its rear side with bearing-surfaces for the sounding-board along all the edges of the same, and with a corner forming a bearing for a corner of the sounding-board, substantially as herein shown and described.

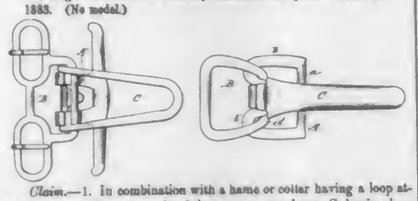


2. A piano-frame provided with rabbeted flanges B and end flanges, C, the edges of which are in the same plane with the surfaces of the shoulders or offsets formed by the rabbets in the flanges B, substantially as herein shown and described.

3. A piano-forte frame constructed with top and bottom flanges, B, having offsets or shoulders D, formed in the inner surfaces, with end flanges, C, the edges of which are on the same plane with the shoulders D, and with a triangular part, F, forming an offset, E, in the frame, and having its inner surface on the same plane with the shoulders D and the inner edges of the flanges C, substantially as herein shown and described.

299,480. SAW-GUARD. HENRY F. KUHLMANN, MERRITT F. ROBINSON, and EDWARD S. IRVIN, Indianapolis, assignors to the National Saw-Guard Company, Marion County, Ind. Filed Oct. 15, 1883. (No model.)

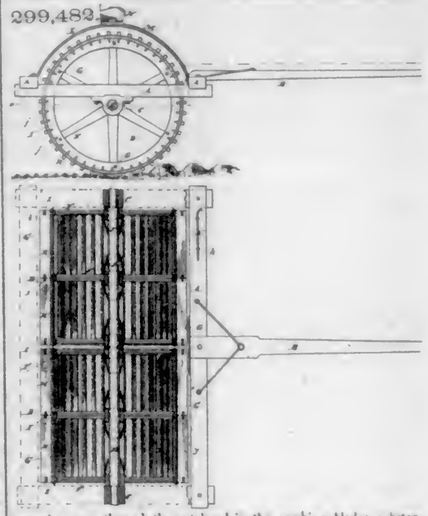
299,480.



Claim.—1. The combination of the hood and upright, a fastening-plate having a vertical portion provided at its lower end with the pivotal bolt for the upright, a transverse plate fastened across the upper portion of the vertical portion of the fastening-plate by means of two screws, one at each end, and a wedging-plate having a transverse slot at its lower end, and a number of longitudinal slots parallel with each other, and having their inner edges slightly inclined toward the lower inner corner of the plate, as and for the purpose shown and set forth.

2. The combination of the fastening-plate having the upright carrying the hood attached adjustably to it, and provided with two lugs and a female threaded perforation, all in a longitudinal line, the saw-table having a longitudinal series of perforations, a screw fitting in the perforations in the table and in the female threaded perforation in the fastening-plate, and a longitudinally-slotted plate or bar spanning the fastening-plate, and having the lugs and the end of the screw projecting into the slot and fastened to the under side of the saw-table, as and for the purpose shown and set forth.

3. A hood for a saw-guard having the inner surfaces of its sides lined with rubber, as and for the purpose shown and set forth.

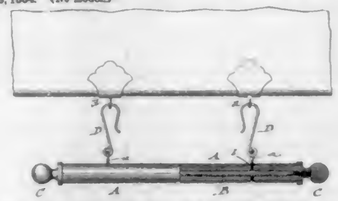


299,481. HORSE-COLLAR LOCK. ERASTUS S. LAFFERTY, Indiana, Pa., assignor of one-half to Godfrey Marshall, same place. Filed June 11, 1883. (No model.)

Claim.—1. In combination with a hame or collar having a loop attached to one of the free ends of the same, a cam-lever, C, having lugs *c c* formed on its upper side, which are adapted to be upset so as to embrace a cross-bar of a loop attached to the opposite free end of the hame or collar, said lever being provided with a hook on its under side, substantially as shown, and for the purpose set forth.

2. In a hame or collar fastener, the loop A, provided with rounded cross-bar *a'*, raised above the plane of the portions *a* and *b*, in combination with the cam-lever C, with lugs *c c*, embracing the bar *a'*, and loop B, attached to the opposite side of the hame or collar, the parts being organized substantially as shown.

299,482. CLOD-CRUSHER. BURNET LANDRETH, Philadelphia, Pa. Filed Nov. 12, 1883. (No model.)



Claim.—1. A crushing-cylinder for a clod-crusher, consisting of wheels F, having tapering notches *f* in their flanges, in combination with wedge-shaped crushing-blades H, adapted to set into said notches, and having notches A upon their ends, and bands I, shrunk on the flanges of said wheels F, and arranged to pass through the notches A in the crushing-blades, substantially as shown.

2. A crushing-cylinder for a clod-crusher, consisting of wheels F, having tapering notches *f* in their flanges, in combination with wedge-shaped crushing-blades H, adapted to set into said notches, and having notches A upon their ends, rods G, to prevent spreading of the wheels, and bands I, shrunk on the flanges of said wheels F, and arranged to pass through the notches A in the crushing-blades, substantially as shown.

3. A crushing-cylinder for a clod-crusher, consisting of three wheels, F, having tapering notches *f* in their flanges, in combination with two sets of wedge-shaped crushing-blades, H, adapted to butt against each other, as shown, set into said notches, and having notches A upon their ends, and three bands, I, shrunk on the flanges of said wheels F, and arranged to pass through the notches A in the crushing-blades, substantially as shown.

4. A crushing-blade for a clod-crusher, made tapering in cross-section and having one or both of its sides curved, substantially as and for the purpose specified.

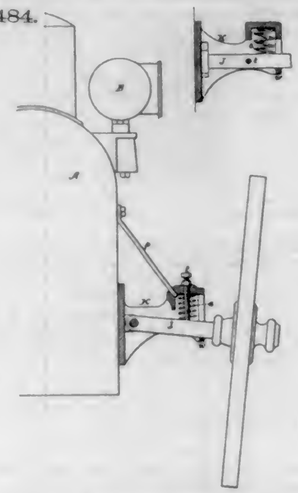
299,483. WINDOW-SHADE PULL. WILLIAM LAWS, Brooklyn, assignor to himself and Krickl, Gould & Co., New York, N. Y. Filed Apr. 18, 1884. (No model.)

Claim.—1. The combination, with a tubular shade bar or pulley having transverse slots or mortises, of links or eyes passing through said mortises, and a rod within the tubular bar for securing the links thereto, substantially as set forth.

2. The combination, with a tubular shade-bar, of a central rod passing through the bar, and of end tips attached to the ends of the rod, substantially as set forth.

3. The combination, with a tubular shade-bar, of eyes or links passing through mortises of the bar, a rod within the bar for holding same, and end tips attached to the ends of the rod, substantially as described.

4. The combination, in a shade-pull, of a tubular bar, links or eyes passing through mortises of the bar, a rod passing longitudinally through said bar and said links or eyes, and end tips attached to the ends of the rod, substantially as set forth.



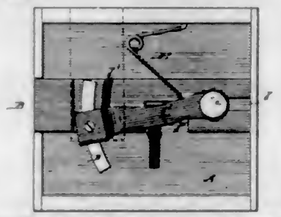
5. The combination of a tubular bar having transverse mortises, eyes or links passing through said mortises, a rod passing through said bar and said eyes or links, and end tips attached to the ends of said rod and fitting by cup-shaped bases over the ends of the bar, substantially as set forth.

299,484. PORTABLE ENGINE. HENRY R. LARZELERE, Greencastle, Pa., assignor to the Crowell Manufacturing Company, same place. Filed Feb. 13, 1884. (No model.)

Claim.—1. The combination of the boiler, the hangers K thereon, the short axles J, capable of yielding vertically independently of the hangers, the springs *s*, and bolts for locking the axles to the hangers, as set forth.

2. The combination of the boiler, the hangers K thereon, the short axles J, capable of yielding vertically independently of the hangers, the springs *s*, and screw-bolts *t*, adapted to bear upon the axles, and the bearings *w*, forming seats for said axles, as set forth.

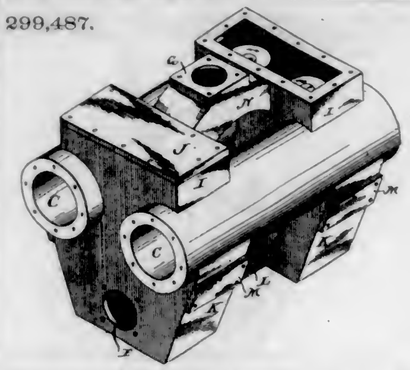
299,484.



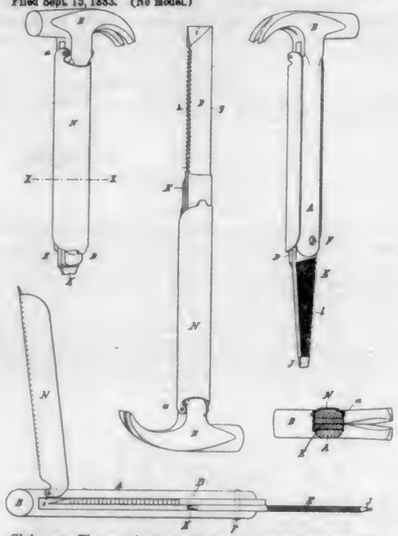
299,485. GRATE FOR BURNING SAWDUST. MICHAEL J. LYONS, Saginaw, Mich. Filed Mar. 20, 1884. (No model.)

Claim.—The hollow supplemental grate herein described, to be used in furnaces in which sawdust is used for fuel, being of A form at one end, and provided with a straight closed perforated wall, and of tapering triangular form at its opposite end, the walls of which are also provided with perforations, being of greater diameter at their inner than their outer ends, substantially as specified.

299,486. LOCK. JONAS G. MATTHEIN, Chicago, Ill. Filed June 1, 1883. (Model.)



Claim.—In a lock, a lock-bolt provided with transverse grooves and notches for engagement with the key, in combination with a movable spring-actuated arm carrying a locking dog or slide adapted to be adjusted in the arm and secured by a set-screw, and formed with a notch, as shown, substantially as and for the purpose set forth.



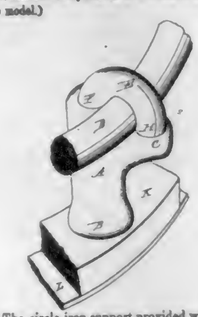
299,487. PUMP. JAS R. MAXWELL, Cincinnati, assignor to the Gordon & Maxwell Company, Hamilton, Ohio. Filed Sept. 15, 1883. (No model.)

Claim.—In a duplex pump, the combination of two parallel pump cylinders or barrels, a pair of discharge-valve boxes disposed across the ends of the cylinders or barrels and cast integrally therewith, and a trunk-pipe placing the two discharge-valve boxes in free communication disposed centrally over the two cylinders or barrels, cast integrally with the two cylinders or barrels and the two discharge-valve boxes, and provided with a junctare-seat for a discharge-pipe or air-chamber, substantially as set forth.

299,487.

299,488. COMBINATION-TOOL. JAS. A. MORRELL, New York, N. Y. Filed Sept. 15, 1883. (No model.)

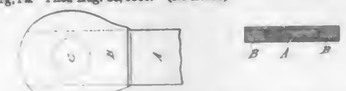
Claim.—1. The combination, with the handle fitted with the hammer-head at one end and bifurcated at the opposite end, of the pivoted blade D, comprising the knife *g*, saw *h*, and chisel *i*, substantially as described.



2. The combination, with the handle fitted with the hammer-head at one end and bifurcated at the opposite end, of the blade D, comprising a knife, saw, and chisel, and the U-shaped clasp pivoted to the handle, substantially as and for the purpose described.

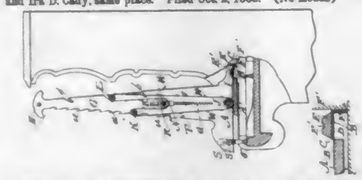
299,489. SHEET-METAL BOX. JOSEPH MUNGER, Waterbury, Conn., assignor to the Scovill Manufactaring Company, same place. Filed Apr. 5, 1884. (No model.)

Claim.—A sheet-metal box having one of its sides constructed with an opening, D, a plate having the raised surface E corresponding to said opening, introduced from the inside of the box, the said raised surface into said opening, the surrounding surface of the plate lying upon the inner surface of the side of the box and secured thereto, substantially as described.



299,490. CIRCLE-IRON SUPPORT. FREDERICK MUTNER, Rockford, Ill., assignor of one-half to Sylvester B. Wilkins, same place. Filed Mar. 5, 1883. (No model.)

Claim.—1. The circle-iron support provided with the tubular openings, in combination with the hook-staple adapted to enter said openings and clamp the circle-iron between it and said support, substantially as described.



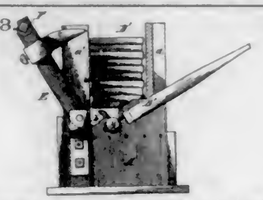
2. The circle-iron support, grooved to receive the circle-iron, and provided with tubular openings arranged upon each side of the groove, in combination with the hook-staple adapted to enter the tubular openings and embrace the circle-iron, substantially as described.

299,491. CONSTRUCTING EYE-BARS. JOHN NABOBLEY, Jr., Pittsburg, Pa. Filed Aug. 23, 1883. (No model.)

Claim.—As an improvement in forming re-enforced heads to eye-bars, the construction of the re-enforcing pieces—one for each side and edge of the bar—of two rabbeted plates whose shoulders respectively abut against the edges, and whose plane portions lie upon the faces of the bar, substantially as shown and described.

299,492. KEY-BOARD ATTACHMENT FOR MUSICAL INSTRUMENTS. EDWARD FORBES O'NEILL, Storm Lake, Iowa, assignor to himself and Ira D. Cady, same place. Filed Oct. 2, 1883. (No model.)

Claim.—1. The combination, with a series of false keys hinged to a strip and adapted to pass between the black keys of a key-board, of a frame resting partly on the strip to which the false keys are hinged, and of an endless music belt or band held on the frame which is provided with means for moving the belt or band, substantially as herein shown and described.



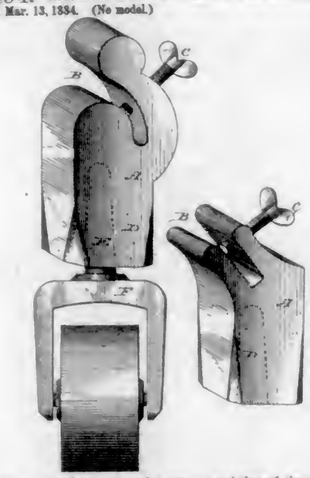
2. The combination, with the strip C, the false keys A, the grooved strip E, the standards G, and the rod I, fitting in the grooved strip E, of means for passing an endless music belt or band provided with projections over the keys, substantially as herein shown and described.

3. The combination, with the strip C, the false keys A, the grooved strip E, the standards G, the rod I, fitting in the groove in the strip E, and the adjustable front legs, S, of means for passing an endless music belt or band provided with projections over the keys, substantially as herein shown and described.

4. The combination, with the standards G, of the adjustable rollers K and L, the roller J, the roller M, provided with friction-rings R, the slides N, the springs Q, and an endless band or belt provided with projections W, substantially as herein shown and described.

299,493. STAVE-PACKING MACHINE. JEREMY H. OVERTON, Norris, Mich. Filed Mar. 23, 1884. (No model.)

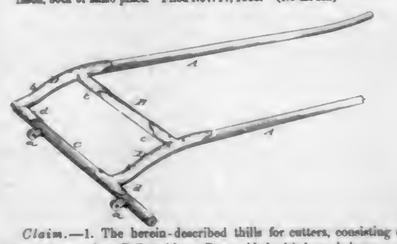
Claim.—1. The combination, in a stave-packing machine, of a supporting-frame, A, standards E, pivoted to swing back and forth on the



frame and provided with lateral arms *e* and *e'*, to be brought upon the package, and cam mechanism for compressing the package, substantially as described.

2. The combination, in a stave-packing machine, of the frame A, the swinging standards E, pivoted at one end to the frame, the arms *e e'*, adjustable along the length of the standards, and cam mechanism for compressing the package, substantially as described.

3. The combination, in a stave-packing machine, of the frame A, the swinging standards E, pivoted at one end to the frame and having lateral arms *e e'*, to be brought over the package, and the cam-shaft B, journaled in the frame, substantially as described.



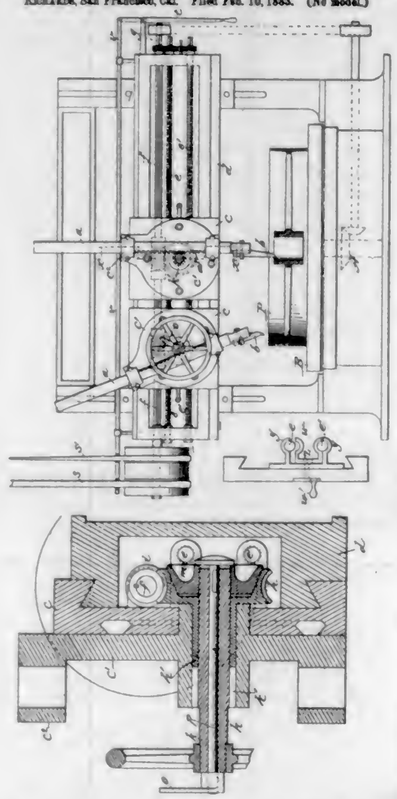
4. The combination, in a stave-packing machine, of the frame A, the swinging standards E, pivoted at one end to the frame and connected at the other end by the handle F, the arms *e e'* on the standards, and the cam-shaft B, substantially as described.

299,494. CASTER FOR STOVES. ANNA J. PECK, Frostburg, Md. Filed Mar. 13, 1884. (No model.)

Claim.—A roller-support for stoves, consisting of the socket A, having slot B and clamping-screw C, and taper hole D, in combination with the caster F, having taper shank E, as and for the purposes set forth.

299,495. IRON FOR SLEIGH-SHAFTS. HEZEKIAH H. RICHARDS, Racine, Wis., assignor of one-half to William S. Buffham and Thomas Dickinson, both of same place. Filed Nov. 17, 1883. (No model.)

Claim.—1. The herein-described thills for cutters, consisting of shafts A A, cross-bars B C, and irons D, provided with lateral sleeves *c d*, substantially as and for the purpose explained.



2. A thill-iron consisting of concave body *b*, provided with lateral sleeves *c* and *d*, substantially as shown and described.

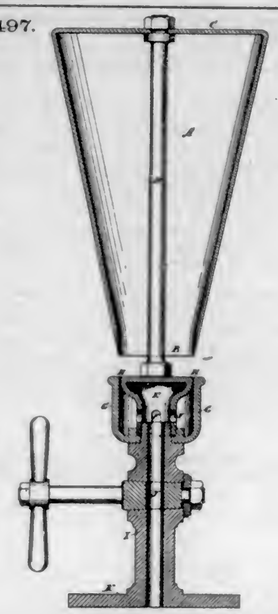
3. A pair of thills for a cutter, consisting of shafts A A, irons D, provided with lateral sleeves *c d*, cross-bar B, extending from one shaft to the other, and cross-bar C, extending from one thill to and beyond the other, as shown.

4. In a pair of cutter-thills, the combination of shafts A A, irons D D, each provided with lateral sleeves *c d*, one of said sleeves, *d*, being open at both ends, and cross-bars B C, the former extending from shaft to shaft, the latter extending from one sleeve, *d*, to and through the other, and projecting beyond the side of the thills.

5. A thill-iron consisting of hollow body *b*, curved upward in the direction of its length, and provided with hollow lateral sleeves *c d*, as shown.

299,496. METAL BORING AND SLOTTING MACHINE. JOHN RICHARDS, San Francisco, Cal. Filed Feb. 10, 1883. (No model.)

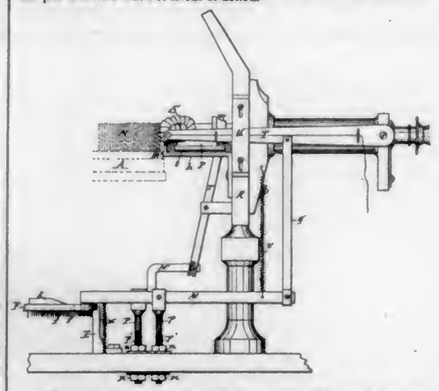
Claim.—1. The combination of the saddle *c*, reciprocating cutter-bar *a*, having rack *a'*, the motion-rod *f*, provided with worm-gear *i*, the worm-wheel *h*, cone-plate *m*, the shaft *k*, carrying pinion *l'*, the rod *p*, and nut *o*, substantially as shown and described.



2. The combination, with the saddles *c c*, carrying half-nuts *w*, and reciprocating cutters *a*, of the feed-screws *e e'*, and means for actuating the same, substantially as shown and described.

3. The combination of the saddles *c c*, reciprocating cutter-bars *a a*, having racks *a' a'*, the feed-screws *e e'*, motion-rod *f*, having worm-gear *i*, the worm-wheel *h*, pinion *l'*, and suitable connecting and actuating mechanism, substantially as shown and described.

299,497. WHISTLE. EDWARD E. SWETT, Biddeford, Me. Filed Aug 21, 1883. (No model.)



Claim.—A steam-whistle the bell of which enlarges from its base to its crown, so that the width of the chamber will gradually increase from base to crown and be wider at the crown than at the base, substantially as described.

299,497.

299,498. KNITTING-MACHINE. JOHN TERWILLIGER, Amsterdam, N. Y., assignor of one-half to the Greene Knitting Company, of New York. Filed Feb. 8, 1883. (No model.)

Brief.—The machine is designed to knit a circumferentially-striped single-threaded striped fabric. Two loop-wheels and thread-guides are arranged side by side and supplied with different-colored threads, the striping of the fabric being effected by alternately and at predetermined intervals of time withdrawing and severing one of said threads and immediately introducing the other. The end of the severed thread is clamped and held while it is out of action.

Claim.—1. In combination with the needle-cylinder, needles, and loop-wheel of a knitting-machine, a thread-supporting plate arranged beneath the loop-wheel, an oscillating thread-guide adapted to throw the thread off the loop-wheel onto the aforesaid plate, a stationary shearing-blade fixed to said plate, a cutter arranged to move across the shearing-blade, a clamping device for holding the severed thread, and mechanism for operating the thread-guide and thread-severing and thread-clamping devices, substantially as set forth.

2. In combination with the needle-cylinder, needles, and loop-wheel of a knitting-machine, a vertical oscillating thread-guide, a thread-supporting plate arranged beneath the loop-wheel and provided with a stationary shearing-edge and with a stationary thread-clamping shoulder

a thread-clamping plate sliding on the thread-supporting plate and having integral with it a cutter arranged in line with the stationary shearing-edge, and mechanism for transmitting motion to the thread-guide and to the thread-severing and thread-clamping devices, substantially as specified.

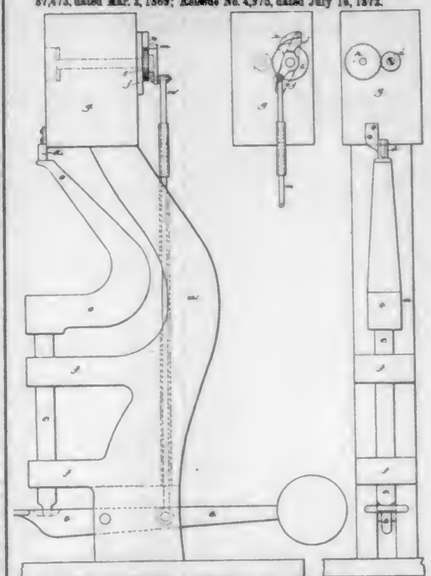
3. In combination with the loop-wheel, the plate *h*, having the front shoulder, *m*, with the cutting-edge O on one end thereof, the sliding plate *p*, having the abutting-edge *p'*, provided with the knife p^3, in range with the cutting-edge O, the lever *r*, connected with the plate *p*, the oscillatory thread-guide T, adapted to throw the thread off the loop-wheel onto the plate *p*, and mechanism for operating the lever *r* and the thread-guide, substantially as shown and described.

4. In combination with the plate *h*, provided with the cutting-edge O, and with the stationary guide *s*, and the sliding plate *p*, provided with a knife, p^3, the adjustable guide *t'*, and spring *t*, pressing against the outer side of said guide, substantially as described and shown, for the purpose set forth.

5. In combination with the spindle A', needle-cylinder A, oscillatory thread-guide T, and the within-described thread-severing mechanism, the collar B, provided with cams *a*, the annular disk F, arranged concentric around the spindle and adapted to rotate independently thereof and provided with the ratchet G and pins *f f*, the arms C, pivoted outside of the disk F, and having the pawl *d*, engaging the ratchet G, the dog H, the cams K, K', K^2, and K^3, and the levers M and M', pitman *g*, and lever *r*, substantially as described and shown.

299,499. DETACHABLE RESERVOIR FOR PENS. GEORGE WASHINGTON WOOLLEY, Washington, D. C. Filed Oct. 25, 1883. (No model.)

Claim.—1. An ink-holding attachment for pens, consisting of a reservoir and a shank, each provided with an air-opening near the upper end of the bulb of the reservoir, substantially as set forth.



2. The ink-holding attachment for writing and drawing pens, consisting of a reservoir and a shank, and provided with an air-duct in the former and an under-cut at and near the point, substantially as and for the purpose set forth.

3. The ink-holding attachment for writing and drawing pens, consisting of a reservoir and a shank, the former provided with a cut-away portion, *g*, at and near its point, substantially as and for the purpose set forth.

4. The ink-holding attachment for writing and drawing pens, consisting of a reservoir and a shank, and provided with an air-transmission duct, and cut-away portion *g* at and near the point, as set forth, combined with a tongue or valve, *d*, substantially as described and shown.

REISSUES.

10,482. NAILING OR PEGGING MACHINE. JOSEPH R. CROSBY, Boston, assignor, by mesne assignments, to Gordon McKay and James W. Brooks, Trustees, Cambridge, Mass. Filed Dec. 15, 1883. Original No. 87,473, dated Mar. 2, 1869; Reissue No. 4,975, dated July 16, 1872.

Claim.—The combination of the vertically-moving horn with the feeding mechanism of the wire-like material, so that the feed of said material shall be in proportion to the thickness of the stock at the points at which fastenings are to be inserted, substantially as described.

PHOTO-LITH. NORRIS PETERS WASHINGTON, D.C.

DECISIONS
OF THE
COMMISSIONER OF PATENTS
AND OF UNITED STATES COURTS IN PATENT CASES.

DECISIONS OF THE U. S. COURTS.

Supreme Court of the United States.

MCMURRAY *et al. v.* MALLORY *et al.*

Decided March 24, 1884.

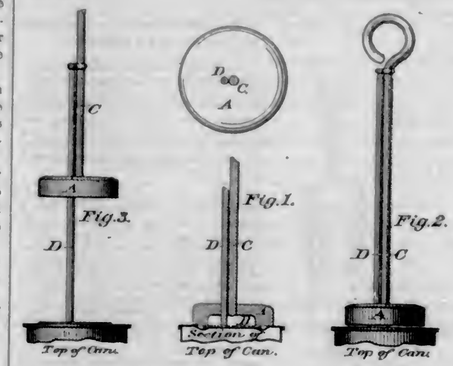
1. The specification and drawings of the reissue upon which the suit is brought being substantially the same as those of the original patent, it follows that the reissue was not for the purpose of making the original specification more full, accurate, or intelligible, or for the purpose of eliminating from it what the inventor had not the right to claim as new.
2. A claim to a combination of parts which specifies that such parts are constructed in a particular way for a special purpose cannot be expanded by reissue so as to include combinations of those parts, expressed so as to cover them broadly and without limitation as to their construction or advantages.
3. It is not competent for the patentee or his assignees by merely disclaiming all the changes made in a reissue patent to revive and restore the original patent. This could be done only, if it could be done at all, by surrender of the reissued patent and the grant of another reissue.
4. The reissue patent granted July 1, 1879, to Edward M. Long as assignee of Abel Barker, construed and held to be invalid as to the first three claims and not to be infringed as to the remaining claims, and the reissue patent to Long as assignee of Bostwick held to be invalid as to the first claim and not to be infringed as to the other claim.

APPEAL from the Circuit Court of the United States for the District of Maryland.

STATEMENT OF THE CASE.

The bill was filed September 2, 1879, by Louis McMurray, Edward M. Lang, and George Burnham, doing business as a firm under the name of McMurray, Lang & Burnham, against Dwight D. Mallory and Jesse C. Luddington, doing business as a firm under the name of D. D. Mallory & Co., to restrain the infringement by them of two certain letters patent. The first was a reissued patent "for certain new and useful improvements in soldering-machines," the original of which had been granted to Abel Barker, May 17, 1870, reissued to Edward M. Lang, one of complainants, January 11, 1876, and again reissued to him July 1, 1879. The second was a reissued patent for an "improvement in soldering-irons," the original of which had been granted to Jabez A. Bostwick, June 21, 1870, and reissued October 29, 1878, to E. M. Lang & Co. The answer of the defendants denied the infringement of either of the patents on which the suit was brought; denied that either Barker or Bostwick was the original inventor of the improvements for which the original letters patent were issued to them respectively; denied that either of the letters patent were ever surrendered according to law, and alleged that the reissues were not for the same inventions as those described in the original letters patent. Upon final hearing the circuit court dismissed the bill, and the complainants have brought that decree under review by this appeal.

Mr. Benj. Price for the appellants.



Mr. S. H. Brown and *Mr. R. H. Smith* for the appellees.

Mr. Justice WOODS delivered the opinion of the Court.

We shall first consider the Barker patent. The original patent was described in the specification as—

A new and useful machine for opening and closing or sealing fruit, oyster, and all other cans hermetically sealed.

The specification was illustrated by drawings, as follows:

They were described thus:

Figure 1 is a vertical section. Fig. 2 is a representation of the machine as applied to the can in opening; Fig. 3 as applied in closing or sealing, with the disk withdrawn and the sliding rod pressed upon the cover to hold it until the solder or sealing material hardens.

The specification then proceeds as follows:

In constructing this machine I make the disk or casting A of sufficient thickness to retain the heat, and of suitable size to cover the lid of the can, with the recess B in the under side to give room for the convex lid of the can, and to confine the soldering process to the outer edge of the lid or cover. To this disk I connect the handle C, of sufficient length to hold when heated. At the side of, and parallel with, the handle I connect the small rod or wire D with a loop or ring connecting it with the handle at the top and the bottom, passing through the disk A, so as to allow it to slide up and down.

The process of sealing a can was thus described:

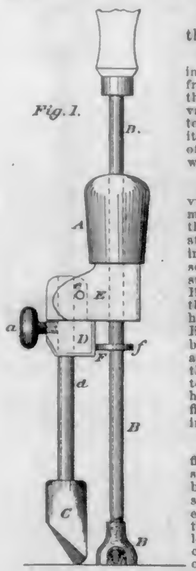
The disk A is sufficiently heated to melt the solder. The rod D is pushed down through the disk and placed upon the center of the cover to hold it. The heated disk is then to be pushed down in contact with the solder or sealing material till it is melted, then turned back and forth till the solder is spread evenly around the lid. The disk is then to be withdrawn, with the rod D still pressed upon the lid, till the solder or sealing material sets or hardens, when the operation is completed.

The claim was as follows:

The disk A, with the recess B in the under side, as set forth, in combination with the movable rod or wire D, to hold the lid while sealing or closing.

The specification of the reissue upon which the suit is brought, and the drawings and the description of the drawings, were substantially the same as for the original patent. It is apparent, therefore, that the reissue was not for the purpose of making the original specification more full, accurate or intelligible, or for

the purpose of eliminating from it what the inventor had not the right to claim as new.



The claims of the reissue, which were five in number, were as follows:

1. In a soldering-machine, a rod adapted to hold the can cap or lid in place, in combination with a soldering-iron mounted upon and arranged to be rotated about said rod, substantially as described.
2. In a soldering-machine, a rod adapted to hold the can cap or lid in place, in combination with a soldering-iron sliding upon said rod and adapted to be rotated about it, as set forth.
3. In combination with a soldering tool or die, the rod D, in passing through said tool or die to hold the can cap or lid in the process of soldering, substantially as described.
4. In a soldering-machine, the combination, with a soldering-tool conforming in shape to the cap to be soldered, of an independently movable rod, D, upon which the said tool is mounted, substantially as described.
5. The disk or tool A, with the recess B in its under side, in combination with and mounted upon the independently movable rod or wire D, as set forth.

The proof showed that defendants used the instrument described in the letters patent issued to Tillery and Ewalt, May 21, 1872.

The specification of these letters was illustrated by the following drawing:

Fig. 1.

The specification described the invention as follows:

The invention consists, first, in making a soldering-tool adjustable radially from a hinge-joint, in order to adapt the same tool to be used with caps of varying size; second, in moving said tool out and in, at the same time fixing it at any point of adjustment by means of a screw that has a loop-head through which passes the holder.

A represents our soldering-tool, provided with the cap-holder B, which maintains the cap in position while the soldering-iron C is rotated. D is a stock, in which the shank *d* of soldering-iron is held at any point by a clamp-screw, *d*. E is the body, in which the stock D is hinged at *e*, while the holder B passes vertically and loosely therethrough. F is a screw, having loop-head *f*, which connects the said holder B and stock D, while it allows them to be spaced at any desired distance apart. In order to effect a change in the radial distance between the centering-holder B and the stock D, that holds the soldering-iron, the holder is first removed and the screw F moved in or out. * * *

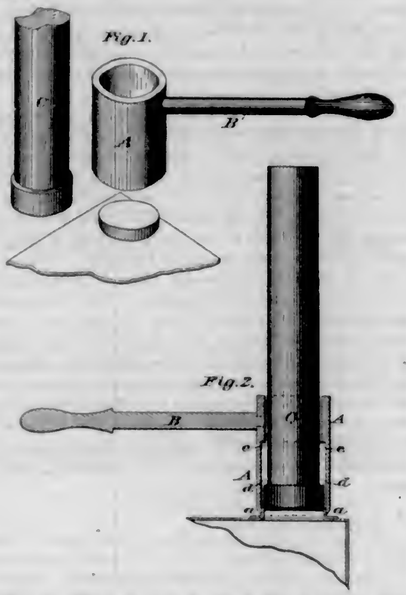
The advantages of this tool consist, first, in the arc shape, by which we can see at a glance any point which has been left unsoldered or imperfectly soldered, and which defect can be remedied at once without removing the tool; second, in the option that it allows us using either wire-solder or the cheaper drop-solder, thereby saving one-half the expense.

There is no doubt that the first three claims of the reissued patent of Barker cover the device here described, but are void because they are each of them broader than the claim of the original patent. The claim of the original patent was for a combination—that is to say, a combination of the disk A with the recess B on its under side, and the movable rod D, to hold the lid of the can while resealing or closing. The specification mentioned a disk and particularly described and illustrated it as forming a part of the combination. By its size, shape, and the recess in its under surface, it was designed to perform certain specified functions. It was made thick so as to retain the heat. It was made circular, like the lid of the can, and of sufficient diameter to cover the lid, so as to reach its outer edge, where the soldering was to be done, and it had the recess in its under side sufficient to give room for the convexity of the lid, so as to confine the soldering process to the outer edge of the lid. The patent did not, therefore, include every soldering-iron of whatever form and shape. In the case of *Brooks* v. *Mears* (16 Pet., 336) it was said of a patent for a combination consisting of three parts that "the use of any two of these parts only, or of two combined with a third, which is substantially different in form or in the manner of its arrangement and connection with the others," is not an infringement. "It is not the same combination if it substantially differs from it in any of its parts." The disk therefore in the Barker patent, substantially as described, is an essential element of the combination covered by that patent.

In the reissue the first three claims of the Barker patent are expanded so as to include all soldering-irons, no matter what their shape or size or specific advantages, in combination with the movable rod D. The contention of the appellants that a device so unlike the soldering-tool described in the original Barker patent as the Tillery & Ewalt tool is embraced by the first three claims of the reissue is striking proof of the expansion of the original claim. It is plain that the claims mentioned include many soldering devices not covered by the original patent. The claims are therefore void. (*Gill* v. *Wells*, 22 Wall., 1; *The Wood Paper Patent*, 23 Id., 566; *Powder Company* v. *Powder Works*, 98 U. S.; *Ball* v. *Langles*, 102 Id., 28; *Miller* v. *Brass Company*, 104 Id., 350; *James* v. *Campbell*, Id., 356; *Heald* v. *Rice*, Id., 737; *Johnson* v. *Railroad Company*, 105 Id., 539; *Bantz* v. *Frantz*, Id., 160; *Wing* v. *Anthony*, 106 U. S., 142.)

The fourth and fifth claims of the reissued Barker patent are not, in our opinion, infringed by the defendants. The fourth claim embraces as one element of the combination a soldering-iron in shape of the cap or lid to be soldered. The shape of the iron is expressly made an essential part of the combination. This element is wanting in the Tillery & Ewalt device used by the defendants. The soldering-iron used by them is totally unlike in shape a cap or lid or the disk described in the Barker patent. One of the two elements of the combination covered by the fourth claim of the Barker reissue is therefore clearly wanting in the Tillery & Ewalt device, and there can consequently be no infringement. The fifth and last claim of the reissued Barker patent is identical with the claim of the original patent, and is therefore free from the objection to which the first three are open. But we think it also is not infringed by the device used by the defendants. The soldering-iron described in both the original and reissued Barker patent is a disk of suitable size to cover the lid of the can to be soldered, with the recess B in the under side, to give room for the convex lid of the can and to confine the soldering process to the outer edge of the lid or cover. This is entirely unlike the soldering-iron described in the Tillery & Ewalt patent, the tool used by the defendants. The latter is not a disk, but closely resembles the common soldering-iron, which is an old and familiar tool, and differs from it only in not having a pointed end, but one made so as to form a short arc of a small circle. The device covered by the Tillery & Ewalt patent was contrived for two purposes, neither of which the Barker contrivance is capable of accomplishing—namely, the adjustment of the soldering-iron radially from a hinge-joint in order to adapt the same

tool to be used with caps or lids of different sizes, and, second, the giving of the soldering-iron such a shape as that it would not hide the process of soldering, but made it possible to see at a glance, without removing the tool, any part of the cap which had been left unsoldered.



The contention of the appellants that the soldering-iron of the Tillery & Ewalt patent is merely the disk of the Barker patent with a large part of its circumference removed defeats itself, for when a large part of the disk is removed it ceases to be a disk, and becomes the mere soldering-iron of the Tillery & Ewalt device, whereas, as we have seen, a disk is an essential element in the invention covered by the Barker patent. We think that by no stretch of construction can the device used by defendants be included in the fourth and fifth claims of the Barker reissued patent, and that the defendants do not infringe those claims.

It remains to consider whether the appellants were entitled to relief against the defendants for the alleged infringement of the Bostwick patent.

The original Bostwick patent was for "a new and useful soldering-iron for soldering metallic caps or other projecting pieces on metallic vessels." It related, so the specification states—

To the construction and use of a hollow soldering-iron for soldering metallic caps or other projecting pieces upon metallic oil-cans or other vessels; said iron, when made with an inclosing edge of the dimensions and form of the rim or edge of the cap or piece to be soldered, so as to conform thereto when placed thereon, and so extended and formed interiorly as to receive and embrace loosely a guiding-rod to be placed upon the cap to be soldered, to hold the latter down firmly until it has been secured by the solder, and at the same time guide the iron to its proper place upon or against the rim or edge of the cap.

The specification was illustrated by drawings, as follows:

The manner in which the device was to be used was thus stated:

After the iron has been properly heated it is slipped over this rod, and the rod, being then placed upon the cap, is held thereon firmly, while the lower rim of the heated iron, duly supplied with solder, bearing upon the joint of the cap with the vessel, will instantly solder and secure the same about its entire circumference. By lifting the rod, its shoulder, engaging with the offset within the iron, will take up the latter with it in readiness to be placed upon another cap, and thus a number of caps may quickly and thoroughly be soldered at one heat of the iron.

The specification then proceeds:

I contemplate making the soldering-iron A and its guiding-rod C of any form in transverse section which may be required, to cause it to fit upon any form of cap or other projection, whether round, square, oval, or of any other curved or polygonal shape. Its lower rim or edge need not be made continuous, but may be broken or slotted.

The claim was as follows:

The hollow soldering-iron A, having a handle, B, and beveled rim *a a*, in combination with the rod C, substantially as herein described and set forth.

On September 3, 1878, Bostwick, with the assent of E. M. Lang & Co., the assignees, made application to the Patent Office for a reissue of his patent. His application was granted, and his patent reissued with a largely expanded specification, and with two claims instead of one, which were as follows:

1.-A tool for soldering the caps on can, consisting of a soldering-iron revolving about a central pivotal rod, which is made to rest upon and steady the cap during the operation of soldering.
2. The combination of a hollow iron for soldering caps on cans with a separate and inclosed weight for steadying the cap on the can during the operation of the soldering.

Comparing the first claim of the reissue with the claim of the original patent, it appears that the former has been greatly broadened. The claim of the original patent was for a combination. One element of the combination was a hollow soldering-iron, A, with the handle B and beveled rim *a a*. This was described in the specification as a hollow cylinder, of metal, made to fit over and inclose the metallic cap to be soldered, its inner diameter at its lower end being somewhat greater than that of the cap. This was nothing more than the annular soldering-iron, which it is conceded was old when the Bostwick patent was issued. The second element was the rod C, whose lower end was described to be about equal in diameter to that of the cap to be soldered.

The first claim of the reissued patent is expanded to embrace as the first element of the combination any "tool for soldering caps," no matter what its shape or size. This tool is made to revolve about a central pivotal rod. The idea of revolving the soldering-tool about the pivotal rod is not suggested in the original patent, but is excluded by the statement in the specification that the inventor contemplated making the soldering-iron and the guiding rod of any form in transverse section necessary to fit in any form of cap, whether round, square, oval, or of any other curved or polygonal shape.

The claim under consideration does not describe with any accuracy the device covered by the original patent, but is made broad enough to include any soldering-iron which is constructed to revolve about a central pivotal rod resting on the cap to be soldered. This claim, however, does accurately describe the Tillery & Ewalt device, and it is apparent from the record that it was drawn for the purpose of making the use of the latter an infringement on the reissued patent. It could not do this without expanding the claim of the original patent. In our judgment, therefore, the invention thus described and claimed is a different invention from that described and claimed in the original patent, and the claim is therefore void.

The second claim of the reissued patent, it is clear, is not infringed by the use of the Tillery & Ewalt de-

vice. The latter employs no hollow soldering-iron, nor does it have a separate and inclosed weight for steadying the cap in the can during the process of soldering, both of which are essential, and they are the only elements of the claim.

The appellants have endeavored to avoid the objection to the reissued Bostwick patent by filing a disclaimer in the Patent Office. The disclaimer was filed September 24, 1883, more than two years and a half after the final decree in the circuit court, and while the case was pending on appeal in this court. If the appellants are, under these circumstances, entitled to have the disclaimer considered, it cannot aid their case.

In support of the application for reissue of his original patent, which was made by Bostwick with the assent and in behalf of the appellants, he took an oath as follows:

That he believes that by reason of an insufficient or defective specification his aforesaid letters patent are inoperative or invalid.

By the disclaimer referred to, the appellants declare that they thereby "di claim all words, phrases, and sentences introduced in the specification" of the reissued patent "which may mean or may be construed to contain any other or different invention than that justly belonging to the inventor, and fairly included in the invention as originally described and claimed," and that they "desire that the reissued patent, when the disclaimed matter is canceled, should read as follows." Then follows a specification and claim, which, with the exception of six consecutive words, not affecting its meaning, is identical with the specification and claim of the original patent. The purpose of the disclaimer and its effect, if valid, was to abandon the reissued patent and resume the original. We are of the opinion that this could not be done by a disclaimer. The original patent had been declared on the oath of the patentee to be invalid and inoperative. It had been surrendered and canceled and reissued letters patent granted in its place. It is not competent for the patentee or his assignees, by merely disclaiming all the changes made in the reissued patent, to revive and restore the original patent. This could be done only, if it could be done at all, by surrender of the reissued patent and the grant of another reissue.

It follows from these views that the decree of the circuit court dismissing the appellants' bill was right and must be affirmed.

U. S. Circuit Court—Southern District of New York.

SIMON *v.* NEUMANN *et al.*

Decided May 10, 1884.

An expansion of claims by reissue nearly five years after the issuance of the original patent is not warranted according to the recent decisions upon this subject.

42

Mr. Frederic H. Betts and *Mr. J. S. Hindon Hyde* for the orator.

Mr. W. C. Hauff and *Mr. John Van Santvoord* for the defendants.

WHEELER, *J.*:

This suit rests upon Reissue Letters Patent No. 9,772, dated June 21, 1881, the original of which was No. 177,020, dated May 2, 1876, and granted to the orator for an improvement in traveling-bags. The improvement consisted in making the lock-plate long enough to support, not only the lock itself and its fastenings, but also ring-loops for the handle attached to raised portions of the plate, and having creases under the ends of the plate for rings or other devices for a carrying-strap, so that attaching the plate to the frame would attach all these parts to the bag.

There were three claims in the original patent—one for the lock-plate, having secured to it the lock, fastening, and ring-loops; one for the lock-plate, having the recesses formed by the raised portions for receiving the ring-loops; and one for the combination of the plate, the lock, and the fastening device secured together and adapted to be fastened to the frame. The ring-loops and the mode of attaching them to an extended plate, and the creases under the ends of the plate for the rings of a carrying-strap, appear to have been new. A lock and fastening secured to a plate adapted to be attached to a bag-frame appear to have been old. The first two claims would, therefore, be valid; but the defendants do not have the ring-loops nor their mode of attachment to the plate, and do not infringe those claims. The third claim, not calling for anything peculiar about the plate more than that it should be combined with the lock and fastening device and adapted to be attached to the frame, by its terms covered nothing that was new and appears to be invalid. Nothing in respect to the creases under the ends of the plate was claimed.

The reissue has two new and additional claims—one for a lock provided with means whereby the rings of the carrying-strap can be attached directly thereto, substantially as specified, and one for a lock having its bottom plate provided with creases for the rings for the handles. These claims have reference to the creases for the rings of the carrying-strap or handle under the ends of the extended lock-plate. They are extended to cover this feature. The defendants have the extended plate and this feature. There is no claim anywhere for the extended plate by itself, and none that is infringed, except these expanded claims made to cover the infringement by the expansion. The expansion was nearly five years after the original, and does not seem to be warranted according to the recent decision upon this subject. Therefore the defendants do not infringe any valid claim, and the bill must be dismissed. Let a decree be entered accordingly, with costs.

DESIGNS.

15,034.—TYPE.—*David Wolfe Bruce*, New York, N. Y. Application filed April 10, 1884. Term of patent 14 years.

15,035 and 15,036.—SPOON OR FORK.—*Hiram W. Hayden*, Waterbury, Conn., assignor to *Holmes, Booth & Haydens*, Connecticut. Applications filed April 7, 1884. Term of patents 7 years.

15,037.—ORGAN-CASE.—*Thomas Hill*, Chicago, Ill. Application filed March 25, 1884. Term of patent 3½ years.

15,038.—TYPE.—*Herman Ihlenburg*, Philadelphia, Pa., assignor to *David Wolfe Bruce*, New York, N. Y. Application filed April 10, 1884. Term of patent 14 years.

15,039.—CHENILLE PENDANT.—*Joseph Loeb*, Philadelphia, Pa. Application filed March 24, 1884. Term of patent 3½ years.

15,040.—ORGAN-CASE.—*Charles W. Newman*, Chicago, Ill. Application filed March 27, 1884. Term of patent 3½ years.

15,041.—NAIL-TRIMMER.—*J. Parker Pray*, New York, N. Y. Application filed December 18, 1883. Term of patent 14 years.

15,042.—FIRE-PLACE FRONT.—*Joseph A. Read* and *John E. McMenomay*, Philadelphia, Pa. Application filed April 21, 1884. Term of patent 7 years.

15,043.—COFFIN-SCREW ESCUTCHEON.—*William M. Smith*, Meriden, Conn., assignor to *The Meriden Britannia Company*, same place. Application filed March 17, 1884. Term of patent 14 years.

15,044.—COFFIN-SCREW.—*William M. Smith*, Meriden, Conn., assignor to *The Meriden Britannia Company*, same place. Application filed March 17, 1884. Term of patent 14 years.

15,045.—DISH-HANDLE.—*Gustav Vogt*, Limoges, France. Application filed April 11, 1884. Term of patent 7 years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upward are registered under the act of March 3, 1881.]

11,211.—CIGARS, CIGARETTES, SMOKING AND CHEWING TOBACCO, AND SNUFF.—*H. Breitwieser & Bros.*, Buffalo, N. Y. Application filed April 29, 1884.

"The words 'THE PRESS,' the pictorial representation of a printing-press, and the pictorial representation of a group of two or more newspapers."

11,212.—OIL OR WATER PROOF CLOTHING.—*John Francis Carter*, Beverly, Mass. Application filed April 14, 1884.

"A five-pointed star."

11,213.—CIGARS, CIGARETTES, AND MANUFACTURED TOBACCOS.—*Gustav Fuchs*, Chicago, Ill. Application filed April 25, 1884.

"The arbitrarily-selected words 'ON TRACK.'"

11,214.—SMOKING AND CHEWING TOBACCO.—*G. W. Gail & Ax*, Baltimore, Md. Application filed April 22, 1884.

"The word-symbol 'THE KRONER' and the coat of arms of Norway."

11,215.—PLUG AND TWIST TOBACCO.—*Hardgrove & Co.*, Richmond, Va. Application filed March 10, 1884.

"The word 'PEACH.'"

11,216.—BALSAMS, LOTIONS, AND LINIMENTS.—*Adolph Hofmann*, Milwaukee, Wis. Application filed March 18, 1884.

"The arbitrarily-selected word-symbol 'UNION.'"

11,217.—FLOUR.—*Samuel Jacoby*, New York, N. Y. Application filed April 11, 1884.

"The arbitrary word 'ESQUISITA.'"

11,218.—SHOE AND GLOVE LEATHER.—*James Kent*, Gloversville, N. Y. Application filed April 7, 1884.

"The word 'DAISY' and the picture of a daisy."

11,219.—CURATIVE PLASTERS.—*Charles F. Fish*, Saratoga, N. Y. Application filed March 29, 1884.

"The picture of a helmet and visor."

11,220.—DENTIFRICK.—*Morley Bros.*, Austin, Tex. Application filed April 29, 1884.

"The word 'ORIDONTO.'"

11,221.—SUPPOSITORIES.—*Mansfield B. Snevily*, Brooklyn, N. Y. Application filed April 14, 1884.

"The word 'VITA.'"

11,222.—INTERNAL REMEDIES.—*Walter A. Taylor*, Atlanta, Ga. Application filed May 2, 1884.

"The words 'DR. BIGGERS.'"

11,223.—MATCHES.—*Aktiebolaget Jönköpings Östra Fabriker*, Jönköping, Sweden. Application filed January 19, 1884.

"The representation of a castle or the word 'CASTLE.'"

11,224.—CHAINS, BRACELETS, BUTTONS, AND OTHER ARTICLES GENERALLY DESCRIBED BY THE TERM JEWELRY.—*Carter, Sloan & Co.*, New York, N. Y. Application filed April 21, 1884.

"The arbitrary symbol of an Indian arrow-head with the letter 'C' marked thereon."

11,225.—WATCHES.—*Georges Favre-Jacot*, Locle, Switzerland. Application filed October 11, 1883.

"The firm-name 'GEORGES FAVRE-JACOT.'"

11,226.—SOFT AND ELASTIC RUBBER GOODS, SUCH AS ARTICLES OF WEARING-APPAREL AND THE LIKE.—*Goodyear Rubber Company*, New York, N. Y. Application filed April 12, 1884.

"The words 'GOLD SEAL' and a gold seal, (or its representation,) either separately or together."

LABELS.

4,133.—Title: "WATERTOWN WOOLEN YARN."—*George A. Lance*, Watertown, N. Y. Application filed April 30, 1884.

4,134.—Title: "ROBERT SHOEMAKER & CO., PURE GROUND SPICES AND DRUGS, PHILADELPHIA."—*Robert Shoemaker & Co.*, Philadelphia, Pa. Application filed May 6, 1884.

4,135.—Title: "SURE HEAVE CURE."—*Thomas K. Smith*, Girard, Erie county, Pa. Application filed April 7, 1884.

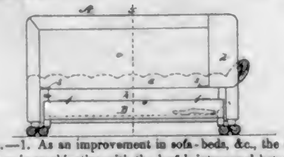
4,136.—Title: "NELSON'S FOOD DIGESTER."—*J. Nelson Solomons*, East Orange, N. J. Application filed May 7, 1884.

4,137.—Title: "J. H. TAYLOR'S GREAT KIDNEY AND LIVER CURE."—*John Henry Taylor*, Three Rivers, Mich. Application filed April 4, 1884.

4,138.—Title: "BLOOD'S IMPROVED GOUT AND RHEUMATIC PILLS."—*Milton S. Woodman*, Lebanon, N. H. Application filed May 12, 1884.

PATENTS

GRANTED JUNE 3, 1884.

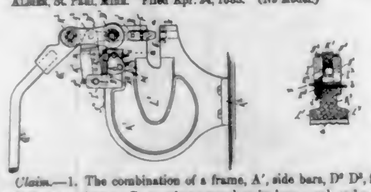


299,500. GEM-SETTING. DEWEY F. ADAMS, Providence, R. I. Filed Feb. 11, 1884. (No model.)

Claim.—1. A gem-setting consisting of a frame or cup, a stone or other object to be set, having a channeled face, as described, and inserted into said frame from the face side thereof, and a cap member which is secured to the frame, and has arms or bars adapted to occupy the channels in the face of the stone, substantially as set forth.

2. A gem-setting consisting of a frame, B, a stone or object, A, having channels *a* in its face, a cap member, C, having arms or bars *c*, adapted to occupy the said channels, and a rim, *c'*, which surrounds the stone and is secured to the frame to hold the stone in place, substantially as set forth.

299,501. SOFA-BED. HENRY L. ALDEN, Boston, Mass. Filed June 7, 1883. (No model.)



Claim.—1. As an improvement in sofa-beds, &c., the drawer B and the back *c*, in combination with the leaf *h*, interposed between them for supporting the back in an upright position, constructed to operate substantially as described.

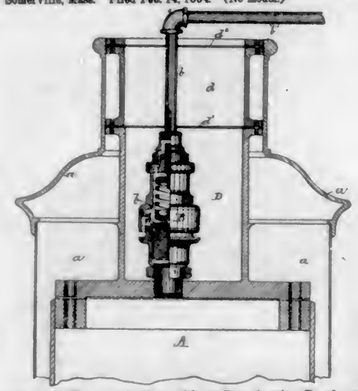
2. In combination with the drawer B and an auxiliary head-rest, *d*, the brace *i*, for supporting the latter when the bed is in use, substantially as set forth.

3. The auxiliary head-rest *d*, the drawer B, with its caster-leg *l*, beveled at its top, and the supporting-brace *i*, pivoted to the inside of the drawer, all combined and arranged to operate as and for the purpose specified.

299,502. PUNCHING AND SHEARING MACHINE. ALEXANDER ALBEE, St. Paul, Minn. Filed Apr. 24, 1883. (No model.)

Claim.—1. The combination of a frame, A', side bars, D^2 D^2, fixed to said frame, a plunger, C, carrying a punch at its lower end, and means adapted to give said plunger an up-and-down movement between said bars, and a shear-jaw, K', pivoted at one end to the frame A' and at the other end to the plunger C, substantially as set forth.

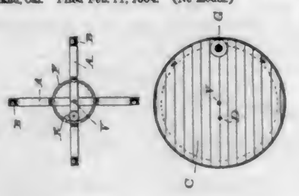
2. The combination of a frame, A', side bars, D^2 D^2, fixed to said frame, a plunger, C, carrying a punch at its lower end and inclosed between said side arms, a forked lever-head, G', adapted to embrace the upper end of said plunger C, a shaft, H', fixed to the lever-head and passing loosely through an aperture in the upper end of the plunger, and provided with eccentric studs H^2 H^2, which turn in bearings in the side arms, D^2 D^2, whereby the plunger is given a vertical movement, and a shear-jaw, K', pivoted at one end to the frame A' and at the other end to the plunger C, whereby it is operated together with said plunger, substantially as set forth.



3. The combination of the frame A', plunger C, eccentric-shaft H' H^2 H^2, lever-head G', side bars, D^2 D^2, shear-jaw K', and graduated plate M, substantially as set forth.

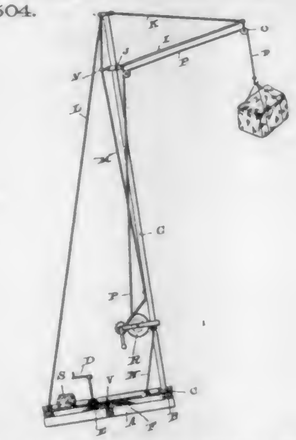
4. The combination of a frame, A', having shear-blade K^3, set-screws *k i*, and shear-jaw K', pivoted adjustably by its rear end upon said frame and movable by its front end, substantially as set forth.

5. The combination of a frame, A', having a shear-blade, K^3, a shear-jaw, K', pivoted adjustably by its rear end upon said frame and movable by its front end, and movable graduated plate M, pivoted to said frame, substantially as set forth.



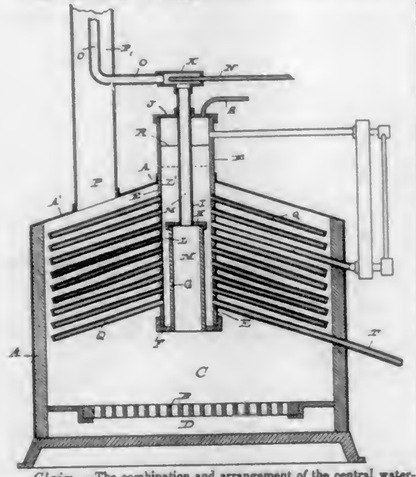
6. The combination of a frame, A', having a shear-blade, K^3, set-screws *k i m*, a shear-jaw, K', pivoted adjustably by its rear end upon said frame and movable by its front end, and provided with a cutting-blade, K^3, and a movable plate, M, provided with a series of graduated openings, substantially as set forth.

299,503. MUFFLER FOR SAFETY-VALVES. HENRY G. ASHTON, Somerville, Mass. Filed Feb. 14, 1884. (No model.)

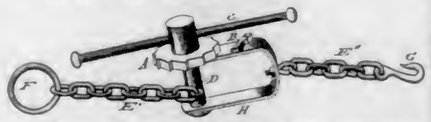


Claim.—The combination, with muffler-chamber D, of a safety-valve and a chamber, *b*, communicating with the air and inclosing the outer part of the valve, substantially as and for the purpose set forth.

299,504. PORTABLE DERRICK. HARRIS AUSTIN and IVES SCOVILLE, Oakland, Cal. Filed Feb. 11, 1884. (No model.)



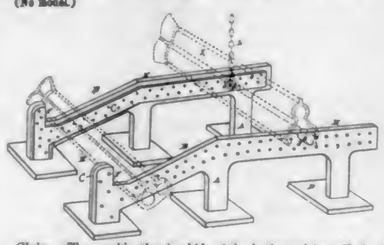
299,504.



Claim.—In a derrick, the combination of the base A, provided with the internally-toothed gear F, friction-rollers B, and supporting the revolving counterbalanced platform C, adapted to be rotated by the crank-handle D and pinion E, and carrying the king-post G, and boom I, all when constructed and arranged to operate substantially in the manner and for the purpose herein shown and set forth.

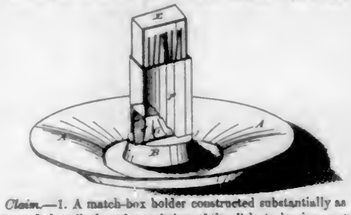
299,505. STEAM-BOILER. EDGAR B. BADLAM, San Francisco, Cal. Filed Dec. 19, 1883. (No model.)

Claim.—The combination and arrangement of the central water-chamber, E, pipes G I, T piece or joint K, and the pipes N and O, the former leading into the furnace and the latter leading into the funnel, substantially in the manner and for the purpose as set forth and described.



299,506. LOAD-BINDER. HORACE B. BANKER, Minneapolis, Minn. Filed Nov. 19, 1883. (No model.)

Claim.—1. The combination, in a log and lumber binder, with the lever C, spindle D, ratchet A, and pawl B, attached to the frame H, of the chains E' and E'', with their ring F, and grab-hook G, substantially as described, to operate in the manner and for the purpose set forth.



2. The combination, in a log and lumber binder, of the ratchet A, pawl B, lever C, spindle D, chains E' and E'', ring F, grab-hook G, and frame H, all combined for operation with the long binding-chains thrown around the logs or lumber, and with the clevis or bolster of the wagon or other conveyance, as described.

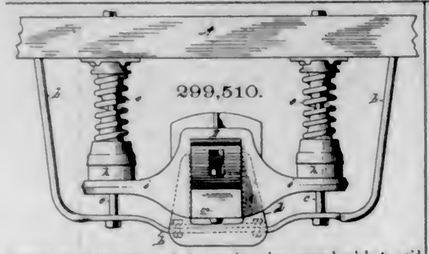
299,507. SKID. JAS. BARNETT, Louisville, Ky. Filed Nov. 30, 1883. (No model.)

Claim.—The combination in skids of the horizontal faces E, the inclined faces B, and the lugs F, substantially as described.

299,508. SELF-ADJUSTING MATCH-BOX HOLDER. HENRY BEEUWKES, Jr., Paterson, N. J. Filed Sept. 17, 1883. (No model.)

Claim.—1. A match-box holder constructed substantially as herein shown and described, and consisting of the dish A, having central upward projection, B, and the U-spring C, as set forth.

2. In a match-box holder, the combination, with the dish A, having a central upward projection, B, of the U-shaped spring C, having its ends bent inward, and provided with side springs, G, substantially as herein shown and described, whereby the holder is adapted to receive and hold different-sized match-boxes, as set forth.



299,509. BOOT. ALBERT BELTZ, Warsaw, Wis. Filed Jan. 24, 1884. (No model.)

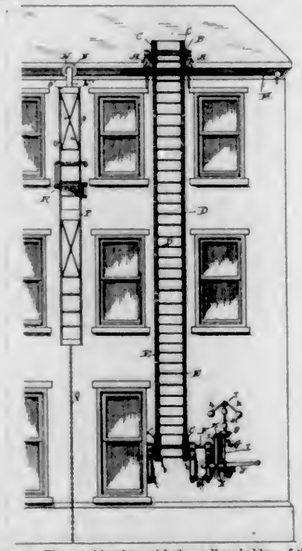
Claim.—As an improved manufacture, a boot composed of felt foundation throughout, the foot portion of which is covered with leather attached to a leather outsole, such leather foot-covering having an upward extension at the heel, as shown, and the parts all united by stitches, substantially as described.

299,510. CAR-TRUCK. SUMNER A. BEMIS, Springfield, Mass. Filed Dec. 5, 1883. (No model.)

Claim.—1. The within-described improved car-box connection consisting of a strap secured to the car on opposite sides of the car-box and

299,510.

passing under the latter, and of a car-box shoe secured solely to said strap under the car-box, and having jaws projecting upward on opposite sides of the latter, substantially as set forth.

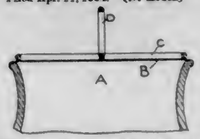


2. An improved car-box connection consisting of a strap secured to the car on opposite sides of the car-box and passing under the latter, and of a car-box shoe secured to said strap under the box, having jaws projecting upward on opposite sides of the latter, which permit of a certain degree of lateral movement of the car-box therebetween, substantially as set forth.

3. In combination with the strap *b*, and with a car-box having perforated spring-steps thereon, substantially as described, the spring-studs passing loosely through said steps and rigidly secured to the car-frame and to said strap, the springs supported on said studs having rubber bases loosely fitted on the latter and bearing on said spring-steps, and a car-box shoe secured on said strap under the car-box, having jaws thereon projecting upward on each side of the car-box, which permit the latter to move laterally between them, substantially as set forth.

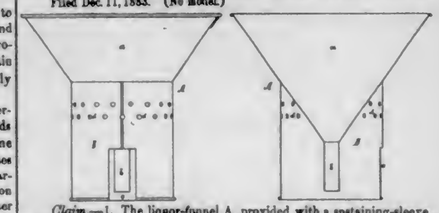
4. In combination with the strap *b*, and with a car-box provided with the braces *i*, and the perforated spring-steps, the spring-studs passing loosely through said steps and rigidly secured to the car-frame and to said strap, the springs supported on said studs having rubber bases loosely fitted on the latter and bearing on said spring-steps, and a car-box shoe secured on said strap under the car-box, having jaws thereon projecting upward on each side of the car-box and between said braces, substantially as set forth.

299,511. FIRE-ESCAPE. LOUIS BLESSING, Jackson, Mich. Filed June 15, 1883. (No model.)



Brief.—A carrier traveling on a ropeway is made to travel to and from the endless ladder, and swinging platforms are arranged adjacent to the windows.

Claim.—1. The combination, with the endless ladder, of the carrier arranged to travel toward and from the ladder, substantially as set forth.

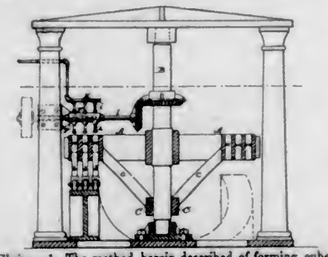


2. The combination, with the endless ladder and the carrier, of the swinging rests, substantially as set forth.

299,512. JUG OR PITCHER COVER. WILLIAM C. BODRETEL, San Francisco, Cal. Filed Apr. 11, 1884. (No model.)

Claim.—The pitcher-cover herein described, consisting of the combination of the wire-netting with curled-over edges closely hugging the rim of the pitcher, and the stiffening-rim C, soldered thereto, as and for the purpose described.

299,513. LIQUOR-FUNNEL. JOSEPH WARREN BOLTON, Lewiston, Me. Filed Dec. 11, 1883. (No model.)



Claim.—1. The liquor-funnel A, provided with a sustaining-sleeve, B, extending downward from the body *a*, and around and below the educt or nose *b* of such funnel, and provided with the notch *c*, to receive a jug-handle, when the sleeve may be on the body, and the educt may be within the mouth of such jug, all being substantially as set forth.

2. The liquor-funnel A, provided with a sustaining-sleeve, B, extending downward from the body *a*, and around and below the nose *b* of such funnel, and perforated where around the body, and provided with a notch, *c*, to receive a jug-handle, when the said sleeve may be resting on the body, and the nose may be within the mouth of the jug, all being substantially as represented.

299,514. METHOD OF AND APPARATUS FOR COMPRESSING PLASTIC, PULVERIZED, AND OTHER MATERIALS. THEODORE C. BRECHT, Washington, D. C. Filed Nov. 6, 1883. (No model.)

Brief.—Improvement on the invention of Letters Patent No. 279,384.

Claim.—1. The method herein described of forming cubes, cakes, &c., composed of pulverized, granulated, or plastic material, which consists in subjecting the molds and the ends of the plungers to a jet or jets of sprayed or comminuted water prior to the filling of the molds with the material, and then compressing it in said molds, as set forth.

2. The process herein described of compressing material into any desired size or shape, consisting in subjecting the molds and the ends of the plungers to one or more jets of sprayed or comminuted water or its equivalent, automatically, just prior to the filling of the molds with the material, and then compressing it within the molds, as specified.

3. In a compressing-machine, a plug, E, provided with one or more cavities arranged in a cylinder provided with openings and spraying-nozzles for injecting jets or sprays into the molds of said machine, as and for the purpose set forth.

4. In a compressing-machine, a rotary plug, E, provided with one or more cavities in its periphery, arranged in a shell, F, having spraying-nozzles, and connected to a source of supply, so as to automatically and intermittently inject into the molds and against the ends of the plungers of said machine one or more jets of water, &c., as and for the purpose specified.

5. In a compressing-machine, a mold-wheel provided with an auxiliary or extended hub having arms or braces cast or secured to said mold-wheel, substantially as shown, and for the purpose set forth.

6. The process herein described of compressing pulverized, granulated, plastic, or other materials into suitable shape and size, which consists in subjecting the molds and ends of the plungers to a jet or jets of sprayed or comminuted water or other fluid, and then compressing it, as and for the purpose specified.

299,515. PROCESS OF TREATING THE WASTE OF SALT FISH.

REUBEN BROOKS, Gloucester, Mass., assignor to the Russia Cement Company, same place. Filed Mar. 3, 1884. (No specimens.)

Claim.—1. The process of preparing the waste portions of salt fish for the manufacture of glue, consisting in, first, crushing, tearing, or otherwise mechanically disintegrating the waste, and, secondly, removing the salt therefrom by the use of water or dilute sulphuric acid, substantially as set forth.

2. The process of preparing the waste portions of salt fish for the manufacture of glue, consisting in, first, crushing, tearing, or otherwise mechanically disintegrating the waste, and, secondly, removing the salt therefrom by exposing the waste to the action of flowing water, substantially as set forth.

3. The process of preparing the waste portions of salt fish for the manufacture of glue, consisting in, first, crushing, tearing, or otherwise mechanically disintegrating the waste, and, secondly, removing the salt therefrom by exposing the waste to the action of flowing water, said water passing downward through the mass, and leaving the material through which it has passed by the pressure of the water in the tank, substantially as set forth.

4. The process of extracting glue from the waste of salt fish, consisting in, first, mechanically disintegrating the waste; secondly, removing the salt therefrom by the use of flowing water, or water with an antiseptic in solution; thirdly, cooking; fourthly, straining, and, fifthly, evaporating, substantially as set forth.

5. The process of extracting glue from the waste of salt fish, consisting in, first, mechanically disintegrating the waste; secondly, removing the salt therefrom by the action of flowing water or dilute sulphuric acid; thirdly, steaming the desalted mass; fourthly, straining, and, fifthly, evaporating, substantially as set forth.

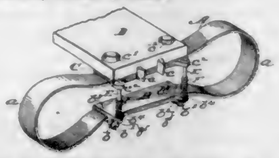
299,516. ORNAMENTATION OF GLASS IN IMITATION OF FROSTING.

DAVID F. BROWN, Omaha, Nebr. Filed Nov. 15, 1883. (Specimens.)

Claim.—1. The method herein described for the production of ornamental imitation frosted glass, which consists in first coating the surface to be ornamented with a varnish or like adhesive material, and then applying thereto a coating of the translucent, scaly, silicious matter herein specified.

2. Glass or like vitreous ware having a frosted surface of adhesive material, and the scaly, translucent, silicious material herein specified.

299,517. CUFF-BUTTON.



JOSEPH BULOVA, New York, N. Y. Filed Mar. 27, 1884. (No model.)

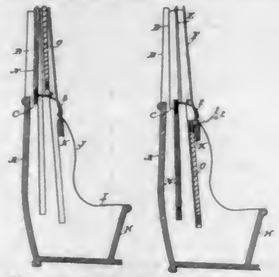
Claim.—The combination of a face-plate, *a*, having shank *b*, with back plate, *c*, lugs *d*, spring *f*, and pin *e*, all being so arranged that the spring is loosely laid on the back plate, and that a space is left between the spring and back plate, substantially as specified.

299,518. WAGON-BOLSTER SPRING.

JOHN R. CALHOUN, St. Louis, Mo. Filed July 16, 1883. (No model.)

Claim.—1. The combination of the spring A, the saddle B, the plate C, and the bolts E E, substantially as described.

2. The combination of the spring A, made of one piece, bowed at *a a*, as described, the saddle B, having ears formed on it, the plate C, having side flanges to receive the edges of the spring A, and the bolts E, substantially as specified.

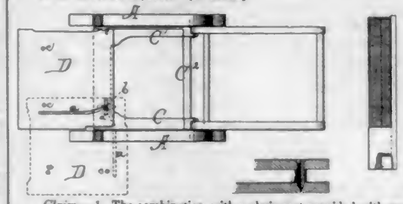


3. The combination of the single spring A, bowed at *a a*, the saddle B, the plate C, having flanges on its sides, the bolts E, and the spring F, and the wagon-bed support D, substantially as described.

4. The spring A, formed in one piece flattened on top at or near its mid-length, having bow *a a* and crooked ends a^2, combined with the plate C and the saddle B, substantially as described.

299,519. WINDOW-GUARD.

GEORGE W. CLARK, Brooklyn, N. Y. Filed Feb. 4, 1884. (No model.)

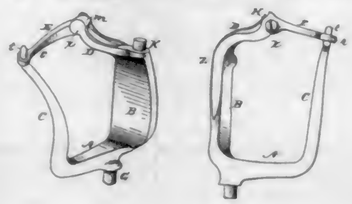


Brief.—A pivoted window-guard hinged to the car-belt closes the mouths of the window and blind chamber at the rear of the seats. The guards also prevent rattling of the windows.

Claim.—The combination, with the sliding windows of a vehicle and the chamber for their reception when dropped, of a movable guard constructed substantially as described, and operating to rest snugly against the sash, and thus close the opening to said chamber, as set forth.

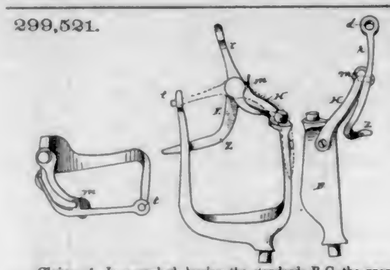
299,520. GYNECOLOGICAL CHAIR.

MONROE M. COFF, Batavia, N. Y. Filed Oct. 11, 1883. (No model.)



Claim.—1. The combination, with a chair-seat provided with ways, substantially as described, of a slide fitted to said ways and pivoted to the seat-frame, substantially as set forth, whereby the same may rest beneath the cushion of the seat or be withdrawn in front of the seat or turned to one side, as and for the purpose specified.

2. The combination, with the seat of a chair having ways, substantially as described, of a slide provided with the slot *a*, fitted to said ways, and a bolt, *b*, passing through said slot, substantially as and for the purpose set forth.

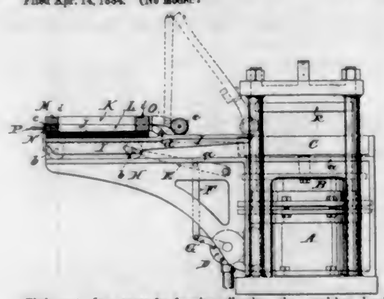


3. The combination, with the chair-seat provided with ways, substantially as described, and having the locking-lug *e*, of the slide D, having the slot *a* and recess *d*, and the bolt *b*, passing through the slot in the slide and uniting the two parts of the frame, substantially as set forth.

299,521. ROWLOCK.

JOHN F. CUMMING, Boston, Mass. Filed Mar. 15, 1884. (No model.)

299,521.



Claim.—1. In a rowlock having the standards B C, the guard E, said guard being pivoted upon one of said standards and adapted to engage the other by means of its apertured end, in combination with a spring for pressing the guard into its engaging position and holding it open, substantially as set forth.

2. In a rowlock having the standards B C, the guard E, provided with the arms *r s*, and projection *m*, said guard being centrally pivoted to one of said standards, in combination with the spring H, all constructed and arranged to operate substantially as specified.

3. In a rowlock, a guard for closing the lock and acting as a brace to its standards, said guard being provided with two arms standing at an angle to each other, one of said arms being adapted to engage one of the standards by its apertured end, and the other adapted to engage the oar when it is inserted in the lock, and thereby close the guard, said guard being centrally pivoted to one of the standards, substantially as set forth.

299,522. PRESS FOR OIL-CAKES.

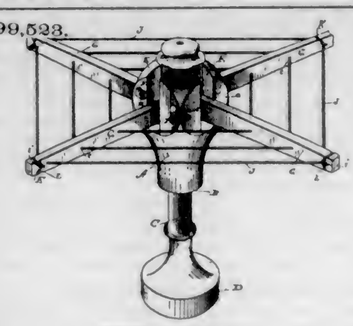
THOS. DE ARMON, Dayton, Ohio. Filed Apr. 14, 1884. (No model.)

Claim.—1. In a press for forming oil-cakes, the meal-box having removable connected side and end walls, substantially as described.

2. In a press for forming oil-cakes, the meal-box mounted upon a traveling carriage and having sectional side and end walls connected and hinged together and hinged to the carriage, whereby said walls may be lifted from the bottom of the box, substantially as and for the purpose described.

3. In a press for forming oil-cakes, a traveling or sliding meal-box composed of the side pieces, I, mounted on rollers *b*, bed-plate J, end walls, K L, and side walls, M N O, said end walls being hinged to the side pieces, I, and provided with rollers *a*, the parts constructed and united substantially in the manner and for the purpose specified.

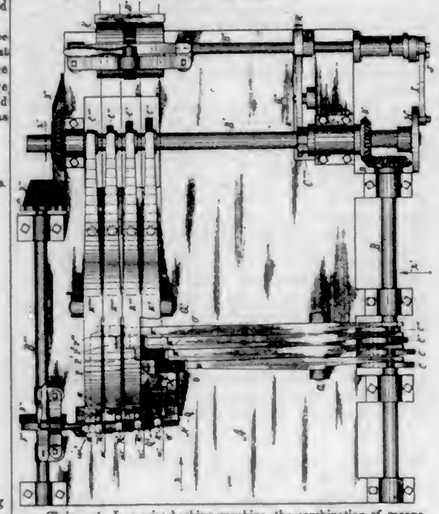
4. In a press for forming oil-cakes, the combination, with the meal-box, of the enfolding-cloth having side and end flaps, as and for the purpose described.



5. In a press for forming oil-cakes, the combination, with the meal-box having removable side and end walls, of the enfolding-cloth having side and end flaps, substantially as described.

299,523. CLOTHES-DRIER.

GEORGE W. DEKER, Canandaigua, N. Y. Filed Sept. 5, 1883. (No model.)



Claim.—As an improvement in clothes-driers, a standard, C, in combination with the head A, provided at its lower end with a socket loosely fitting the upper end of the standard, and having sides or faces *a*, each of which is formed with vertical slots E, recesses F in the rear of the slots, and arranged above the bottom wall of the same, thereby forming shoulders *e*, the arms G having an elongated slot at the inner end, and bolts passing through the head and arms within the slots, the said bolts being located as shown, whereby the arms may be held in an extended or a vertical position, as set forth.

299,523.

299,524. WIRE-BARBING MACHINE.

THOMAS H. DODGE, Worcester, Mass. Filed Feb. 23, 1884. (No model.)

Claim.—1. In a wire-barbing machine, the combination of means for supporting a series of main wires to be barbed, means for feeding a single barb-wire across and in contact with all the main wires, and means for forming from said single barb-wire a series of barbs, and for applying one of them upon each of the main wires of said series.

2. In a wire-barbing machine, the combination of a series of wire-supporting spindles, each adapted to support a main wire to be barbed, means for feeding a single barb-wire across the entire series of main wires so supported, and in front of said wire-supporting spindles, and means for forming from said single barb-wire a series of barbs and for applying one of them upon each of said main wires.

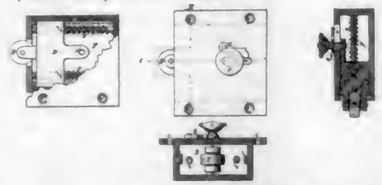
3. In a wire-barbing machine, the combination of a series of parallel spindles, axially perforated for the passage and support of a corresponding series of main wires separated by uniform spaces, each equal to the length of wire required to form a barb on one of said main wires, means for feeding a single barb-wire across said main wires and in front of said spindles, and means for successively forming from said single barb-wire a series of barbs and for applying them successively one on each of said main wires.

4. In a wire-barbing machine, the combination of a series of parallel spindles axially perforated for the passage and support of a corresponding series of main wires separated by uniform spaces, each equal to the length of wire required for a barb upon one of said wires, suitable wrapping-pins fixed in the front faces of said spindles, means for feeding a single barb-wire across said main wires in front of said spindles, and between said main wires and said wrapping-pins, a series of cutting devices adapted to sever said barb-wire in the spaces between said spindles, means for successively rotating said spindles at suitable intervals of time, and means for successively operating said cutting devices in the intervals of time between the movements of said spindles, whereby from

said single wire barbs are successively wrapped about said main wires by said wrapping-pins, and severed by said cutting devices.

5. The combination of the series of parallel axially-perforated spindles Q Q′ Q″ Q‴, and a suitable stationary bearing in which they are journaled, the series of pinions P P′ P″ P‴, mounted on the rear ends of said spindles, respectively, each pinion of the series lying wholly in rear of the one next preceding it in the series, the series of segments O O′ O″ O‴, engaging with said pinions, respectively, and means, substantially as described, for imparting reciprocal motion to said segments, whereby said spindles are rotated reciprocally, substantially as shown and described, and for the purpose set forth.

6. The combination of the journaled barb-wrapping spindles Q Q′ Q″ Q‴, pinions P P′ P″ P‴, mounted on said spindles, respectively, segments O O′ O″ O‴, engaging with said pinions, respectively, and adapted, when moving downward, to rotate said spindles in the direction for wrapping, and when moving upward to rotate said spindles in a reverse direction, the pivoted levers E E′ E″ E‴, formed integrally with said segments, respectively, and the cams C C′ C″ C‴, operating said levers, respectively, and adapted, through the operation of said levers, to depress said segments successively, and raise them simultaneously, substantially as and for the purpose set forth.



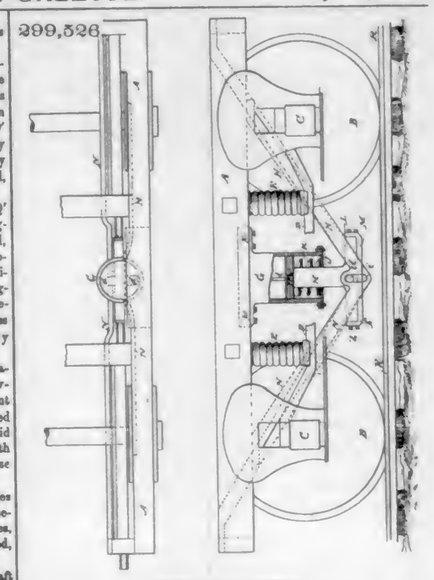
7. The combination of the series of knives R′, fixed in suitable stationary bearings, the vertically-reciprocating levers E′ E‴ E⁴ᵗʰ E⁵ᵗʰ, pivoted on a suitable horizontal axis, the knives R, fixed in seats in the front faces of said levers, respectively, and the cams C′ C‴ C⁴ᵗʰ C⁵ᵗʰ, mounted on the shaft B′, and adapted to depress the knife-carrying ends of said levers successively, whereby said knives R co-operate successively with the knives R′, substantially as shown and described, and for the purpose set forth.

8. The combination of the series of stationary knives R′, the series of vertically-reciprocating knives R, co-operating therewith, and the series of slotted wire-guides T, attached to the heads carrying said knives, and moving reciprocally therewith, substantially as shown and described, and for the purpose set forth.

9. The combination of the geared barb-feeding rolls F′ F″, the shaft B‴, on which the lower of said rolls is mounted, the shaft B′ at right angles to said shaft B‴, the mutilated gear D″, mounted on the shaft B′, and provided with a circumferential flange, d''', which is cut away on the arc subtending the toothed surface of said gear, and the pinion D‴, mounted on the shaft B‴, and provided with the opposite cam-faces, d, adapted to engage with the flange d''' and prevent the rotation of said pinion when not in engagement with the toothed portion of the mutilated gear, substantially as shown and described, and in combination with the obliquely-placed front faces of the spindles Q Q′ Q″ Q‴.

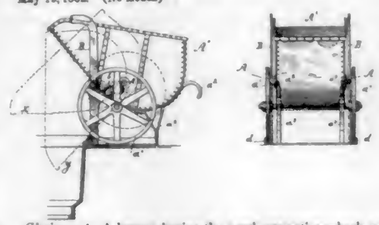
10. The combination of the series of wire-supporting spindles Q Q′ Q″ Q‴, whose front ends are in a line slightly oblique to the lines of their axes, and means, substantially as described, for feeding a barb-wire along the oblique line of said front ends, and in contact with the faces of said spindles, substantially as and for the purpose set forth.

299,525. WINDOW-SASH HOLDER. JOHN E. DOHEN, Charleston S. C. Filed June 3, 1883. (Model.)



Claim.—The combination of the slide D, having rubber or other wheel, E, and compressed into place by the springs H, the whole inclosed in box F, with a knob, C, connecting with the slide D and running in the slot a', and the catch G, as and for the purpose specified.

299,526. CAR-BRAKE. THOMAS WM. DUFFY, Medford, Mass., assignor to Dudley G. Hall, same place. Filed Mar. 19, 1884. (No model.)

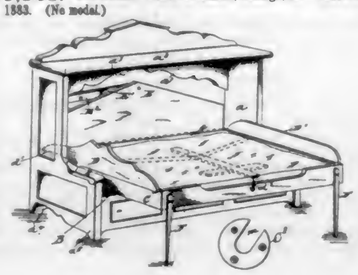


Claim.—1. In a car-brake substantially such as described, the following instrumentalities, to wit: an air-cylinder provided with a piston, a piston-rod connected with said piston within the cylinder and carrying a brake-shoe at its outer end adapted to engage the rail, a spring disposed within the cylinder and adapted to retract the piston-rod, and a brace, substantially as described, adapted to resist the end-thrust of the brake-shoe when said shoe is in frictional contact with the rail, in combination with suitable operative mechanism, substantially as set forth.

2. In a car-brake substantially such as described, the cylinder G, provided with the piston m and spring K, the rod H, provided with the bar L, shoe M, and stud d, and the braces N, provided with the slots i, constructed, combined, and arranged to operate substantially as specified.

299,526

299,527. BARROW. JULIUS AARS DYBLIE, Cummings, Ill. Filed May 19, 1882. (No model.)



Claim.—1. A barrow having the usual supporting-wheels and a set of supplemental trunnions, about which the entire barrow, with its wheels, may temporarily turn, substantially as described.

2. The combination, with the barrow having the usual supporting-wheels and a set of supplemental trunnions, of the tip-stands adapted to receive and support said trunnions and to allow the barrow to turn thereon, substantially as described.

3. The combination, with the barrow A′, having supporting-wheels a' and supplemental trunnions A, of the tip-stands B, having lips b, substantially as described.

4. The combination, with the barrow A′, having supporting-wheels a' and supplemental trunnions A, of the tip-stands B, having lips b and guides D, substantially as described.

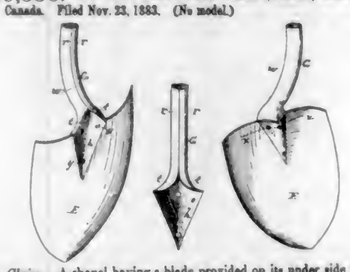
299,528. SOFA-BED. PHILIP A. EMERY, Chicago, Ill. Filed July 5, 1883. (No model.)

Claim.—1. The combination of the frame A, constructed substantially as shown and described, with the bed-frame C and head-board D, the latter being reduced at its inner end, and adapted to operate as set forth, said frame and head-board being independently pivoted to the frame, as shown and described.

2. The combination, with the pivoted bed-frame C, of a hinged side board, E, hook d^3, and the folding bars E′ and E², as and for the purpose set forth.

299,529. LIFTING-JACK. HENRY J. ENGLAND, Falls Church, Va. Filed May 2, 1884. (No model.)

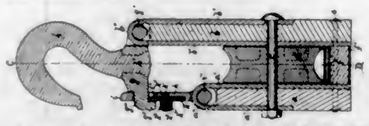
Claim.—1. A lifting-jack, consisting of a bent body formed of a single piece of wood or metal, a central lifting-bar pivoted within said body and provided with a bracket secured a short distance from the outer end of the same, said bracket and outer end of said lifting-bar being provided with corrugated plates, substantially as shown.



2. A lifting-jack, consisting of a body formed of a single piece of wood or metal, the center cut out to form a lifting-bar, which is pivoted between the cut sides, the free ends of said piece being held in place by a straight hand-piece and bolt, substantially as shown.

3. A lifting-jack, consisting of a body formed of a single piece of wood or metal, the center cut out to form a lifting-bar, which is pivoted between the cut sides, the free ends of said piece being held in place by a curved hand-piece secured by screw-bolts, substantially as shown.

4. In a lifting-jack, the bent body A, the thickened bearing part B, having points C, the tie-bolt E, the pivot-bolt G, the holding-bolt H, and the rounded handle part A′, in combination with the lifting-bar F, having bracket e, provided with corrugated plate f, and the flexible connecting-strap I, all arranged and operated substantially as shown and specified.



5. In a lifting-jack, the body A², having end bearing, B², and straight sides A⁴, the pivot-pin G, the binding-bolt H, and the curved handle L, secured by screw-bolts g, in combination with the lifting-bar, F, pivoted between sides A⁴, and having bracket e and the flexible strap C, connecting-bolt H, and bar F, all arranged and operated substantially as shown and specified.

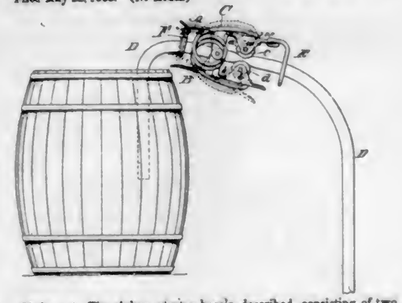
299,530. SHOVEL. EDWD. LAWSON FENERTY, Halifax, Nova Scotia, Canada. Filed Nov. 23, 1883. (No model.)

Claim.—A shovel having a blade provided on its under side with a depression which gradually decreases in depth and diminishes in size from its outer to its inner end for receiving the attaching tang or flange of the handle-socket, said depression being V-shaped in area and A-shaped in cross-section, and a handle-socket provided with an attaching tang or flange which is V-shaped in area and A-shaped in cross-section, and adapted to fit said depression, said tang or flange being integral with the body of the socket and riveted to the blade of the shovel by rivets, the lower ends of which are within said depression and above the plane of the under side of the blade at said depression, substantially as set forth.

299,531. SNATCH-BLOCK. THOS. R. FERRALL, Boston, Mass. Filed Apr. 28, 1884. (No model.)

Claim.—1. In a snatch-block, the head g, hinged to the bow-strap b' on the side piece b, as and for the purpose set forth.

2. In a snatch-block, the side pieces, a b, having the bow-straps a' b', as described, and the head g, hinged to bow-strap b', and link i, hinged to the bow-strap a', as and for the purpose set forth.



3. In a snatch-block, the side pieces, a b, and their respective bow-straps a' b', in combination with the head g, hinged to bow-strap b', and having locking projection g''', with lip g^4, adapted to be locked to the link i, hinged to bow-strap a', or its equivalent, and having locking-disk k, as and for the purpose set forth.

4. In a pulley-block, the sides a b, in combination with the end piece, f, and its metal shield or casing f', as and for the purpose set forth.

5. In a snatch-block, the sides a b, with their two bow-straps a' b', as and for the purpose set forth.

6. In a snatch-block, the hinged link i and its locking button or disk k, combined with the frictional or equivalent retaining device, substantially as and for the purpose set forth.

299,532. SIPHON-STARTER. EUGENE L. FITCH, Des Moines, Iowa. Filed May 22, 1883. (No model.)

Claim.—1. The siphon-starter herein described, consisting of two spring-pressed plates hinged to each other, and carrying opposite rollers for grasping a tube, one of the spring-pressed plates being provided with a ring at one end for engaging with the rear end of the other plate, substantially as shown and described.

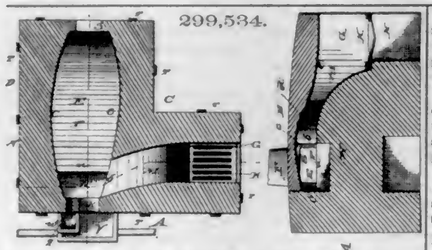
2. The siphon-starter herein described, consisting of two spring-pressed plates hinged to each other, and carrying opposite rollers for grasping a tube, one of the spring-pressed plates being provided with a ring at one end for engaging with the rear end of the other plate, and a guide-loop for the tube at its opposite end, substantially as shown and described.

3. In a siphon-starter, the combination, with the hinged plates A B, formed with side arms, a b, by which the plates are hinged together, and with the side arms, a' b', of the rollers c d, journaled in the arms a' b', substantially as shown and described.

4. In a siphon-starter, the plate A, provided with the loop E and ring F, in combination with the hinged plate B, the plates A B being adapted for grasping and collapsing the siphon-tube, substantially as described.

299,533. DOUBLE BUCKLE. CHARLES H. FREER and MAYNARD M. FREER, Blue Earth, Minn. Filed Mar. 26, 1884. (No model.)

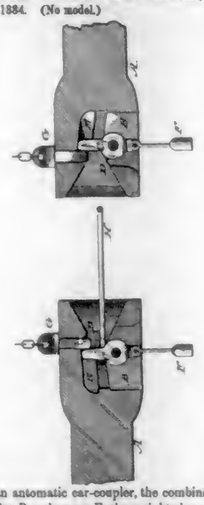
Claim.—1. In a buckle, the combination, with the sides having the cross-bars a and end cross-bars, b, of the tongue-bar c and cross-bar d, substantially as set forth.



2. The herein-described buckle A, consisting of the sides B, having the cross-bars a, and having their ends bent upwardly and connected by cross-bars b, one of which is provided with a bushing or roller, a tongue-bar, c, carrying a pivoted tongue, and the cross-bar a, having an upwardly-projecting stud, and a bar, d, forming, in connection with the bar b, a tuck-loop, substantially as set forth.

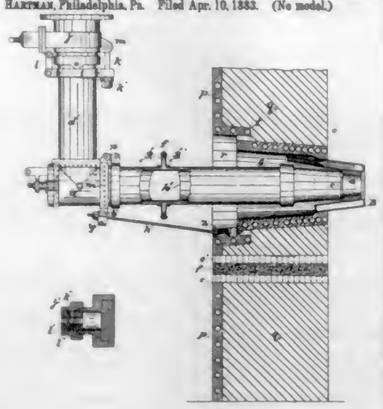
299,534. SMELTING-FURNACE. ABRAM GIBSON, Hughesville, Mont. Filed June 23, 1883. (No model.)

Claim.—1. In a smelting-furnace of angular or L form, the inclined transverse oven-floor P, terminating in a lip at a, and at the end of the floor below the lip, and directly in rear of the flame-throat a lead-well or crucible, w, having an opening, k, through the furnace-wall for the escape of the slag, substantially as specified.



2. The combination, with the L-shaped furnace having the inclined

299,534.



oven-floor, and the crucible or lead-well *w*, having a discharge-opening, *k*, of a cooling-tank, V, having a supply-pipe for cold water and a discharge-pipe for the water which is warmed by the slag passing over from the crucible, substantially as specified.

299,535. CAR-COUPLING. MAHLON HARROLD, Fort Worth, Tex. Filed Mar. 27, 1884. (No model.)

Claim.—In an automatic car-coupler, the combination of the drawhead having the slot B and recess E, the weighted and pivoted lever C, extending up into said recess, and a locking-pin, G, with which said lever engages, substantially in the manner as and for the purpose herein shown and described.

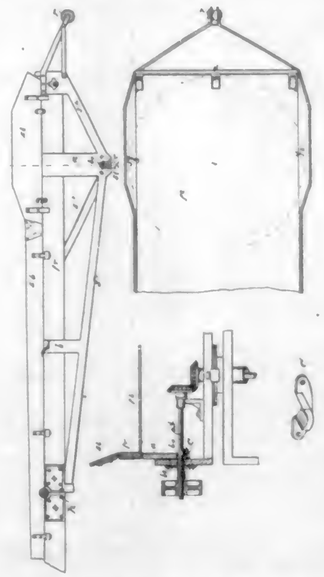
299,536. TUYERE AND ATTACHMENT THEREFOR. JOHN M. HARTMAN, Philadelphia, Pa. Filed Apr. 10, 1883. (No model.)

Claim.—1. The combination, with the tuyere, of a detachable nozzle-piece made of metal having higher conducting-power than iron, and fitting the interior of the tuyere, metal and metal, in immediate proximity to the tuyere-nose, substantially in the manner and for the purposes specified.

2. The combination, with the tuyere and the hinged tuyere-pipe *c*, of the detachable nozzle-piece *a*, fitting closely within the tuyere in immediate proximity to the nose thereof, and having its rear end countersunk to receive the convex end of said tuyere-pipe, substantially as specified.

3. The combination, with the tuyere-pipe *c*, formed in two sections, of the annular flanges *g g'*, and washer *f*, forming a flexible joint between said sections, and the freely-suspended inner pipe, A, constituting a continuous lining for said sectional tuyere-pipe, substantially as and for the purposes set forth.

4. The combination of the downwardly-depending pipe *d'*, having the tuyere-pipe hinged to its lower end, and lugs *o* at its upper end, with the hinged swivel-bridle *i*, upon which said projections rest, and suitable attaching devices for securing said bridle, substantially as set forth.



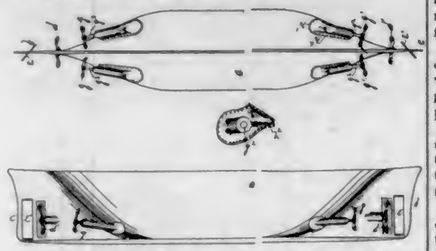
5. The combination of the elbow *a'*, having a flange, *m'*, the tuyere-pipe *c*, hinged to said flange, the tie-rod A, and lug *z*, whereby said pipe and elbow are secured together and stayed against the pressure within the furnace, substantially as specified.

6. The combination, with the flange *m'* and tie-rod, of the lug *y*, opening at the side, substantially as specified, and for the purposes set forth.

7. The combination, with the crucible-jacket and the tuyere-breast, of the flange *t*, formed upon said jacket, and adapted to receive and sustain said breast, substantially as specified.

8. As an improvement in eye-pieces for tuyeres, the combination, with the glass thereof, of washers of fire-proof, non-conducting, pliable material arranged upon each side of said glass, substantially in the manner set forth.

299,537. STRAW-CARRIER. LEWIS W. HASSELMAN, Indianapolis, Ind. Filed Nov. 5, 1883. (No model.)

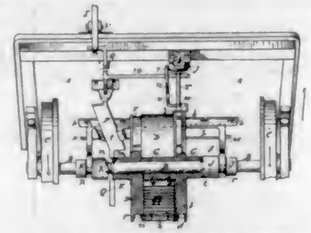


Claim.—1. The straw-carrier frame *fr*, the tilting arm *a*, connected by struts *s' s²* to the frame, the boxing *bo*, cap *c*, and shaft *ax*, all combined substantially as described.

2. The straw-carrier frame *fr*, tilting arm *a*, mounted on shaft *ax*, boxing *bo* and cap *c*, struts *s s' s²*, and brace *b*, all combined substantially as described.

3. The carrier-frame *fr*, tilting arm *a*, shaft *ax*, boxing *bo*, cap *c*, hinge *h*, and struts *s²* and *s*, the latter fitting into a socket formed under the inner part of hinge *h*, all combined substantially as described.

299,538. SCREW-PROPELLER FOR VESSELS. ELIAS S. HAWLEY, Buffalo, N. Y. Filed Nov. 28, 1882. (No model.)



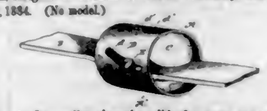
Claim.—1. A vessel having its bow and stern of like tapering configuration, and being provided with three propeller-screws at each end, one screw being located in the dead-wood in the line of the keel, and the other two being twin screws, located substantially as shown, the six screws having their combined working area at least equal to or somewhat greater than the maximum immersed transverse section of the vessel, substantially as shown and described.

2. A vessel having its bow and stern of like tapering configuration, and provided with twin screws in both bow and stern, the shafts of which are inclined in an upward direction, substantially as shown, and for the purpose stated.

3. A vessel having its bow and stern of like tapering configuration, and provided with twin screws in both bow and stern, the shafts of which are inclined in an upward direction and converge toward the bow and stern, substantially as shown, and for the purpose stated.

4. The sheath for the protruding ends of the shafts of the twin screws *g g g' g'*, consisting of the cylindrical portion A and the extension A', having the sharp edge A^3 between the end of the shaft and the side of the vessel, substantially as shown and described.

299,539. CAR-STARTER. SAMUEL HENRY, Braintree, Mass. Filed Mar. 19, 1884. (No model.)



Claim.—1. The improved car-starter herein described, the same consisting of the case D, spring H, sleeve G, clutches J K, bar I, rods T F, levers U W, arms 10 and 23, rod Q, slide P, levers R S, axle B, and wheels C, constructed, combined, and arranged to operate substantially as specified.

2. In a car-starter, the lever W, in combination with the rod F, rod Q, arm 23, and case D, substantially as and for the purpose set forth.

3. In a car-starter, the lever U, in combination with the rod T, rod Q, arm 10, and sleeve G, substantially as and for the purpose specified.

4. In a car-starter, the plate P, in combination with the rod Q, bar I, arms N, clutches J K, and levers R S, substantially as and for the purpose set forth.

299,540. CLAMPING-SLIDE FOR STRAPS. JACOB HERRINER, Chicago, Ill., assignor of one-half to Robert V. Stanley, same place. Filed Mar. 27, 1884. (No model.)

Claim.—1. In a roller clamping-slide for straps or strips, the combination, with a roller, of a slide-body provided with a wall opposed to the roller, a guide or guides for the roller inclined with reference to said wall, and a prominence at *a*, whereby the strap is borne into engagement with the roller before the latter is brought into clamping position, all substantially as described, and for the purposes set forth.

2. In a roller clamping-slide, the combination, with a ribbed or serrated roller, of a slide-body provided with a wall opposed to the roller, and a roller guide or guides inclined with reference to said wall and serrated to positively engage the roller, all substantially as described, and for the purposes set forth.

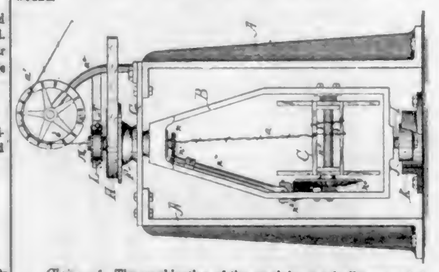
3. In combination with the wall of the slide having a prominence, *a*, a roller guiding surface or surfaces inclined to said wall and provided with serrations, and a roller serrated to positively engage the serrated guiding surface or surfaces, substantially as described, and for the purposes set forth.

4. A reversible cylindric clamp-slide having a central stop-passage, side walls provided with oblique slots, a clamping-roller movably retained in said slots, and two oppositely-arranged prominences at *a a* in the strap-passage, whereby the strap is brought into engagement with the clamp-roller, all substantially as described.

5. The combination, in a clamping-slide for a strap or strip, of an oppositely and obliquely slotted shell, D, a roller movably retained in the slots, and oppositely-arranged parts C and C', secured within the shell and provided with rounded ends and prominences *a*, all substantially as described.

6. The combination, with a harness-rein, of an adjustable clamp-button constructed with a passage for a strap having one or more prominences, *a*, a clamping-roller, and oblique roller-guides, all substantially as described.

299,541. MACHINE FOR ATTACHING TAGS AND LABELS TO PLUG-TOBACCO. NAPOLEON B. HEATT and EDWIN R. HEARN, Jersey City, N. J., assignors to P. Lorillard & Co., same place. Filed Aug. 9, 1881. (No model.)



Claim.—1. In a machine for attaching tin tags to plug-tobacco, the combination, with the vertically-sliding platform A' A^2, of the independent and removable strip E, provided with apertures *f*, and of the posts or uprights G below the strip E, substantially as herein shown and described, and for the purpose set forth.

2. In a machine for attaching tin tags to plug-tobacco, the combination, with the vertically-sliding platform A' A^2, of the apertured independent and removable strip E, the posts or uprights G, the springs J, and the stops K, substantially as herein shown and described, and for the purpose set forth.

3. In a machine for attaching tin tags to plug-tobacco, the combination, with the platform A' A^2, of the apertured strip E, the posts G, and the adjustable gages L and N, substantially as herein shown and described, and for the purpose set forth.

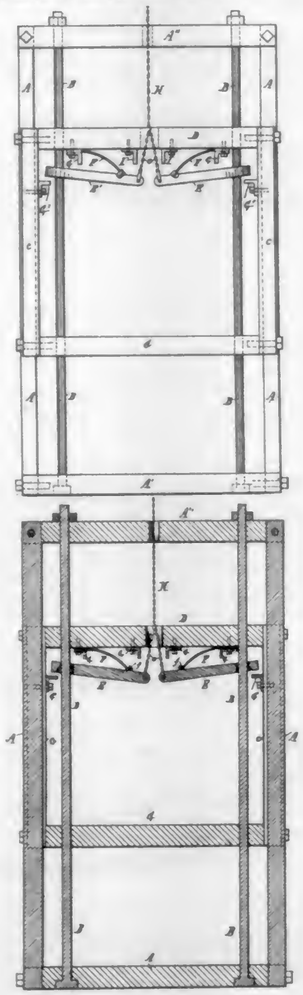
299,542. BARBED-WIRE TWISTING AND SPOOLING MACHINE. CHRISTIAN C. HILL, Chicago, assignor to George Monroe Fish, Oak Park, Ill. Filed June 18, 1883. (No model.)

Brief.—The revolving spool-frame is suspended from a ball-and-socket joint. The lower end of said frame has no fixed bearing, but is provided with a friction-pulley which fits within a large cup or shell secured to the base of the machine, so as to prevent the frame from being swung or oscillated too much out of position. Suitable mechanism is provided for revolving the spool upon which the twisted strands are wound.

Claim.—1. The combination of the revolving vertically-suspended frame with a universal joint or bearing from which said frame is suspended, means for supporting said joint or bearing, and a spool mounted on said frame, so that the center of gravity and rotation may always coincide, substantially as specified.

2. The combination of the spool with a vertically-suspended revolv-

ing frame, a ball-and-socket joint or bearing from which said frame is suspended, means for supporting said joint or bearing, and mechanism for revolving the spool to wind the twisted strands thereon, substantially as specified.

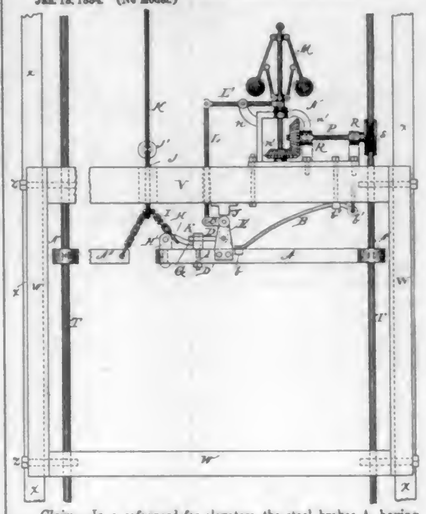


3. The combination, with the spool, of the vertically-suspended revolving frame, a universal joint or bearing from which said frame is suspended, means for supporting said joint or bearing, a cup or shell loosely confining the lower end of said frame so that the same may adjust its center of gravity to its center of rotation, and mechanism for revolving the spool to wind the twisted strands thereon, substantially as specified.

4. The combination, with spool C, of revolving suspended frame B, sleeve D, ball E, socket F, means for supporting said socket, pulley H, and mechanism for revolving the spool to wind the twisted strands thereon, substantially as specified.

5. The combination, with spool C, of revolving frame B, sleeve D, ball E, socket F, pulley H, stud I, friction-pulley J, cup K, and mechanism for revolving the spool to wind the twisted strands thereon, substantially as specified.

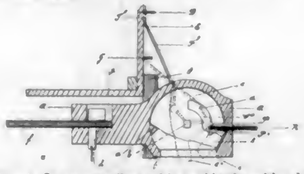
299,543. AUTOMATIC SAFETY-BRAKE FOR ELEVATORS.



CHARLES A. HOFFNAGLE, Vergennes, Vt., assignor of one-half to Frederick W. Cox, same place. Filed Dec. 3, 1883. (No model.)

Claim.—In an automatic safety-brake for elevators, the steel brakes E E', provided with oval slots beveled inwardly from below, in combination with the rods B, springs F, flanged plates G', secured to the hoisting-frame sides C, and the hoisting-beam D, provided with flanged plates G and I, all constructed and arranged to operate substantially as specified.

299,544. SAFEGUARD FOR ELEVATORS.

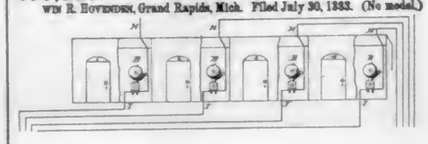


CHARLES A. HOFFNAGLE, Vergennes, Vt., assignor of one-half to Frederick W. Cox, same place. Filed Jan. 18, 1884. (No model.)

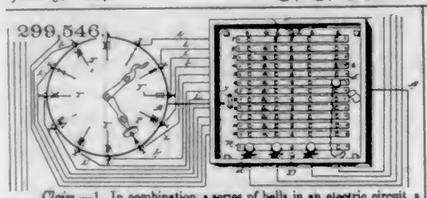
Claim.—In a safeguard for elevators, the steel brakes A, having oval slots beveled inwardly from below, and provided with trigger H, bell-crank lever C, and sliding bar D, in combination with the chain I, springs B, governor M, and friction-wheel S, all constructed and arranged to operate substantially as specified.

299,545. CAR-COUPLING.

WILLIAM H. HOLLEY, Kansas City, Mo., assignor of one-fourth to Mathew T. Whipple, same place. Filed Apr. 4, 1884. (No model.)



Claim.—1. In a car-coupling and in combination with a draw-head that is devoid of openings in its upper side, the vertical disk-chamber *i i*, provided with projecting stop *a*, the link-opening P P', formed with a convexity near its outer end, upon which the link is adapted to be oscillated, and with the described angular surfaces at its inner extremity for the purpose of raising and lowering and thrusting outward the said link, the unbalanced coupling-disk *c*, provided with segmental coupling-hook W, annular cam-slot *d*, and stop-lug *e d'*, all arranged substantially as shown and described.



2. In an apparatus for coupling cars, the combination of the unbalanced coupling-disk *c*, the journal N N', cranks M M', bail F F', and chains T T', substantially as shown and described.

299,546. ELECTRIC FIRE-ALARM.

GEORGE E. HOVENDEN and EDWIN R. HOVENDEN, Grand Rapids, Mich. Filed July 30, 1883. (No model.)

299,546.

Claim.—1. In combination, a series of bells in an electric circuit, a clock mechanism having the hand connected to one pole of the battery, and its face connected at suitable points by wires adapted to close the circuit successively by the movement of the hand, and a switch-board in the circuit, with mechanism for connecting the bells of any room or rooms with the wire to any given point on the clock-face, all substantially as described.

2. In combination, the series of bells, wires I, and wires H, a switch-board having perforated strips adapted to receive the pins *d*, of the wires H, the wires *i*, connected to strips set in the clock-face, the hand and wheel P, and the wires A A', all substantially as described.

3. In combination with the bells and with the clock, both in the circuit, and the latter constructed to close the circuit successively on a series of wires, a switch-board having a series of strips, *a*, in electric connection, respectively, with the various points on the dial-face of the clock, and wires H, leading from the bells, with flexible ends, and devices adapted to form electrical connection with the strips *a*, substantially as described.

4. In combination with a series of electric bells, a clock having circuit-connections, as described, with the hands, and having points on its face, and a switch-board adapted to connect said bells with the points or strips of the clock-face, a device, substantially as described, for connecting all the bells directly with the line, or for including the clock in the circuit at the will of the operator, all substantially as set forth.

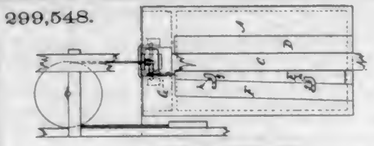
5. In combination, the clock provided with points and electric wires constructed as described, the bells in an electric circuit, the switch-board having strips *a* and R connected to the clock-face points or strips, the pins connecting wires H to strips of the switch-board, and the strips K and bar having electrical connection and operating devices, whereby the clock may be included in the circuit and the bell sounded thereby or excluded from the circuit, and all the bells may be sounded at once, substantially as described.

299,547. PASSENGER OR OTHER ELEVATOR.

MERRILL N. HUTCHINSON, New York, N. Y. Filed Nov. 1, 1883. (No model.)

Claim.—1. The combination of the posts C, car or cage A, having guide-bars D, arranged with wedge-shaped spaces between their inner edges and the adjacent sides of the post C, wedges E, placed in the said spaces upon opposite sides of the said posts C, and levers F, having their inner arms connected with the draft rope or chain B, whereby, in the event of the breaking of the said draft rope or chain, the wedges E may rise to grip the post C between them, all substantially as and for the purpose herein set forth.

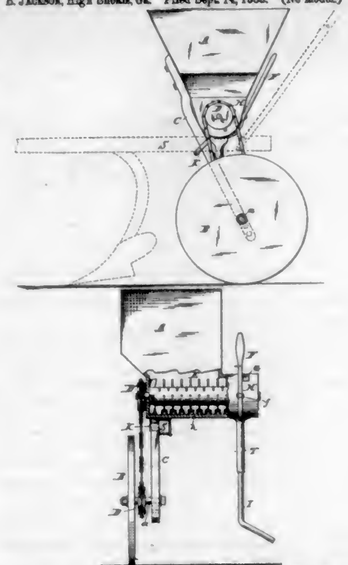
2. The combination of the post C, the car or cage A, having guide-bars D, arranged with wedge-shaped spaces between their inner edges and the adjacent sides of the said post C, wedges E, placed in the said spaces, levers F, having their outer arms connected with said wedges and their inner arms connected with the draft rope or chain B, and springs *k*, arranged to force downward the inner arms of the levers F, when the latter are relieved from the upward strain exerted by the draft-rope in raising or lowering the car or cage A, all substantially as and for the purpose herein set forth.



3. The combination of the posts C, the car or cage A, having guide-bars D, with wedge-shaped spaces between their inner edges and the adjacent sides of the aforesaid posts C, links or connections *c*, levers F, head *g*, recessed block G, yoke H, and a draft rope or chain, B, connected with the said block G, all substantially as and for the purpose herein set forth.

299,548. PASSENGER OR OTHER ELEVATOR.

MERRILL N. HUTCHINSON, New York, N. Y. Filed Dec. 27, 1883. (No model.)

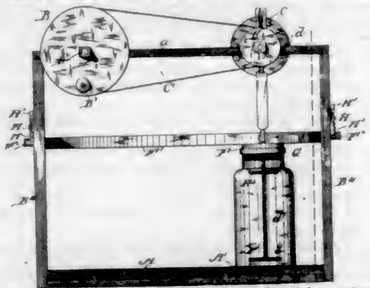


Claim.—The combination, with the posts and car or cage A, of the shoulders D, fixed on said car or cage, and arranged to grip in immediate contact with said posts, the inclined guides F upon the car or cage, and the wedges placed between said guides and posts, the whole arranged substantially as and for the purpose herein set forth.

299,548.

299,549. SEED-PLANTER AND GUANO-DISTRIBUTER.

WILLIAM B. JACKSON, High Shoals, Ga. Filed Sept. 14, 1883. (No model.)



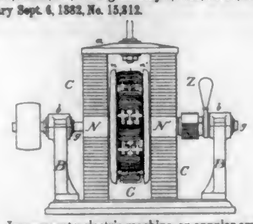
Claim.—1. In a seed and fertilizer distributer, the combination, with beam or bracket C, carrying a driver-wheel at one end, of a hopper supported on said beam, having a mixing and feeding cylinder and distributing-pipe, and connections between the driving-wheel and the cylinder, the whole being adapted to be detachably secured to an ordinary plow.

2. The combination, with the mixing-chamber H, having a suitable regulating-valve, of a flexible pipe secured over the valve, and a bent rigid pipe adjustably connected to the flexible pipe, as set forth.

3. The combination, with a beam or bracket, carrying a driving-wheel at one end, of a feed-hopper having a mixing-chamber and stirrer therein, adjusting-regulator, and a flexible pipe having a rigid bent nozzle attached thereto, the arrangement being such that the whole is adapted to be attached to an ordinary plow.

299,550. CHURN.

EDMOND W. JETER, Conyers, Ga., assignor of one-half to John H. Dabney, same place. Filed Jan. 17, 1884. (No model.)



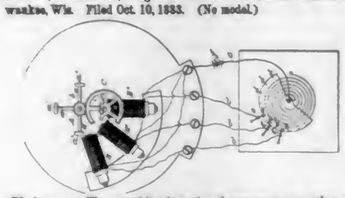
Claim.—1. In a churn, the combination of the driving mechanism, the dasher-sections E and E', cover F, clamp F', slide H, secured by

cleat-guides H', and slotted standards B'', substantially as shown, and for the purpose described.

2. The combination of the churn having cover F, cover-clamp F', slide H, secured by cleat-guides H', and slotted standards B'', substantially as shown, and for the purpose described.

3. In a churn, the combination of pulley B', secured by bracket K, the double crank C, the dasher-sections E and E', cover F, having clamp F', slide H, secured by cleat-guides H', and slotted standards B'', substantially as shown, and for the purpose described.

299,551. MAGNETO-ELECTRIC MACHINE. HENRY FRANCIS JOEL, London, England. Filed Oct. 2, 1883. (No model.) Patented in England Oct. 21, 1831, No. 4,607; in France Apr. 21, 1882, No. 143,533; in Germany Apr. 23, 1882, No. 21,193; in Belgium May 5, 1882, No. 57,513, and in Austria-Hungary Sept. 6, 1882, No. 15,812.



Claim.—1. In a magneto-electric machine, an annular armature-core composed of two parallel magnetically-insulated rings, formed by overlapping plates, attached by transverse screws to a spoked frame, substantially as hereinbefore described.

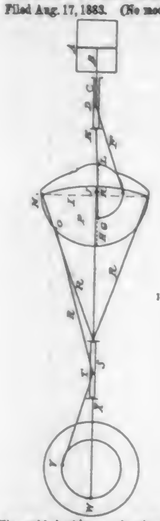
2. In a magneto-electric machine, the combination, in an annular armature, of a core composed of two parallel magnetically-insulated rings, formed by overlapping plates in pairs, attached by transverse screws to a spoked frame, and insulated armature-coils surrounding the respective pairs of core-plates, substantially as described, for the purposes set forth.

3. In a magneto-electric machine, the combination, in an annular armature, of a core composed of two parallel magnetically-insulated rings, formed by overlapping plates in pairs, attached by transverse screws to a spoked frame, insulated armature-coils surrounding the respective pairs of core-plates, and the within-described cheeks attached to the respective sides of the armature between its coils, substantially as shown.

4. In a magneto-electric machine, the combination, with the coiled-plate armature and side cheeks, of stepped or overlapped field-magnet poles, and projections thereon to obtain many magnetic makes and breaks, substantially as described.

299,552. ELECTRO-MAGNETIC INDICATOR. WARREN SEYMOUR JOHNSON, Whitewater, assignor of one-half to William Blankinton, Milwaukee, Wis. Filed Oct. 10, 1883. (No model.)

Claim.—1. The combination of a thermometer or other gage, a wheel having contact-points arranged at equal distances from each other and electrically connected, contact pieces or levers arranged in an arc contiguous to the circumference of said wheel, said contact pieces or levers electrically insulated from each other and adapted to make successive contact with the points on the wheel, suitable electric generators and conductors, and an electro-magnetic indicating device at a remote point, whereby the movements of the thermometer or other gage are reproduced, substantially as set forth.



2. A thermometer or gage and a disk or wheel operated thereby and carrying a series of contact-points, in combination with fixed contact-points, each wired to one of a series of electro-magnets that are arranged just outside of the path of an indicator-wheel having armatures on its spokes, and with a battery which serves to magnetize the core of the electro-magnet that is brought into circuit as the contact-disk is turned by its thermometer or gage to indicate the amount of heat or pressure acting on the thermometer or gage, as set forth.

3. In an electro-magnetic indicator, the combination, with a contact wheel or disk operated by a thermometer or gage, of slightly overbalanced levers having contact-points for engagement with those of the contact wheel or disk, electro-magnets arranged about the periphery of a remote armatured indicator-wheel, and a battery with suitable connections, whereby the movement of the contact wheel or disk on an arc of a circle will break connection with one of the cores, and by making connection with another cause the latter to attract the nearest armature of the indicator-wheel to it, and thus change the position of the indicator, as set forth.

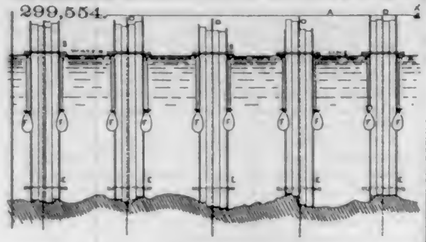
4. The combination, with a thermometer or gage, of a contact-plate, D, having contact-points *d*, with other contact-points, arranged in the path of the points *d*, wires leading to electro-magnets B B' B², an armatured indicator-wheel, and a battery wired to the cores and plate D, as set forth.

5. An armatured indicator-wheel adapted for being revolved by electro-magnets, and carrying a band lettered or figured, as described, in combination with a cover having a slot for exposing one of the letters or figures at a time, as set forth.

299,553. DUPLICATING-ENGINE. MARMADUKE B. KELLOGG, San Francisco, Cal. Filed Aug. 17, 1883. (No model.)

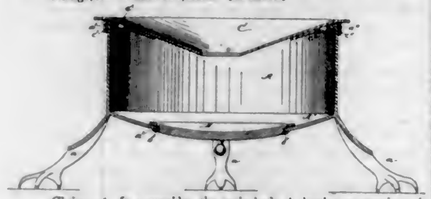
Claim.—1. The said double-crank wheel or crank with its said crank-pins, constructed as aforesaid, to be operated by the half-motion aforesaid from the applied power, and the combination thereof with the connecting-rods F and R, and the slide-block T, constructed and operated substantially as above described, and substantially as and for the purpose of producing the said double motion of a drive or pulley wheel, or said other appliance from a single motion from the applied power.

2. The said crank-wheel or crank and the said crank-pins located therein, as above described, and operated as above set forth, for producing the said forward and backward motion of said second crank-pin and connecting-rod R therefrom at each forward or at each backward motion of said connecting-rod F.



3. The said crank-wheel or crank with said second crank-pin, so located therein, as above described, that said connecting-rod R may operate to the right or left or above or below the center thereof to either a slide-block or drive or pulley wheel or walking-beam, or such other appliance as may be desired, substantially as above set forth, for the purposes above described.

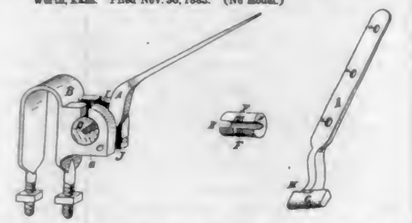
299,554. BUILDING AND SETTING MOLDING-CAISSONS. PHILIP A. KEWLEY, San Francisco, Cal. Filed Aug. 21, 1883. (No model.)



Brief.—To construct a mold for forming in the water a pier of concrete a centering anchoring-iron rod is driven into the bed-rod, a wooden frame is placed thereon, the rod passing through a hole in a cross-piece of the frame, and staves to form the sides of the mold are then set on end upon the rocky bottom and nailed to the inside of the frame. Upon projecting side pieces of the frame weights may be hung to keep the mold down.

Claim.—The method of erecting caissons in the water for molding concrete piers herein described, consisting of driving the anchoring-rod D into the bed-rock below the water, placing thereon a frame, B, and to this frame securing in the water the narrow boards forming the sides of the caisson, in the manner substantially as and for the purpose described.

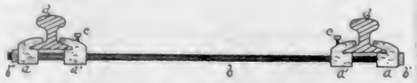
299,554.



299,555. CUSPIDOR. CHARLES F. LARSEN and BERNT A. S. NIELSEN, Chicago, Ill. Filed Feb. 7, 1884. (No model.)

Claim.—1. In a cuspidor, the main body A, having an opening, *a'*, in its bottom, in combination with a flanged disk, B, provided with lugs *b b*, substantially as and for the purpose set forth.

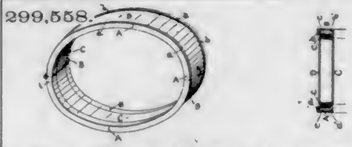
2. In a cuspidor, the main body A A' and legs or feet *a a*, cast in one piece, with the opening *a'* and flanges *a²*, in combination with the disk B, having legs *b*, and cover C, having flange *c'* and lugs *c²*, substantially as and for the purpose set forth.



299,556. THILL-COUPLING. SAMUEL DEXTER LECOMPTE, Leavenworth, Kans. Filed Nov. 30, 1883. (No model.)

Claim.—The clips made with the ears or legs, as described, the peculiar formation of the head or end of the thill-iron, the roller as shaped and slotted and as held in place by the projections of the said end or head, all constructed as described and combined, for the purposes set forth.

299,557. CLAMP FOR RAILWAY-RAILS. JESSE LOCKHART, Niantic, Ill. Filed Nov. 20, 1883. (No model.)

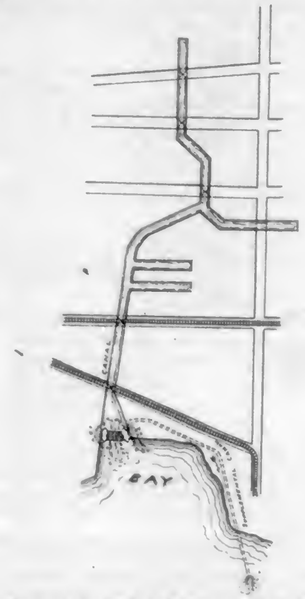


Brief.—Tie-rods consisting of sliding blocks upon headed and screw-threaded rods, the inner blocks being secured in position by set-screws, and the outer ones being drawn to the rails through the nuts on the screw ends of the rods.

Claim.—The combination, in a clamp for railway-rails, of bolt *b*, provided with head *b'* and nut *b''*, loose mounted blocks *a a*, adapted to be adjusted with relation to one another by means of head *b'* and nut *b''*, and loose mounted blocks *a' a'*, adapted to be adjusted with relation to the railway-rails by means of set-screws *c c*, as and for the purpose set forth.

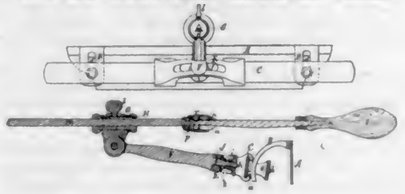
299,558. BRACELET. CHARLES W. LORD, Pawtucket, R. I., and ANALDO M. ENGLISH, Boston, Mass. Filed Mar. 29, 1884. (No model.)

299,558.



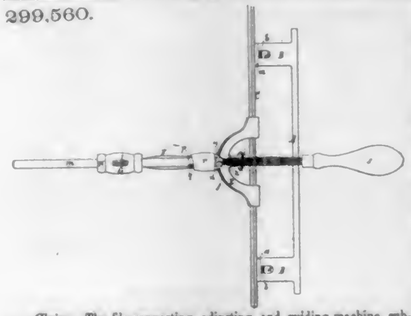
Claim.—1. The combination of the two distinct edge members A B, having inwardly-projecting top flanges, *a b*, and upwardly-projecting bottom flanges, *a' b'*, and the intermediate member, C, having side flanges, which are interlocked with the side members, substantially as set forth.

2. The combination of the two distinct side members, A B, having inwardly-projecting flanges *a b* and upwardly-projecting flanges *a' b'*, the flanged member C, interlocked with said side members, and the face-member D, substantially as set forth.



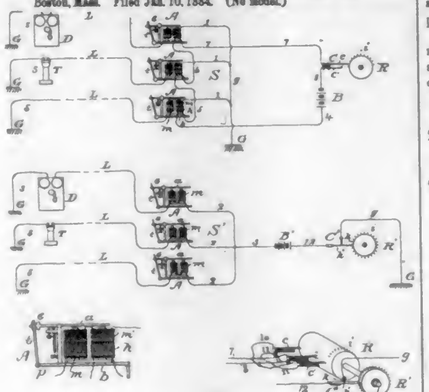
299,559. METHOD OF PURIFYING CANALS AND BASINS CONNECTING WITH TIDAL WATERS. ARTHUR J. L. LORETZ, Brooklyn, N. Y. Filed Aug. 13, 1883. (No model.)

Brief.—A triangular canal-basin with its inlet at one angle and a dam on the subtending side facing tidal water and fitted with controllable outlets and inlets, as described, by means of which, from time to time, the canal may be flushed at low tide without too rapid current at the dam, and a supply of purer water to the canal at high tide may be insured.



Claim.—A triangular basin, B, whose apex A is the inlet of a canal, and its base C forming a dam, arranged substantially as and for the purpose described, with locks, gates, weirs, run-arounds, and supplemental canals.

299,560. MACHINE FOR FILING SAW-TEETH. HENRY LUTTS and FRANK WARREN LUTTS, Malden, Mass. Filed Aug. 7, 1883. (No model.)



299,560.

Claim.—The file supporting, adjusting, and guiding machine, substantially as described, consisting of the bar A, slotted and curved projections B B, bar C, sliding and slotted arch E, arm F, pivoted box G, prismatic bored sleeve H, the bar *m*, and the clamping devices of such bar C, arm F, box G, and bar *m*, all adapted and arranged essentially in manner to operate as set forth.

299,561. METHOD OF AND APPARATUS FOR INDIVIDUALIZING TELEPHONE TIME-SIGNALS. HENRY B. LITTLE and JOHN J. CAREY, Boston, Mass. Filed Jan. 10, 1884. (No model.)

Claim.—1. The hereinbefore-described method of regulating or individualizing the supply of time-signals to the subscribers of a telephone-exchange system by producing induced currents corresponding to the time-signals in the line-circuits to be supplied, and simultaneously sending a confusing signal or succession of signals over the line-circuits which are not to be supplied.

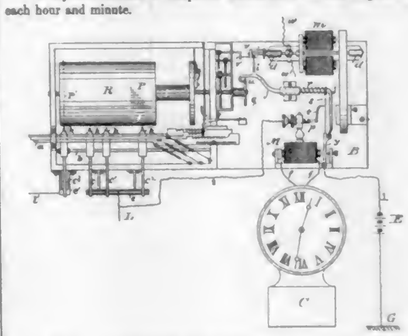
2. The method herein described of compensating for the involuntary distribution of time-signals by induction and leakage over telephone-circuits which are not intended to receive the same, which consists in transmitting over the said circuits a confusing or obliterating signal, whereby the induced time-signals are confused and made incomprehensible.

3. The method hereinbefore described of producing induced currents corresponding to time-signals in a series of telephone line-circuits, which consists in passing battery-currents equal in number and duration to the said time-signals through a series of helices (one for each line) placed on the core of the annunciators of the said telephone line-circuits, and in juxtaposition to the helices thereof, substantially as specified.

4. The combination, in a telephone-exchange system, of a series of main lines and central-station annunciators therefor, the said annunciators each being provided with an extra helix, a local battery-circuit including the said helices, and a circuit-closer for said local circuit adapted to be operated by a clock-actuated time-cylinder, and to send time-signals to line, with a second series of main lines and a battery and circuit-closer in the main ground-wire thereof, the said circuit-closer being adapted to alternately make and break the circuit of the said battery and ground-wire during the time of transmission of time-signals over the first series of lines, for the purposes specified.

5. In a telephone-exchange, a time-transmitting system therefor, consisting of the combination of a series of main lines, receiving-instruments at the respective sub stations of the said main lines, an annunciator for each line at the central station, an auxiliary helix placed on each of the said annunciators, a local battery, a local circuit including the battery and the said auxiliary helices, and a circuit-closer actuated by a rotating cylinder and arranged to close the circuit under the influence of the said cylinder a number of times corresponding to the hour and minute, whereby currents of similar number and character may be induced in the main lines and the time-signals reproduced in the receiving-instruments thereof, substantially as described.

6. The combination, substantially as described, with a main telephone-line and a sub-station bell included therein, of the hereinbefore-described time-transmitting devices, consisting of the local battery, circuit-closer, time-repeating cylinder, auxiliary annunciator-helix, and the annunciator, provided, as described, with a polarized armature, whereby when the actuating current is strong enough to ring the bell it is prevented from giving the annunciator-signal.



7. The combination, in an electric annunciator, of an electro-magnet provided with two separate helices, the larger of the said helices being adapted for inclusion in the main line, and the smaller in a local circuit, and a polarized armature therefor adapted to respond to the magnetism of the electro-magnet when induced by the main-line helix, but not when induced by the local circuit, as described.

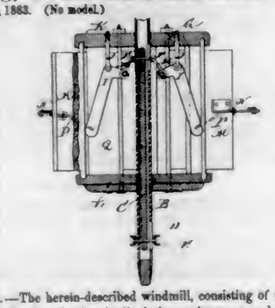
8. The combination, with a series of telephone-lines, of a series of local circuits arranged in inductive proximity to a portion of said main lines, and adapted to generate induced currents therein, a series of local circuit-closers adapted to open and close the said local circuits, a separate circuit-closer included in the common ground-wire of the remaining portion of the series of main lines, and a revolving clock-controlled cylinder actuating the said circuit-closers, and adapted to close the local circuit-closers in correspondence with time-signals, and simultaneously open and close the main-line circuit-closer without reference to time, for the purposes specified.

9. In combination with a series of telephone-lines and time-transmitting signaling apparatus for a portion of the said lines, means, substantially as described, for sending a confusing signal over the remainder of the said telephone-lines, for the purpose specified.

299,562. TELEPHONE TIME-SIGNAL APPARATUS. HENRY B. LITTLE and JOHN J. CAREY, Boston, Mass. Filed Jan. 16, 1884. (No model.)

Brief.—Transmits to telephone subscribers an audible signal for each hour and minute.

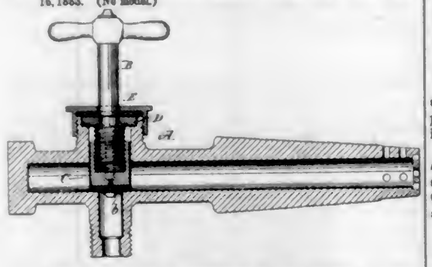
Claim.—1. The combination, substantially as hereinbefore described, in a telephone time-repeating system, of a controlling-clock, a repeating mechanism controlled thereby and acting to transmit a designating time-signal to a number of telephone-lines, and a short-circuiting relay adapted to short-circuit the repeating mechanism and send a vibratory current to line to indicate the precise occurrence of the designating-time.



2. In a telephone time-distributing system, the combination of a repeating mechanism adapted to transmit successive currents to a number of telephone-lines to indicate the designating-signal of each minute, with means, substantially as indicated, for sending a special momentary vibratory signal over the said lines, to indicate the precise occurrence of the minute designated.

3. The combination, in a telephone time-distributing system, of a repeating mechanism adapted to transmit a series of signals to a number of telephone-lines to designate each minute of the day, and means for throwing the same into and out of gear, other means for sending a momentary vibratory signal to indicate the precise occurrence of the minute immediately following the said signal, an electro-magnet actuating simultaneously the starting and signaling devices, and a controlling-clock adapted to energize the said electro-magnet, substantially as and for the purposes described.

4. In combination with a group of telephone-lines leading to sub-stations, and provided with receiving-instruments at said sub-stations, circuit-closing devices adapted, as described, to transmit to the said lines successively electrical pulsations representing the hour and minute, a source of electricity for supplying electricity therefor, and means for sending a signal to denote the precise occurrence of the designated minute, said means consisting of an electro-magnet, a circuit-closer operated thereby, and circuit-connections leading from the said source of electricity to a point connected with the main lines outside of the designating circuit-closers, substantially as specified.



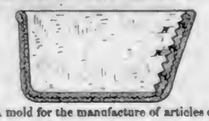
5. In a telephone time-signal distributing system, the combination, substantially as hereinbefore described, of a repeating mechanism of the character indicated and normally at rest, a group of telephone-circuits connected therewith by a common wire, and an electric battery with a controlling-clock, an electro-magnet adapted to be energized periodically by the action of said clock, devices operated by the armature of said magnet to start the said repeating mechanism, and a normally-open short circuit from said battery to the common terminal wire of said telephone-lines adapted to be closed upon the energization of said electro-magnet, and thereupon to momentarily close the circuit of said battery directly to line, and to produce a short vibratory signal in the receiving-instruments of said lines.

299,563. WINDMILL. ALBERTUS MARTIN, Plainville, Kans. Filed June 29, 1883. (No model.)

Claim.—The herein-described windmill, consisting of the hollow vertical shaft having the longitudinal slots at its upper and lower portions, the circular disks or plates fastened upon the shaft, and connected and braced by the stationary inner vanes, the pivoted vanes, the horizontal plates fastened upon the outer sides of the vanes, the connecting-rods hinged to the inner ends of the horizontal plates, and to the outer ends of the horizontal plates to the rear of the plates to which they are hinged with their forward ends, the arms hinged to the vanes and bell-cranks, the bell-cranks, the arms hinged to the bell-cranks and the lugs upon the sliding rod, the sliding rod having the laterally-projecting lugs upon its upper end and sliding in the shaft and the sleeve sliding upon the lower portion of the hollow shaft fastened to the lower end of the sliding rod and connected to a speed-governor, as and for the purpose shown and set forth.

299,564. FAUCET. FRANK MCCABE, Providence, R. I. Filed May 16, 1883. (No model.)

Claim.—In a faucet, the combination of a split washer, D, a spindle, B, having an annular groove just above its thread to receive said washer, a valve-case rabbeted on the inside of its upper end to rigidly support the ring, and the screw-cap E, whereby the spindle is prevented from moving longitudinally as well as laterally, and thus all lost motion is avoided.



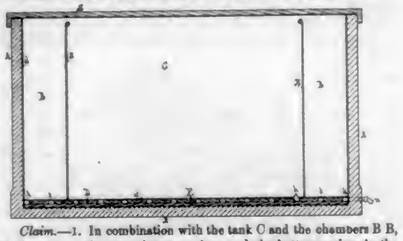
299,565. BILLIARD-TABLE TOP. JOHN WESTLEY MCKNIGHT, Washington, D. C. Filed Nov. 5, 1883. (No model.)

Claim.—1. A billiard-table top formed of artificial slate having embedded therein sheets or strips of wire gauze or netting, as set forth.

2. A billiard-table top formed of artificial slate, having a smooth upper surface, the body of which is of varying thickness, and having embedded therein sheets or strips of wire gauze or netting, as set forth.

299,566. COMPOSITION AND MOLD FOR THE MANUFACTURE OF ARTICLES FROM ARTIFICIAL SLATE. JOHN WESTLEY MCKNIGHT, Washington, D. C. Filed Nov. 7, 1883. (No model.)

Claim.—1. A mold for the manufacture of articles of artificial slate, stone, or marble, having a facing of vitreous or vitrifiable material fused thereon, as set forth.



2. A composition for artificial slate, consisting of cement, oxide of iron, metallic red, drop-black, lamp-black, Venetian red, soluble glass, pulverized alum, and solution of iron-rust and vinegar, in substantially the proportions set forth.

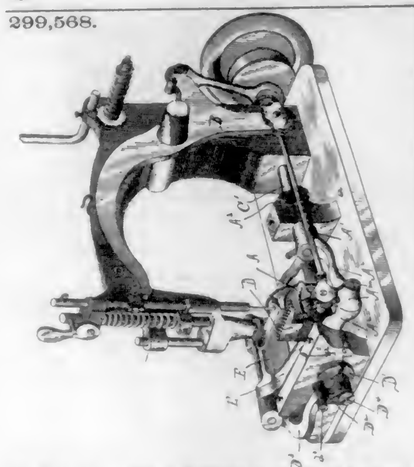
3. The method herein described of finishing artificial slate, which consists in coating the same with boiled linseed-oil or glycerine, and rubbing the same thoroughly into the article with French putty-powder or finely-ground litharge, suitably colored, as set forth.

4. As a new article of manufacture, a wash-tub having a washing-surface of a sheet of corrugated zinc, the edges of which are embedded in the artificial slate of which the body of the tub is composed, as set forth.

5. A wash-tub composed of artificial slate, artificial stone, or artificial marble, having a washing or rubbing surface of corrugated sheet-zinc or other suitable metal, the edges of which are embedded or otherwise secured to the sloping inner surface of said tub, as set forth.

299,567. REFRIGERATING CORNED-BEEF TANK. HENRY MENSLAGE, South Boston, Mass. Filed June 8, 1883. (No model.)

Claim.—1. In combination with the tank C and the chambers B B, and the connected spaces between them and the bottom casing A, the passages *k k*, and the cover S, so arranged that a space is left between it and the walls H H, substantially as described.



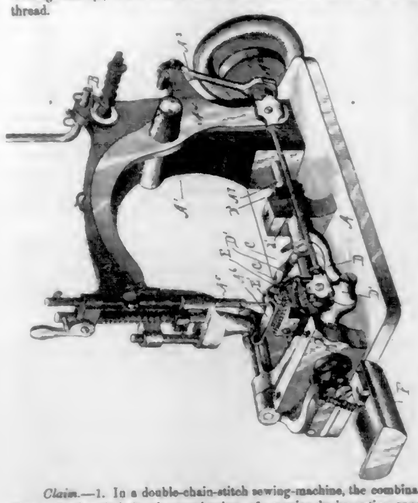
2. In combination with the tank C, the chambers B B, the passages *k k*, and the series of slats with intervening spaces opening on their lower sides extending transversely across and adjacent to the bottom of the tank C, and forming spaces within which the air is compressed, substantially as described.

299,568. SEWING-MACHINE. LORENZ MUTHER, Chicago, Ill., and CHARLES A. DEARBORN, New York, N. Y., assignors to the Union Bag Machine Company, Chicago, Ill. Filed May 11, 1883. (No model.)

Brief.—The looper is oscillated by the rear end of the needle-arm in one direction and by a pivoted swinging arm and rock-shaft in the cross direction. The cloth-feeder is operated by a wrist-pin adjustably secured in a disk on the end of the main shaft, said pin being connected by a link with the rocking frame to which the feeder-bar is hinged.

Claim.—1. The combination, with the needle and the feeding mechanism, of a pivoted looper-frame whose axis of oscillation is substantially at right angles to the line of feed, a looper pivoted to said frame and

299,568.



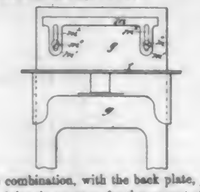
having an axis of oscillation substantially at right angles to the axis of the frame, and means for oscillating said frame and said looper, respectively, the whole operating substantially in the manner specified.

2. In a sewing-machine having an eye-pointed needle, the combination, with said needle, of the oscillating looper-frame A^2, the looper pivoted thereto upon an axis at right angles to the axis of the frame, and the pitman A', connected with the looper by means of a ball-and-cocket joint, whereby the oscillation of the looper-frame at right angles to the movement of the pitman is permitted.

3. The combination of the rocking frame having the feed-dog mounted thereon, the driving-shaft provided with a lifting-cam beneath said feed-dog, and also provided on its outer end with a radially-adjustable crank-pin, and the freely-pivoted link connecting said crank-pin and said frame, whereby the length of feed may be altered without varying the time of feed movement, substantially as set forth.

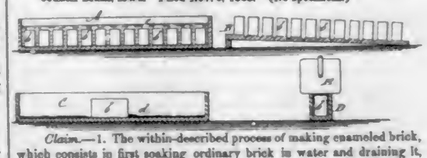
299,569. SEWING-MACHINE. LORENZ MUTHER and RUSSELL G. WOODWARD, Chicago, Ill., assignors to the Union Bag Machine Company, same place. Filed May 14, 1883. (No model.)

Brief.—A revolving take-up consisting of two disks of cam shape, and affording a channel between them for the reception of one end of a throw-off, a throw-off arm, thread-guides, (one on each side of the revolving take-up,) and a thread stop or clamp serve to control the lower thread.



Claim.—1. In a double-chain-stitch sewing-machine, the combination, with the stitch-forming mechanism, of a tension device acting upon the upper thread, and an intermittently-operating stop and take-up acting upon the lower thread, substantially as specified.

2. As an improvement in take-up devices for sewing-machines, the combination of a cam-disk arranged with its periphery in contact with the thread, mechanism whereby said cam is rotated in proper relation to the action of the stitch-forming mechanism, and a throw-off arm extending within the line of rotation of the cam's periphery, the whole operating substantially as set forth.

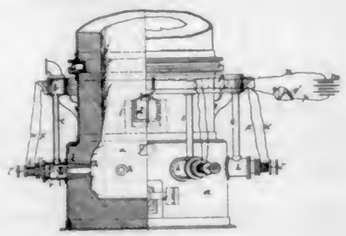


3. As an improvement in take-up devices for sewing-machines, the combination of a cam-disk and mechanism for rotating the same, with thread-guides arranged on each side of said cam and having eyes for the passage of the thread, said eyes being located within the outer periphery of the cam, substantially as and for the purposes set forth

299,570. BOX-NAILING MACHINE. FREDERICK MYERS, New York, N. Y. Filed June 26, 1882. (No model.) Patented in England Jan. 28, 1882, No. 442, and in France Apr. 18, 1882.

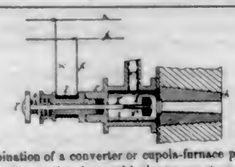
Claim.—The combination, with the back plate, *g*, and table *f* of a nailing-machine, of the cleat-rest *m*, for the support of the narrow strips or cleats of made-up box-ends, said cleat-rest *m* being attached to said back plate, and also being adjustable thereon for adaptation to box-ends of various dimentions, substantially as described.

299,571. MANUFACTURE OF ENAMELED BRICK. CHAS. NEWTON, Council Bluffs, Iowa. Filed Nov. 6, 1883. (No specimens.)



Claim.—1. The within-described process of making enameled brick, which consists in first soaking ordinary brick in water and draining it, next rubbing, under pressure, hydraulic cement of a cream-like consistency onto and into its surface to be enameled, afterward applying a second coating of pure cement, with or without coloring-matter, to said surface and leveling the same; also, where necessary, smoothing or finishing off the head end of the brick, and subsequently drying and hardening the brick, essentially as specified.

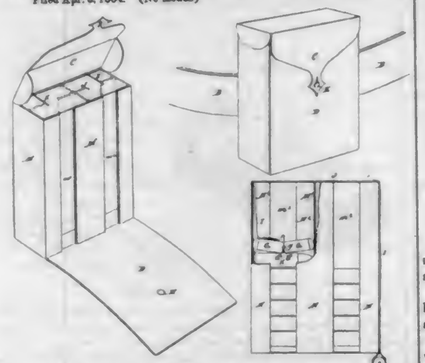
2. In the within-described process of making enameled brick by the application of hydraulic cement to its surface, hardening the brick so coated or surfaced by exposing it to the action of carbonic-acid gas, essentially as specified.



3. Brick having its surface or surfaces enameled by rubbing in and applying hydraulic cement thereto, and afterward drying and hardening the same, essentially as described.

299,572. DEVICE FOR OPERATING TUYERE-STOPPERS. HENRY W. OLIVER, Jr., Pittsburg, Pa. Filed Jan. 23, 1884. (No model.)

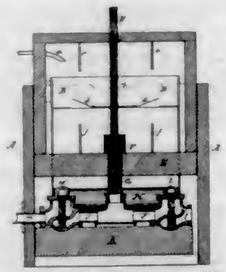
Claim.—1. The combination of a converter or cupola-furnace provided with tuyeres, with the tuyere-stoppers and their stems or shafts and an electro-magnet or helix for closing or opening the stoppers, substantially as and for the purposes described.



299,572.

2. The combination of a converter or cupola-furnace provided with tuyeres and external blast-chambers, with the tuyere-stoppers and their stems or shafts, an electro-magnet or helix for moving the stoppers in one direction, and devices for moving them in the other direction, substantially as and for the purposes described.

299,573. CARTRIDGE-BOX. EDWARD O. C. ORD, United States Army. Filed Apr. 8, 1884. (No model.)



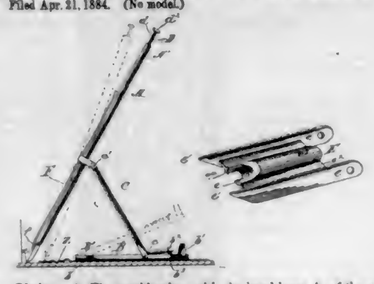
Claim.—1. The cartridge-box M, having one or more pockets, *m*, with a narrower slit, m^2, extending up and down the front of each, adapted to allow cartridges to lie in tiers and be removed, as shown, in combination with means, A, for attachment to a belt, and arranged to serve as herein specified.

2. In a cartridge-box of the construction herein shown, the arrangement of two or more pockets, *m*, side by side, each with a slit, m^2, in its front, in combination with a single flap, C, covering the whole, adapted to allow the cartridges to be removed from one or more of the several tiers singly or in quantities, as specified.

3. In a cartridge-box, a holding-down device composed of two parts, G and G, with the hinge *g* and spring H, combined and arranged to serve as herein specified.

4. The cartridge-box M, having a pocket, *m*, and vertical slit m^2, in combination with a holding-down device, G G, and a flexible attachment, I, arranged to serve the double function of displacing the holder and keeping it attached to the box, as herein specified.

299,574. PUMP. NATHAN C. PAGE, Monkton, Vt. Filed Nov. 20, 1883. (No model.)



Claim.—A balance force-pump consisting of a tank, A, containing a water-receiver, B, attached to the piston, and provided with one or more valves, *d*, in its bottom, which are actuated by the rods *e* and *f*, and to which are suspended one or more floats, H, in combination with a cylinder, G, and pipe J, having reciprocating check-valves, substantially as specified, and for the purpose set forth.

299,575. VEHICLE-SPRING. JAS. PERCY, Chicago, Ill. Filed Jan. 30, 1884. (No model.)

Claim.—In a buggy-spring, the variably-curved reaches A A', having opposite parallel lateral inclinations curved inwardly at their ends *a*, and continued integrally through short reverse curves *a''* into a bow-shaped curve, A'', to be centrally connected to the side bars, and thereby arranged for operation throughout its entire body, substantially as specified.

299,576. CARPET-STRETCHER. ELIAS F. PERSONS, Westfield, N. Y. Filed Apr. 21, 1884. (No model.)

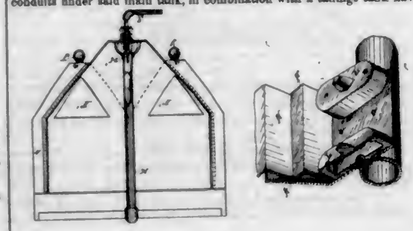
Claim.—1. The combination, with the hand-lever A, of the connecting-rod C and the foot-lever B, provided with the spurs *b*, stirrup *b'*, and spring-spur b^2, substantially as specified.

2. The hand-lever A, provided with the driving-rod D, having the knob d^3, spring *d*, and the end casting, E, having the pointed flanges *e* and the central internally-grooved tube, e^2, substantially as specified.

3. The combination, with the hand-lever A, of the casting E, provided with the internally-grooved tubular portion, the driving-rod D, and the central and longitudinally slotted and curved feed-tube, substantially as specified.

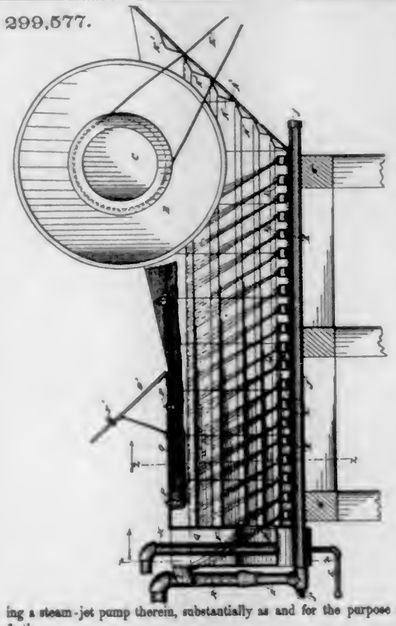
4. The combination of the hand-lever A, connecting-rod C, foot-lever B, having the stirrup *b* and spurs b^2, the longitudinally-slotted feed-tube F, and the driving-bar D, the whole constructed and arranged and operating substantially as shown and described.

5. The combination of the hand-lever A, connecting-rod C, and foot-lever B, having the metallic T-head casting B', provided with spurs, substantially as specified.



6. The casting B', with spurs cast or otherwise secured thereto, and having the bent portion B^2, in combination with the lever B, substantially as specified.

299,577. HYDRAULIC CONCENTRATOR AND AMALGAMATOR. HENRY E. PICKET, Bradford, Pa. Filed Jan. 29, 1884. (No model.)



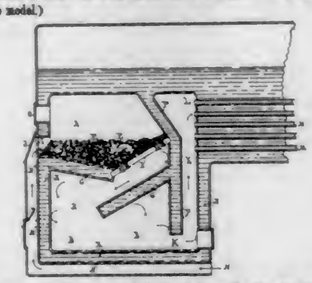
Claim.—1. In a hydraulic concentrating and amalgamating machine, a tank having a longitudinal angular bottom, in combination with one or more rows of diagonal jets and jet-tubes projecting through the bottom of said tank into conduits under said tank, substantially as and for the purpose set forth.

2. In a hydraulic concentrating and amalgamating machine, a main tank having a longitudinal angular bottom, a revolving screen mounted over one end of said tank, and a tailings-tank at the opposite end of said tank, provided with means for removing tailings therefrom, in combination with one or more rows of adjustable diagonal jets, and conduits under said tank communicating through the bottom thereof with said jets, substantially as and for the purpose set forth.

3. In a hydraulic concentrating and amalgamating machine, a main tank having longitudinal V-shaped angles in the bottom thereof, provided with jet-tubes extending through the bottom of said angles into conduits under said main tank, in combination with a tailings-tank hav-

299,577.

ing a steam-jet pump therein, substantially as and for the purpose set forth.



4. In a hydraulic concentrating or amalgamating machine, the combination and arrangement of the conduits J, the nipples K K, and jet-caps L L, substantially as and for the purpose set forth.

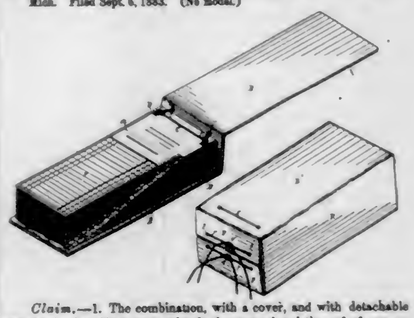
5. In a hydraulic concentrating or amalgamating machine, the adjustable jet-tubes L^2 L^2, in combination with the jet-caps L L, substantially as and for the purpose set forth.

6. In a hydraulic concentrating or amalgamating machine, the nipples K, extending through the bottom of the angle *a* in the tank A into conduits under the said tank, in combination with an alternate arrangement of the jet-caps L L with the adjustable jet-tubes M M, substantially as and for the purpose set forth.

7. In a hydraulic concentrating or amalgamating machine, the tank A, in combination with the conduits J J, provided with caps *j j* and plugs *j' j'*, substantially as and for the purpose set forth.

299,578. STEAM-BOILER AND FURNACE. WILLIAM S. POST, Boston, and HOWARD DE WOLF SAWYER, Revere, Mass. Filed Sept. 7, 1883. (No model.)

Claim.—1. In a steam-boiler or furnace, the fire-box having an oblique depending water-leg, forming a deflecting-wall opposite the feed-door, in combination with the hearth C and water-grate D, extending obliquely from the hearth to said water-leg, substantially as and for the purposes set forth.



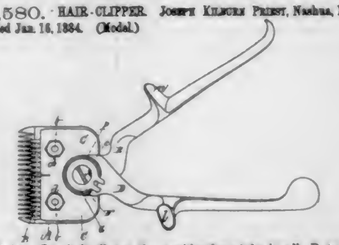
2. In a steam-boiler or furnace, the oblique water-grate D, in combination with the water-legs C F G, substantially as and for the purposes set forth.

3. The water-spaces H, forming walls for the fire-box and ash-box, and the water-legs F G, communicating therewith, in combination with the hollow hearth C and grate D, serving together to support the fuel and promote a lateral and oblique draft through it, for the purpose set forth.

4. In a steam-boiler or furnace, the combination of the fire-box A, the door J, and the vertical and separable grate I, located below the feed-door, and forming a lateral support and guard for the fuel, substantially as set forth.

5. The fire-box and the ash-box, separated from each other by the oblique water-hearth C and grate D, in combination with the flue K and its terminal enlargement L, separated from the ash-box and fire-box by the unperforated water-leg F, extending below the grate nearly to the bottom of the ash-box, whereby the caloric current is at all times indirect, substantially as set forth.

299,579. TEMPORARY BINDER. HERBERT L. PRATT, Kalamazoo, Mich. Filed Sept. 6, 1883. (No model.)

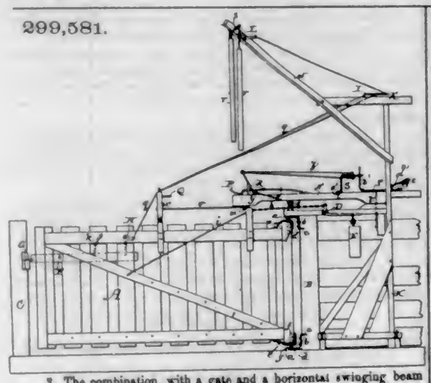


Claim.—1. The combination, with a cover, and with detachable contents having side open notches in the secured end thereof, of a securing-cord and guide-rod, substantially as described.

2. A cover formed with the central end notch and a lid each side of said notch, adapted when folded in book form to close one end, substantially as set forth.

3. The combination, with the detachable contents and securing-cord, of a folding cover having the end lids and central notch adapted to fold in book form and close one end, substantially as set forth.

299,580. HAIR-CLIPPER. JOSEPH KILBURN PRIEST, Nashua, N. H. Filed Jan. 16, 1884. (Model.)



Claim.—In a hair-clipper, the combination of the handle D, having the head *c*, provided with a tubular cylindrical neck, *d''*, the cutter-plate-operative lever E, having a cylindrical fulcrum, A, which enters the neck *d''*, such fulcrum having a substantially prismatic neck, the bifurcated arm F, which is secured on the neck of the fulcrum, and the spring G, secured at one end to the head *c* and at the other in the yoke of the arm F, whereby the position of the arm can be changed on the fulcrum and the tension of the spring varied, as set forth.

299,581. GATE. ADDISON F. PURIFOY, Wake Forest, N. C. Filed Oct. 17, 1882. (No model.)

Claim.—1. The combination of the gate-post, the gate hinged thereto, the separate post or support in the rear of said gate-post, and the horizontal swinging beam pivoted to said separate post or support and connected with the gate, substantially as described.

2. The combination of the gate-post, gate hinged thereto, separate post or support in the rear of the gate-post, and the horizontal swinging beam pivoted to said separate post or support and connected with the gate, the said parts being disposed, as explained, so that when the gate is opened the beam makes an angle therewith of about forty-five degrees, and when closed the middle of the front arm of the beam is about over the gate-post, substantially as described.

299,581.

3. The combination, with a gate and a horizontal swinging beam for shifting said gate, of a stop on the gate for arresting the motion thereof by contact with said beam, substantially as described.

4. The combination of the gate-post, the gate hinged thereto, the swinging beam pivoted to a support in the rear of said post, and the arresting-stop on the gate, substantially as described.

5. The combination, with the gate and the mechanism for opening and closing the same, of the positive catch attached to and carried by the gate-shifting mechanism for locking said mechanism in position to hold the gate open, and connections whereby the catch may be released through said mechanism, substantially as described.

6. The combination, with the gate and gate-shifting beam, of a catch for engaging and locking together the said gate and beam, so as to hold the gate open, substantially as described.

7. The combination of the gate, gate-shifting beam, catch for locking said beam to the open gate, mechanism for swinging the beam to open and close the gate, and connections whereby the catch may be released through said mechanism, substantially as described.

8. The swinging beam having between its front end and the gate a connection, such as the eye and rod or its equivalent, for permitting the said end to slide lengthwise of the gate, in combination with a catch for locking the open gate to said beam, substantially as described.

9. The combination of the gate, the swinging beam, the devices for making a sliding connection between the beam and gate, and the stop for arresting the motion of the gate by contact with said beam, substantially as described.

10. The combination of the gate, the beam, the rod fixed to the gate, and the eye on the beam embracing said rod, substantially as described.

11. The combination, with the latch-releasing and gate-shifting mechanism, of a spring, such as P, separate from the latch-spring and connected with said mechanism, substantially as described.

12. The combination, with the three-armed lever S, of the rock-shaft T for turning said lever, a latch or catch, such as P, and connecting devices for withdrawing said latch or catch on turning said lever, substantially as described.

13. The combination, with the hinged gate, its latch, the horizontal swinging beam, the pivoted upright, and the devices for releasing the latch and for operating said upright and beam to open the gate, of the means for operating said upright and beam to close the gate without danger of withdrawing the latch, said means including a device separate from the latch and latch-spring as the point of resistance to the pull of the passer-by in closing the gate, substantially as described.

14. In a gate, the combination, with the pivoted upright and the operating arm or arms fixed thereto, of the latch and the latch-releasing devices connected with and carried by said upright and its arms, and capable of a slight independent movement, so that the latch may be withdrawn before the upright is turned to swing the gate, substantially as described.

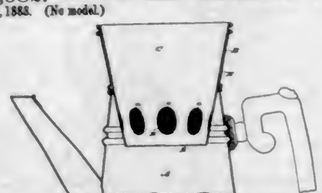
15. The combination, with a gate, a latch for holding it closed, and a catch for holding it open, of the devices for releasing the latch, the devices for releasing the catch independently of the latch, and the mechanism for shifting the gate, substantially as described.

16. In combination with the gate-post, gate, and gate-operating mechanism, the hinges for connecting the gate with the gate-post, the said hinges, one or both, having an attaching-plate split and spread apart, and being secured to said post by said plate, substantially as described.

17. In combination with the gate-post, gate, and gate-operating mechanism, the hinges for connecting the gate with the gate-post, the said hinges, one or both, being provided with a flexible steady-plate attached to the gate, substantially as described.

18. The combination, with the swinging gate and a stationary support above the axis on which the gate swings, of a counterpoise and a flexible cord or connection connecting the gate and counterpoise, and running through an opening in a device or between devices on the aforesaid stationary support, substantially as described.

19. The combination of the swinging gate, the counterpoise, the lever, the flexible cord or chain, the rollers or their equivalent over the gate-hinges, and the stationary support for the said rollers, substantially as described.

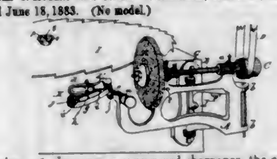


20. The combination of a gate, its counterpoise, a lever, a stationary support above the gate-hinges, and a flexible connecting cord or chain running through an opening in said support, said counterpoise being adjustable on an arm of said lever, substantially as described.

21. The pivoted upright having a long pivot-piece with its opposite ends journaled in bearings, and braces connecting the body of the upright to said pivot-piece, substantially as described.

22. In a gate, the combination, with the gate-shifting lever turning upon a fulcrum exterior to the gate and its hinges, such as the pivoted upright shown, of the latch, the latch-releasing devices carried by said lever, and capable of a limited movement independent thereof, but adapted when said movement is completed to engage and operate said lever, and the means for operating the lever independently of said devices, substantially as described.

23. The herein-described automatic gate, comprising in combination the gate, gate-posts, hinges, latch, catch on the front gate-post, counterpoise, horizontal swinging beam, spring-catch thereon, arresting-stop on the gate, and device for engaging the spring-catch also on the gate, together with the various levers and connecting and operating means, substantially as set forth.



299,582. COFFEE-POT. HENRY C. RICE, Louisiana, Mo. Filed Oct. 27, 1883. (No model.)

Claim.—1. The combination, with the coffee pot or vessel having a conical mouth-piece, B, of the conical filter C, adapted to fit snugly into the said mouth-piece, and the filtering-cloth E, the said cloth being arranged to cover the lower end of the filter and to be clamped between the filter and the mouth-piece, as set forth.

2. The combination of the pot or vessel A, provided with a conical mouth-piece, B, secured to it as set forth, the conical filter C, constructed to fit snugly into said mouth-piece, and the filtering fabric clamped between the filter and the mouth-piece, the said filter being arranged to project through the mouth-piece into the pot, substantially as set forth.

299,583. MACHINE FOR GUMMING AND SHARPENING SAWS. SAMUEL C. ROGERS and JAMES T. BARNARD, Hamilton, Ontario, Canada. Filed June 18, 1883. (No model.)

Claim.—1. In a saw gummer and sharpener, the combination of the plate G, when secured vertically to its support, the frame F, attached thereto, the horizontally-movable frame A, and non-sliding spindle B, carrying the grinding-wheel E, to operate on a saw placed horizontally, substantially as shown and described.

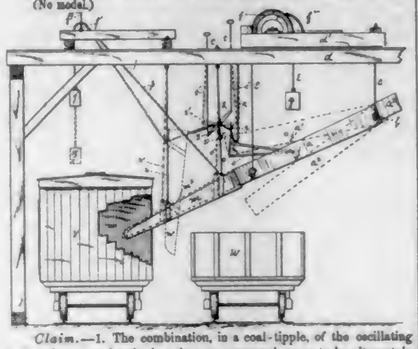
2. In a saw gummer and sharpener, the combination of the hinged guide-arm *f*, slotted plate *d*, and the screw *j*, substantially as and for the purpose specified.

3. In a saw gummer and sharpener, the combination of the slotted plate *d*, the same being formed at one end with a lug, *d'*, and projection *k*, the guide-arm *f*, hinged to the plate *d*, a spring, *g*, attached to guide-arm *f*, and made adjustable by thumb-screws *h*, *i*, and *i'*, and a stop-screw, *j*, all constructed substantially as and for the purpose specified.

4. In a saw gummer and sharpener, the combination, with the guide-frame H and frame A, of the adjustable stop-pin *e*, provided with a lock-nut, *r*, substantially as and for the purpose specified.

5. In a saw gummer and sharpener, the saw-support having a circular spiked base-piece, *m*, the same being provided with a cone, screw-pin, and nut, all constructed to hold a saw while being gummed and sharpened.

6. In a saw-gummer, the combination, with arm J, of frame A,



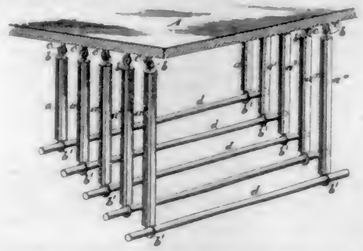
provided with pin *s*, spindle *x*, wheel *y*, and pulleys *a'* and *z*, for grinding wood and crosscut saws on a bevel, substantially as specified.

7. In a saw gummer and sharpener, the combination of a spring-templet, *g*, and guide-arm *f*, substantially as and for the purpose specified.

299,584. TOBACCO-SOAP. CARL L. F. ROSE, New York, N. Y. Filed Sept. 20, 1883. (No specimens.)

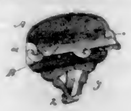
Claim.—A bar or cake of soap composed of the usual ingredients, to which is added the extract of tobacco, substantially in the proportions specified.

299,585. COAL-TIPPLE. WILLIAM ROSENSTIEL, Pittsburg, Pa., assignor to Oliver Brothers & Phillips, same place. Filed Mar. 31, 1884. (No model.)



Claim.—1. The combination, in a coal-tipple, of the oscillating basket-chute *a* and swinging chute *m*, arranged so as to be alternately connected and detached, substantially as and for the purpose specified.

2. In a coal-tipple, the combination of an oscillating basket-chute, *a*, having a swinging gate at the free end thereof, and a swinging chute, *m*, the swinging gate being arranged so as to be alternately connected and detached with and from the oscillating basket-chute *a*, substantially as and for the purpose specified.



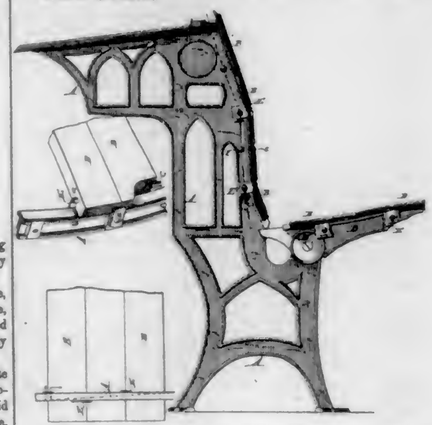
3. The combination, in a coal-tipple, of the oscillating basket-chute *a*, having a swinging gate at the free end thereof, with the hook *r*, operated by suitable arms, *t*, and capable of connecting and detaching said oscillating basket-chute *a* with and from the supports of a swinging chute, *m*, substantially as and for the purposes described.

299,586. FRAME FOR DISPLAYING GOODS. MILLARD F. SAGER, Pittston, Pa. Filed Nov. 3, 1883. (No model.)

Claim.—In a device for displaying goods, the hangers *a a' a² a³ a⁴*, formed of different lengths, and having screw-hooks *b* and *b'* and cross-rods *d*, one above the plane of the other, in combination with the eyebolt *c*, secured to the ceiling, substantially as shown and specified.

299,587. SUSPENDER-BUCKLE. CHRISTOPHER C. SHELEY, New York, N. Y. Filed Apr. 10, 1884. (No model.)

Claim.—1. The lever-catch having the pivot-studs *b b* and the wings *c c*, in combination with the buckle-frame, substantially as described.



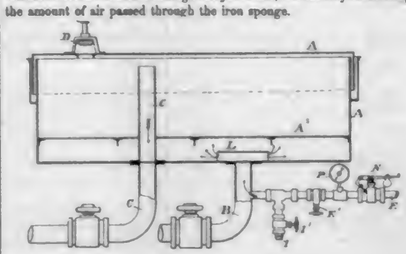
2. The combination, with the buckle-frame having the perforated ears, of the lever-plate for locking the webbing, having the pivots for engaging perforations in the ears, and having the wings turned down on the outside of the said ears, so as to cover the ends of the pivots, substantially as described.

3. The combination, with the buckle-frame having the perforated ears, of the locking-lever plate having the pivots and the turned-down wings provided with the struck-out or recessed portions for receiving the ends of the pivots, substantially as described.

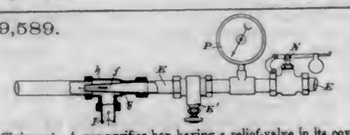
4. The combination, with the buckle-frame having a catch at its lower end for engaging the eye or ring of a suspender-end, and having also the perforated ears, of the locking-lever plate provided with the pivots and turned-down wings.

5. The buckle-frame having the hook *k*, in combination with the slide *s*, working in guides formed by the turned-down wings or ears of the buckle-frame, substantially as described.

299,588. FURNITURE. PITT LEE SHEPLER, Toledo, Ohio. Filed July 3, 1883. (No model.)



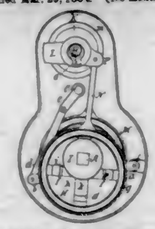
Claim.—1. As an improvement in furniture, the combination of a standard, parallel slats provided in their rear faces with thin slits at right angles to their edges partially across the slat, and flat connecting-plates, each secured at the rear end to the standard and seated at the forward end firmly in the recesses of the two contiguous slats.



2. In combination with the standards and the series of slats provided with narrow slits at right angles to their edges, the series of flat connecting-plates applied to the two sides of the standard alternately, and seated in the slits, whereby the edges of the plates are caused to assist in maintaining the rigidity of the structure.

299,589. GAS-PURIFIER AND METHOD OF REVIVIFYING IRON SPONGE. OLIVER H. SHIRAS, New Castle, Pa. Filed July 19, 1883. (No model.)

Brief.—Iron sponge used for purifying gas, after having become fouled, is reoxidized and revivified in the purifying-box by means of a current of steam and air blown through it, while the air and gases or vapors escape through a relief-valve. The temperature of the sponge is controlled during the operation by controlling the pressure and the volume of steam admitted through the jet-nozzle, and thereby controlling the amount of air passed through the iron sponge.

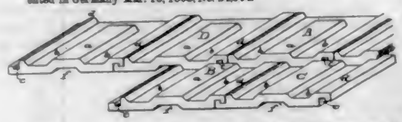


299,589.

Claim.—1. A gas-purifier box having a relief-valve in its cover, a steam-jet blower and an air-inlet adapted to force mixed steam and air into the box, a steam-pressure regulator attached to the steam-pipe, and a gage, as shown and described.

2. The method of regulating the temperature of the iron sponge or other oxide while undergoing reoxidation, consisting in confining the iron sponge or other oxide in a box, passing steam and air together through the mass of oxide, and increasing or diminishing the pressure of the steam as it passes into the box, as set forth.

299,590. VARIABLE-SPEED MOVEMENT. CHARLES L. SMITH, Jamestown, N. Y. Filed Mar. 29, 1884. (No model.)



Claim.—1. In a variable-speed movement, an eccentric upon the driving-shaft, constructed of an adjustable ring, F, and a second ring, G, revolving inside of and concentric with it, a fixed collar, I, upon the driving-shaft, and with the eccentric ring H between the fixed collar I and the ring G, all connected and operated as shown, whereby the throw of the eccentric ring H may be increased or diminished at will and while the machinery is in motion, substantially as described.

2. In a variable-speed movement, the adjusting-ring F, hinged to the case on the one side, and on the other connected by rods and shafts to the index-lever D, whereby the throw of the eccentric H may be increased or diminished by the operator at will and while the machinery is in motion, substantially as shown and described.

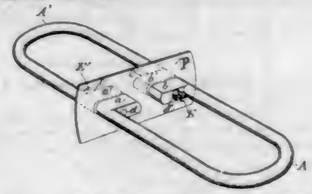
3. In a variable-speed movement, the locking-arm L, working loosely over the driven shaft B, and held in position against the shaft by a spring, O, and with lugs *n n*, so arranged as to grip the rim of a pulley on the driven shaft on the forward motion, but releasing the grip on the backward motion, of the arm, substantially as shown and described.

4. A mechanical device for producing a variable-speed movement, consisting of two or more adjustable eccentrics upon the driving-shaft, connected with and operating on two or more locking-arms, operating on a pulley on the driven shaft, the adjustable eccentrics and the locking-arms being constructed and connected together as described, the adjusting-ring of the eccentrics being connected with and controlled by the movement of the index-lever on the outside of the case, whereby the throw of the eccentric, and consequently the relative speed of the driven shaft, is varied at will by the operator while the machinery is in motion, all the parts working in combination, and constructed substantially as shown and described.

299,591. BRICK AND TILE MACHINE. JOHN GEORGES STADLER, Rothenbach, Bavaria, Germany. Filed Jan. 11, 1884. (No model.) Patented in Germany Mar. 10, 1883, No. 24,564.

Claim.—1. In roofing devices, as a new article of manufacture, the parallel-ridge tile A, provided with the two border ridges *d d*, wherein the side joints, *c c*, are spared, in combination with the partly-cut-off middle ridge, *a*, and the channel *f*, formed thereby at the bottom of the tile, the grooves *b b*, formed between the ridges *d a d*, and the ears *e e* at the upper end of the bottom face of the tile all substantially as shown, and for the purpose set forth and described.

2. In combination with a tile-machine, the die or mold, substantially as shown in Figs. IV, V, VI, and VII of the accompanying drawings, with the delivery end D and the feed end F, said mold provided at the middle portion of the hole with a swelling or thickening, and with greater taper on the walls on said portion of the hole than on the side borders of the same, for the purpose set forth and described.

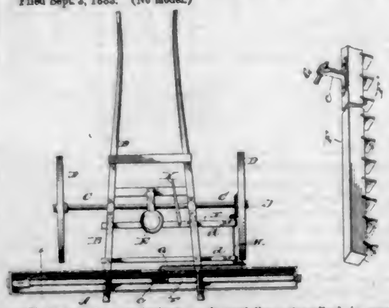


3. In a tile-machine, the combination of an attachment for simultaneously trimming the middle ridge and the ears of the tiles, consisting of horizontal cutting-wires strained within a vertical frame, said frame being movable, in the vertical sense, by means of a hand-lever within suitable guides attached to the cutting-table of the machine, the cutting-table constructed of a rectangular frame set on wheels, and supporting the suitably-shaped conveying-rollers for the clay band, and the device for cutting the tiles to their proper lengths, substantially as shown and described.

4. In a tile-machine, the combination of an attachment consisting of wires *i i*, bracket u_4, studs u_1 u_4, cross-bars q_7 q_8 q_9, studs q_7 q_8, sleeves on frame q_7 q_8, lever k_4, with handle k_5, link k, and bracket k_6, the cutting-table consisting of frame q_1 q_2 q_3 q_4, wheels W W, bearings *g g*, shaft s_5, brackets u_4 u_6, wires *i i*, rollers r_1 r_2, rollers r_3 r_4, r_5 r_6, roller r_8, bracket q_5, and cross-piece q_6.

5. In combination with a cutting-table of a machine for manufacturing parallel-ridge tiles, side rollers for guiding and supporting the clay band at its borders, constructed with hollow cast-iron caps journaled on pins secured to the frame of the cutting-table, said caps provided with inside bearings, and recessed corresponding to forked angles bolted to the frame of the cutting-table, substantially as shown, and for the purpose set forth and described.

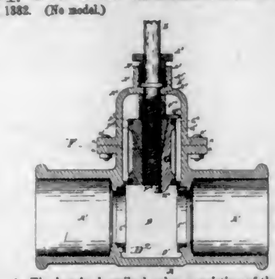
6. In combination with the cutting-table of a machine for manufacturing parallel-ridge tiles, the recessed side rollers, r_1 r_2, mounted on beam q_1 of the cutting-table, and supporting the borders of the clay bands, stands r_7, and forked angles r_8, substantially as shown, and for the purpose set forth and described.



299,592. LINK FOR CHAIN CONVEYERS. LOUIS O. STEVENS, Burlington, Iowa, assignor of one-half to George H. Lane, same place. Filed Jan. 28, 1884. (No model.)

Claim.—1. A link for chain conveyers, consisting of two parts or halves, each half provided with two separate perforated shoulders, the shoulders of one half abutting against those of the other half, and united by a securing device, which is held in perforations of said shoulders, as set forth.

2. A link for chain conveyers, consisting of two parts or halves, A A', provided with the shoulders *a a'* and *b b'*, respectively, each shoulder having perforations *c* and *c'*, *d* and *d'*, united by suitable locking-bolts inserted through the perforations, in combination with a push-plate, P, substantially as set forth.

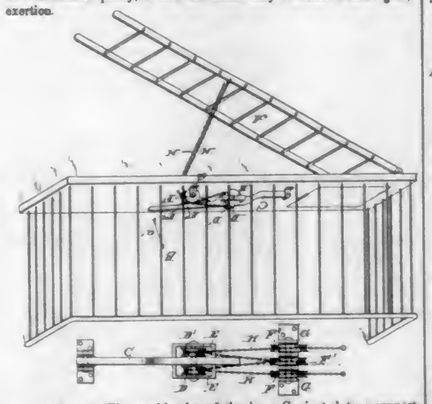


299,593. SEED-PLANTER. WILLIAM STODDARD, Valparaiso, Ind. Filed Sept. 3, 1883. (No model.)

Claim.—1. In a seed-planter, substantially as described, in combination with the hopper, cut-off, and feed-operating gear, as G H I J, the bar F, having a series of rigid depending plates, F', of equal width throughout and in number and location corresponding to the feed-apertures, as set forth.

2. The removable hopper A, secured to the rear of the shafts B, the feed-bar F F', as described, the gear-connections, as G H, the gear I, and lever K, all constructed and arranged to serve with the parts B C D J of an ordinary hay-rake, as set forth.

299,594. GATE-VALVE. JOS. H. STRENELL, Cincinnati, Ohio. Filed July 11, 1883. (No model.)



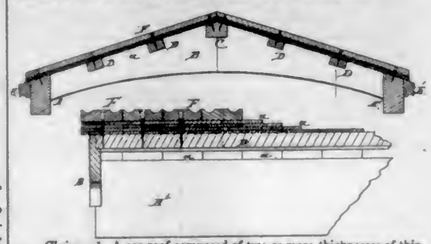
Claim.—1. The herein-described valve, consisting of the portions F and G, the outer faces of said portions being at all times parallel and the inner faces being beveled in opposite directions, as shown, and in contact with each other throughout their entire extent, the portion G being provided with ribs or projections G^2, and the portion F with recesses F^2, to receive said ribs to prevent lateral motion, substantially as and for the purposes specified.

2. The herein-described valve, consisting of the portions F and G, the outer faces of said portions being at all times parallel, and their inner or meeting faces being beveled in opposite directions, the portion F being connected to the valve-stem, and the upper edge of the portion G being provided with a projection, G^3, to engage with the lug or projection at the upper part of the valve-box, to stop said portion G at the proper point, substantially as and for the purposes specified.

299,595. FIRE-ESCAPE. JAMES TAYLOR, New York, N.Y. Filed Oct. 5, 1883. (No model.)

Brief.—The fixed pulleys on the balcony, over which and the pulleys journaled on the lever the rope is passed, are arranged to act as a differential pulley, so that the ladder may be raised without great exertion.

Claim.—1. The combination of the lever C, pivoted to a support or balcony, provided with the pulleys D D', the chain H, and the pulleys F F^2 F^3, substantially as described, for operation as set forth.



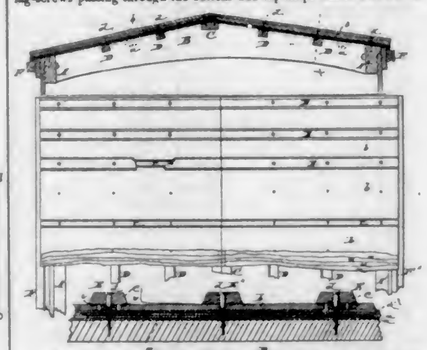
2. The combination, with a ladder, of a support to which it is pivoted, a lever, a differential pulley formed by pulleys on the lever and on the support, and of a chain secured to the side bars of the ladder and passing over the pulleys, substantially as herein shown and described.

3. The combination, with a ladder, of a support to which it is pivoted, a lever pivoted on the support, pulleys pivoted on the lever, and pulleys pivoted on the support, and of a chain secured to the side bars of the ladder and passed over the several pulleys, substantially as herein shown and described.

4. The combination, with a ladder, of a support to which it is pivoted, the lever C, pivoted on the support, the pulleys D D', pivoted to the lever, the pulleys F F^2 F^3, pivoted to standards G on the support, and of the chain H, secured to the side bars of the ladder and passed over and around the several pulleys, substantially as herein shown and described.

299,596. CAR-ROOF. HIRAM S. TIPTON, Chicago, Ill. Filed Oct. 26, 1883. (No model.)

Brief.—Consists of two or more thicknesses of thin narrow strips and battens, the strips and battens being of uniform width and arranged over each other to break joints, all held in place by bolts passing through the center of the battens and between the edges of one series of strips and through the center of another series. The outer ends of the battens terminate back of the outer edges of the side strips of the roof.

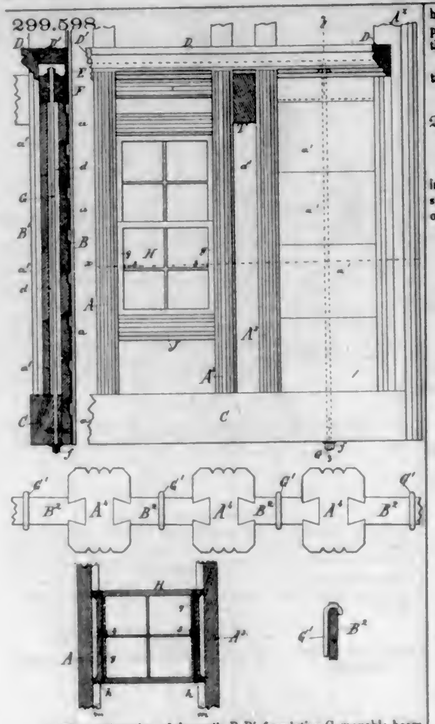


Claim.—1. A car-roof composed of two or more thicknesses of thin narrow strips, *a*, in combination with battens F, such thin narrow strips and the battens being of uniform width, and arranged over each other so as to break joints, all held in place by screws or bolts, which pass through the center of the battens, and between the edges of one series of strips and through the center of another series of strips, substantially as and for the purpose specified.

2. In a car-roof, the thin narrow strips *a* and the battens F, having their outer ends terminating back of the outer edges of the side strips, E E', for the purpose of protecting the ends of the roof-boards from injury, substantially as specified.

299,597. CAR-ROOF. HIRAM S. TIPTON, Chicago, Ill. Filed Jan. 19, 1884. (No model.)

Brief.—Consists of a top layer of strips and battens and two or more thicknesses of thin strips arranged so as to break joints, and so that lag-screws passing through the battens and top stripe will be in one line.



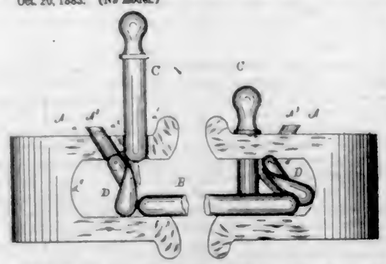
Claim.—A car-roof composed of two or more thicknesses of thin stripe, *a*, in combination with stripe *b* and battens, all arranged and held in place substantially as described, whereby the lag-screws or other fastenings do not pass through any one of the stripe *a* in more than one line, substantially as and for the purposes specified.

299,598. MODE OF CONSTRUCTING FRAME HOUSES. EDSELL TUTHAM, Hinsdale, Ill. Filed Mar. 8, 1884. (No model.)

Brief.—A movable timber upon top of side walls is adjusted to keep the cracks closed, said timber moving behind a stationary frieze-board. Grooved sashes receive wooden springs which are regulated by springs.

Claim.—1. A frame house having wooden walls provided with vertical tie and tightening rods, boarding E, and foundation C, whereby wind and water cracks are closed, substantially as described.

299,598.



2. The combination of the walls B B', foundation C, movable beam F, screw-bar G, and means for tightening the same, substantially as and for the purpose described.

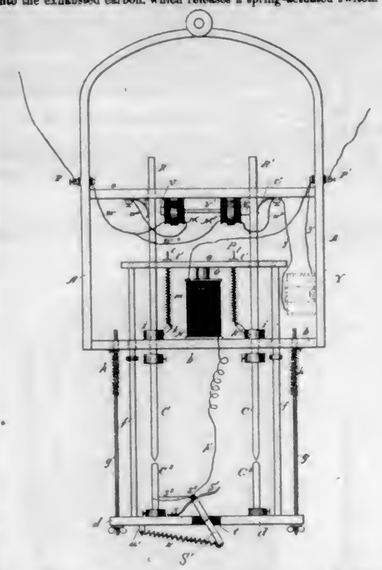
3. The frieze-board E, in combination with the movable beam F, walls B B', and foundation C, substantially as and for the purpose described.

4. A frame house provided with upright studs having longitudinal dovetail grooves to receive the planking which constitutes the walls of the house, and with vertical tightening-rods G, movable beam F, and frieze-board E, substantially as and for the purpose described.

5. The combination of upright studs A A^2, sash H, wooden springs A A, and tightening-screws *s s*, substantially as and for the purpose described.

299,599. CAR-COUPLING. ISAAC H. TRABUE, Louisville, Ky. Filed Oct. 20, 1883. (No model.)

Claim.—1. In a coupling, the combination of a swinging pendulum having a projection immediately under the pin-hole, and a pin having a recess in its lower end, substantially as described.



2. In a coupling, the combination of a bolt having a slotted end, and a pendulum suspended from said bolt by a pintle passing through said slot, substantially as described.

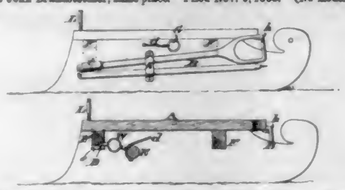
3. In a coupling, the combination of a draw-head having a bolt-hole, a bolt passing through said hole and having a slotted end, and a pendulum having ears connected with said bolt by a pintle, which passes through said slot, substantially as described.

4. In a coupling, a pendulum having a U-shaped groove, substantially as described.

299,600. ELECTRIC-ARC LAMP. THOMAS G. TURNER, New York, N. Y., assignor, by mesne assignments, to H. A. Seymour, Washington, D. C. Filed Nov. 16, 1882. Renewed Jan. 29, 1884. (No model.)

Brief.—A double lamp. The inactive carbon is held locked by an independent magnet in the active branch of the main line. Current is switched into the fresh carbon by the burning of a fusible wire looped onto the exhausted carbon, which releases a spring-actuated switch.

Claim.—1. In a double-carbon electric-arc lamp, the combination, with two upper and two lower carbon pencils, of an electro-magnet arranged to move the lower away from the upper carbons, automatic devices controlled by said magnet for feeding the carbons, and two electro-magnets arranged to automatically prevent the feeding of one or the other of the upper carbons, substantially as described.



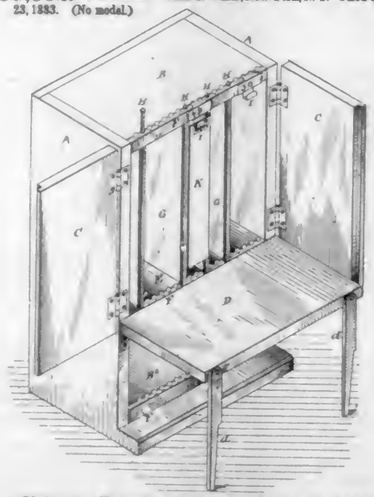
2. In a double-carbon electric-arc lamp, a movable support for the lower carbons, in combination with a single electro-magnet arranged to move said support for separating the upper from the lower carbons, clamping devices operated by said magnet for preventing the upper carbons from falling as the lower are moved away, and an automatic switch for throwing a second set of carbons into circuit when a first set has been consumed, substantially as described.

3. In a double-carbon electric-arc lamp, the combination, substantially as before set forth, of electro-magnetic devices in the main circuit for separating the carbons to form the arc and to control the feed of the upper carbon, which is in circuit, and independent electro-magnetic devices in, and actuated by, the main circuit, to prevent the feeding of the upper carbon, which is not in circuit.

4. The combination, with the lower-carbon-supporting frame constructed and supported, substantially as described, of the core O, projecting from the upper bar of said frame, the helix N, surrounding said core, the upper-carbon holders mounted in suitable guides, the clamping devices connected with said lower-carbon-supporting frame, and automatic and electro-magnetic devices arranged to be automatically thrown into circuit for alternately locking said upper-carbon holders, substantially as and for the purpose set forth.

5. In a double-carbon electric-arc lamp, the combination, with the movable lower-carbon-supporting frame, the electro-magnet arranged to move said frame, the suitably-guided upper-carbon holders, the clamps connected with the lower-carbon frame and arranged to hold said upper-carbon holders, and the automatic switch arranged to change the circuit from one pair of carbons to the other, of the helices M M', and their movable cores arranged to lock the upper-carbon holders alternately, and the intermediate electrical connections, essentially as set forth.

299,601. SLED. EMIL WAGNER, Cincinnati, Ohio, assignor of one-half to John Brandstattner, same place. Filed Nov. 9, 1883. (No model.)



Claim.—1. In a sled, the combination of longitudinally-movable pushers projecting in rear of the sled, and locks to guide the pushers, arranged substantially as shown and described.

2. The combination, in a sled, of longitudinally-movable pushers, locks, and concave bearings R, in which the pushers work, substantially as and for the purpose set forth.

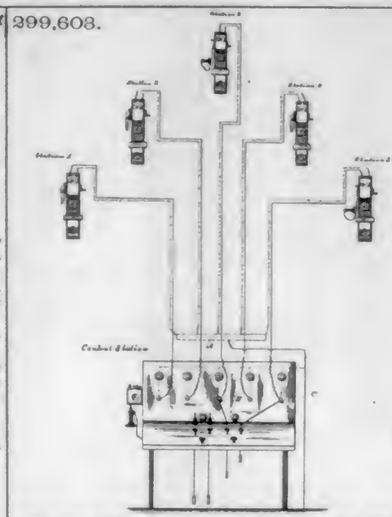
3. The strap or spring S and hook A, arranged on each side of a sled, for the purpose described.

4. In combination with sled A, rock-shaft E, provided with weighted detents D, cord *d*, wound upon said shaft, and provided with a ring, and hook G, adapted to receive the ring, as shown.

299,602. BOOK-CASE. CALEB T. WARD, New York, N. Y. Filed Mar. 23, 1883. (No model.)

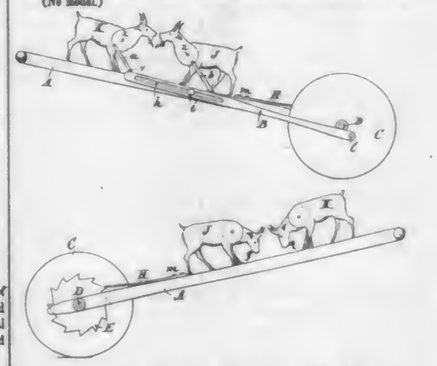
Claim.—1. The combination, substantially as herein set forth, of the rods with the vertical partitions having their front edges constructed as described, to engage the rods, and the book-case having its horizontal walls provided on the front edges with vertical passages to receive and hold the rods in position.

2. The combination, substantially as herein set forth, of the rods with the vertical partitions having their front edges bent to form tubes for engaging the rods, and the book-case having its horizontal walls provided on the front edges with vertical passages to receive and hold the rods in position.



3. The combination, substantially as herein set forth, of the rods with the vertical partitions having their front edges constructed, as described, to engage the rods, and the book-case having its horizontal walls provided on the front edges with grooved plates to form vertical passages for receiving and holding the rods in position.

299,603. METALLIC CIRCUIT FOR TELEPHONE-EXCHANGES. JAMES C. WARNER and ERNEST P. WARNER, Chicago, Ill., assignors to the Western Electric Company, same place. Filed Nov. 5, 1883. (No model.)



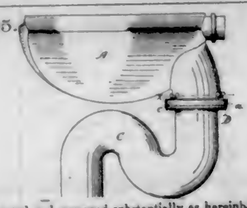
Claim.—1. The combination of a group of metallic circuits with a common connecting-piece from which the lines branch severally through an annunciator and spring-jack or switch upon the switch-board, and thence to a subscriber's station, and thence back to the common connecting-piece, whereby any two of these lines may be connected together by ordinary cords and plugs, substantially as set forth.

2. The combination of a group of telephone-stations and a central station, each telephone-station being connected to said central station by a metallic circuit, said metallic circuits each including a signaling device, a connecting-switch, and a connecting-piece at the central station, said connecting-piece being common to all the lines of the group, and provided with a permanent branch to ground, substantially as and for the purpose set forth.

299,603.

299,604. TOY. JESSE G. WEBB, Boston, Mass. Filed Apr. 14, 1884. (No model.)

Claim.—1. In a toy substantially such as described, the image K, mounted on the body A and provided with a pivoted head, in combination with the jointed lever *a*, and arranged to be operated by the pitman B and wheel C, substantially as set forth.



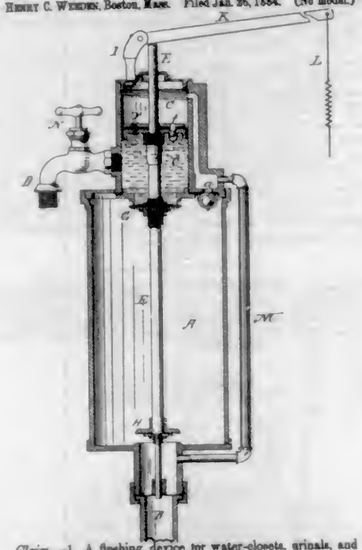
2. In a toy substantially such as described, the image J, provided with a pivoted head and mounted on the body A, in combination with the jointed lever *b*, and arranged to be operated by the pitman B and wheel C, substantially as specified.

3. In a toy substantially such as described, the images J K, provided with movable or pivoted heads, and arranged to face each other on the body A, in combination with the jointed levers *a b*, pitman B, ratchet-wheel E, spring-pawl H, and wheel C, substantially as set forth.

299,605. WATER-CLOSET CONNECTION. HENRY C. WEEDEN, Boston, Mass. Filed Jan. 12, 1884. (No model.)

Claim.—1. The combination, with an earthenware bowl, A, having the continuous perforated terminal flange *a* integral with said bowl, of the lead trap C, having the continuous flange *c* integral with said trap, clamp-screws B, passing through the two flanges, and the suitably-perforated stay-plates D, adapted to engage with and hold said screws, all

299,605.



being constructed and arranged substantially as hereinbefore set forth.

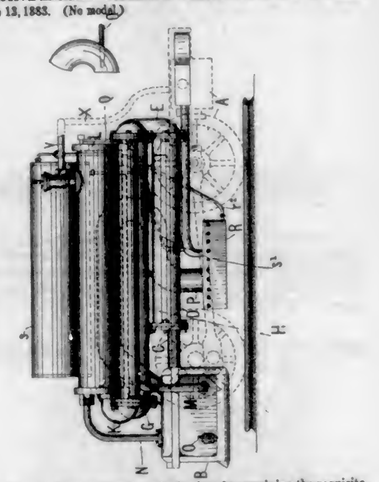
2. The combination, with the earthenware bowl A, having the perforated flange *a*, and the lead trap C, having a corresponding unperforated flange, *c*, of the gimlet-pointed clamping-screws B, and the suitably-perforated and screw-threaded segmental stay-plate D, all substantially as herein described and shown, and for the purposes set forth.

3. The combination of the earthenware closet or bowl A, having the perforated flange *a*, with the lead trap C, having a corresponding unperforated flange, *c*, the gimlet-pointed clamping-screw B, and the upper and lower clamping-segments, D' and D, all substantially as herein specified, and for the purposes herein set forth.

299,606. FLUSHING APPARATUS FOR WATER-CLOSETS, &c. HENRY C. WEEDEN, Boston, Mass. Filed Jan. 26, 1884. (No model.)

Claim.—1. A flushing device for water-closets, urinals, and similar structures, consisting of a water-chamber connected with the source of water-supply and kept normally closed by the pressure of said supply, and a second or flushing chamber connected with the first and also with the closet or basin to be flushed, and means whereby the passage from the first chamber into the second and from the second chamber to the closet may be successively opened by the occupant of the closet, all substantially as herein set forth.

2. In a flushing device for water-closets, urinals, and similar structures, the combination, with a water-retaining chamber connected with the source of water-supply, and having an outlet toward the closet, of a water-tight head or packing closing said chamber above the entrance of the water-supply, and a valve closing the outflow from the said chamber toward the closet, the packing or head and the valve being connected by a common rod or piston, all substantially in the manner herein described and shown.



3. In a flushing device for water-closets, urinals, and similar structures, the combination, with a water-retaining chamber connected with the source of water-supply, and a second or flushing chamber communicating with the first and also with the closet or urinal to be flushed, of a water-tight packing or piston-head, F, and valves closing the passages between the chambers and from the flushing-chamber to the closet, respectively, said piston-head and said valves being attached to a common stem, whereby they may be simultaneously moved or depressed, all substantially as and for the purposes herein set forth.

4. In a flushing device for closets, urinals, and similar structures, the combination of the water-retaining chamber C and flushing-chamber A, provided with a valved air-escape, *a*, of the piston-head F, provided with the valved air-passage *f*, the valves G and H, and the common valve-rod, E, attached to and carrying said piston-head and said valves, all substantially as herein described.

5. In a flushing device for water-closets, urinals, and similar structures, the combination, with the communicating water-chambers C and A, of the rod E, carrying the piston-head F and valves G H, the lever I K, and the cord or connection L, extending to the closet or urinal to be flushed, all substantially as herein described.

6. In a flushing device for water-closets, urinals, and similar structures, the combination, with the communicating chambers C and A, of the piston-head F, valves G H, closing the passage between the chambers and the passage from the chamber A, respectively, said piston-head and valve being mounted upon a common rod or support, E, the piston-head F and lower valve, H, being fixedly attached thereto, and the intermediate valve, G, being movably or adjustably attached thereto, all substantially as and for the purposes set forth.

299,607. STEAM-GENERATOR FOR STREET-CAR OR OTHER LOCOMOTIVE ENGINES. FREDERICK G. WHEELER, New York, N. Y. Filed June 13, 1883. (No model.)

Claim.—1. The combination of a fire-box for supplying the requisite heat to produce the steam or to sustain that already produced in a separate stationary boiler with a water-chamber in contact with the fire-box and a system of water-tubes communicating therewith, not in contact with the fire-box, substantially as described.

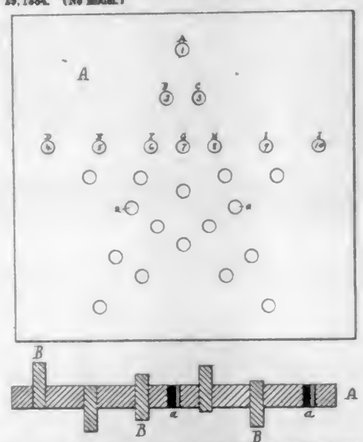
2. In combination with the water-chamber surrounding the fire-box, the circulating system of pipes and tubes, and the auxiliary pipes M M and N N, as described.

3. The water-box having the basin, the chamber, and the injector-pipe, as described.

4. A steam street-car or locomotive containing the following elements working in combination, substantially as herein described, namely: a fire-box and surrounding water-chamber, a tube system connected with water-chamber, an engine taking steam from tube system, a water-box communicating with the chimney of the fire-box, a steam-jet in the chimney to eject and cool the products of combustion and regulate chimney-draft, a water-tank and spray to condense the exhaust-steam, an ejector-pipe to return the water of the water-box to the tank, all as set forth.

5. In a steam street-car or locomotive, the water-box R, constructed with an interior water-basin, *r*, the flanges of which have openings to allow the descent of the surplus water into the bottom of the box R, substantially as herein shown and described.

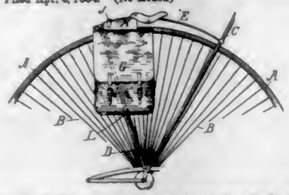
6. In the combination of the fire-box and smoke-flue with a water-box having perforations, as described, the products of combustion being discharged upon the top of the water, and not into the same, as and for the purpose described.



7. In combination with a water-chamber in contact with the fire-box and a system of water-tubes not in contact with the fire-box, a cock, O, for receiving a heated water-supply from a stationary boiler, as described.

8. In combination with the steam-jet pipe Q, the flue P, and the water-box R, having the series of openings r^3, as described.

9. A steam-generator for street-cars, consisting of a fire-box, a system of water-tubes remote from the source of heat, and a steam-dome, substantially as described.

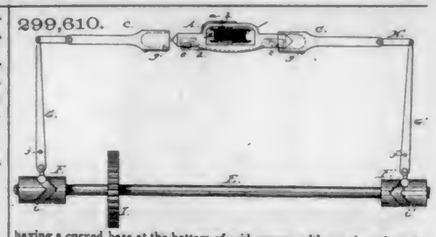


10. In combination with a steam-dome supplying a locomotive or street-car engine, a reservoir of connected water-tubes remote from the source of heat, and forming a storage and circulating system for water heated before entering the tubes to a degree which shall evolve steam.

299,608. TOY. ARTEMAS WILHELM, Wilmington, Del. Filed Mar. 29, 1884. (No model.)

Claim.—A toy composed of a board provided with a number of holes extending entirely through the board, and of uniform size throughout their length, in combination with pins of a length exceeding the thickness of the board, and adapted to fit tightly in said holes, substantially as and for the purpose herein specified.

299,609. SADDLE-BAGS FOR BICYCLES. JOHN B. WOOD, Camden, N. J. Filed Apr. 4, 1884. (No model.)



Claim.—1. In a bicycle of the class herein described, and in combination therewith, saddle-bags supported upon and attached to the bicycle-frame or to an attachment thereof at a point in the rear of the saddle and nearly central over the carrying-wheel, as specified.

2. In a bicycle of the class hereinbefore referred to, saddle-bags the pouches of which at their upper extremities are connected together by a strip of leather or other pliable material, in combination with the saddle-bar and rear upright rod, said saddle-bags being supported by having the strip of leather or other material connecting their upper ends slung across said saddle-bar and fixed thereto by a buckle or other suitable device, and having the pockets or pouches thereof secured at their lower extremities to said rear upright rod by a thumb-screw and clamp or other suitable fastening device, as and for the purpose specified.

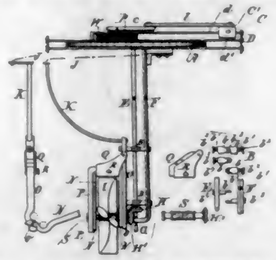
3. In combination with the saddle-bar E and rear upright rods, D D, of a bicycle, saddle-bags the lower extremities of the pockets of which are fixedly attached to the respective rods D D, and the upper extremities of said pockets or pouches of which are connected by a strip, H, of leather or other yielding material, which at its central portion is supported upon and fixedly attached to the saddle-bar E in such manner that yielding portions A A are provided, as and for the purpose specified.

299,610. POSITIVE SHUTTLE-MOTION FOR LOOMS. FREDERICK K. WRIGHT, Homer, N. Y. Filed Jan. 23, 1883. (No model.)

Claim.—1. The combination of a shuttle-body formed with a central opening for a bobbin and a longitudinal groove in one of its sides, and

having a curved base at the bottom of said groove, with a spring adapted to move longitudinally to the right and left over the said curved base at the bottom of said groove, said spring having slots at its ends and pins fixed in the shuttle-body across the ends of the said longitudinal groove passing through said slots, and serving to limit the longitudinal movement of said spring, and to cause the ends of the same to be retracted within the shuttle-body, substantially as described.

2. The combination, with the shuttle, formed as described, and provided with the spring *d* and means for limiting the longitudinal and lateral movement of said spring, of the reciprocating carriers C C', provided with springs *g g'*, all arranged substantially as set forth.



299,611. PROCESS OF REFINING PETROLEUM. LESLIE A. BAKER, Olean, N. Y., assignor of one-half to Edward A. Gould, same place. Filed Jan. 17, 1883. (No specimens.)

Claim.—1. A process of separating crude petroleum into its light and heavy constituents, consisting in mixing with the crude petroleum a cold medium, and thereby reducing its temperature, and then filtering the same, substantially as set forth.

2. A process of separating crude petroleum into its light and heavy constituents, consisting in mixing with the crude oil snow or its equivalent, and then filtering the oil while at a temperature below the freezing-point of water, substantially as set forth.

3. A process of separating crude petroleum into its light and heavy constituents, consisting in reducing the temperature of the crude petroleum and then filtering it by gravity, and collecting the filtrate or lighter constituent from below the filtering medium and heavier constituent from above the filtering medium, substantially as set forth.

299,612. PROPELLING-RUDDER. JEAN LOUIS FREDERIC BARNIER, Havre, France. Filed Jan. 3, 1883. (No model.) Patented in France Aug. 8, 1882, No. 150,476; in Belgium Dec. 18, 1882, No. 59,861; in Germany Dec. 18, 1882, No. 52,262, and in England Dec. 18, 1882, No. 5,994.

Claim.—1. The combination, with the rudder-post O P, the frame N, connected therewith, as described, the propeller-shaft and propeller, a driving-shaft to rotate said propeller, a false stern-post from which the shaft and rudder-posts are supported, of hinge-joints for flexibly connecting the rudder-post with the false stern-post and of which said driving-shaft forms the pintle, substantially as and for the purposes specified.

2. The combination, in a steering-propeller, of a false stern-post, a driving-shaft for the propeller, and a rudder-post from which the rudder and propeller are supported, both the driving-shaft and rudder-post being supported from the false stern-post, of hinge-joints for flexibly connecting the rudder-post with the false stern-post, of which the driving-shaft forms the pintle, substantially as and for the purposes specified.

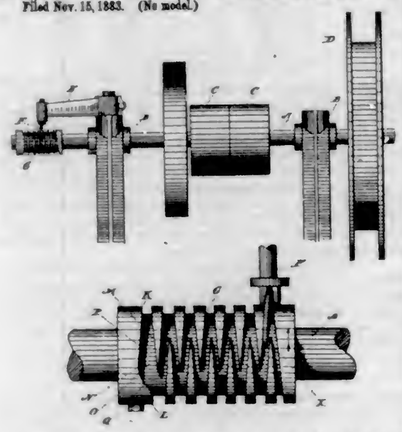
3. The combination, with the false stern-post, the rudder-post O P, the frame N, and braces B, of the shaft E, arranged to form the pintle for the braces, whereby both the rudder-post and parts connected therewith are hinged to and supported from the false stern-post, substantially as described, for the purpose specified.

4. The combination, with the propeller-shaft S, carrying pinion H' and the propeller, the rudder-post O P and frame N, forming a housing

and support for said propeller-shaft and propeller and constituting the rudder, the shaft E and pinion H for rotating the propeller, of the false stern-post F, the frame D, from which shaft E is supported, and the braces B, by means of which the rudder-post is hinged to the false stern-post through the medium of said shaft E, substantially as described, for the purpose specified.

5. The combination, with the false stern-post and the propeller-shaft, of the rudder composed of the rudder-post O P and the frame N, hinged together at o and secured to the false stern-post, as described, and the clamp Q, and retaining bolt and nut R, all arranged for co-operation, substantially as described, for the purposes specified.

6. The combination of the frame D, the false stern-post F, the braces B, the pivoted rudder-post O P, the frame N, and tiller K, the shaft E, having its bearings in post F and frame D, the pinion H, the propeller-shaft S, pinion H', and suitable mechanism for rotating shaft E, all constructed and arranged for operation as described.



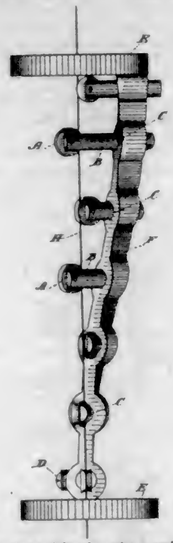
299,613. COMBINATION METALLIC LAST. JOHN BLAKEY, Leeds, County of York, England. Filed Feb. 25, 1884. (No model.)

Claim.—1. As an improved article of manufacture, a combination metal last comprising the lasts *a* and *b* and the heel-anvil *c*, formed in one piece, and constructed and arranged with respect to each other substantially as described.

2. As an improved article of manufacture, a combination metal last comprising the larger last, *a*, and its shank *a'*, the smaller last, *b*, and its shank *b'*, the heel-anvil *c*, and the projection *g*, all formed in one piece, and constructed and arranged substantially as set forth.

299,614. SWITCH-THREAD. HUGO BORCHARDT, Bridgeport, Conn. Filed Nov. 15, 1883. (No model.)

Claim.—1. A switch thread or worm in which the wall at each end diverges outward from the inner wall in a mechanical ratio equal to the pitch of the thread, beginning at the point where the thread reverses and extending into an open space or pocket, from the bottom of which the wall extends inward toward the inner wall.

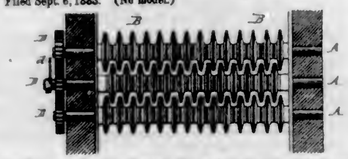


2. A switch-thread whose outer walls at each end are cut away to form open spaces or pockets O, substantially as and for the purpose set forth.

3. A switch-thread in which the outer wall between point K and point N is a straight line diverging outward from wall M in a mechanical ratio equal to the pitch of the thread, and from point N to point L diverging inward toward the opposite wall, substantially as described.

299,615. WIRE-STRAIGHTENER. HUGO BORCHARDT, Bridgeport, Conn. Filed Nov. 15, 1883. (No model.)

Claim.—1. In a device for straightening wire, a series of stationary rolls arranged in spiral form, and acting on alternate sides of the wire, whereby the surface is acted on from all directions.



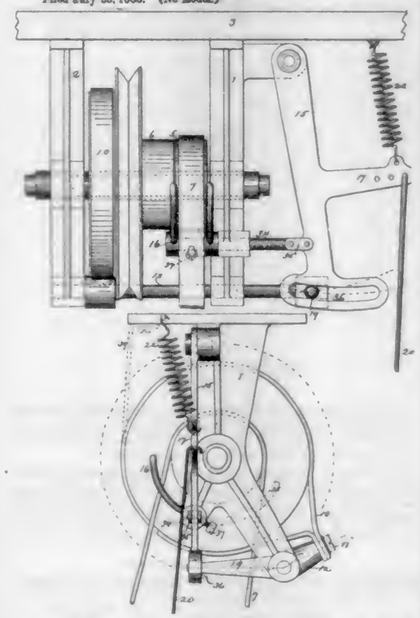
299,615.

2. In a device for straightening wire, a series of rolls journaled in the ends of pins, which are capable of adjustment in sockets arranged in spiral form, whereby each roll is caused to act on the surface of the wire in a plane at an acute angle to the adjacent rolls.

3. In a wire-straightener, the plates or rings E, through which the wire passes, and a single strip, F, connecting said plates or rings, and constructed to make a partial turn about the center, said strip being provided with a series of sockets, in combination with a series of pins adjustably arranged in said sockets, substantially as described.

299,616. FURNACE-GRATE. EDUARD BRESLAUER, Berlin, Germany. Filed Sept. 6, 1883. (No model.)

Claim.—1. The combination of a series of rotary shafts, each shaft provided with a series of removable circular disks beveled from their hubs to their peripheries, and having projecting separating hubs, the disks of one series extending into the spaces between the disks of adjoining series, and means for rotating said shafts, substantially as described.



2. The combination of a series of fixed shafts and independent separable disks movable on said shafts, said disks being provided with projecting hubs having interlocking recesses and projections, substantially as described.

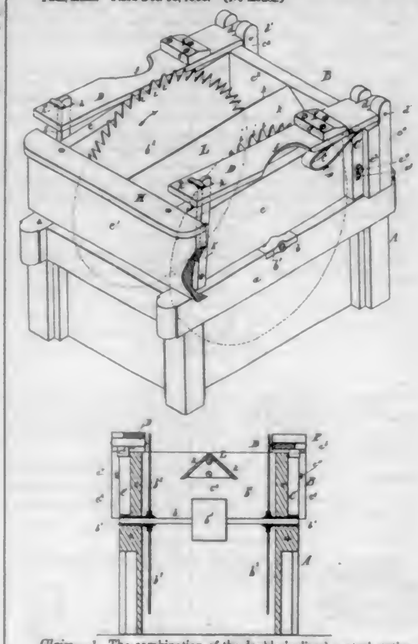
299,617. ONE-WHEELED VELOCIPEDE. BERNERD G. EHRLINGHAUSEN, Cleveland, Ohio. Filed Mar. 10, 1884. (No model.)

Claim.—In a one-wheel velocipede, the combination, with the hubs, the hangers D, depending from said hubs, and cranks secured to the hubs for revolving the wheel, of the cross-piece E, the balance-rod provided with the adjustable foot-rest, and the seat secured to the upper surface of the cross-bar, substantially as described.

299,618. SPEED-GOVERNOR. THOMAS L. CALKINS, Newark, N. J. Filed July 25, 1883. (No model.)

Claim.—1. The combination, in a speed-governor, of an idle and driving pulley, said driving-pulley having a friction-drum, a friction band or brake bearing upon said drum and connected to a stud upon the rocking shaft 13, a belt-shipping lever and shipper, connections between shipping-lever and the rocking shaft, and means for operating said rocking shaft, whereby the shifting of the belt and friction of the brake are controlled relatively to each other, substantially as set forth, to produce the required rate of speed, as described.

2. The combination, in a speed-governor, of idle and driving pulleys, said driving pulley having a friction-drum, a friction band or brake bearing upon said drum and connected to the rocking lever 13, a belt-shipper and lever, also connected to said rocking shaft, a retracting-spring, as 22, and a treadle and connections to the rocking shaft, whereby the shaft may be operated and the shifting of the belt and friction of the brake controlled relatively to each other, substantially as set forth.



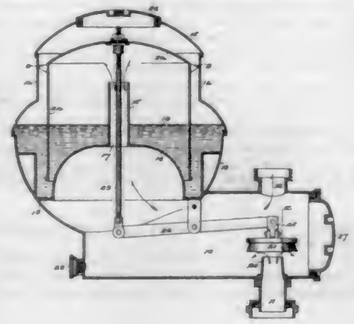
3. The combination, in a speed-governor, of the idle and driving pulleys, the latter being provided with a friction-drum, a rocking shaft, as 13, supported in the brackets of the governor, a friction-brake adjustably connected to a stud upon the shaft, a pivoted belt-shifter lever and shipper connected by the rod 18 and lever 19 to the rocking shaft, and means for operating the shaft, and thereby controlling the relative movement of the brake and belt-shifter, substantially in the manner set forth.

4. In a speed-governor, a belt-shifting lever provided with a curved slot and a belt-shipper, and means for adjusting the shipper in the slotted lever, so as to accommodate it to the varying angles of the driving-belt, as set forth.

5. The combination, with loose pulleys, of a hollow stationary shaft closed at both ends, and provided with an oil-feeding hole at or near one end, and having oppositely-arranged oil-holes in the top and bottom of the shaft, whereby the oil is kept in constant circulation and lubricates the bearings of the loose pulleys, as set forth.

6. The combination, with loose pulleys, of a hollow stationary shaft closed at both ends, and provided at or near one end with an oil supply or feeding hole, and having oppositely-arranged oil-holes in the top and bottom of the shaft, the upper holes being provided with gutters leading thereto, whereby the loose pulleys are lubricated and the excess of oil is returned to the hollow shaft, as set forth.

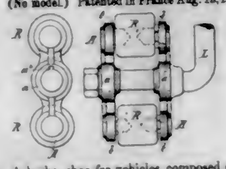
299,619. SHINGLE-JOINTING MACHINE. WILLIAM CARSON, St. Paul, Minn. Filed Dec. 13, 1883. (No model.)



Claim.—1. The combination of the double-inclined central stationary guard, L, affixed to the frame above the driving-pulley, with the single supporting-frame A, carrying shaft *b*, with driving-pulley, and provided with two hinged adjustable tables, D, arranged outside of the outer face of the saws, for supporting the shingles while being jointed, and with two disk-saws, b^2, arranged on the inside of the frame A on shaft *b*, and outside of the said inclined stationary guard L, substantially as described.

2. A machine for jointing shingles, comprising in its construction a table, D, pivoted at its rear end to a post, c^2, and provided with an actuating-spring, as c^3, which has its rear end applied to an adjustable post, C, whereby the tension of the spring can be increased or diminished, substantially as and for the purpose described.

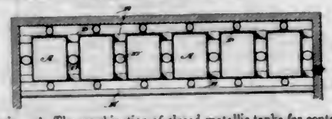
3. A machine for jointing shingles, which comprises in its construction a table, D, pivotally hinged at its rear end to a rear portion of the machine and slotted at its forward end, as at A, in combination with a stationary obliquely-set post, h', having a stop, h^2, to limit the upward throw of the table, and a spring, c^3, for actuating the table D in an upward direction, substantially as described.



299,620. GAS-REGULATOR. DAVID CHANNERS, New York, N. Y., assignor to William C. Howard, same place. Filed Nov. 12, 1883. (No model.)

Claim.—1. The combination, with the casing 13 14, of the dome-shaped plate 16, having an aperture, 17, at its summit, and surmounted by the tubular extension 18, of the sealing-fluid 19, cup 24, rod 23, passing through said aperture and tubular extension, and the horizontal pivoted lever 22, attached at one end to the rod 23 and carrying at its other the regulating-valve 21, secured thereto by a universal joint, substantially as described.

2. In a gas-regulator, the combination, with the cup 24, rod 23, and horizontal lever 22, of the valve-seat 20 and the flat valve 21, connected to said lever by a universal joint, 25, substantially as described.

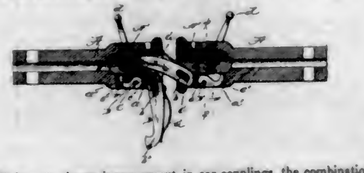


299,621. BRAKE-SHOE. GABRIEL CHANIER, Le Donjon, France. Filed Feb. 21, 1884. (No model.) Patented in France Aug. 13, 1883, No. 156,983.

Claim.—1. A brake-shoe for vehicles composed of one or more rollers and of two cheek-pieces, A, provided with bearings for the reception of the end of a brake-lever and conical bearings for the said rollers, as described, for the purpose specified.

2. A brake-shoe for vehicles, composed of one or more rollers and of two cheek-pieces, having bearings for the reception of the end of a brake-lever, in combination with the pointed screw-bolts B, and suitable tightening and check nuts, substantially as and for the purpose specified.

299,622. REFRIGERATING APPARATUS. WARREN A. CHASE, Boston, Mass. Filed Aug. 17, 1883. (No model.)



Claim.—1. The combination of closed metallic tanks for containing the refrigerating material, and the air-circulating tubes fixed vertically to the exterior of the walls of the tanks, and having their upper and lower ends open and their upper ends terminated below the tops of the tanks, whereby the condensed moisture is collected upon the interior and exterior of the tubes, substantially as described.

2. The combination of closed metallic tanks for containing the refrigerating material, and the metallic air-circulating tubes fixed vertically upon all sides of the exterior of the tanks and having upper and lower open ends, the open upper ends terminating below the tops of the tanks, whereby the tanks are braced and the condensed moisture collected upon the interior and exterior of the tubes, substantially as described.

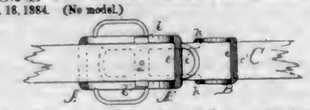
3. The combination of a preserving-compartment, a series of closed metallic tanks arranged therein adjacent to but separated from one wall of the preserving-compartment, the metallic air-dividing and condensing partition arranged at a distance from one side of the tanks, the air-circulating pipes fixed vertically to the sides of the tanks between their outer sides and the walls of the preserving-compartment, similar pipes interposed between the tanks, and air-circulating pipes fixed vertically to the sides of the tanks between the latter and the air-dividing and condensing partition, said pipes having upper and lower open ends, and their upper ends terminated below the tops of the tanks, substantially as described.

299,623. CAR-COUPLING. HENRY C. COBBETT, ANDREW B. HOLDEN, and DAVID BOOCHER, Scranton, Pa. Filed Apr. 11, 1884. (No model.)

Claim.—1. As an improvement in car-couplings, the combination of the draw-head, a coupling-hook pivoted therein and provided with the shoulder at its rear end, and a cam-piece arranged at the bottom of the draw-head in rear of the hook and provided with a front shoulder to engage the shoulder upon the hook, substantially as set forth.

2. The combination of the draw-head, the coupling-hook having the pivot-slot in its rear end, and provided with the shoulder in rear of this slot, the transverse pivot-pin passing through the slot, the rock-shaft arranged in rear of the pivot-pin, and a cam-piece secured upon the rock-shaft and provided with a shoulder adapted to engage the shoulder of the coupling-hook, substantially as set forth.

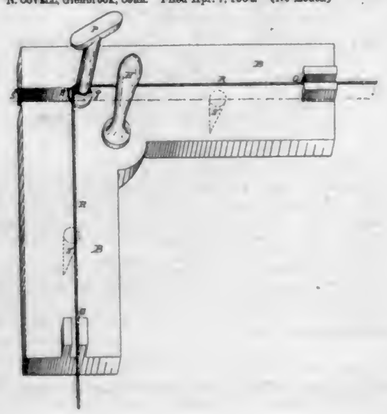
3. The combination of the draw-head having the front chamber or recess and the slotted bottom, the coupling-hook having the slot at its rear end and the shoulder in rear of the slot, a transverse rock-shaft, a cam-piece secured upon this shaft and having the shoulder, and the transverse coupling-pin arranged on a horizontal plane above the cam-piece, substantially as set forth.



4. The herein-described improved car-coupling, comprising the draw-head having the chamber or recess and the longitudinally-extending slot in the bottom thereof, the transverse pivot-pin extending through this slot, the coupling-pin having the pivot-slot and the shoulder at its rear end and provided with the flat retaining-spring at its top, the rock-shaft arranged in rear of the pivot-pin, the cam-piece secured centrally upon this shaft and having the front shoulder and the projecting rear end, the rear end of the slot in the draw-head being adapted to support this rear end of the cam-piece and corresponding therewith, and a transverse coupling-pin arranged above the cam-piece, substantially as set forth.

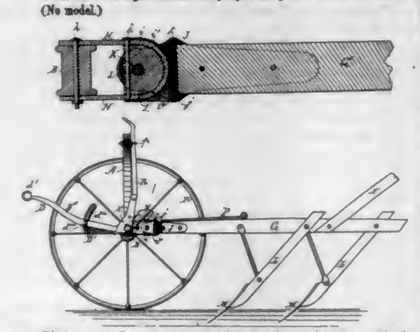
5. As an improvement in car-couplings, the combination, with a draw-head having a transverse coupling-pin over which the coupling-hook of an adjoining draw-head is adapted to engage, of a cam-piece secured upon an operating-shaft below this coupling-pin and projecting in rear of the latter to act directly upon the nose of the hook and elevate it above the pin, substantially as set forth.

6. The combination, with a draw-head having a transverse coupling-pin and a coupling-hook pivoted in front of the same, of a cam-piece arranged upon an operating shaft in rear of said hook and under the said coupling-pin, the front portion of the cam being adapted to engage the hook, and the rear end of the cam being adapted to act in relation to the coupling-pin, substantially as and for the purpose set forth.



7. The combination, with the draw-head having the recess or chamber and the longitudinally-extending slot provided in the bottom thereof, and having a curved rear end, of a transverse rock-shaft, and a cam-piece secured thereto and having a projecting rear end corresponding to and normally resting upon the rear end of the said slot, substantially as set forth.

299,624. TRACE-BUCKLE. FREDERICK CONWAY, Buffalo, N. Y. Filed Jan. 18, 1884. (No model.)

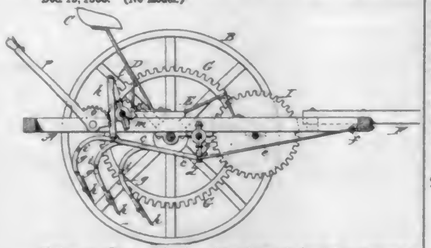


Claim.—The trace-buckle consisting of the two parts A and B, the latter having the curved bottom *d* and tongue-bar *b*, and with its projections b' b' resting on the sides of frame A, all constructed and arranged substantially as specified.

299,625. DEVICE FOR LAYING OUT TENNIS-GROUNDS. HARRY N. COVELL, Glenbrook, Conn. Filed Apr. 7, 1884. (No model.)

Claim.—In an apparatus for laying out lawn-tennis grounds, the combination of the bars B B, connected at their ends to form the corner of a square, the guides G on the ends of each of the bars, the slot or opening S^2, arranged as shown, the laying-off pin P, and the spikes S' on the bottom of the bars, with the said parts constructed to be used in the manner and for the purposes set forth.

299,626. CULTIVATOR. RICHARD CRACRAFT, Berwick, Ill., assignor to the Berwick Agricultural Company, same place. Filed Dec. 14, 1883. (No model.)

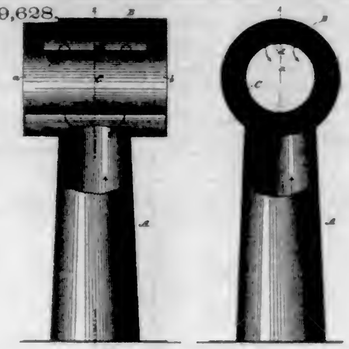


Claim.—1. In a tongueless cultivator, in combination with the arched axle and wheels, and plow-gangs connected to the axle by a joint which permits free movement of the gangs upwardly, but limits their downward movement, a draft-plate constructed in two parts, an angular part, D', rigidly connected with the wheel-spindle plate, and the part D'', hinged to the angular part D' at its rear end and its forward end adjustable vertically with reference to the parts D', substantially as and for the purpose specified.

2. In combination with the arched axle and wheels, vertically-adjustable draft-plate, and plow-gangs hinged to the axle, the blocks I, constructed as described, and adapted to coact with the beam-plate J, having shoulders *j*, substantially as and for the purpose specified.

3. In a tongueless cultivator, in combination with an arched axle and plow-gangs hinged thereto, and provided with devices for suspending the gangs to the axle, a shoe constructed as described and reversibly attached to the axle, substantially as and for the purpose specified.

4. In a cultivator, in combination with the plow-beams and plow-carrying standards, the plate *l*, having hole *l'* and stud *l''*, and the plate *m*, having tubular stud *m'* and bent brace *m''*, substantially as and for the purpose specified.



299,627. CULTIVATOR. BURWELL J. CURRY, Huntsville, Ala. Filed Dec. 15, 1883. (No model.)

Claim.—1. The combination of the frame A, having a transverse rod or shaft, *a*, provided with laterally-adjustable pendants *b b*, the brace-rods *a c*, the cultivator-stocks *c c'*, carrying suitable blades, the rock-shaft *m*, having adjustable arms *l l*, and the rods or bars *k k*, for connecting said arms to the cultivator-stocks, whereby the latter may be raised or lowered, substantially as described.

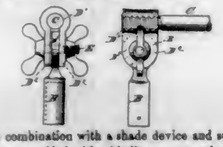
2. The combination of the cultivator-frame A, having transverse shaft *a*, the two-part box pendants *b b*, mounted on said shaft, the brace-rods *a c*, and the adjustable cultivator stocks or beams *c c'*, pivoted in the slotted lower ends of the pendants *b*, and carrying cultivator-blades, substantially as described.

299,628. CHIMNEY-CAP. HENRY S. DICKINSON, Jersey City, N. J. Filed Jan. 28, 1884. (No model.)

Claim.—As a new article of manufacture, a chimney-cap consisting of the cap B, having a transverse tube, C, provided with openings *a*, *b*, and *d*, substantially as and for the purposes set forth.

299,629. TENSION DEVICE FOR SEWING-MACHINES. CHARLES R. EDWARDS, Buffalo, N. Y. Filed Sept. 6, 1883. (No model.)

Claim.—1. In a tension device for sewing-machines, the combination, with a tension-member, of the tension-screw *c*, provided with the stop finger or projection *c'*, and of a stop by means of which the stop-finger is restricted in its movement to one revolution of the tension-screw, as and for the purpose stated.



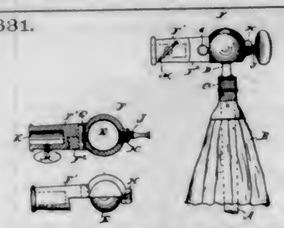
2. In a tension device for sewing-machines, the combination, with a tension-member, of the tension-screw *c*, provided with indicating-figures and the stop finger or projection *c'*, and of a stop by means of which the stop-finger is restricted in its movement within a single revolution of the tension-screw, as and for the purpose stated.

3. In a tension device for sewing-machines, the combination of the plate *f*, having its end at *d* immovably fastened to the supporting-frame *a'*, and the plate *b*, having its forward end touching and bearing on that portion of plate *f* between its fastened end *d* and its inner end, substantially as and for the purpose stated.

4. In a tension device for sewing-machines, the plate *f*, having its end immovably secured to the supporting-frame *a'*, and the plate *b*, having its forward end touching and bearing on the elastic portion of the plate *f*, between its fastening at *d* and its inner end, in combination with the tension-liberating lever *k*, pivoted to frame *a'*, and acting upon plate *b* from beneath, and between the elastic end of plate *f* and its rigid fastening at *d*, substantially as and for the purpose stated.

5. In a tension device for sewing-machines, the tension-plate *b*, in combination with the screw *c*, provided with shoulder *c'*, and the tension-screw *a*, provided with stop-finger *d'*, substantially as and for the purposes set forth.

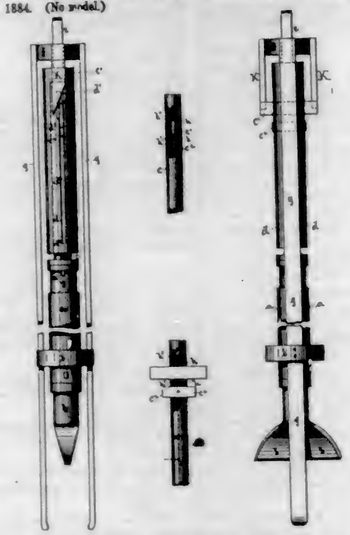
299,630. CANOPY-HOLDER FOR VEHICLES. HENRY EICHLING, New York, N. Y. Filed July 14, 1883. (No model.)



Claim.—In combination with a shade device and support therefor, an adjustable clamp provided with a binding-screw, and adapted to simultaneously and rigidly grasp the said support and the ferrule or similar part of said shade device, for the purpose set forth.

299,631. CANOPY-HOLDER FOR CHILDREN'S CARRIAGES. HENRY EICHLING, New York, N. Y. Filed July 27, 1883. (No model.)

Claim.—1. In a canopy or umbrella holder, the combination, with the socket F, provided with a threaded neck, H, at one end, and a cavity,



299,631.

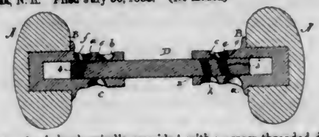
K, at the opposite end, of the binding-screws J M and the ball E, connected to the canopy or umbrella, substantially as herein specified.

2. In a canopy or umbrella holder, the combination, with a socket, F, of the ball E, united with a ferrule, C, secured permanently with a canopy or umbrella, and of the binding-screw J, substantially as herein specified.

299,632. BORING-TOOL OR DETENT-TERRIER FOR OIL-WELLS, &c. ALBERT FADER, Kleczany, Galicia, Austria-Hungary. Filed Mar. 5, 1884. (No model.)

Claim.—1. The combination of a guide-frame, *g g*, having fixed rails K K, inclined at the ends, a slotted sleeve, *d*, having a square rod, *e*, a detent-piece, *c*, carrying the boring-tool *a*, the detent-piece *c* having a longer oscillating cross-piece, *c'*, and a fixed lower cross-piece, c^3, the cross-piece *c'* being engaged by the rails K and automatically disengaged by the same during the ascent of the boring-tool, substantially as set forth.

2. The combination of a guide-frame, *g g*, having fixed rails K K, with inclined ends, a sleeve, *d*, having a fixed rod, *e*, and longitudinal guide-slots d^2, with inclined upper ends, *d'*, and seats d^3, a detent-piece, *c*, carrying the boring-tool *a*, and having a transverse longer oscillating cross-piece, *c'*, and a fixed shorter cross-piece, c^3, substantially as and for the purpose set forth.

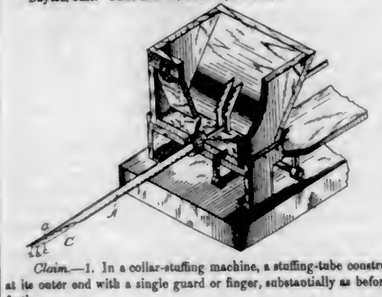


3. In detent-terriers, the combination of the detent-piece *c*, having an oscillating cross-piece, *c'*, with rails K, having inclined ends, said rails being fixed to the head of the guide-frame *g g*, substantially as described.

4. The combination of the boring-tool *a* with the detent-piece *c* by means of a double key, *a' a'*, which facilitates the taking apart of the different parts of the apparatus, substantially as described.

5. In detent-terriers, a guide-frame composed of side rails, a head, and a connecting-ring at the lower part of the side rails, substantially as set forth.

6. In detent-terriers, the detent-piece *c*, having a fixed lower cross-piece, c^3, and an upper longer cross-piece, *c'*, that is centrally pivoted to transverse steel bearings *h h*, secured by wedge-keys *h' h'*, substantially as set forth.

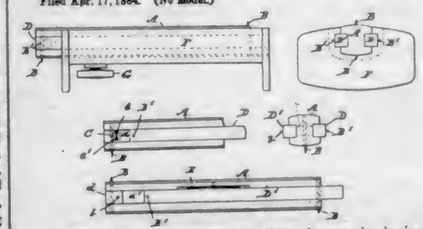


299,633. DOOR-KNOB ATTACHMENT. WILLIAM HENRY FLINN, Nashua, N. H. Filed July 30, 1883. (No model.)

Claim.—1. A knob-spindle provided with a screw-threaded diagonal hole combined with a knob-shank provided with a screw-hole, whereby by a partial rotation of the knob-shank on the knob-spindle the hole in the shank may be placed opposite either of the two ends of the hole made diagonally through the spindle, to enable a screw inserted through the hole in the shank and into one or the other end of the same diagonal hole to alter the effective length of the knob-shank, substantially as described.

2. The spindle having a diagonally-placed threaded hole and a screw combined with a knob-shank having holes at opposite sides thereof and at different distances from its end, as and for the purposes set forth.

299,634. COLLAR-STUFFING MACHINE. WASHINGTON FOGLESONG, Dayton, Ohio. Filed Dec. 15, 1883. (No model.)



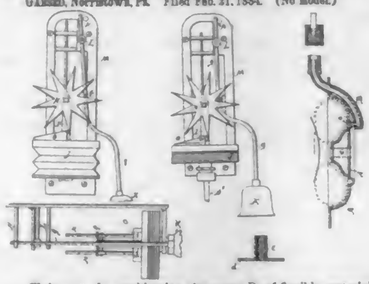
Claim.—1. In a collar-stuffing machine, a stuffing-tube constructed at its outer end with a single guard or finger, substantially as before set forth.

2. In a collar-stuffing machine, a stuffing-rod constructed with a slanting end formed with a series of teeth, substantially as before set forth.

3. The combination, substantially as before set forth, of the stuffing-tube provided with the single guard or finger on the outer end thereof, and the stuffing-rod having a slanting end formed with a series of teeth.

299,635. CARPENTER'S GAGE. GEORGE S. FORREST, Concord, N. H. Filed Apr. 17, 1884. (No model.)

Claim.—1. In a carpenter's gage consisting of a gage-bar having suitable marking-points, and a movable head provided with a thumb-screw for setting the same, the adjustable tongues D D', having marking-brads B' B', for use as a gage, fitted to grooves in said gage-bar and movable head, forming ways upon which said head may move, substantially in the manner and for the purpose set forth.



2. In a carpenter's gage consisting of a gage-bar having suitable marking-points, and a movable head provided with a thumb-screw for setting the same, the adjustable tongues D D', having marking-brads B B', for use as a gage, fitted to grooves in said gage-bar and movable head, forming ways upon which said head may move, and suitable springs, E, secured within the grooves in said head and bearing against said tongues D D', substantially as and for the purpose set forth.

3. In a carpenter's gage consisting of a gage-bar having suitable marking-points, and a movable head provided with a thumb-screw for setting the same, the adjustable tongues D D', having marking-brads

B B', for use as a gage, fitted to grooves in said gage-bar and movable head, forming ways upon which said head may move, and suitable springs, E, fastened upon the tongues D D', and bearing against one side of the grooves in the movable head, substantially as described, and for the purpose specified.

4. In a carpenter's gage, the following combinations: the adjustable tongues D D' and tongue *d*, having marking-brads B' *b*, with the gage-bar A, having grooves *a a'*, the adjustable tongues D D'' and tongue *d*, having marking-brads B' *b*, with the movable head F, having suitable grooves for their reception, the spring E, with the tongues D D', gage-bar A, and movable head F, and the fastening-pin C, having flattened side *c* and slot *c'*, with the marking-brads, all constructed and operating substantially in the manner and for the purpose specified.

299,636. PNEUMATIC BELL-RINGING APPARATUS. ROBERT P. GARSED, Norristown, Pa. Filed Feb. 21, 1884. (No model.)

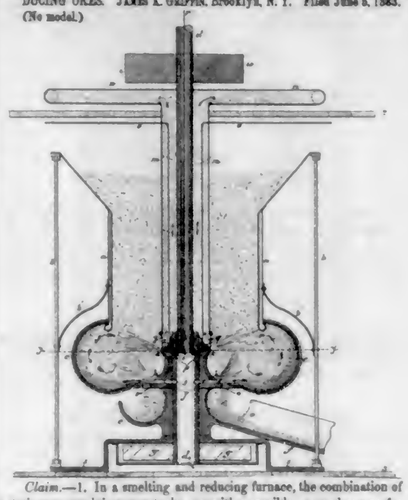
Claim.—1. In combination, the pump D, of flexible material, with central walled opening, and supported by metal holder A, having a peripheral raise on its outside bottom and a hollow central upwardly-extending form on its inside adapted to extend within the pump D, and the metal disk *d*, suited for being held within the hollow opening, and forming a guide for the plunger-stem, and said plunger-stem, as and for the purposes set forth.

2. In combination, the pump D, of flexible material, with central walled opening, and supported by the metal holder A, having a peripheral raise on its outside bottom, with hole for the passage of air, and a tube with a connecting-hole on its face, and with a coupling device on its end, and so shaped as to pass through a hole in pump-holder flange around pump-holder, and form a connecting device for an air-conveying pipe with pump, as and for the purposes set forth.

3. In combination with a bell, a connected pump, pipe, and bellows, and a star supported upon the latter, which upon one motion of the bellows remains rigid and actuates the bell and upon the other motion revolves, whereby it is again placed in position to actuate the bell, substantially as set forth.

4. A free vibrating bell actuated through a pump, pipe, and bellows, and a supported star carried upon the latter, and whose rigidity is maintained in one direction by a shouldered head attached to the bellows, in combination with a supported shaft for such star, substantially as set forth.

5. In combination, a suspended vibrating bell, a pump, connected pipe, inflatable bellows, and an inclined sliding arm supported by said bellows, and adapted by its movement to actuate the bell, a vertical-moving guide pin or standard connected with bellows, and guiding the same in its motions as well as supporting sliding arm, and the bracket M, with guide-piece attached thereto, substantially as and for the purposes set forth.



6. In combination, the pump-supporting bracket C, adapted by reversal of position of its parts for ceiling or wall attachment, the air-pump, with plunger and tubular rod attached thereto, the handle, with cord passing through the plunger-rod, an air-conveying pipe attached to pump, and an air-operated bell, substantially as and for the purposes set forth.

7. In combination, a pump-supporting bracket adapted by reversal of its parts for ceiling or wall attachment, an operative air-pump, connected pipe, and an actuated bell, substantially as and for the purposes set forth.

8. In combination, a supported air-pump, an actuating-plunger having a tubular rod passing through the pump, a handle with attached cord passing through the rod, an air-conveying pipe attached to pump, and an actuated bell substantially as and for the purposes set forth.

9. In combination, a pump-supporting bracket with vertical and horizontal arm, an air-pump with tubular plunger-rod passing through its center, a handle with cord passing through plunger-rod, a spring surrounding said rod and supported upon one of the arms of the bracket, an air-conveying pipe, and an operative bell, substantially as and for the purposes set forth.

299,637. PROCESS OF AND FURNACE FOR SMELTING AND REDUCING ORES. JAMES K. GRIFFIN, Brooklyn, N. Y. Filed June 5, 1883. (No model.)

Claim.—1. In a smelting and reducing furnace, the combination of a stationary supplying-receptacle, *a a*, with a crucible, *c c*, and means for rotating the same, the receptacle and crucible arranged in relation to each other, as shown and described, whereby one vessel is practically formed for containing the ore to be reduced, while a division-line of attrition is established between the stationary receptacle and the crucible, as and for the purpose set forth.

2. In a smelting-furnace, the stationary supplying-receptacle *a a* and rotating crucible *c c*, in combination with the discharge-pipe *m m*, substantially as described.

3. In a smelting-furnace, the stationary supplying-receptacle *a a* and rotating crucible *c c*, in combination with discharge-pipe *m m* and rotating exhaust-pipes *n n*, substantially as described.

4. In a smelting-furnace, the combination of stationary supplying-receptacle *a a*, rotating crucible *c c*, with blower *g*, vertical tubular axle *d*, tuyeres *h h*, and burner *k k*, substantially as described.

5. In a smelting-furnace, the combination of stationary supplying-receptacle *a a*, rotating crucible *a a*, with blower *g*, vertical tubular axle *d*, and tuyeres *h h*, substantially as described.

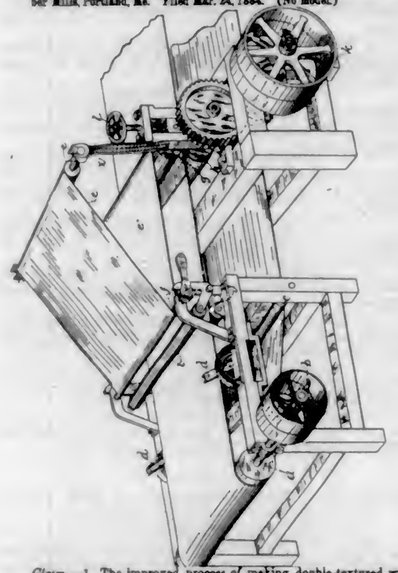
6. In a smelting-furnace, the combination of stationary supplying-receptacle *a a*, rotating crucible *c c*, with blower *g*, vertical tubular axle *d*, and burner *k k*, substantially as described.

7. In a smelting and reducing furnace such as described, the combination of the crucible *c* with the discharge-pipe *m m*, provided with the exhaust-pipes *n n*, substantially as set forth.

8. In a smelting and reducing furnace, the combination of the rotating crucible and stationary hopper with the central burner, *k k*, arranged to extend up within the crucible to a height approximating the line of attrition between the stationary receptacle and the crucible, substantially as and for the purpose set forth.

9. In a smelting and reducing furnace, the combination of the rotating crucible *c* and stationary receptacle with the central burner, *k k*, arranged to extend up within the crucible to a height approximating the line of attrition between the stationary receptacle and the crucible, the tubular axle *d*, and blower *g* for supplying air thereto, substantially as set forth.

10. In a smelting-furnace, the following elements in combination: stationary receptacle *a a*, discharge-pipe *m m*, rotating crucible *c c*, and burner *k k*, arranged and operated substantially as described.



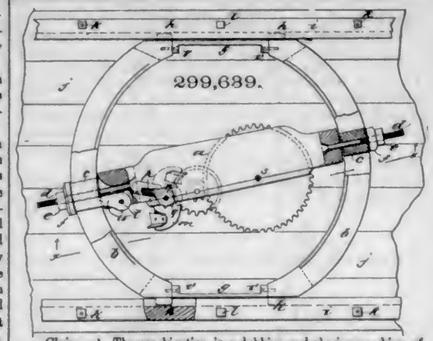
11. The process of reducing and smelting ores which consists in rotating one mass or division thereof, while being held and smelted in the crucible *c c*, under the weight of and against another stationary mass or division thereof, held in the stationary supplying-receptacle *a a* while the said ores are under the influence of heat generated on the line of attrition between the stationary and rotating masses or divisions of ore, and forced between and among the particles thereof by the combustion of coal or other fuel, substantially as described.

12. The process of smelting and reducing ores which consists in rotating one mass or division thereof, while being held and smelted in the crucible *c c*, under the weight of and against another stationary mass or division thereof, held in the stationary supplying receptacle *a a* while the said ores are under the influence of heat generated on the line of attrition between the said masses or divisions of ore, and forced between and among the particles thereof, by the combustion of coal or other fuel, and at the same time separating and carrying off the waste materials upwardly by the pneumatic force described, while the metal is being separated and forced outwardly and downward within the crucible *c c* by centrifugal force, substantially as described.

13. The method herein described of separating the impurities from the molten metal, which consists in subjecting the molten mass at its point of exit from the crucible to a blast of air projected within the crucible and across the line of discharge, substantially as described.

14. The process of smelting and reducing ores which consists in rotating one mass or division thereof, while being held and smelted in the crucible *c c*, under the weight of and against another stationary mass or division thereof, held in the stationary supplying-receptacle *a a* while the said ores are under the influence of heat generated on the line of attrition between the said masses or divisions of ores, and forced between and among the particles thereof, by the combustion of coal or other fuel, and at the same time separating and carrying off the waste material upwardly by the pneumatic force developed in the furnace by combustion while the metal is being separated and forced outwardly and downward within the crucible *c c* by centrifugal force, when by its gravity it is pressed back to and through the discharge-ports *o o*, under and against a current of air from the tuyeres *h h*, over the said ports within the crucible *c c*, in the manner substantially as described.

299,638. PROCESS OF MANUFACTURING GOSSAMER WATER-PROOF CLOTH. FRANK E. HALL, Boston, Mass., assignor to the Hall Rubber Mills, Portland, Me. Filed Mar. 24, 1884. (No model.)



Claim.—1. The improved process of making double-textured water-proof cloth by uniting a fabric designed as the outer part of the cloth with that intended for the lining by first covering one or both with an adhesive and water-proof substance, and then uniting the two fabrics while one is in the form of an endless belt, substantially as above described.

2. The improved process of making water-proof cloth of two fabrics by coating one of said fabrics with an adhesive and water-proof substance, the said fabric for that purpose being made in the form of an endless belt, to which the other fabric is caused to adhere, the two for that purpose passing between rolls, one of which is heated, and the other is a rubber covered or cushioned roll, and afterward cutting the belt so as to form a strip, substantially as above described.

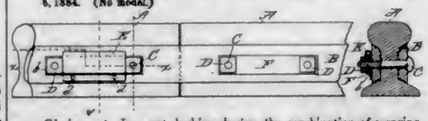
3. The improved process of making a double-textured water-proof fabric by uniting two pieces of cloth with an adhesive substance, one of said pieces being made in the form of an endless belt, while the other is rolled thereon, and afterward cutting the belt so as to form a strip, and curing the double-textured fabric thus formed in the sun, substantially as described.

299,639. MACHINE FOR DRESSING SHIPS' SIDES. OWEN HAMILTON, St. Johns, New Brunswick, Canada. Filed Oct. 20, 1883. (No model.)

Claim.—1. The combination, in a dubbing and planing machine, of a beam, *a*, having a cutter and driving-gear mounted on it, curved supports *b*, in which said beam is adjustably mounted, and guides *i*, attached to the ship's side and having the supports *b* arranged to be shifted along them, substantially as described.

2. The beam *a*, having the cutter and driving-gear mounted on it, in combination with curved supports *b*, arranged in the guides *i*, the beam *a* being connected to the supports *b* by the blocks *c* and bolts *d*, the blocks being adjustable along the supports, and the bolts being arranged to clamp the beam fast to the supports, substantially as described.

3. The beam *a*, having the cutter and driving-gear mounted on it, in combination with the supports *b*, arranged in guides *i*, the beam being connected to supports *b* by clamping and pivot bolts *d*, whereon the beam is adjustable to adjust the cutter to the surface of the ship's side, substantially as described.



4. The beam *a*, having the cutter and driving-gear mounted on it, in combination with the supports *b*, arranged in the guides *i*, and being pivoted on the connecting-bolts *d*, and having an adjusting-screw, *l*, to set it on said pivot-bolts, substantially as described.

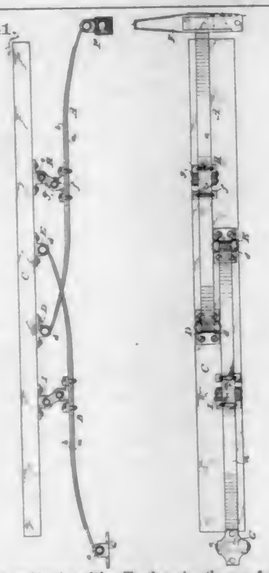
5. The beam *a*, having the cutter and driving-gear mounted on it, in combination with the supports *b*, arranged in the guides *i*, the cutter *m* being adjustable to and from the beam by an extensible arbor, to adjust it to the work and to regulate the depth of the cutting, substantially as described.

6. The beam *a*, having the cutter and driving-gear mounted on it, in combination with the supports *b* and guides *i*, and being adjustable on its pivot-supports *d*, and the cutter being arranged on an extensible arbor, substantially as described.

7. The combination, with guides *i*, attached to the sides of the ship by bolts *k*, and temper-screws *l*, for springing them to the curves of the ship, of the beam *a*, having a cutter and driving-gear mounted on it, and the supports *b* for said beam, said supports *b* being connected by bars *g*, and having lugs *h* arranged in the grooves of said guides *i*, substantially as described.

299,640. NUT-LOCK. JOHN W. HAWK, Huntsville, Ala. Filed Mar. 6, 1884. (No model.)

Claim.—1. In a nut-locking device, the combination of a spring locking-plate, E, supporting and connecting strap F, washers *b b*, nuts D D, bolts C C, fish-plates B, and rails A A, substantially as shown and described.



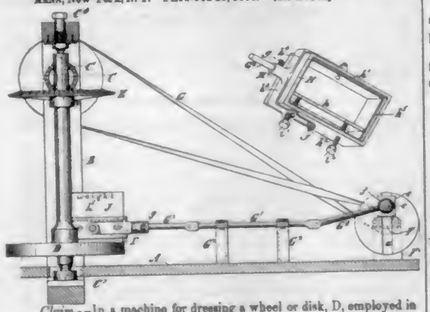
2. A nut-locking device consisting of a locking-plate, E, provided with lugs *d d* and lip *c*, a supporting-strap, F, for holding said locking-plate in place, and washers *b b*, for affording a space for the insertion of said locking-plate, substantially as shown and described.

3. A spring nut-locking plate, E, formed from one piece of metal so bent as to form a lip, *c*, and spring *e*, and provided with lugs *d d*, or equivalents, for the purpose described.

299,641. VEHICLE-SPRING. JACOB HERBRAND, Fremont, Ohio; E. Loudenslager, Administrator of said Herbrand, deceased. Filed June 16, 1883. (No model.)

Claim.—1. The combination of the sills, the axles, the springs hinged at their ends directly to the sills and the axles, and the hinged hangers for supporting the springs about at their middle, substantially as described.

299,641.

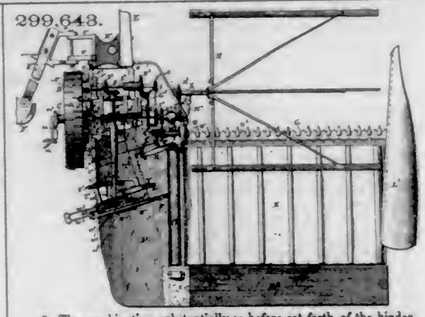


2. The combination of the sills, the axles, the re-enforced overlapping springs hinged to the sills and the axles, and the hinged hangers, which hold together the leaves of the springs and support them, substantially as described.

3. The spring-supporting hanger consisting of the bracket, the clip, and the links hinged to the bracket and the clip, substantially as set forth.

4. The spring-supporting hanger herein described, composed of the bracket, the sleeve-bearing therein, the clip, the sleeve-bearing therein, the links with hollow bearing-studs, and the bolts for holding the links in position, substantially as set forth.

299,642. MACHINE FOR DRESSING THE FACES OF WHEELS FOR GRINDING DIAMONDS AND OTHER ARTICLES. ISAAC HERMANN, New York, N. Y. Filed Oct. 25, 1883. (No model.)



Claim.—In a machine for dressing a wheel or disk, D, employed in grinding diamonds and other articles, the combination of the frame B, the bearings C^3 C^4, one of which is adjustable, the gear-wheel E on the spindle of the wheel or disk D, the wheel C', the shaft C, the pulley C^2, the band or belt G, the pulley F^2, the shaft F, the pulleys F^3 F^4, &c., arranged on said shaft and adapted to receive a belt, whereby motion is transmitted to the said shaft, the head F^1, the wrist J, adjustably connected to the head F^1, the holder H, for the material used to dress the wheel or disk D, and the pitman-rod G^4, connected to the wrist d and adapted to impart a reciprocating motion to the holder H.

299,643. PLATFORM SELF-BINDER. PLINY F. HODGES, Chicago, Ill. Filed June 13, 1883. (No model.)

Claim.—1. The combination, substantially as before set forth, of a butt-hastening rake and a packer, both arranged as described, so as to move in vertical planes oblique to the line of the cutting apparatus and operating mechanism.

299,643.

2. The combination, substantially as before set forth, of the binder-table, the oblique butt-hastening rake suspended above it, and the oblique packer.

3. The combination, substantially as before set forth, of the endwise butter and the independent butt-hastening rake.

4. The combination, substantially as before set forth, of the endwise butter, the independent butt-hastening rake, and the packer.

5. The combination, substantially as before set forth, of the endwise butter, the binder-table, the oblique butt-hastening rake, and the oblique packer.

6. The combination, substantially as before set forth, of the endwise adjustable binder, the fixed oblique butt-board, and the fixed oblique butt-hastening rake.

7. The combination, substantially as before set forth, of the endwise adjustable binder, the packer connected to and adapted to move with the binder in adjusting the same endwise, the fixed butt-board, and the fixed butt-hastening rake.

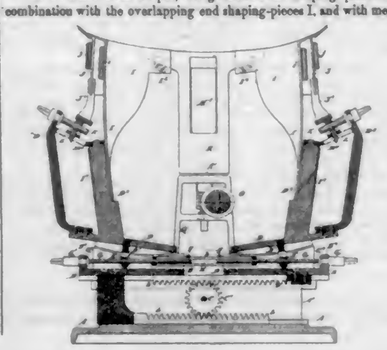
8. The combination, substantially as before set forth, of the adjustable binder-table, the oblique packer connected to and adapted to move therewith, the fixed oblique butt-hastening rake, and the fixed oblique butt-board.

9. The combination, substantially as before set forth, of the binder-table, the oblique butt-hastening rake suspended above the same, the oblique packers, and the oblique binding-arm.

10. The combination, substantially as before set forth, of the main binder-shaft, the oblique counter-shaft, and the binding-arm connected with and moved by said oblique counter-shaft.

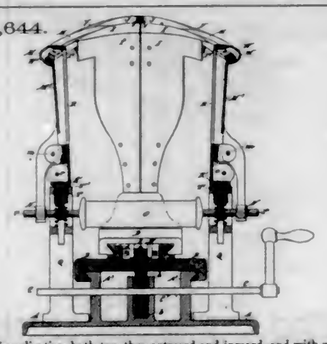
11. The combination, substantially as before set forth, of a binding-arm, the packer, and a rotating segmental cut-off which checks the flow of the grain to the packer.

12. The combination, substantially as before set forth, of a binding-arm, the independent cut-off for checking the flow of the grain to the packer, and a cord-tucking device attached to said cut-off.



13. The combination, substantially as before set forth, of the platform-carrier, the endwise butter, the roller for stripping the grain from said platform-carrier, the butt-hastening rake, and the packers.

299,644. APPARATUS FOR SHAPING HAT-BRIMS. LOREN H. HOTT, Danbury, Conn. Filed Oct. 25, 1883. (No model.)



Brief.—Improvement on Patent No. 277,035, dated May 8, 1883.

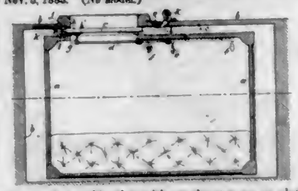
Claim.—1. In a hat-brim-shaping machine, the single gear-wheel C', in combination with the racks b and slides B, carrying the end shaping parts, arranged to serve as herein specified.

2. In a hat-brim shaper, the graduated end shaping-pieces J, in combination with the overlapping end shaping-pieces I, and with means,

299,644.

as b C', for adjusting both together outward and inward, and with means J' K, for adjusting the breadth of the brim, and springs L, pressing the parts J I in contact, all substantially as herein specified.

3. In a hat-brim shaper, the combination of end shaping parts, divided vertically, with means for engaging the same with the side shaping parts, and with provisions for increasing and diminishing the width of the space for the hat-body, substantially as and for the purposes herein specified.



4. In a hat-brim shaper, the top slides, D, carrying the end shaping-surfaces, in combination with the curved supporting-ways B', and means, as G, for traversing the one relatively to the other, so as to change the scope without changing the position of the shaping parts, substantially as herein specified.

5. The adjustable brackets Q, carrying the side shaping-pieces R, in combination with the pinching-screws U, engaging in the slots q', arranged to serve relatively to each other and to suitable end shaping-pieces J J, substantially as specified.

6. The movable side shaping-pieces M, carried on levers M', in combination with the screws P, and means O, for connecting and turning them, arranged to adjust the hat-brim-shaping surfaces on the two sides by a single motion, substantially as herein specified.

7. In a hat-brim-shaping machine, the screws P, connected together as shown, in combination with the swiveling-nuts N, levers M', and side shaping-pieces M, and inner side shaping-pieces R, arranged to serve as herein specified.

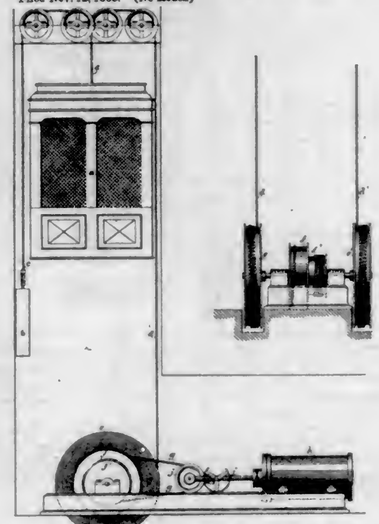
299,645. ELEVATOR. MERRILL N. HUTCHINSON, New York, N. Y. Filed Nov. 5, 1883. (No model.)

Claim.—1. In combination with an elevator car or platform and the door of the passage leading thereto, the hooks i and j, and the projection k, whereby the said door is held closed, excepting when the elevator-car is in proper position for it to be opened, substantially as set forth.

2. In combination with the elevator-car and the door of the passage leading thereto, the flanges h h', and the finger g, arranged to engage therewith as the elevator is passing the landing, substantially as and for the purpose set forth.

3. In combination, the elevator car or platform, the door of the passage leading thereto, the rope or other device whereby the motion of the elevator is controlled, and mechanism, substantially as described, whereby said rope or other device is locked when the door is open, as and for the purpose set forth.

4. In combination, the elevator car or platform, the door of the passage leading thereto, the handle e, and the rod d, connected therewith, and provided with mechanism, substantially as described, for engaging with the door when the elevator is in proper position for the same to be opened, as set forth.



5. In combination, the elevator-car, the door of the passage leading thereto, the hooks i and j, the projection k, and the finger g, engaging the said door when the elevator is opposite the landing, substantially as described.

6. In combination, the elevator-car, the door of the passage leading thereto, the finger g, engaging the said door when the elevator is opposite the landing, and a locking mechanism, substantially as described, for arresting the operation of the elevator-rope when the door is open.

7. In combination, the elevator car or platform, the door of the passage leading thereto, the hooks i and j, and the projection k, whereby the door is automatically secured when the elevator-car is passing between landings, and unfastened when opposite landings, and the locking mechanism, substantially as described, whereby the starting of the elevator-car is prevented when the said door is open.

8. In combination, the elevator car or platform, the door of the passage leading thereto, the hooks i and j, the finger g, engaging with the door, and the locking device k', substantially as and for the purpose set forth.

299,646. ELEVATOR. MERRILL N. HUTCHINSON, New York, N. Y. Filed Nov. 12, 1883. (No model.)

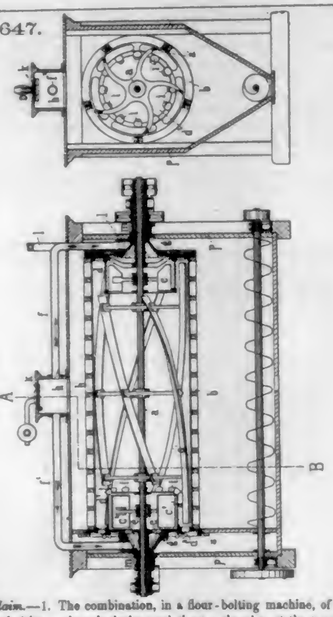
Claim.—1. The combination, substantially as described, of the differential windlass and hoisting-drum interposed between the elevator car or platform and the motor, as and for the purpose set forth.

2. In combination, the elevator car or platform a, the hoisting-rope d, the differential windlass $f f'$, the rope g and pulley j, and cylinder h and piston thereof, substantially as described.

3. In a hoisting apparatus, the combination, with the piston-rod of the motor, of the rope g and the differential windlass, the said rope being attached to said windlass, substantially as described, whereby the line of pull on said piston-rod is preserved constant, as and for the purpose set forth.

4. In combination with the differential windlass $f f'$, the two hoisting-drums e e', each connected by a rope or chain with an elevator car or platform, substantially as and for the purpose set forth.

5. In a hoisting apparatus, the combination of the differential windlass, the rope g, connected with the motor, substantially as described, and the rope c c', and the pulley l, connected with the counter-weight, as and for the purpose set forth.

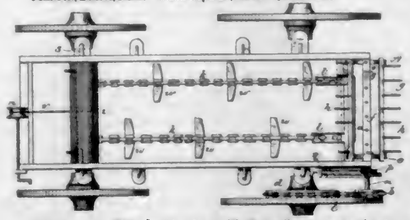


6. In combination with the hoisting-drum of an elevator and the motor whereby the same is operated, the counter-weight and ropes connected with said hoisting-drum and suspending said counter-weight, whereby the pull of said counter-weight assists said motor by exerting its force upon the said drum, substantially as set forth.

7. In combination with the double-acting motor and the elevator cars or platforms a a', to be operated therefrom, the differential windlass $f f'$, the rope g g' g'' g''', and the hoisting-drum e, substantially as and for the purpose set forth.

8. In combination with the hoisting-rope of an elevator car or platform, the pulley j, attached thereto, and combined with a differential windlass connected with the motor A, substantially as and for the purpose set forth.

299,647. FLOUR-BOLTING MACHINE. GEORG CARL FRIEDRICH PAUL JANSSEN, Hamburg, Germany. Filed Jan. 18, 1884. (No model.)

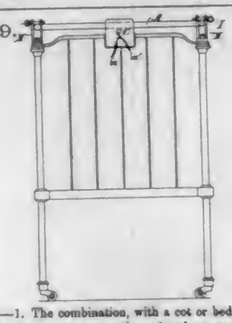


299,647.

Claim.—1. The combination, in a flour-bolting machine, of a revolving bolting-reel, an inclosing reel-chest, a chamber at the top of the reel-chest, interior fan-casings attached to the head of the reel, fans secured to the stirrer-shaft, fixed funnels at both ends of the reel, and air-pipes connecting the same with the chamber at the top of the reel-chest, substantially as described.

2. In a machine for bolting flour, the combination of a reel-chest, *p*, a revolving reel, *b*, having fan-casings *d d'* attached to its heads, fans *c c'*, attached to the stirrer-shaft *a*, funnels *g g'*, connecting air-pipes *f f'*, a chamber, *h*, located in the top of the reel-chest, and a valve, *k*, substantially as described.

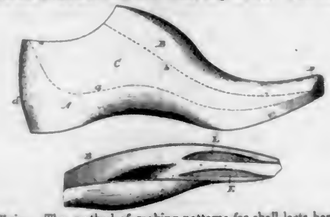
299,648. MANURE PULVERIZER AND DISTRIBUTER. PETER JOHNSON, Dassel, Minn. Filed Sept. 10, 1883. (No model.)



Claim.—1. The combination, with the ordinary wagon having a fixed or closed bottom, of the shaft *a*, journaled at the rear end of said wagon, heads *e*, and bars *f*, the latter having the pins *h* and knives *g* thereon, the eccentrics *p*, and spring-pressed pawls *o* on said shaft, the scraper *i*, chains *k*, connected therewith, the shaft *m*, having chain-wheels *l* thereon, and also the ratchet-wheel *n*, to be operated by pawls *o*, and the gearing, substantially as shown, for rotating the shaft *a*, and consequently the shaft *m*, all operating as set forth.

2. In a manure-distributing wagon, substantially as described, the distributing-wheel A at the rear end of the wagon-body, and having cutters or knives *g* and pins *h* thereon, for the purposes specified.

3. The combination, in a manure-distributer constructed as shown and described, of the scraper *i*, chains *k*, connected to said scraper, and the auxiliary plates *w* on said chain, for the purpose set forth.



299,649. ELECTRIC ALARM APPLIED TO COTS, &c. WILLIAM F. KEEP and WALTER H. KEEP, 11 Hazellville Road, Hornsey Lane, County of Middlesex, England. Filed Feb. 9, 1884. (No model.) Patented in England Sept. 5, 1883, No. 4,265.

Claim.—1. The combination, with a cot or bedstead, of a movable frame attached to the upper part thereof, and an apparatus, substantially as herein described, for making and breaking the electric circuit of an alarm or bell, substantially as herein set forth.

2. The combination, with a bedstead or cot and a movable frame hinged to the upper part thereof at one side or end, of the circuit-closing device of an electric alarm interposed between the cot or bedstead and said movable frame on the side or end opposite to that at which they are hinged together, substantially as herein described.

299,650. METHOD OF MAKING PATTERNS FOR METAL LASTS. EDWARD S. KINGSTON, Utica, N. Y. Filed Aug. 18, 1883. (No model.)

Claim.—The method of making patterns for shell lasts herein described, which consists in cutting from a solid last the transverse section *C*, and hollowing out the separated sections of said lasts, so as to leave flaring sides, in order that the shell-castings may be made without the use of cores, substantially as set forth.

299,651. LEVELING ATTACHMENT FOR TABLES, &c. GUSTAV LADEMIN, Stettin, Prussia, Germany. Filed Apr. 12, 1884. (No model.)

Claim.—The combination of the leg A of a table or other piece of furniture, a socket, *a*, attached to the leg, a slide-bolt, *b*, guided vertically in said socket and provided with serrations at one side, and a horizontally-guided and spring-actuated pin, *f*, having a toothed head, *e*, interlocking with the serrated bolt, substantially as set forth.

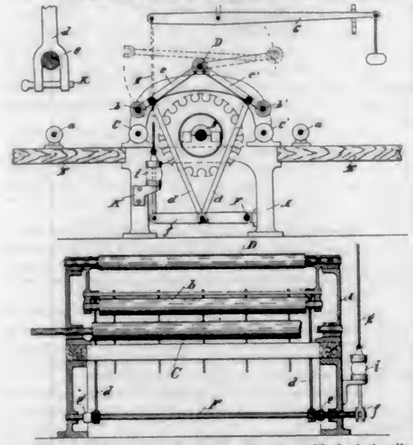
299,652. SIGN. JOHN C. LAFE, Big Prairie, Ohio. Filed July 24, 1883. (No model.)

Brief.—In lieu of the card, the body of the sign may be painted with ordinary or illuminated paint, so as to show through the stenciled letter-plate.

Claim.—1. The combination, with the main strip or backing of the sign, of the top plate presenting the smooth top surface and having its rear edge turned down to form a securing-flange, and its front edge projecting from the front edge of the backing to form a projecting cap and turned down and under to provide a strengthening-edge, substantially as and for the purpose set forth.

2. The combination of the main strip or backing, a face-plate independently removable from the same, and a top plate projecting from the front edge of the strip to form a protecting cap or flange and removably connected to the face-plate, substantially as and for the purpose set forth.

3. The combination of the longitudinal main strip or backing, the top plate secured thereto and projecting forwardly to form the top cap

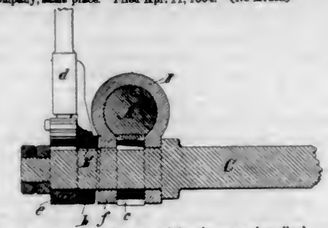


299,652.

or flange, and having its extreme front edge bent down and under to form a ⊃-shaped edge, and the face-plate secured to the face of the strip and having a forwardly-projecting top flange arranged at right angles to its main portion, and having its edge received and retained by the ⊃-shaped edge, substantially as and for the purpose set forth.

4. The combination of the main strip or backing, the top plate having the smooth top surface, the downwardly-bent rear edge by which it is secured to the rear face of the strip, and the front projecting cap or flange having the downwardly and under bent extreme edge in ⊃ shape, and the front plate secured to the face of the main strip and having the top forward flange received into the down and under bent edge of the top plate, and having the letters forming the sign cut in its main portion to expose a color-backing in rear of the face-plate, substantially as and for the purpose set forth.

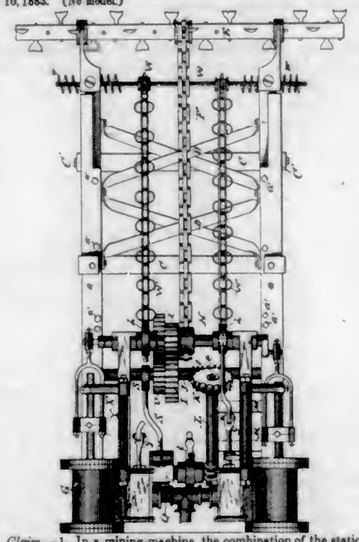
299,653. PRESSER-ROLL FOR GANG-EDGERS. PHILANDER P. LANE and JAMES B. STANWOOD, Cincinnati, Ohio, assignors to the Lane & Bodley Company, same place. Filed Apr. 11, 1884. (No model.)



Claim.—1. In a gang-edger, the combination, with the bed-rolls, of upper feed-rolls mounted in swinging arms over the saws, links connected to and supporting said arms, a crank-shaft beneath the saws having cranks, to which said links are connected, and operative mechanism, substantially as described, whereby the links may be raised, as set forth.

2. The combination, with the bed of a gang-edger, of a bearing-roll journaled in swinging arms, link-supports for said arms, a crank-shaft having cranks, with which said links are connected by a loose adjustment, and operative mechanism for said crank-shaft, substantially as described.

3. The combination, with the bed of a gang-edger, of bearing-rolls mounted in swinging arms above said bed, links connected to said arms, a crank-shaft having cranks, to which said links are connected, an operating-crank for the crank-shaft, and a draw-rod and lever connected to said operating-crank, substantially as described.



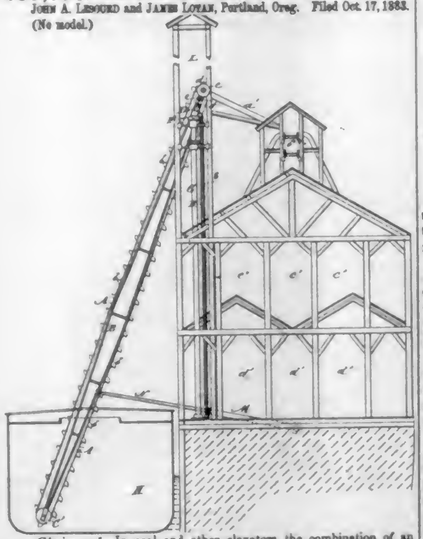
4. The combination, with bearing-rolls journaled in swinging arms supported by links, of the crank-shaft and cranks to which said links are connected, the operating-crank, draw-rod and lever, and the spring placed between the draw-rod and lever to take up the shock, all substantially as set forth.

299,654. LOCKING DEVICE FOR RATCHETS. PHILANDER P. LANE and JAMES B. STANWOOD, Cincinnati, Ohio, assignors to the Lane & Bodley Company, same place. Filed Apr. 11, 1884. (No model.)

Claim.—In ratchet devices of the character described, a rotating collar having its bearing-surfaces and its abutment inclined to the plane of its rotation, substantially as set forth.

299,655. MINING-MACHINE. BENJAMIN A. LEGG, Columbus, Ohio, assignor to the Lechner Manufacturing Company, same place. Filed Oct. 10, 1883. (No model.)

Claim.—1. In a mining-machine, the combination of the stationary bed-frame having parallel side pieces, the sliding frame having its side bars fitted to slide in the side pieces of the bed-frame and provided with inwardly-projecting ribs, the cutter-bar and cutters mounted across the front end of the sliding frame, means connecting the cutter-bar with the engine-shaft for driving the cutters, cogged racks projecting inwardly from the upper edges of the side pieces of the bed-frame, a horizontal shaft provided with pinions upon its outer ends meshing with the cogged racks, bearings for the horizontal shaft attached to the inwardly-projecting ribs of the sliding frame, an engine-shaft, and means connecting the engine-shaft with the horizontal shaft for advancing the cutters into the coal, substantially as set forth.



2. In a mining-machine, the combination of a stationary bed-frame having parallel side pieces, the sliding bed-frame having its side bars fitted to slide in the side pieces of the bed-frame, cogged racks projecting inwardly from the side pieces, a horizontal shaft supported at its ends in bearings which are attached to and project inwardly from the side bars of the sliding frame, the pinions mounted on the ends of the horizontal bars between its bearings and the side pieces of the main frame, and openings in the side pieces of the sliding frame to receive the pinions, substantially as set forth.

3. In a mining-machine, the combination of a stationary bed-frame having parallel side pieces, the sliding frame having its side bars fitted to slide in the side pieces of the bed-frame, the cutter-bar mounted across the front ends of the sliding frame, means connecting the cutter-bar with the engine-shaft for driving the cutters, cogged racks projecting inwardly from the side pieces, a horizontal shaft supported between the side bars of the sliding frame and in the same horizontal plane, or thereabout, pinions mounted on the ends of the horizontal shaft, a continuously-rotating cogged gear mounted loosely on the horizontal shaft, and a clutch adapted to connect the continuously-rotating gear with the horizontal shaft, substantially as set forth.

4. In a mining-machine, the combination of a stationary bed-frame having parallel side pieces, the sliding frame having its side bars fitted to slide in the side pieces of the bed-frame, means connecting the cutter-bar with the engine-shaft for driving the cutters, the cutter-bar mounted across the front end of the sliding frame, cogged racks projecting inwardly from the side pieces, a horizontal shaft supported between the side bars of the sliding frame, two wheels mounted loosely on the horizontal shaft and rotating in opposite directions, and clutches adapted to connect the oppositely-rotating wheels with the horizontal shaft alternately, substantially as set forth.

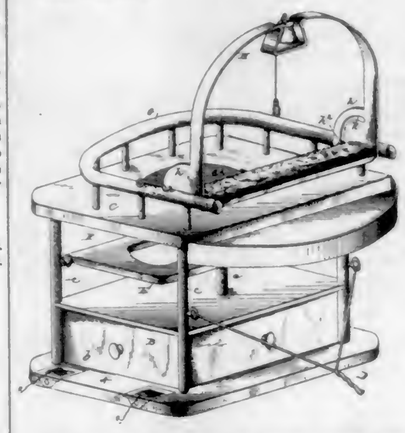
5. In a mining-machine, the combination of a stationary bed-frame, a sliding frame carrying a cutter-bar, and having its side bars fitted to slide on the bed-frame, cogged racks attached to the bed-frame, a horizontal shaft mounted on the sliding frame and carrying pinions which mesh with the cogged racks, two rotating wheels loosely mounted on the pinion-shaft, devices connecting one of the loosely-mounted wheels with the engine-shaft and adapted to advance the cutter-bar slowly into the coal, and devices connecting the other loosely-mounted wheel with the engine-shaft for withdrawing the cutter-bar from the coal at a higher rate of speed, substantially as set forth.

299,656. ELEVATOR FOR COAL AND OTHER SUBSTANCES. JOHN A. LEGOURD and JAMES LOVAN, Portland, Oreg. Filed Oct. 17, 1883. (No model.)

Claim.—1. In coal and other elevators, the combination of an endless chain of buckets, a laterally-swinging frame carrying the same, and one or more raising and lowering rams or jacks, on which said swinging frame is mounted, essentially as and for the purposes herein set forth.

2. In coal and other elevators, the combination, with one or more raising and lowering rams or jacks, of an endless chain of buckets, a laterally-swinging frame carrying said chain, and one or more engines, with mechanism for operating the chain, all mounted on or carried by the raising and lowering ram or rams, substantially as herein described.

3. The combination of one or more raising and lowering hydraulic jacks or rams, one or more hydraulic engines carried by said jacks or rams, and a laterally adjustable or swinging endless chain and bucket elevator arranged for operation by said engine or engines, substantially as specified.



4. The combination of the hydraulic jacks or rams G G, the intermediately-arranged endless chain A of buckets, with its drums C C′ and frame B, the cross-shaft F, and the engines D D, with mechanism for driving the upper drum of the chain, essentially as described.

5. The combination, with the laterally adjustable or swinging frame B and endless chain A of buckets, with its drums C C′, of the metallic frames E E′, the engines D D, carried by the one of said frames, and the rock-shaft F, on or by which the whole are carried, substantially as specified.

6. The telescoping inlet and outlet pipes R S and their flexible connections *r s*, in combination with the raising and lowering jacks or rams G G and the engines D D, and laterally adjustable or swinging endless chain and bucket elevator carried by said jacks or rams, essentially as described.

7. The maneuvering-ram M N, in combination with the laterally-swinging endless chain and bucket elevator, and one or more raising and lowering rams, on which said elevator is mounted, substantially as specified.

299,657. BABY-WALKER. SOLOMON LEVY, Ware, Mass. Filed Mar. 3, 1884. (No model.)

Claim.—1. The combination, with a suitable base or platform mounted upon rollers, of a stand supported thereon and having a central opening and a box having doors, the roof or top of which forms a rest or support for the user, substantially as set forth.

2. The combination, with a suitable base or platform mounted upon rollers, of a stand supported thereon and having a central opening, to the sides of which are hinged doors upholstered or cushioned on their under sides, and a box located below said opening and resting on the platform, the roof or top of said box forming a support for the user, substantially as set forth.

3. The combination, with the legs of a baby-walker, of two hinged sections recessed to form an opening, and secured to said legs by means of screw-eyes, which engage trunnions formed on one of said sections, and a pivoted upright or standard for supporting the same, substantially as set forth.

4. The combination, with the legs of a baby-walker, of two hinged sections, one of which is provided with trunnions to engage screw-eyes secured to said legs, a pivoted support having a pin, and a hook secured to the top of the stand or table, whereby said sections may be folded and supported outside of the legs, substantially as set forth.

5. The combination, with the top portion of a baby-walker, of a pivoted bracket carrying a bell, and a cord for operating the same, substantially as set forth.

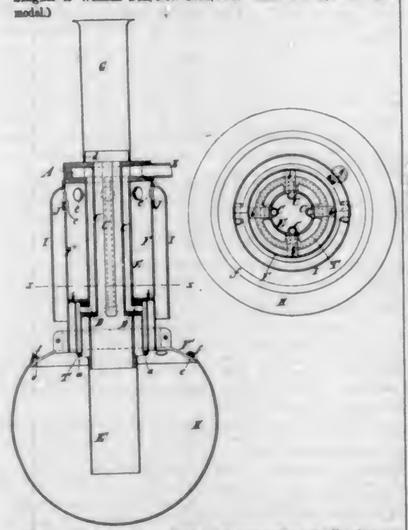
6. The combination, with the top portion of a baby-walker, of a pivoted U-shaped bracket formed with a depending loop at its upper end, a bell pivoted in the sides of said loop, and a cord for operating the same, substantially as set forth.

7. The combination, with a baby-walker, of a pivoted U-shaped bracket having a depending loop, a bell pivoted in said loop, a cord for operating the same, and a pin projecting from the frame of the top portion adapted to engage a slot formed at the bottom of the said bracket, substantially as set forth.

8. The combination, with a stand having a railing, as shown, of a U-shaped bracket having enlargements A, secured to said railing, and provided with a depending loop, in which is mounted a bell having a cord attached thereto for operating the same, one of the enlarged ends A being formed with a curved slot to engage a pin projecting from the railing, and the other with a perforation to receive a hook, whereby the bracket may be locked in a raised position, substantially as set forth.

299,658. BRACELET. HUGO LIEBE, North Attleborough, Mass. Filed Mar. 29, 1884. (No model.)

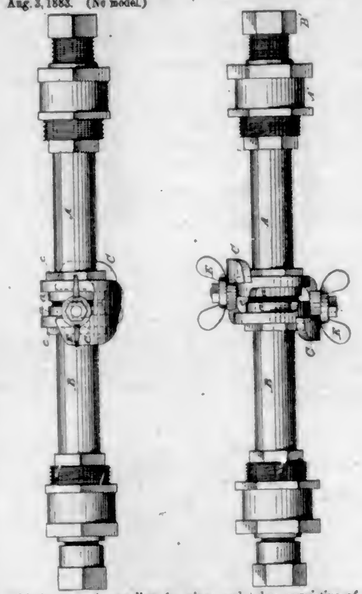
Claim.—1. A bracelet composed of the open frames A A′, jointed together and having the spring-fulcrum plates *a a′*, the wing-pieces B B′, secured to the frame, and a spring, C, located in said frames, substantially as set forth.



2. A bracelet composed of the open frames A A′, jointed together and having the spring-fulcrum plates *a a′*, the wing-pieces B B′, secured to the frames, a spring, C, located in said frames, the keepers D D′, and joint-covering plate E, substantially as set forth.

299,659. SUPPORT FOR PICTURES. KARL GUSTAV E. LIERSCH and L. REINHOLD ERCHE, Berlin, Germany. Filed Mar. 26, 1884. (No model.)

Claim.—A support for pictures, consisting of a curved spring-plate provided with retaining-hooks integral therewith at the upper and lower ends, and of a brace that is hinged to the back of the spring-plate, substantially as set forth.



299,660. GAS-BURNER. ANDREW B. LIPSKY, West Hoboken, N. J., assignor to William Bell, New York, N. Y. Filed Nov. 18, 1882. (No model.)

Claim.—1. A gas-burner having a downwardly-extending burner-tip or downwardly-extending burner-tips, a flue or passage for carrying air downwardly to the burner tip or tips, a conduit or conduits for conveying gas downwardly to the burner tip or tips, and a flue or passage serving to convey away the products of combustion, the last-named flue or passage being arranged inward of the burner tip or tips, and extending a considerable distance below the same, and all the parts being so combined and organized that a flame will be caused to burn around the exterior of the lower portion of the last-named flue or passage, the waste products of combustion will be caused to pass around the end thereof and into its interior, and in passing away will heat the downwardly-coming air and gas before their arrival at the burner tip or tips, substantially as specified.

2. In a gas-burner, the combination, with a downwardly-extending burner tip or tips, of a flue or passage serving to convey air downwardly to the same, a conduit or conduits for conveying gas downwardly to the burner tip or tips, and a flue or passage located within the air flue or passage inward of the gas conduit or conduits, extending considerably below the burner tip or tips, and serving to convey products of combustion upward, substantially as specified.

299,661. PIPE-COUPLING. WILLIAM MARTIN, Tidioute, Pa. Filed Aug. 3, 1883. (No model.)

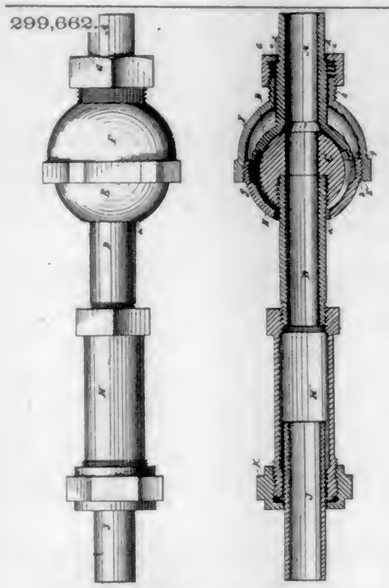
Claim.—1. A coupling for pipes and tubes, consisting of rings loosely secured to the ends of the sections to be joined or coupled together, said rings being provided with a hook and cam thumb-nuts, the hooks being adapted to engage with the thumb-nuts of the adjacent sections, and the sections drawn together by the impingement of the thumb-nuts against the inner faces of the hooks, as set forth.

2. As a means for coupling pipes and tubes, the rings *b*, provided with hooks C and cam-nuts E, said rings being attached to the ends of the sections to be coupled, and the hooks of one section adapted to engage with the thumb-nuts of the adjacent section, as set forth.

3. The combination of the sections A and B, provided with the rings *b*, hooks C, and cam thumb-nuts E, with the packing *e*, as and for the purpose set forth.

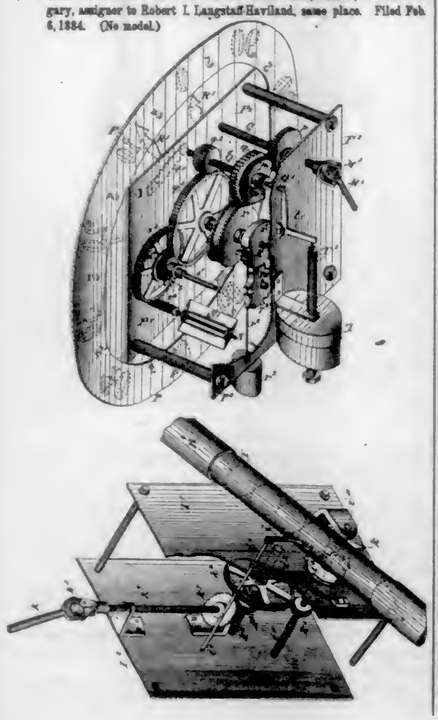
299,662. PIPE-COUPLING. WILLIAM MARTIN, Tidioute, Pa. Filed Aug. 27, 1883. (No model.)

Claim.—1. In a pipe-coupling, a pipe, A, provided with a hemispherical shell, B, a pipe, D, provided with a ball, C, combined with an incasing-shell having a screw-threaded extension, *c*, and nut G, as set forth.



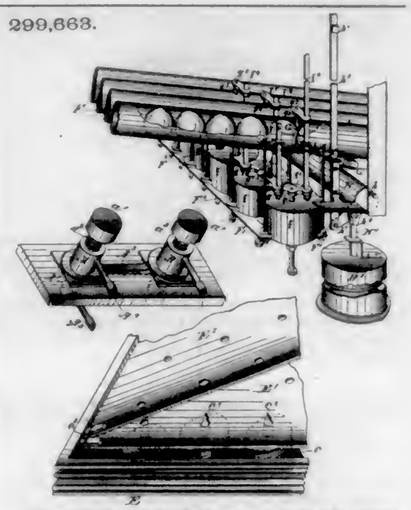
2. In a pipe-coupling, a pipe, A, provided with a shoulder or offset, *d*, and shell B, combined with a nut, G, an incasing-shell and pipe, D, provided with a ball, C, as set forth.

3. In a pipe-coupling, the hemispherical shell, B, ball C, and external casing provided with the screw-threaded extension *c*, combined with the pipe A and screw-nut G, as set forth.



4. In a ball-and-socket pipe-coupling, the external casing provided with a screw-threaded extension, *c*, combined with the nut G, pipe A, and shoulder *d*, as set forth.

5. The hemispherical disk B, provided with a groove, *f*, for packing material, combined with the outer casing and the ball C, as set forth.



299,662.

299,663. MECHANISM FOR AUTOMATICALLY CASTING AND RECORDING BALLOTS ACTUATED BY THE PRESSURE OR EXPANSION OF FLUID. CHARLES ALBERT MAYERHOFER, Vienna, Austria-Hungary, assignor to Robert I. Langstaff-Haviland, same place. Filed Feb 6, 1884. (No model.)

299,663.

Claim.—1. In a system of balloting, the combination of mechanism whereby a ballot is cast or delivered from a holder or receiver, and mechanism whereby a permanent or indelible record of the ballot cast or delivered from the holder is made, said parts being operated by the pressure or expansion of a fluid, with a key or valve, on the depression of which a ballot is cast or delivered from its holder and a permanent record thereof made by the power exerted by the pressure or expansion of the fluid.

2. In a system of balloting, the combination of mechanisms whereby ballots differing in nature (affirmative and negative) are cast or delivered from their holders or receivers, and mechanisms whereby a permanent or indelible record is made of the ballots cast or delivered, said mechanisms being operated by the pressure or expansion of a fluid, with a compound key lever or valves, on the depression of which an affirmative or negative ballot is cast or delivered from their respective holders and a permanent record thereof made by the power exerted by the pressure or expansion of a fluid.

3. In a system of balloting, the combination of mechanism whereby a ballot is cast or delivered from a holder or receiver, and mechanism whereby a permanent record of the ballot cast or delivered and by whom cast is produced, said parts being operated by the pressure or expansion of a fluid, with a key lever or valve, on the depression of which the ballot is cast or delivered from its holder and a permanent record thereof and by whom cast is made by the power exerted by the pressure or expansion of such fluid.

4. In a system of balloting, the combination of mechanisms for casting or delivering ballots differing in nature (affirmative and negative) from holders or receivers, and mechanisms for producing a permanent record thereof and showing by whom such ballots were cast, said mechanisms being operated by the pressure or expansion of a fluid, with compound key levers or valves for controlling the fluid actuating medium, whereby ballots differing in nature may be cast or delivered from their holders and a permanent record thereof simultaneously produced, such record showing the totality of votes, their nature, and by whom cast.

5. In a system of balloting, the combination of mechanism for casting or delivering a ballot from a holder or receiver with appliances for locking said ballot-delivering mechanism out of operation, to prevent the casting of a second ballot until said ballot-delivering mechanism is released from the locking appliances, said appliances being operated by the pressure or expansion of a fluid.

6. In a system of balloting, the combination of mechanism for casting or delivering a ballot from a holder or receiver, a key or valve lever, on the depression of which a ballot is delivered from said holder, and appliances for automatically locking the ballot-delivering mechanism out of operation after the delivery of a ballot, with a key or valve lever for releasing the locking appliances from the ballot-delivering appliances by the power exerted by the pressure or expansion of a fluid, for the purposes described.

7. In a system of balloting, the combination of mechanism for casting or delivering a ballot from a holder adapted to be operated by the pressure or expansion of a fluid, and a key or valve lever for controlling the fluid operating medium, with mechanism set in operation by the ballot cast or delivered, whereby said ballot is counted, as and for the purposes set forth.

8. In a system of balloting, the combination of mechanism whereby a ballot is delivered from the holder by the power exerted by the pressure or expansion of a fluid, and mechanism actuated by the delivered ballot, whereby the latter is counted, with appliances for locking the ballot-delivering mechanism out of operation after a ballot has been delivered without locking the counting mechanism out of operation, for the purposes specified.

9. In a system of balloting, the combination of mechanism whereby a ballot is delivered from a holder or receiver, mechanism whereby a permanent record of such ballot is made, said mechanism being operated by the pressure or expansion of a fluid, and mechanism whereby the delivered ballot is counted, with a key or valve lever, on the depression of which said mechanisms are simultaneously set in operation, for the purposes specified.

10. In a system of balloting, the combination of mechanism whereby a ballot is cast or delivered from a holder and operated by the pressure or expansion of a fluid, and a suitable fluid main and distributing pipe, the latter being connected with said mechanism, with a valve interposed in the main and distributing-pipe, whereby the communication between the two is established or cut off, for the purposes specified.

11. In a system of balloting, the combination of mechanism operated by the pressure or expansion of a fluid, whereby a ballot is cast or delivered from a holder, a suitable conduit connected therewith, and a fluid-main, with a valve interposed between said main and conduit, whereby the communication between the main and conduit can be established and cut off and the fluid in the latter exhausted, for the purposes specified.

12. In a system of balloting, the combination, with mechanism whereby a ballot is cast or delivered from a holder, mechanism whereby a permanent record of the delivered ballot is simultaneously produced, both operated by the pressure or expansion of a fluid, and a suitable distributing-pipe and main connected together and with said mechanism, of a valve interposed in the main and distributing pipe or pipes, whereby communication between the two is established or cut off and the fluid exhausted from the distributing-pipe, for the purposes described.

13. In a balloting system, the combination of mechanism whereby a ballot is cast or delivered from a holder, mechanism whereby a permanent record of the delivered ballot is simultaneously produced, appliances for operating said mechanisms by the pressure or expansion of a fluid, a suitable fluid distributing pipe or pipes and main, and mechanism actuated by the delivered ballot, whereby said ballot is counted, with a valve interposed in said main and distributing-pipe, whereby the fluid is admitted to the distributing-pipe from the main to actuate the ballot-delivering and permanent-record-producing mechanisms, whereby a ballot is delivered from its holder, a permanent record thereof made, and the ballot counted simultaneously, for the purposes specified.

14. In a balloting system, the combination of mechanism whereby a ballot is cast or delivered from a holder, mechanism whereby a permanent record of the ballot delivered is simultaneously produced, and appliances for operating said mechanism by the pressure or expansion of a fluid, with a valve for admitting compressed air to the actuating appliances, and through which valve said compressed air is exhausted after having done its work, for the purposes specified.

15. In a balloting system, the combination of mechanism whereby a ballot is cast or delivered from a holder, appliances for operating such mechanism by means of compressed air, and a valve for admitting compressed air to and exhausting the same from said operating appliances, and mechanism for automatically locking the ballot-delivering mechanism out of operation after a ballot has been delivered, with a bellows or its equivalent for operating the locking devices by means of compressed air, to release said ballot-delivering mechanism, for the purposes set forth.

16. In a balloting system, the combination of mechanism whereby a ballot is cast or delivered from a holder, a bellows or piston for actuating said mechanism, a valve for admitting a fluid to and exhausting it from said bellows, and mechanism for automatically locking the ballot-delivering mechanism out of operation, with a bellows or piston for actuating the locking-out mechanism and a valve for admitting a fluid under pressure to and exhausting the same from the latter bellows, for the purposes described.

17. In a balloting system, a ballot-holder containing a number of ballots, combined with mechanism operated by the pressure or expansion of a fluid for releasing said ballots one at a time and delivering the same from the holder.

18. In a balloting system, a ballot-holder containing a number of ballots, combined with mechanism operated by the pressure or expansion of a fluid for releasing the ballots one at a time, and with a key or valve lever for setting the ballot-delivering mechanism into operation from a point distant from such mechanism, for the purposes described.

19. In a balloting system, the combination of ballot-holders arranged in parallel horizontal series, mechanism operated by the pressure or expansion of a fluid, whereby a ballot is cast or delivered from the holders, a valve for each holder, whereby the fluid is controlled, and appliances for automatically locking the ballot-delivering mechanism of the holders out of operation, with mechanism whereby all the ballot-delivering devices are simultaneously released from the locking appliances, for the purpose stated.

20. In a balloting system, the combination of ballot-holders arranged in horizontal and vertical parallel series, mechanism for each holder operated by the pressure or expansion of a fluid, whereby a ballot is cast or delivered from the holders, a valve for each holder for controlling the fluid, and appliances for automatically locking the ballot-delivering mechanism for each holder out of operation, with mechanism operated by the pressure or expansion of a fluid, whereby the ballot-delivering mechanisms of the series of holders are simultaneously released from the locking-out mechanism, for the purposes specified.

21. In a balloting system, the combination of ballot-holders arranged in horizontal or vertical parallel series, or both, operated by the pressure or expansion of a fluid, mechanism for each holder whereby a ballot is cast or delivered from said holders, a valve for each holder for controlling the fluid and exhausting the same from the ballot-delivering mechanism, and appliances for each holder whereby the latter mechanism is automatically locked out of operation after the delivery of a ballot from a holder, with mechanism operated by the pressure or expansion of a fluid, whereby the ballot-delivering mechanisms of all the holders are simultaneously released from their locking-out appliances, and a valve for admitting the fluid to and exhausting the same from the releasing mechanism, for the purposes specified.

22. In a system of balloting, the combination, with a ballot-holder, mechanism operated by the pressure or expansion of a fluid for casting or delivering a ballot therefrom, and mechanism actuated by the released ballot to count the same, of a registering mechanism for making a visible record of the ballot cast or delivered from the holders, operated by the counting mechanism.

23. In a system of balloting, the combination, with the mechanism whereby the ballots are counted, of a relay or auxiliary power transmitting mechanism to transmit the movements of the counting mechanism, for the purposes stated.

24. In a system of balloting, the combination, with a ballot-holder, mechanism for casting or delivering a ballot therefrom, mechanism actuated by the ballot delivered from the holder for making a count thereof, and mechanism operated from the counting devices to make a visible record of the ballot cast or delivered from the holder, of an auxiliary power or relay interposed between the counting and registering mechanism, for the purposes stated.

25. In a system of balloting, the combination of the following elements: a series of ballot-holders, mechanism operated by the pressure or expansion of a fluid to cast or deliver the ballots therefrom, a counting mechanism operated by the ballots, a registering mechanism operated from the counting mechanism, mechanism to automatically lock the ballot casting or delivering appliances out of operation, and mechanism operated by the pressure or expansion of a fluid to release said appliances after a vote has been taken, for the purposes specified.

26. In a system of balloting, the combination of the following elements: a series of ballot-holders, mechanism for casting or delivering the ballots therefrom, mechanism operated by the ballots delivered from the holder to transmit a count thereof, a registering mechanism operated from said counting mechanism, a relay or auxiliary power operated by a weight to transmit the movements of the counting mechanism to said registering mechanism, and appliances for automatically winding up the weight after each ballot, for the purposes stated.

27. In a system of balloting, the combination, with a series of ballot-holders, mechanism to cast or deliver the ballots therefrom, mechanism operated by the ballots delivered from the holders, whereby a count of such ballots is made, a registering mechanism operated from the counting mechanism, and a relay or auxiliary power operated by a weight for transmitting the count made by the counting mechanism to the registering mechanism, of appliances for automatically winding up the weight of the relay and automatically and simultaneously returning the registering-indexes to their starting-point, for the purposes described.

28. In a system of balloting, the combination, with the mechanism whereby the ballots are registered and appliances for returning the index hand or hands thereof to their starting-point, of mechanism operated by the pressure or expansion of a fluid, whereby the appliances for returning the said hand or hands to their starting-point are set in operation, as described, for the purposes specified.

29. In a system of balloting, the combination and co-operation of the following elements: a series of ballot-holders, mechanism operated by the pressure or expansion of a fluid, whereby a ballot is cast or delivered from said holders, mechanism to lock the ballot-delivering devices out of operation after the delivery of a ballot, mechanism whereby a count of the ballots is effected, mechanism for registering the count, mechanism for transmitting the count to the registering devices, mechanism operated by the pressure or expansion of a fluid, whereby a permanent record of each ballot cast is obtained, and appliances operated by the pressure or expansion of a fluid for simultaneously releasing the ballot-delivering mechanism, for the purposes specified.

30. In a system of balloting, the combination of the following elements: a series of ballot-holders, mechanism for casting or delivering a ballot therefrom, and mechanism whereby a permanent record of each

ballot cast is simultaneously obtained, said parts being operated pneumatically by means of a valve or key interposed in the compressed-air main and the delivering or distributing pipes, whereby the compressed air is admitted to and exhausted from the latter pipes, mechanism for automatically locking the ballot casting or delivering appliances out of operation after the delivery of a ballot, mechanisms whereby a count of each ballot is made and registered, and an intermediate auxiliary transmitting power or relay to transmit the count to the registering mechanism, said locking-out mechanism, relay, and registering mechanism being arranged in a pneumatic circuit and operated pneumatically and simultaneously by means of a valve lever or key, whereby the compressed air is admitted to operate said devices and exhausted from said distributing-pipes after the automatic and simultaneous release of the ballot-casting devices, the return of the registering devices to their normal position, and the return of the auxiliary power to its operative condition, for the purposes stated.

31. In a system of balloting, the combination of the following elements in duplicate: a series of ballot-holders, mechanism to cast or deliver a ballot therefrom, mechanism to lock the ballot-casting levices out of operation after a ballot has been cast, mechanism for automatically producing a permanent record of each ballot cast, mechanism for producing a count, and mechanism for temporarily registering each ballot and indicating the totality of ballots cast, said duplicate elements being arranged in two pneumatic circuits, one of which circuits is under the independent control of each voter, whereby by means of valves or keys he may cast an affirmative or negative ballot, and is prevented from casting such ballot a second time during the taking of a vote, the second circuit being under the control of a single person, whereby by means of a single valve said person is enabled to return all the duplicate mechanisms automatically and simultaneously into their operative or normal conditions, or to their initial or starting point, as described, for the purposes stated.

32. The ballot casting or delivering mechanism, consisting, essentially, of ball-holders arranged in series with their longitudinal axes inclined in the same direction, and containing each a number of balls, and controlling devices operated by the pressure or expansion of a fluid, consisting of co-operating retaining-pins arranged in front of each other and operating to release the balls from their holders one at a time, as and for the purposes specified.

33. The ball casting or delivering mechanism, consisting, essentially, of ball holders or receivers containing a number of balls each, and arranged in horizontal or vertical parallel series, or both, in combination with controlling appliances operated by the pressure of a fluid controlled by a valve consisting of two co-operating retaining-pins arranged in different horizontal planes, the free ends of which move simultaneously in reverse directions, whereby a ball is released by one pin and the remaining balls of the series held in check by the other when the pins move in one direction, and the remaining balls released by the check-pin and checked by the releasing-pin when said pins move in a reverse direction, substantially as described, for the purpose specified.

34. The combination of an inclined tubular ball-holder, F, adapted to contain a number of balls, and provided with slots in opposite sides, in combination with a bellows, carrying bars f^4 g, and the pins g' g^2, arranged to move in the plane of the said slots and penetrate into said tubular ball-holder when the bellows is distended, substantially as described, for the purpose specified.

35. The combination of the inclined tubular ball-holder, slotted on opposite sides, with a bellows, the rod f'', cross-head f^3, arm g, bars f^4 f^5, the arm g^2, and the pins g' g^2, said parts being arranged for co-operation substantially as described, and for the purposes specified.

36. The combination, with an inclined ball-holder and the arm g^2 and bar f^4 of the ball casting or delivering devices thereof, arranged for operation as set forth, of a gravity pawl or stop for automatically locking the bars against downward movement when in an elevated position, as described, for the purpose stated.

37. The combination, with a tubular, slotted, and inclined ball-holder, the pins g' g^2, and the bar f^4, having lug or abutment F^3, of the gravity-pawl G, said parts being arranged for co-operation substantially as described, for the purposes specified.

38. The combination, with the ball-holder adapted to contain a number of balls, mechanism to release said balls one at a time, and mechanism for locking the releasing devices out of operation when a ball has been released, of appliances for disengaging the locking devices from the releasing mechanism, consisting of a bellows carrying an actuating-rod, a tripping-bar in the path of said rod, and actuated thereby, and an abutment on said bar in the path of an arm of the locking-pawl, operating to trip the latter, as described, for the purposes specified.

39. The combination, with the bar f^4, its arm g^2, the pin g^2, and the lug F^3, of the pawl G, its arm G', the bar h^2, plate h^3, abutment h^4, and a bellows or piston connected with said bar h^2, said parts being arranged for co-operation substantially as and for the purposes specified.

40. The combination, with ball-holders arranged in vertical or horizontal series of parallel rows, or both, each holder having a locking-pawl, G G', pivoted thereto, the bar f^4 of the ball casting or delivering mechanism, the lug F^3, and arm g^2 of said bar, of a bellows carrying a rod, H', the shaft H, and a tripping-bar, h, for each ball-holder, each of said bars h having one or more abutments, h^3, and a plate, h^2, and the cranks h', that connect the bars with said shaft, said parts being arranged for co-operation substantially as described, for the purposes specified.

41. The combination, with a ballot-holder, mechanism operated by the pressure or expansion of a fluid for casting or delivering the ballots therefrom, and a fluid conduit and main, of a valve interposed between said conduit and main, consisting of a valve-casing divided by diaphragm in two chambers, 1 2, the former connected with the conduit and the latter with the main, a valve having a hollow stem provided with valve-ports 4 and 5, and operating to open or close a port in the diaphragm 3 of the casing, as described, for the purposes specified.

42. The combination, with two independent eduction-pipes and a supply-main, of a compound valve interposed between the main and said pipes, composed of two valve-casings, each divided horizontally into two chambers, 1 and 2, by a diaphragm, 3, the former chambers being in communication with the eduction-pipes, and the latter with each other through a connecting-pipe, and with the main through one of said chambers, 2, substantially as and for the purposes specified.

43. The combination of the valve-casing A, divided into chambers 1 and 2 by a partition or diaphragm, 3, having a valve-port, the valve a, its hollow stem a^2, having ports 4 and 5, the button a', and coiled spring a^3, with the pipes A^2 A^3 A^4, said parts being arranged for co-operation substantially as described, for the purposes specified.

44. The appliances whereby a permanent record of the ballots is produced, consisting of a series of pistons or bellows, e, each provided with a perforator, e^2, and arranged in parallel rows, in combination with hinged clamping-plates E' E^2, having perforations that register with the perforators e^2, between which a sheet of paper extending over all the perforators and in the path thereof may be clamped, and suitable conduits for supplying the motive fluid to said bellows, as described, for the purposes specified.

45. The combination, with the supply-pipe B, eduction-pipe B', and the bent pipe C C', connected therewith, of a three-way valve or cock, C^4, a valve-lever, C^5, and means for locking said lever in position to establish communication between pipes B C and B' C', and appliances to automatically release the lever to shift the valve, substantially as described, for the purpose specified.

46. The combination, with fluid supply and distributing pipes and a valve interposed in said pipes, of mechanism to lock the lever in position to establish communication between said pipes, and appliances operated by the pressure or expansion of the fluid admitted to the distributing-pipe to release the lever and shift the valve, substantially as and for the purposes set forth.

47. The combination, with a fluid supply and distributing pipes and a valve interposed in said pipes, of mechanism to lock the valve in position to establish communication between said pipes, and appliances operated by the pressure or expansion of the fluid admitted to the distributing-pipe to release the same, shift the valve to cut off said communication, and establish communication between the distributing-pipe and the outer atmosphere, substantially as described, for the purposes set forth.

48. The combination, substantially as herein described, of a fluid-main, a distributing-pipe, a valve interposed in said pipes, and operating to establish or interrupt the communication between the two pipes, appliances for automatically locking the valve in position when the communication between the pipes is established, and appliances for automatically interrupting said communication by the pressure or expansion of the fluid admitted from the main to the distributing-pipe, for the purposes set forth.

49. The combination, substantially as herein set forth, of a fluid-main, a distributing-pipe, a three-way valve interposed in said pipes, appliances for automatically locking the valve into position when set to establish the communication between the pipes, and appliances for automatically interrupting said communication and placing the distributing-pipe in communication with the outer atmosphere by the pressure or expansion of the fluid admitted from the main to the distributing-pipe, for the purposes described.

50. The combination, with the pipes B B', the bent pipe C C', the valve C^4, and valve-lever C^5, provided with a harp or slotted plate, c^3, of the pivoted gravity bell-crank lever c, the vertical arm of which has a catch, c', arranged to engage the slot of plate c^3 when the lever C^5 is depressed, said parts being arranged for co-operation substantially as described, for the purposes set forth.

51. The combination, with the pipes B B', the bent pipe C C', the valve C^4, lever C^5, slotted plate c^3, the pivoted gravity bell-crank lever c, and the catch c' thereof, of the bellows or piston b', connected with pipe B' and operating to tilt or trip the bell-crank lever, substantially as described, for the purposes specified.

52. The herein-described mechanism for producing a count of the ballots, which consists in the combination, with an inclined ball-conduit and a train of suitable transmitting-gearing, of the escapement composed of the shaft i^3, carrying a transmitting-pinion, k', the ratchet-wheel i^4, and star-wheel k, and the shaft i', carrying the pawl i and spring-pawl i^2, said parts being arranged for co-operation substantially as described, for the purposes set forth.

53. The combination, with the tubular inclined ball-conduit, slotted on opposite sides, the star-wheel k, ratchet i^4, pinion k', shaft i^3, the pawl i, the spring-pawl i^2, and shaft i, of the transmitting-gear l^2 l^3 on shaft l^2, and l^2 on shaft l^4, said parts being constructed and arranged for co-operation substantially as described, for the purpose specified.

54. The herein-described relay, consisting of a transmitting-gear operated by a prime motor, and an auxiliary driving-gear operated by an independent power to assist in driving said transmitting-gearing, and, in combination therewith, of appliances to wind up the auxiliary power by the pressure or expansion of a fluid, substantially for the purposes specified.

55. The combination, with the transmitting-gearing l l^2 l' l^3, operated by a prime motor, of the auxiliary gearing m m' m^2, the winding-drum N, and weight N^2, said parts being arranged for co-operation substantially as and for the purposes set forth.

56. The combination, with the shaft L^2, ratchet n, rigidly secured to said shaft, the winding-drum N and pinion n', connected together and loosely mounted on the shaft, and the pawl n^2, pivoted on the side of the pinion in position to engage the teeth of the ratchet, whereby said pinion and drum are locked to the shaft and rotate therewith, of the rack-bar o, connected to a bellows or piston and meshing with the pinion n', whereby said pinion and the winding-drum are rotated without rotating the shaft L^2, said parts being arranged for co-operation substantially as described, for the purposes specified.

57. In a system of balloting, a counting mechanism, a relay for transmitting the movements of said counting mechanism, a registering mechanism for registering the operation of the counting mechanism as transmitted thereto by the relay, and rigid transmitting-shafts coupled to the motor-shafts of the relay and the recording mechanisms and to the transmitting-shaft of the counting mechanism by means of universal couplings, whereby said mechanisms may be located at a distance from each other, as described.

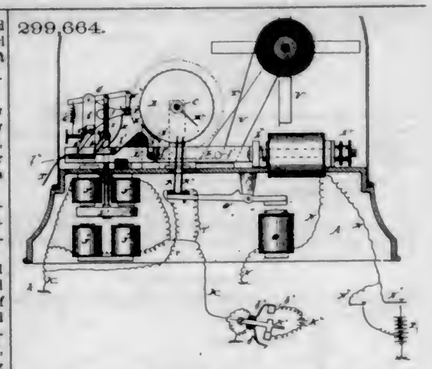
58. The herein-described registering mechanism, consisting of a suitable train of registering-gearing, a hand or hands operated thereby, and appliances for stopping said train of gearing, returning the hands to their starting-point, and placing the registering mechanism in condition for operation by the pressure or expansion of a fluid, for the purposes specified.

59. The herein-described registering mechanism, consisting of a suitable train of registering-gearing, and, in combination therewith, of appliances operated by the pressure or expansion of a fluid, whereby the operation of said mechanism is arrested independently of the power from which it is driven, for the purposes specified.

60. In a registering mechanism, a train of gearing and a hand or hands operated thereby, in combination with appliances for automatically returning the hand or hands to their starting-point by the pressure or expansion of a fluid, as described, for the purposes specified.

61. The combination, substantially as described, of a train of registering-gearing, a hand or hands operated thereby, mechanism for returning the hands to their starting-point, and mechanism for controlling the return movement of said hands and their operating devices, consisting of a train of gearing and a fly.

62. The combination, with the shaft R of the registering mechanism, the gear-wheel q^2, the winding-drum r, cam r', and star-wheel r^2, of the shaft Q, pinion q^3, gear-wheel q and q', the latter having a laterally-projecting locking-tooth and loosely mounted upon the shaft and held against longitudinal movement therewith, and means whereby said shaft is displaced longitudinally in its bearings, substantially as described, for the purposes set forth.



63. The combination, with the shaft Q', the gear-wheel q, rigidly secured thereto, and the gear-wheel p', loosely mounted thereon and held against longitudinal movement therewith, said wheel p' being provided with a locking-tooth adapted to engage the gear-wheel q, of the bell-crank or angle lever t and a bellows or piston, whereby said lever is made to displace the shaft Q' longitudinally by the pressure or expansion of a fluid.

64. The combination, with the shafts M^2 Q, coupled together by means of a universal coupling, the pinion p, shaft R, and gear-wheel q^3, of the shaft Q', pinion q', gear-wheel q, the gear-wheel p', provided with a locking-tooth, p^2, in engagement with the gear-wheel q, and means, substantially as described, for displacing shaft Q' longitudinally to throw the wheels q p' out of engagement, said parts being constructed and arranged for co-operation substantially as described, for the purposes specified.

299,664. PRINTING-TELEGRAPH. WILLIAM J. MCCAUSLAND, Philadelphia, Pa., assignor to William W. Kurtz, same place. Filed June 6, 1883. (No model.)

Claim.—1. In a printing-telegraph, the combination of a type-wheel and a spur-wheel secured thereto with a pinion adapted to mesh with said spur-wheel, a crank to rotate said pinion, means to overcome the dead-centers of said crank, and cause said crank to assume a position substantially at right angles to dead-centers, and means to rotate said crank, said means being controlled by electric currents transmitted over a line-wire, substantially as and for the purpose specified.

299,664.

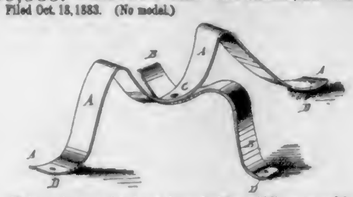
2. In a printing-telegraph, the combination of a type-wheel and a spur-wheel secured thereto with a pinion adapted to mesh with said spur-wheel, a crank to rotate said pinion, means to overcome the dead-centers of said crank, and cause said crank to assume a position substantially at right angles to dead-centers, and means to rotate said crank, said means being controlled by electric currents transmitted over a line-wire, substantially as and for the purpose specified.

3. In a printing-telegraph, the combination of a type-wheel and a spur-wheel secured thereto with a pinion adapted to mesh with said spur-wheel, a crank to rotate said pinion, means to overcome the dead-centers of said crank, electro-magnets, and connecting mechanism to rotate said crank upon changing the polarity of line-current, substantially as and for the purpose specified.

4. In a printing-telegraph, a type-wheel and its shaft, in combination with a spur-wheel secured to said shaft, a pinion adapted to mesh with said spur-wheel, a crank to rotate said pinion, an electro-magnet and armature connected to said crank and adapted to turn said crank up or down and hold it on the dead-centers, and mechanism, substantially as set forth, to throw said crank over the dead-centers upon the armature, releasing it, so that said crank and its pinion may be held in four positions in its revolution, substantially as and for the purpose set forth.

5. The combination of type-wheel B and pin R^2 with electro-magnets and connecting mechanism to rotate said type-wheel, armature O', provided with spring-conductors R R', electro-magnet O, line N, line K, and conductors r r', connected with the line K on each side of type-wheel magnets, substantially as and for the purpose specified.

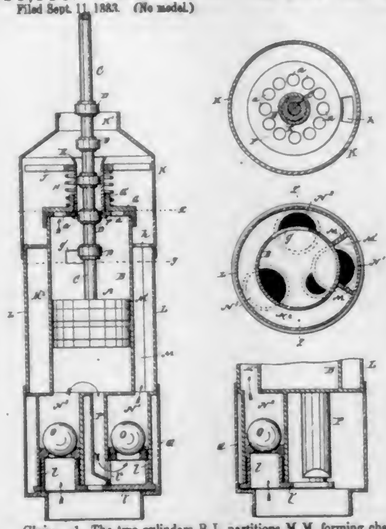
6. The combination of type-wheel B and pin R^2 with electro-magnets, and connecting mechanism to rotate said type-wheel, electro-magnet O, armature O', line K, and means secured to said armature, which, when in contact with pin R^2, short-circuits line K around the type-wheel magnets, substantially as and for the purpose specified.



7. The combination of the type-wheel and press-magnets with a press-armature, a reciprocating press-frame made integral with said armature, and provided with a press-block and a feed-plate, means to guide the paper over said feed-plate and press-block, a stationary pawl, and a moving pawl carried by said press-frame, both of said pawls having sharp points and provided with springs to press them down upon the paper as it passes over the feed-plate, and arranged to feed the paper as the press-frame is reciprocated in the act of printing, substantially as set forth.

8. The combination of the type-wheel and horizontally-reciprocating press-frame L, arranged tangential to the type-wheel, having printing-block L', guides for the paper to cause said paper to pass under and around said type-wheel, and means to feed said paper upon reciprocating said frame, substantially as and for the purpose specified.

9. The combination of a type-wheel and horizontally-reciprocating press-frame L, arranged tangential to the type-wheel, having printing-block L', guides for the paper to cause said paper to pass under and around said type-wheel, means to feed said paper upon reciprocating said frame, two or more press-magnets, a single press-armature adapted to be attracted by all of said press-magnets simultaneously and actuate said press-frame, and a single line-wire, N, the current of which is divided between said electro-magnets to increase their power in printing, substantially as and for the purpose specified.



10. The combination of type-wheel B, having letters and figures arranged upon its periphery and in different parallel planes, the letters being arranged in line with the spaces between the figures, and vice versa, means to press the paper against said type-wheel, and a stationary slotted screen, the slot in which is the full width of the type-wheel, to prevent the printing of more than one letter or figure at a time, substantially as and for the purpose specified.

299,665. CORPSE HEAD-REST. JOHN MCGRATH, New York, N. Y. Filed Oct. 18, 1883. (No model.)

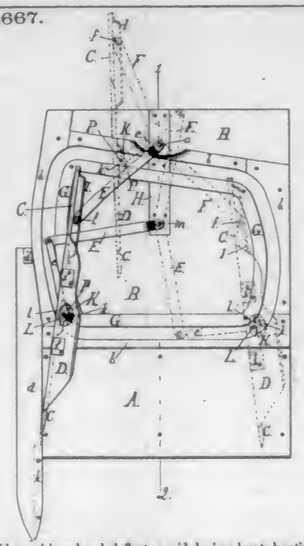
Claim.—A corpse head-rest formed of the middle concaved bar, A, and end concaved bar, B, pivoted at C, both bars being provided with feet D, as shown and described.

299,666. DOUBLE-ACTING PUMP. JAMES MCGWIN, Fulton, Mo. Filed Sept. 11, 1883. (No model.)

Claim.—1. The two cylinders B L, partitions M M, forming channels M' M², connecting with the piston-cylinder and the chamber above said cylinder, respectively, tubes N' N³ N², provided with valves and communicating with the said channels and piston-cylinder, as shown, and duct P, in combination with the top F, having apertures *a*, the spring-pressed annular valve G, and the piston A C, all arranged substantially as shown, and for the purpose set forth.

2. The combination of the piston-cylinder B and piston A C with the apertured cap F, tube E, annular valve G, spring H, and cross-bar J, substantially as set forth.

3. The combination, in a double-acting pump, of the tubes N' N³ N² and duct P with the tubular seats *l*, formed on a base, *l'*, and of smaller diameter than said tubes, one of the seats being provided with an opening, *l²*, registering with the duct, as shown and described.



299,667. GAVEL-DELIVERER FOR HARVESTERS. AARON MILLER, Brockport, N. Y. Filed Oct. 18, 1883. (No model.)

Claim.—1. In a harvester, the combination, with the platform A, of the gavel-board C, crank E, connecting-rod *e*, shaft L, bearings *l*, crank F, shaft *f*, guide-strips I, means for supporting and revolving said cranks E and F, roller P, track G, guide *b*, and means for supporting said track and guide, each constructed, arranged, and operating substantially as and for the purpose set forth.

2. The combination, with the platform A, gavel-board C, crank E, connecting-rod *e*, shaft L, bearings *l*, crank F, shaft *f*, guide-strips I, means for supporting and revolving the cranks E and F, roller P, track G, guide *b*, and means for supporting said track and guide, of the deflector D, articulated to the board C, spring *c*, and plate K, provided with the projection *k*, all constructed, arranged, and operating substantially as shown and described.

3. In a harvester, the combination of a platform, a gavel-board, a deflector hinged to said gavel-board, and devices to support and actuate

299,667.

both said gavel-board and deflector, said devices located entirely at the rear of the platform, and constructed, arranged, and operating in such a manner as to cause the gavel-board to traverse a course in a plane parallel with the platform and to pass over and across said platform only in a direction from the outer to the inner edge of the same, substantially as set forth.

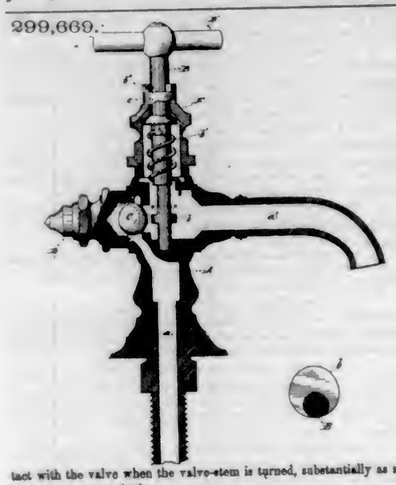
4. The combination of a harvester-platform, a track, a gavel-board, a deflector hinged to said gavel-board and actuated by the same means, cranks arranged to actuate said gavel-board, and means for confining the movements of the gavel-board to a course described by said track, all of the devices for operating the gavel-board being located in the rear of the platform.

5. In a harvester, the combination, with the gavel-board, of a deflector hinged thereto and means for operating the deflector, whereby it will also act as a compressor, substantially as set forth.

6. In a harvester, the combination of the gavel-board, a combined deflector and compressor articulated thereto, and means for changing the angle of inclination between said gavel-board and compressor at different points in the course traversed by said gavel-board, substantially as and for the purpose set forth.

7. In a harvester, the combination of the gavel-board, a gavel-compressor attached thereto, and means for actuating both board and compressor, substantially as and for the purpose set forth.

299,668. COMBINED PEN-HOLDER AND BLOTTER. J. FRANKLIN MILLER, Oakland, Cal. Filed Jan. 30, 1884. (No model.)



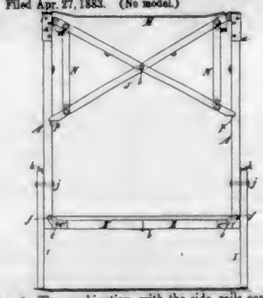
Claim.—1. A combined pen-holder and blotter consisting of the pen-holder A, the plate B, having the socket *b* fitting over the top of the staff of the pen-holder, and the blotting-sheet C, secured to the face of the plate, substantially as herein described.

2. A combined pen-holder and blotter consisting of the pen-holder A, the staff of which has a beveled top, the backwardly-curved plate B, having socket *b*, through which the top of the staff of the pen-holder fits and projects, bearing against the back of the plate, and the blotting-sheet C, secured to the face of the plate, substantially as herein described.

299,669. AUTOMATIC BALL SAFETY-FAUCET. HARRY C. MONTGOMERY, Cleveland, Ohio, assignor to Auguste Romeau, same place. Filed May 31, 1883. (No model.)

Claim.—1. The combination, with a faucet provided with a removable plug adapted to form the valve-chamber and a valve, the latter adapted to be held against its seat by the pressure of water, of a valve-stem provided with a projection, which latter is adapted to come in con-

299,669.



tact with the valve when the valve-stem is turned, substantially as and for the purpose set forth.

2. The combination, with a faucet provided with a valve-chamber, and a valve located within said chamber, of a valve-stem provided with a projection adapted to come in contact with the valve when the stem is turned, and a spiral spring encircling said stem, one end of the spring being secured to the stem, while the opposite end thereof is secured to the faucet, the said spring being adapted to hold the projection on the valve-stem away from the valve, substantially as set forth.

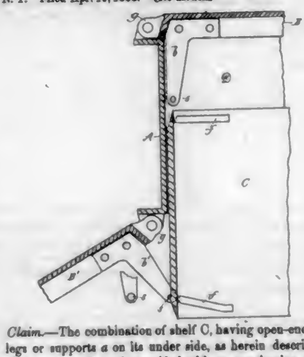
3. The combination, with a faucet provided with a removable valve-chamber and a socketed cap, E, of a ball-valve, the valve-stem provided with an eccentric, and a spring encircling the stem, for the purpose set forth.

4. The combination, with a faucet provided with a valve-chamber, a ball-valve located in said chamber, and a spring-actuated valve-stem provided with an eccentric for moving the ball-valve away from its seat, and the pin b^3, of the screw-cap E, provided with shoulders, against which the pin b^3 strikes, substantially as set forth.

299,670. COMBINED COT-BED, LITTER, AND CHAIR. CALEB P. NASH, Brattleborough, Vt., assignor of one-half to J. Eugene Jacobs, same place. Filed Apr. 27, 1883. (No model.)

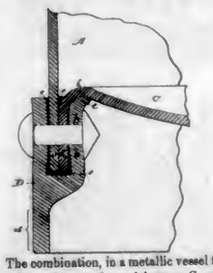
Claim.—1. The combination, with the side rails composed of sections hinged together, one pair of sectional side rails being provided with notches *p*, and brackets or pieces *m*, pivoted to the inner sides of the same pair of sectional side rails, of crossed legs J, pivoted together between their ends, and at their upper ends pivoted to the pieces *m*, all substantially as specified, whereby the said legs may be adjusted at right angles to the side rails, or between and parallel with the side rails.

2. The combination, with the side rails, of crossed legs J, and connecting-pieces *m*, to which the upper ends of the crossed legs are pivoted, and which are pivoted to the side rails, substantially as described, whereby the ends of the legs may be moved toward and from each other, and the legs may be adjusted bodily at right angles to the side rails, or between and parallel with the side rails, and means, substantially such as described, for preventing the movement of the legs relatively to each other when they are swung between the side rails, to cause them to brace and hold the side rails at a proper distance apart, substantially as set forth.



299,671. LOCK-BOLT. HENRY C. NESS, Park Ridge, N. J. Filed Oct. 3, 1881. (No model.)

Claim.—1. In a lock, the spring-bolt A, provided with a transverse hole, the catch C, having the shoulders *e e* and shank *m*, all in one piece and movable longitudinally in the aforesaid hole, combined with the plate B, provided with a T-shaped slot, whereby the bolt can be fastened in the locked and unlocked positions, as shown and described.



2. A lock consisting of the plate B, spring-actuated bolt A, provided with the hole *i*, and the dog *k* to engage said hole *i* by means of a key, combined with the catch C, to operate and lock said bolt in locked or unlocked positions independent of said dog *k*, and the key for operating it, substantially as shown and described.

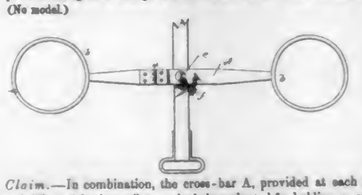
299,672. AUTOMATIC OVEN-SHELF. LEWIS T. NEWELL, Albany, N. Y. Filed Apr. 19, 1883. (No model.)

Claim.—The combination of shelf C, having open-ended grooves *f*, and legs or supports *a* on its under side, as herein described, with the oven door or doors B, each provided with an arm having at its free end a stud, *s*, adapted to traverse in said groove during a part only of its forward and backward movement, whereby the said shelf is slid forward and backward by the said arm by a partial movement of the door, and is out of engagement therewith at the beginning and end of its movement, as and for the purpose set forth.

299,673. METALLIC VESSEL. ADAM O'HARA, New York, N. Y., assignor of one-half to Horatio Nelson Holt, same place. Filed Mar. 11, 1884. (No model.)

Claim.—1. The combination, in a metallic vessel for resisting heavy internal pressure, of the sides A, flanged bottom C, and channeled ring D, of rigid cast metal, embracing the flanges on the sides and bottom, and riveted through said flanges, whereby a strong bottom joint is formed, substantially as set forth.

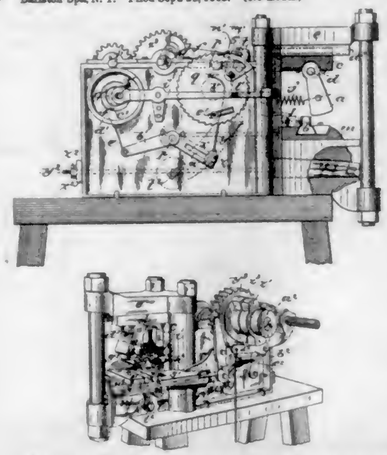
2. The combination, in a metallic vessel for resisting heavy internal pressure, of the sides A, the bottom C, having a down-turned flange, *c*, fitting within the sides, and a channeled ring, D, the channel in which is deeper than the flange *c*, whereby the bottom C is supported by contact at the bend of its flange with the top of the inner flange of the ring, substantially as shown and described.



3. The combination, in a metallic vessel for resisting heavy internal pressure, of the sides A, the bottom C, having a turned-down flange, *c*, and a channeled ring, D, the inner flange, *b*, of which is formed with a rounded lip, *e*, and the channel in which is deeper than the flange *c*, the said channeled ring embracing the lower portion, *a*, of the sides A and the flange *c*, of the bottom C, and fastened thereto by rivets passing

through it and them, substantially as set forth, whereby the bottom is supported by said lip *e* at the bend of its flange.

4. The combination, in a metallic vessel for resisting internal pressure, of a channeled ring, D, the sides A, arranged with their lower edges or flanges *a* in the channel of said ring, but raised above the bottom thereof, the bottom C, resting on the upper edge of said ring, and having a turned-down flange, *c*, fitting within the sides A, arranged within the channel of said ring and of less depth than said channel, consequently not extending to the bottom thereof, rivets passed through said ring, and the flanges *a* and *c*, and a filling of solder or its described equivalent in said channel, extending beneath the edges of *a* and *c* and occupying the interstices of the joint, substantially as and for the purposes set forth.



5. The combination, in a vessel for resisting heavy internal pressure, of the sides A, having flange *a*, the bottom C, having turned-down flange *c*, and a ring, D, having a channel which receives and embraces the flanges *a* and *c*, and with a downwardly-extending flange, *d*, beneath the bottom of said channel, forming a foot or base for the vessel, substantially as set forth.

299,674. FEED-BAG FOR HORSES. WILLIAM H. PACK, Philadelphia, Pa., assignor to George E. Pack, Camden, N. J. Filed Feb. 20, 1884. (No model.)

Claim.—In combination, the cross-bar A, provided at each end with a rigidly and horizontally attached ring adapted for holding an open feed bag or pail, as set forth, a saddle or bracket on the pole or tongue of a wagon, arranged to hold this bar firmly in its proper horizontal position, and a fastening device, substantially as described, for securing the bar to the pole and bracket.

299,675. MACHINE FOR FORMING SCYTHES. LUCIUS C. PALMER, Ballston Spa, N. Y. Filed Sept. 21, 1883. (No model.)

Claim.—1. The combination, in a swaging-machine, of a reciprocating oscillating die with an adjustable bed-die, substantially as set forth.

2. The combination, in a swaging-machine, of the oscillating die *a*, arranged on the reciprocating slide *c*, the bed or anvil die *b*, and a spring or analogous device for raising said oscillating die in its backward movement over the bed-die, substantially as set forth.

3. The combination, in a swaging-machine, of the reciprocating oscillating die *a*, a bed-die, a spring or analogous device for causing the oscillating die to clear the bed-die in its backward movement, and a stop in the path of the oscillating die for arresting said die in its backward movement at a point over the blank for allowing said die to bite on the blank in its forward movement, substantially as set forth.

4. The combination, in a swaging-machine, of the oscillating die *a*, sliding block *c*, having said oscillating die pivoted on it, the arm *i*, connected to the vibrating rod *f*, and the spring *j*, connecting said oscillating die *a* and arm *i*, substantially as described.

5. In a swaging-machine having an oscillating die, *a*, pivoted to a reciprocating block, *c*, a die-block, *m*, mounted on an inclined bed, *n*, and connected to an eccentric, *o*, having intermittent rotary motion to raise or shift die *b* toward die *a* during the intervals between the passes of said oscillating die *a*, substantially as described.

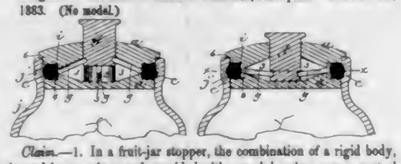
6. In a swaging-machine having an oscillating die, *a*, pivoted on a reciprocating slide, *c*, the die-block *m*, arranged on an inclined bed, *n*, and connected to eccentric *o* on a shaft, *p*, having an arm, *x*, connected by a chain, *y*, to the hub of a ratchet-wheel, *q*, having a pawl, *s*, that is worked by the reciprocating slide *c*, substantially as described.

7. The tripper *k'* on the pawl-lever *t*, in combination with pawl *s*, having stud *n'*, and with the stud-pins *o'* and *p'* of the ratchet-wheel *q*, substantially as described.

8. The friction-wheel *d''*, lever *i''*, drum *c'*, strap *e'*, arm *b'*, and shaft *j'*, in combination with the shaft *p*, having eccentric *o*, connected with die-block *m*, substantially as described.

9. The friction-wheel *d''*, lever *i''*, drum *c'*, strap *e'*, arm *b'*, and shaft *j'*, in combination with shaft *p*, having eccentric *o*, connected with die-block *m* and with the ratchet-wheel *q*, connected to said shaft *p*, and having the tripper *k'* to its pawl *s*, substantially as described.

10. In a swaging-machine, the stationary bending-die *q'*, movable bending-die *t'*, slide *u'*, connected thereto, pivoted lever *x'*, rod *w'*, pivoted to the lower end of lever *x'* and to slide *u'*, and a cam, *y'*, for operating on the free end of the lever *x'*, substantially as shown and described.



11. In a swaging-machine, the combination of the bending-dies *q' t'* and pivoted lever *x'*, connected to the movable die thereof, with the shaft *h*, gear-wheel i^2, clutch mechanism $i' i^2 y^2$, cam *y'*, and lever b^2, provided with a wedge-tongue, d^2, substantially as set forth.

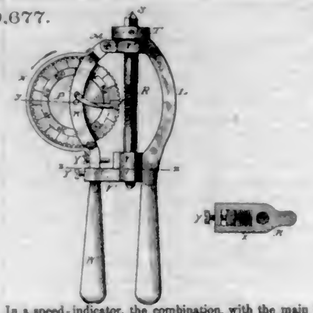
12. In a swaging-machine, the gage *l*, in combination with the bed-die *b* and the oscillating die *a*, said oscillating die being arranged on a reciprocating slide, *c*, substantially as described.

13. In a swaging-machine, the bunter g^3, in combination with the gage *l*, bed-die *b*, and the oscillating die *a*, said oscillating die being arranged on the reciprocating slide *c*, and the bunter being operated by the slide *s'*, substantially as described.

14. The combination, in a swaging-machine, of the bed-die *b*, the oscillating die *a*, arranged on the reciprocating slide *c*, arm *i* of the vibrating rod *f*, spring *j*, connecting said die to said arm, and the stud *k* of the gage *l* to stop the die *a* in the relation to die *b* for allowing said die *a* to bite on the blank in the forward movement of the said die, substantially as described.

299,676. FRUIT-JAR STOPPER. EDWARD F. POLAND, Boston, Mass., assignor of one-fourth to James G. Crawford, same place. Filed Oct. 15, 1883. (No model.)

Claim.—1. In a fruit-jar stopper, the combination of a rigid body, *a*, formed in one piece, and provided with a peripheral groove, a central cavity, and slots extending from said cavity outwardly to said groove, an elastic packing-ring in said groove, an expansible support behind said ring, and devices, substantially as described, contained in and held in place by the cavity and slots of the body *a*, whereby the expansible support and packing-ring are expanded outwardly in all directions from the center of the body *a*, as set forth.



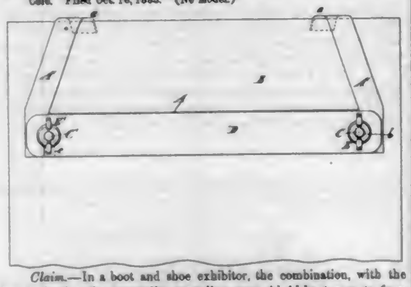
2. In a fruit-jar stopper, the combination of the rigid body *a*, having the peripheral groove 4, the elastic packing-ring *c*, located in said groove, the expansible support *i*, behind said ring, the plunger or pusher *f*, adapted to slide in a socket in the body *a*, and the links *g*, interposed between the pusher *f* and support *i*, and contained in radial slots or apertures in the body *a*, as set forth.

3. In a fruit-jar stopper, the rigid body *a*, having the flange 6, the central socket, 2, extending downwardly from its upper side, the peripheral groove 4, and the radial tapered slots 3, connecting the socket 2 with the groove 4, combined with the elastic ring *c*, located in said groove, the expansible support *i*, behind said ring, the pusher *f* in the socket 2, and the links *g*, passing through the slots 3, and engaged at their inner ends with the pusher *f*, and bearing at their outer ends against the support *i*, as set forth.

299,677. SPEED-INDICATOR. ROBERT JAMES PRATT, Greenbush Heights, N. Y. Filed Jan. 2, 1884. (No model.)

Claim.—1. In a speed-indicator, the combination, with the main frame L, within which is journaled the loosely-turning worm-spindle R, of a hinged arm, W, carrying a toothed dial, P, the main frame and arm being provided with hand-grasps, substantially as described.

299,677.

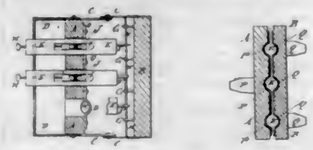


2. In a speed-indicator, the combination, with the main frame L, within which is journaled the loosely-turning worm-spindle R, of a hinged arm, W, and a spring, X, interposed between the main frame and arm, substantially as described.

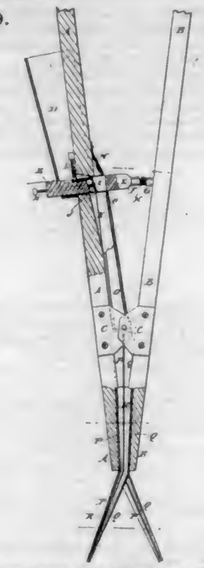
3. In a speed-indicator, the combination, with the main frame L, within which is journaled the loosely-turning worm-spindle R, of the hinged arm W, the main frame and arm being provided with hand-grasps, and an interposed spring, whose recoil forces the dial from the spindle at the end of the recording operation, substantially as described.

4. In a speed-indicator, the combination, with the frame L, carrying the loosely-journaled worm-spindle R, of the hinged arm W, carrying the graduated toothed dial P, and provided with the set-screw Y', for limiting the inward movement of the arm, substantially as shown and described.

5. In a speed-indicator, the combination, with the frame L, provided with the loosely-journaled worm-spindle R, of the hinged arm W, carrying the graduated toothed dial P, said arm extending through an offset, V', on the frame, and provided with the spring X and set-screw Y, substantially as shown and described.



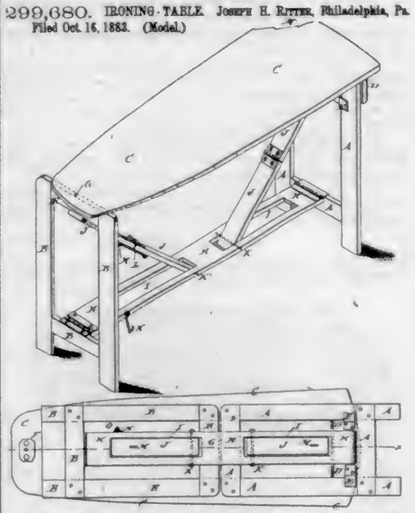
299,678. BOOT AND SHOE EXHIBITOR. ABRAM RAPP, Durango, Colo. Filed Oct. 16, 1883. (No model.)



Claim.—In a boot and shoe exhibitor, the combination, with the bar A, having the upwardly-extending arms A' A' bent over to form the hooks *a a*, adapted to be attached to a box, of the pivoted clamping-bar D, having the notch *c*, and secured to the bar A by screws C C' and nuts E E', as shown and described, and for the purpose set forth.

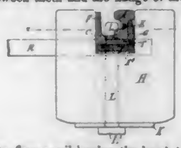
299,679. HAND CORN-PLANTER. JOHN THOMAS RICKETS, Cadiz, Ky. Filed Feb. 1, 1884. (No model.)

Claim.—1. In a hand corn-planter, the combination of the hinged bars A B, provided, respectively, with semi-tubular plates P Q at or below the point of hinging, two pairs of said plates being bent forward and one pair rearward, as shown, with the semi-tubular plates O, and an arm, A, leading from the seed-hopper to the plates P Q, said hopper being provided with separate dropping-slides each communicating with one pair of the transversely-arranged plates P Q through the plates O, as set forth.



299,679.

2. In a seed-dropper having hinged arms, the plate P, formed in one piece with three semi-tubular grooves, two of the said tubular portions being bent in a forward direction and one in a rearward direction, in combination with a similarly-constructed plate, Q, whereby when the semi-tubular portions of the plates P Q come together separate passages R are formed, substantially as set forth.



299,680. IRONING-TABLE. JOSEPH H. RITTER, Philadelphia, Pa. Filed Oct. 16, 1883. (Model.)

Claim.—The combination of the table-top C, provided with a socket-plate, F, at one end, and a bar, D, hinged to the opposite end, and having keepers E thereon to receive the upper ends of legs A, with the legs B A, board H, hinged to the lower cross-bars of said legs and slotted at I I, hinged braces J, pivoted at their lower ends within the inner ends of the slots and hinged at their upper ends to the upper cross-bars of legs B A, and a pin, G, on the upper cross-bar of legs B, whereby when the top is raised from legs B to a vertical position the legs A may slide within the keepers, the braces may be folded within the slots, and the legs B folded between the board H and the top, substantially as set forth.

299,681. TRAMWAY. ARTHUR H. ROWAN, 6 Westminster Chambers, County of Middlesex, England. Filed Feb. 26, 1883. (No model.) Patented in England Nov. 25, 1880, No. 4,911; in Belgium Apr. 2, 1881, No. 54,278, and in Germany June 4, 1882, No. 20,432.

Brief.—A compound tram-rail consisting of two sections, one having a tread, web, and horizontal flange, and the other being a channel-rail, one vertical arm of which supports the tread of the other section, and the other vertical part forming a channel for the wheel-flanges. The rail is secured in channeled paving-sets through vertical fastenings having wedges between them and the flange of the tread-rail.

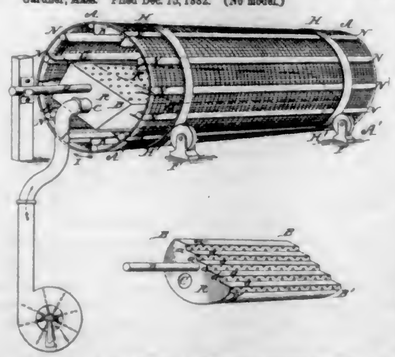
Claim.—1. The flange-rail having the head A, vertical rib B, and base-flange C, in combination with the channel-rail E F G, having the rib F, extending upward, as shown, so as to form a guard-rail and protect the pitching, substantially as herein specified.

2. The combination, in a tram-road, of a tram-rail and a base-plate with intermediate channeled paving-sets, H, secured together by removable fastenings, adjustable substantially as herein set forth.

3. The combination of the bolt L, projecting upward into the groove of the channel-rail E F G, with such channel-rail, and with the flange-rail A B C, operating substantially as herein set forth.

4. The combination, in a tram-road, substantially as described, of a channel-rail, E F G, flange-rail A B C, packing I I', and a base-plate, K, with intermediate paving-sets, H, all arranged substantially as set forth, and secured together by adjustable fastenings, as specified.

299,682. ROLLER-SKATE. LUCIUS LORENZO RYERSON, Boston, MASS. Filed Apr. 17, 1884. (No model.)



Claim.—1. A strengthening-rib, C, secured to the under side of the heel-plate A and turned up at its rear to serve as a stop for the heel, in combination with a sole-support, B, capable of adjustment upon said rib, for the purpose set forth.

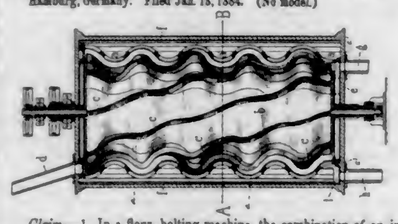
2. A goose-neck axle-bearing and a goose-neck journal-bearing, with an arm, *l*, secured to the lower bend, *i*, of the goose-neck, in combination with a pair of springs, H H, and a holder or bracket, I, therefor, secured to the under side of a portion of the foot-support or around the central rib, as and for the purpose described.

3. A goose-neck, G, with an arm, *l*, projecting therefrom, in combination with a pair of springs located within a holder and having their tension regulated by an adjusting-screw, substantially as set forth.

4. A clip, *m*, extending over the rib C, in combination with and secured to a spring-holder, I, thereunder, substantially as and for the purpose specified.

299,683. MACHINE FOR DRYING GRAIN, &c. EDWD. H. SAWIN, Gardner, MASS. Filed Dec. 15, 1882. (No model.)

Claim.—1. An air-box, as R, adjustable sidewise and endwise in relation to the cylinder A A' at any desired angle, and having the perforated surface B B B' B', substantially as described, and for the purposes specified.



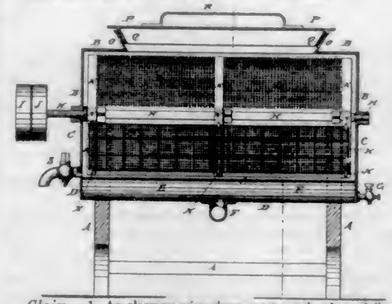
2. An air-box, as R, adjustable sidewise and endwise in relation to the cylinder A A' at any desired angle, with the upper surface, B B B' B', broken, as at *a a'*, more or less perforated, substantially as described, and for the purposes specified.

3. A revolving cylinder, as A A', in combination with an adjustable air-box, as R, substantially as described.

4. The cylinder A A', with the shelves K, rings H H', and trucks F F, in combination with the air-box R, inlet C, and also at the end opposite C, and the perforated surface B B B' B', adjusted with a partition for the use of different kinds of air at the same time, substantially as described, and for the purposes specified.

5. The cylinder A A', rings H H', trucks F F, shelves K, and the perforated spaces between the straight pieces N N, in combination with the air-box R, surface B B B' B', shaft D, support *f*, inlet C, and also at the end opposite C, and the mechanism whereby the end supported by the shaft D is raised or lowered, substantially as described.

299,684. MACHINE FOR BOLTING FLOUR OR OTHER PULVERIZED SUBSTANCES. LOUIS JOHANNES FREDERICH WILHELM SCHARRAU, Hamburg, Germany. Filed Jan. 18, 1884. (No model.)

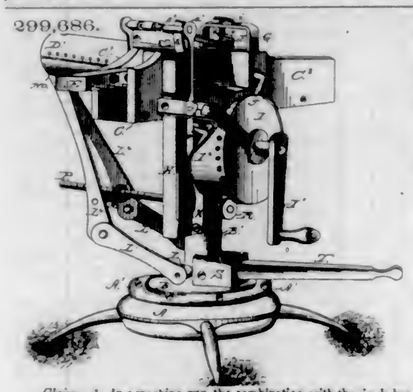


Claim.—1. In a flour-bolting machine, the combination of an interior vertical cylinder, having horizontal corrugations and exterior spiral beaters, with a concentric corrugated exterior bolting-reel and means for causing them to revolve in opposite directions, substantially as described.

2. In a flour-bolting machine, the combination of an interior vertical cylinder, having horizontal corrugations and exterior spiral beaters, with a concentric corrugated bolting-reel, means for causing them to revolve in opposite directions, and an inclosing-box provided with a top supply-pipe and bottom discharge-pipes, substantially as described.

3. The combination of an interior vertical horizontally-corrugated cylinder, *b*, having spiral beaters *c*, a concentric corrugated bolting-reel, *e*, having bottom scrapers, *i* and *z*, an inclosing-box, *f*, a supply-pipe, *d*, and discharge-pipes *h* and *g*, substantially as described.

299,685. JACKETED OLEOMARGARINE-CHURN. SAML. SCHWARZSCHILD, New York, N. Y. Filed Mar. 11, 1884. (No model.)



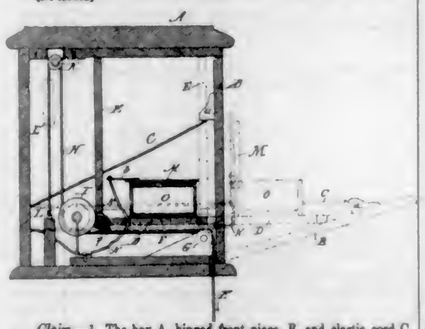
Claim.—1. An oleomargarine-churn constructed, substantially as herein shown and described, with a jacket to receive steam or hot water, and revolving screens to mix the ingredients, as set forth.

2. In an oleomargarine-churn, the combination, with the churn-body B C and the rotary shaft H, of the rows of radial arms K, the fine wire screens L, and the coarse wire screens M, substantially as herein shown and described, whereby the ingredients will be finely divided and thoroughly intermingled, as set forth.

299,686. MACHINE-GUN. CHARLES R. SCOTT, Las Vegas, N. MEX. Filed Jan. 3, 1884. (No model.)

299,686.

Claim.—1. In a machine-gun, the combination, with the single barrel D, having a surrounding jacket, D', provided with inlet and outlet connections, said jacket bearing against the frame C, and serving to support the barrel, of the frame C, the breech-block E, sliding horizontally therein, and mechanism for operating said breech-block and for discharging the cartridges as they are fed into position at the breech of the gun, all substantially as shown and described.



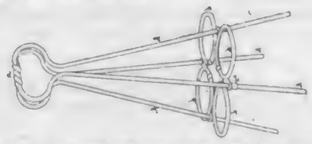
2. In a machine-gun, the combination, with the barrel D, of the slotted frame C, having its bottom provided with a continuous series of anti-friction rollers, *a*, the breech-block reversely ratcheted on opposite sides of top and bottom, and supported on such rollers, together with suitable pawl mechanism, whereby the breech-block is moved endwise and the chambers brought into alignment with the barrel of the gun in proper sequence for firing, all substantially as shown and described.

3. In a machine-gun, the combination, with the frame C, having the horizontal sliding breech-block E and slotted cover C', the uprights *e e'*, pivoted to the frame, and provided with cross-arm e^2, of the arms F F', journaled at their outer ends on the arm e^2, the inner end of the arm F' passed into the slot of the cover to engage the ratchet of the block, and the spring *f*, holding the arm in contact with the ratchet, and the arm F, having its inner end engaging the lug on the rod A, said arm passing through an opening in the cross-arm G, and the spring *i*, for depressing said rod, as shown and described.

4. In a machine-gun, the combination, with the cross-arm L upon the hinged upright B', and the frame C, mounted on said upright, and carrying the gun D, of the arms L' L', pivoted to the cross-arm, and the rods L^2 L^2, pivoted to the end of the gun and to the arms L' L', and provided with cross-bar N, having the screw-rod P, as and for the purpose set forth.

5. The combination of the upright B', carrying the frames C and H and gun D, and provided with the circular base B, cross-frame S, and bar or lever T, with the tripod-shaped base A and flange A', substantially as and for the purpose specified.

299,687. SNUFF AND MATCH BOX. PHILIPP SKILLE, Chicago, Ill., assignor of one-half to William Einfeldt, same place. Filed Mar. 25, 1884. (No model.)



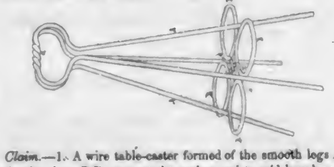
Claim.—1. The box A, hinged front piece, B, and elastic cord C, in combination with the platform D and cord F, secured thereto, as and for the purpose set forth.

2. The box A, hinged front piece, B, and elastic cord C, in combination with weighted platform D and cord F, secured thereto, as and for the purpose set forth.

3. The box A, hinged front piece, B, and elastic cord C, in combination with platform D, a match or snuff receptacle mounted thereon, and cord F, secured to said platform, as and for the purpose set forth.

4. The box A, hinged front piece, B, and elastic cord C, in combination with platform D, match or snuff receptacle O, mounted thereon, a hinged lid secured to said receptacle, an elastic cord, N, for opening said lid, and a cord, F, for operating the platform, as and for the purpose set forth.

299,688. WIRE TABLE-CASTER. DANIEL SHERWOOD and GEORGE D. DUDLEY, Lowell, MASS., assignors to Woods, Sherwood & Co., same place. Filed Jan. 21, 1884. (No model.)



Claim.—1. As a new article of manufacture, a table-caster formed of smooth wire legs and smooth wire wings joined together by clasps and soldering metal, substantially as described.

2. In combination with the legs A A, the smooth wire rings *b b*, having their joints covered with metal clamps c^2 c^2, substantially as described.

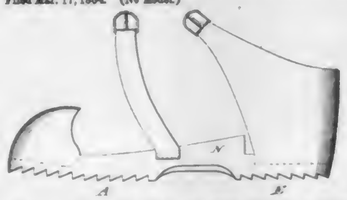
3. The combination of the smooth wire legs A A, the smooth wire rings *b b*, and the binders *c c*, substantially as described.

4. In combination with the rings *b b*, the smooth wire legs A A, twisted together at *a* and bent on each side of said twist, to form the handle of the caster, substantially as described.

299,689. TABLE-CASTER. DANIEL SHERWOOD and GEORGE D. DUDLEY, Lowell, MASS., assignors to Woods, Sherwood & Co., same place. Filed Jan. 21, 1884. (No model.)

Claim.—1. A wire table-caster formed of the smooth legs A A and smooth wire rings B B, connected together and to said legs by soldering metal.

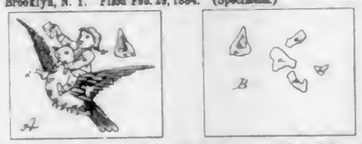
2. The wire rings B B and bridge-piece *c*, formed of a single continuous piece of smooth wire, substantially as described.



3. The wire ring B, formed with the bridge-piece *c*, of a single piece of wire, and having its grooved end *d* overlapping the wire against which it abuts, substantially as described.

299,690. FISHING-BAIT KETTLE. WILLIS H. SHERWOOD, St. Joseph, Mo. Filed May 29, 1883. (No model.)

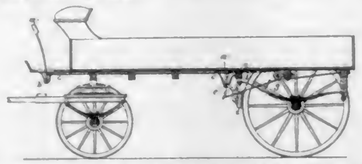
Claim.—The pail A, in combination with the perforated pail B, provided with the rim *b* and flange *c*, by which the perforated pail is suspended within the outer pail, and provided with the dipper E, substantially as and for the purpose specified.



299,691. CARPET-STRETCHER. WILLIAM K. SMITH, La Harpe, Ill. Filed Mar. 17, 1884. (No model.)

Claim.—1. An india-rubber sole carpet-stretcher, to be operated by the foot, as set forth.

2. The serrated inclined teeth A and E, either extending across the sole of stretcher or in sections, substantially as and for the purpose herein set forth.

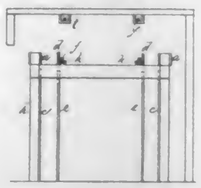


299,692. PROCESS OF PRODUCING PICTURES. ROBT. SNEIDER, Brooklyn, N. Y. Filed Feb. 29, 1884. (Specimens.)

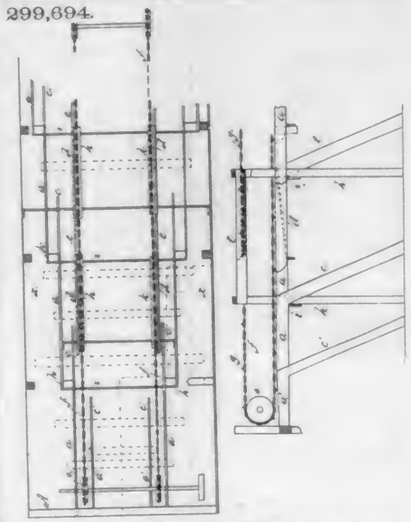
Claim.—1. The process of producing a picture, E, which consists in first printing on background C impressions *b*, pasting thereon sections *d*, of suitable material, and finally printing or stamping the complete picture over and around sections *d*, substantially as specified.

2. In the process of producing picture E, the employment of the following steps: gaging background C, printing thereon sections *b*, mounting silk or other fabric on back, and cutting out sections *d*, pasting these over impressions *b*, and finally printing or stamping the complete picture over and around sections *d*, substantially as specified.

299,693. WAGON-BRAKE. ABNER J. STEELE, Allegheny, Pa. Filed Dec. 14, 1883. (No model.)

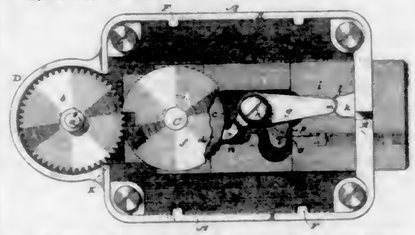


Claim.—In a wagon-brake, the double lever *d*, in combination with the bar *e*, chain *f*, and pulley *g*, substantially as described.



299,694. APPARATUS FOR SORTING LUMBER. WARREN C. STETSON, Minneapolis, Minn. Filed Aug. 24, 1883. (No model.)

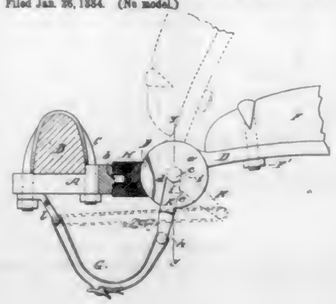
Claim.—1. The apparatus for sorting lumber, consisting of a series of rails or ways in sections successively wider one than another, inclines at the ends of the rails, and an endless traveling chain above the ways, and fitted with lugs or hooks for carrying the material forward, substantially as shown and described.



2. In lumber-sorters, the combination of the rails *a*, placed in sections widening successively, and the endless traveling chains *f*, provided with hooks or lugs, the chains being fitted above the rails and operated by suitable mechanism, so as to act on lumber placed on the rails, substantially as described.

299,694.

299,695. PERMUTATION-LOCK. EMORY STOCKWELL, Stamford, Conn., assignor to the Yale & Towne Manufacturing Company, same place. Filed Sept. 26, 1883. (No model.)



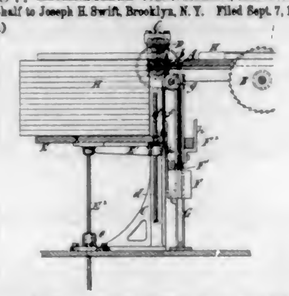
Claim.—1. The combination, with the lock-case of a combination-lock, of a back plate and rotating notched tumblers of ordinary construction, the back plate being provided with a rib, P, or equivalent projection, whereby the tumblers serve normally to lock the plate in place, substantially as and for the purpose set forth.

2. The combination of a lock-case and the separable back plate provided with a fence or rib, P, and a tumbler-curb, all so constructed and arranged that when the plate is locked in position by the tumblers the fence will hold the curb in place, substantially as set forth.

3. The combination, with the tumblers, of the fence, the dog, the bolt, the lug for tilting the fence away from the tumblers, and the spring-bolt bearing against the dog, substantially as set forth.

299,696. THILL-COUPLING. CHARLES E. STRUCK. Newark, N. J. Filed Jan. 26, 1884. (No model.)

Claim.—1. The combination of the clip A, formed with cheek-piece *a a'* and pin *c*, the cheek-piece *a* being provided with an irregularly-shaped slot, with the thill-iron D, also provided with an open irregularly-shaped slot, and a key, E, of irregular form, to correspond with the slots in the cheek-piece and thill-iron, whereby, when the key is passed through the slot in the cheek-piece into the slotted thill-iron, the said iron will be securely hinged to the pin *c*, substantially as set forth.

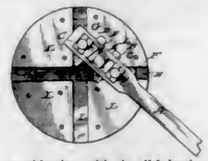


2. The combination of the clip A, formed with pin *c* and cheek-pieces *a a'*, the former having an inclined grooved slot, *d*, and the latter having an aperture, *f*, with the thill-iron D, having an inclined grooved slot, *g*, the said slots inclining in opposite directions, and the tongued key E, constructed to be passed through the slot *d* into the slot *g* when said slots are in alignment, and to be forced therefrom by a suitable implement passed through the aperture *f*, substantially as set forth.

3. The combination of the thill and clip irons A D, slotted as described, with the key E, formed with a loop, *i*, whereby said key may be connected to the axle by a suitable strap, substantially as set forth.

4. The combination of a thill-iron, D, formed with an open slot, one of the walls of which has a transverse groove therein, with a key formed with a tongue on one of its sides to register with said groove, whereby, when the said key is inserted in the slot, the slot will be closed, and a central aperture formed in the said thill-iron between the upper end of the key and the upper end of the slot, substantially as set forth.

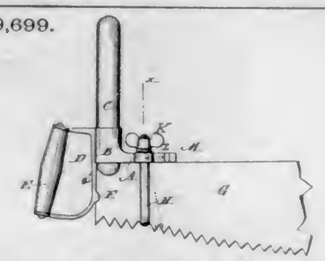
5. In a thill-coupling, the thill-iron D, formed with slot *g* and cavity *h*, in combination with the clip A, having slot *d* and cavity *e*, and the key E, having tongue *i*, substantially as and for the purposes set forth.



299,697. MACHINE-TABLE. JOHN J. SULLIVAN, Green Point, assignor of one-half to Joseph H. Swift, Brooklyn, N. Y. Filed Sept. 7, 1883. (No model.)

Claim.—1. The combination, with a circular-saw table, of a pair of holding and drawing rolls which are adapted to grasp a board before it leaves the saw and to draw it forward, a rising and falling receiving-table arranged at the end of the saw-table, a counterbalance-weight connected with the said receiving-table, and a number or series of supplemental weights which are arranged to be picked up by the ascending counterbalance-weight as the receiving-table descends by the increasing weight of boards received upon it, substantially as and for the purpose herein described.

2. The combination of the saw or other table, A, the standards C, the receiving-table E, fitting between and guided by the standards C, the counterbalancing-weight F, connected with said receiving-table, one or more supplemental weights, and supports *h* for the supplemental weights, at different heights, substantially as and for the purpose described.

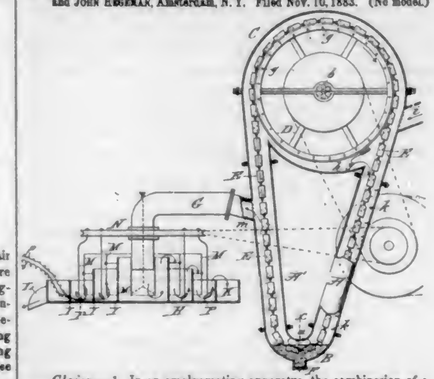


299,698. PITMAN. HENRY HAMLET TRAVIS, Modena, Wis., assignor of one-half to Frank Beandreau, same place. Filed Apr. 10, 1884. (No model.)

Claim.—The combination, with the disk having diametrical ways in its face, crossing each other at right angles, and the detachable sector-shaped plates partly overlapping the ways with their edges, of the blocks having flanged inner portions sliding in the ways, and the pitman, pivoted at its head to the blocks, as and for the purpose shown and set forth.

299,699. HANDLE FOR CROSSCUT-SAWS. ANDREW UREK, Seattle, Wash. Filed Mar. 21, 1884. (No model.)

299,699.



Claim.—1. The combination, with the saw-blade G, of the flat bar A, having a socket, B, and a U-shaped bracket, D, provided with a handle, E, and a vertical post, *a*, abutting against the end of the saw-blade, and having lugs F, straddling the end of the blade, and upright handle C, slotted at its lower end to receive the upper edge of the saw-blade, substantially as shown and described.

2. The combination, with the saw-blade G and flat bar A, having an aperture, L, socket B, and bracket D, provided with a handle, E, and lugs F, of the slotted rod H, nut K, and upright handle C, slotted at its lower end, substantially as shown and described.

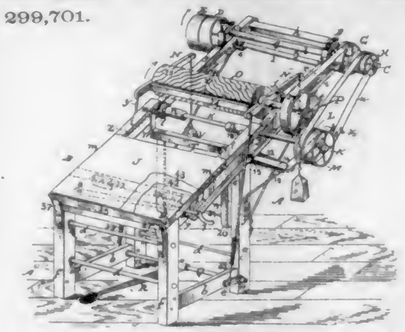
3. In a saw-handle, the combination, with the bar A, adapted to be held on the saw end, of a cushion or buffer, M, on the inner end of the handle, substantially as herein shown and described.

299,700. AMALGAMATING APPARATUS. MILTON T. VAN DERVEER and JOHN HEDEMAN, Amsterdam, N. Y. Filed Nov. 10, 1883. (No model.)

Claim.—1. In an amalgamating apparatus, the combination of a casing or chamber, C, a pair of tubular channels, A A', communicating with said chamber, a mercury-reservoir, B, connecting the lower ends of said tubes, a wheel or pulley, D, mounted in the chamber C, an endless belt or chain passed over said wheel and carrying perforated buckets E E, for raising mercury from the reservoir and spattering it over the pulp that is passed through the tubes A A', and a settling-pan, H, connected to one of said tubes, substantially as described.

2. In an amalgamating apparatus, the combination of the tubes A A', mercury-reservoir B, chamber C, wheel D, having a grooved periphery provided with perforations *g g*, the shelves or brackets *k k*, and the buckets E E, attached to a belt or chain, substantially as described.

3. In an amalgamating apparatus, the settling-pan H, having concentric partitions I I I, of varying height, and adjustably-suspended partitions or plates M M M, connected by wires to a battery, substantially as described.



4. In an amalgamating apparatus, the settling-pan H, having concentric partitions I I and M M, trough K, spout L, and stirrers P P, substantially as described.

5. In an amalgamating apparatus, the combination, with the tubes A A', mercury-reservoir B, and buckets E E, of the tube G, settling-pan H, having partitions I M, and the wheel N, carrying stirrers P P, substantially as described.

299,701. PUTTING-OUT MACHINE. JOSEPH W. VAUGHN, Peabody, Mass., assignor to the Vaughn Morocco Machine Company, Portland, Me. Filed Feb. 11, 1884. (No model.)

Claim.—1. In a machine for putting out, scouring, fleshing, or unhairing hides or skins, the combination of the following instrumentalities,

299,701.

to wit: an inclined table for holding the hide or skin, said table being adapted to traverse or move in a line corresponding with the angle at which it is inclined; a clamp or clamps for securing the hide or skin to the table; a roll adapted to scrape, scour, flesh, put out, or unhair the hide or skin, as the case may be; a treadle for causing the roll to press upon the hide or skin; an automatic belt-shipping device, substantially as described; mechanism for causing the table to move back and forth under the roll, and operative mechanism for the roll, substantially as set forth.

2. In a machine for putting out, scouring, fleshing, or unhairing hides or skins, the brush 24, mounted in the levers N, pivoted on the shaft t, in combination with the roll O, substantially as and for the purpose specified.

3. In a machine for putting out, scouring, fleshing, or unhairing hides or skins, the roll O, provided with a series of flanges, 25, having the sections 29, 30, and 31, constructed and arranged to operate substantially as specified.

4. In a machine for putting out, scouring, fleshing, or unhairing hides or skins, the flange 25, having the sections 29 and 30, arranged, respectively, at different angles to the central axial line of the roll O, and provided with the flange 26, for attaching it to the roll, substantially as and for the purpose set forth.

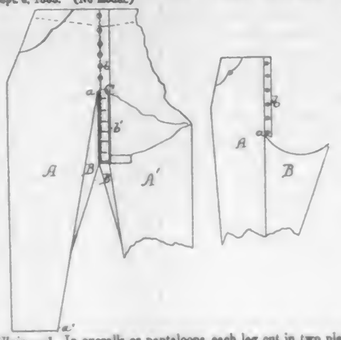
5. In a machine for putting out, scouring, fleshing, or unhairing hides or skins, the swinging bar T, provided with the bars 19, in combination with the rollers n and table J, substantially as specified.

6. In a machine for putting out, scouring, fleshing, or unhairing hides or skins, the stud 22, in combination with the table J, bar 19, and bar T, substantially as and for the purpose set forth.

7. In a machine for putting out, scouring, fleshing, or unhairing hides or skins, the roll O, shaft l, levers N, and weight v, in combination with a treadle or device for causing the roll to press on the hide or skin, substantially as specified.

8. In a machine for putting out, scouring, fleshing, or unhairing hides or skins, the rod y, provided with the spring 33, in combination with the roll O, lever N, and a treadle or means for exerting a pressure on said roll, substantially as and for the purpose set forth.

9. In a machine for putting out, scouring, fleshing, or unhairing hides or skins, and having an inclined table, a shipping mechanism, substantially as described, adapted to be operated automatically by the advancing table, whereby the table may be released and permitted to descend by gravitation to the lower end of its course, substantially as specified.

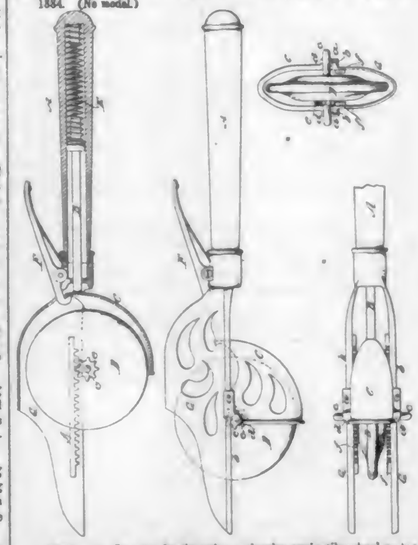


10. In a machine for putting out, scouring, fleshing, or unhairing hides or skins, the bars 6 and 7, bell-crank lever 14, provided with the studs 16, and bar 2, provided with the stud 3, in combination with the table J and operative mechanism, substantially as set forth.

11. In a machine for putting out, scouring, fleshing, or unhairing hides or skins, the shaft K, provided with the pinions l, rollers n, and pulleys L M, in combination with the table J, provided with the racks z, bar T, provided with the bars 19, and operative mechanism, substantially as set forth.

12. In a machine for putting out, scouring, fleshing, or unhairing hides or skins, the inclined table J, having the side rails, m, projecting in advance of its rear edge, as shown at i, and provided with racks z, in combination with the shaft K, pinions l, rollers n, bar T, and operative mechanism, substantially as specified.

13. In a machine for putting out, scouring, fleshing, or unhairing hides or skins, the body consisting of the upright frame-work or structure A and inclined frame-work or structure B, the shaft C, provided with the pulleys E D G H, the shaft l, carrying the roll O and pulley P, the shaft K, provided with the pinions l, rollers n, and pulleys L M, the levers N, provided with the weights v and rods y, the treadle, consisting of the rocker-shaft Q, arms e, and part R, the shipping device, consisting of the bars 2, 7, and 6, and lever 14, the table J, provided with the racks z, and the bar T, lags 17, bars 19, studs 22, and brush 24, combined and arranged to operate substantially as specified.



299,702. OVERALLS. WILLIAM G. VEDDER, Hamburg, N. Y. Filed Sept. 6, 1883. (No model.)

Claim.—1. In overalls or pantaloons, each leg cut in two pieces, a front, A, and back B, the inside seam of the front A cut in a straight line from the point of the fly at *a* to the bottom at *a'*, and the back B cut into a curved and widened point at the crotch, and the point *c* sewed to the point *a* of the front and straight to the bottom *a'*, as and for the purpose specified.

2. A pair of overalls or pantaloons, each leg of which is formed of only two pieces of material, the fronts being cut out beside the fly, and the backs having extensions curved on top to fit the crotch, and of a form to fit the cut-away portions of the fronts and bring the inside seams forward on the leg, one of the fronts being cut with a strip, *b'*, forming a part thereof, and adapted to extend over upon the opposite fly, and a cord, as *d*, inserted in said fly on both sides, all substantially as herein set forth.

299,703. TOY. CHARLES AUGUST VOLKE, Kobe, Japan. Filed Apr. 8, 1884. (No model.)

Claim.—1. In a toy for throwing a circular projectile wheel or top, the combination, with the stock or handle and guide for said projectile, of a carrier for imparting the necessary impulse to the projectile, and means for giving a rapid rotary motion to the projectile while in its guide and carrier, substantially as specified.

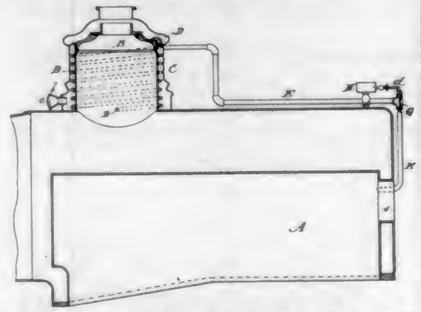
2. In combination with the guide for the wheel or top and the sliding carrier by which said wheel or top is projected out of the guide, the wheel or top provided with a spindle and one or more disks or pinions

for operation in connection with one or more rails or racks on the guide, essentially as described.

3. The combination, substantially as hereinbefore described, of the spring-propelled carrier, the trigger for retaining and releasing the carrier, and the guide.

4. The carrier C, constructed with open-mouthed recessed bearings *d* in its forward end, substantially as and for the purpose herein set forth.

5. The combination, substantially as hereinbefore described, of the spring-propelled carrier, the trigger for retaining and releasing the carrier, the guide, the ledge, rail, or rack on the guide, the wheel to be placed within the carrier, and the disk or pinion formed on or connected to the wheel and bearing against or engaging with the ledge, rail, or rack on the guide.



6. In a toy for throwing and rotating a wheel or circular projectile, the method herein described of giving to said wheel a return rolling motion after the inertia as derived from its projection has been expended, by communicating a back rotary motion to the wheel while in the act of being projected, essentially as specified.

299,704. DRESSING COMPOUND FOR THREADS, YARNS, &c. JOHN S. WATTLES, Canton, Mass. Filed Mar. 21, 1884. (No specimens.)

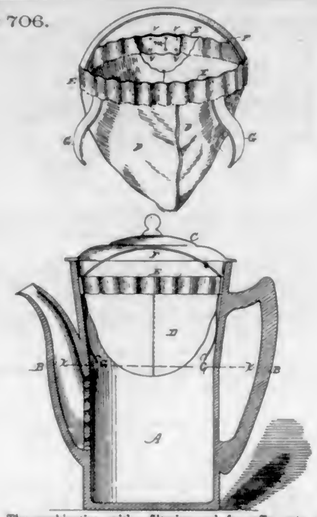
Claim.—1. The improved dressing compound composed of starch, flour, grease, spirits of turpentine or its equivalent, and alum and water, substantially as set forth.

2. The improved dressing compound composed of starch, flour, grease, spirits of turpentine or its equivalent, alum, water, and paraffine-wax, substantially as set forth.

299,705. FEEDING AIR TO LOCOMOTIVE-FURNACES. JAMES N. WEAVER, Sayre, Pa. Filed Apr. 3, 1884. (No model.)

Claim.—1. In apparatus for heating air and supplying the same to the furnaces of steam-boilers, the combination, with the boiler and its furnace, of a jacketed air-space and spaced steam-circulating pipes therein, which pipes are connected at both ends with the interior of the boiler, and a pipe or pipes for conducting the heated air from the jacketed space to the furnace and over the fire, substantially as set forth.

2. The combination, with the steam-dome B of a locomotive-boiler and its furnace A, of the air-jacket C, having a front inlet at or near its one extremity, a coil of steam-circulating pipes around the dome, with an air-circulating space between them, and a pipe or pipes connected with the opposite end portion of the jacket to that at which the air is received, and arranged to conduct the heated air to or over the fire, essentially as described.

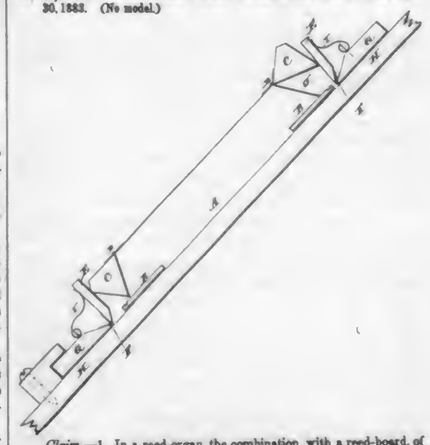


3. The combination, with the steam-dome B of the boiler, furnace A, and the air-jacket C, having a front inlet, of the coiled steam-pipes D, pipes E, leading from the outlet of jacket C to the furnace over the fire, and the steam-injecting nozzles G within the said hot-air pipes, substantially as set forth.

4. The combination, with the steam-dome B and its boiler and furnace, of the air-jacket C, having a front inlet-passage, a coil of spaced steam-circulating pipes, D, connected to the upper and lower ends of the said dome, pipes E, leading from the outlet of the jacket to the rear end of the furnace, and nozzles G, passing within the pipes E, as shown, and connected to the boiler by pipes *d*, provided with valves H, substantially as set forth.

299,706. COFFEE-POT. HUMPHREY P. WEBSTER, Boston, Mass. Filed Sept. 28, 1883. (No model.)

Claim.—1. A filter for coffee-pots, consisting of an adjustable hoop, a filtering-sack suspended therefrom, and springs attached at their upper ends to said hoop and extending outwardly and downwardly therefrom outside of the sack, substantially as described.

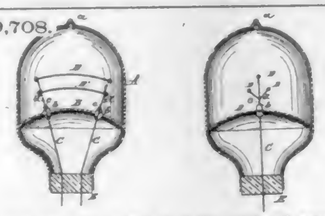


299 706.

2. The combination, with a filtering-sack for coffee-pots, of a corrugated adjustable hoop for supporting said sack, the ends of said hoop being overlapped, intermeshed, and attached together, substantially as described.

3. The combination, with a coffee-pot, of a filter consisting of an adjustable hoop, a filtering-sack suspended therefrom, and springs attached at their upper ends to said hoop and extending outwardly and downwardly therefrom outside of the sack, substantially as described.

299,707. REED-ORGAN. HENRY WREHAN, Ithaca, N. Y. Filed Apr. 30, 1883. (No model.)

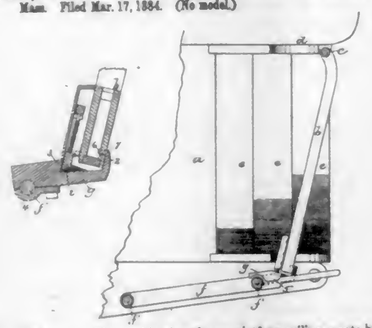


Claim.—1. In a reed-organ, the combination, with a reed-board, of a mute, a device, E, hinged at its lower end, and a spring arranged to maintain the device E in constant engagement with the mute, substantially as set forth.

2. In a reed-organ, the combination, with a reed-board and reeds, of a mute, a device, E, hinged at its lower end to a strip arranged parallel with the mute, and a spring secured to said strip and arranged to maintain the device E in constant engagement with the mutes, substantially as set forth.

299,708. ELECTRIC LAMP. ALEXANDER WELSH, St. Denis, Md., assignor to the Viaduct Manufacturing Company of Baltimore City. Filed Aug. 9, 1883. (No model.)

Claim.—1. An incandescing electric lamp having two opposite metallic filament-supports common to a series of separate carbon filaments,



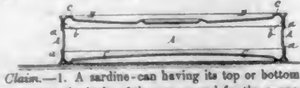
299,708.

all of which are at the same time in circuit through said supports, and each independently and removably connected directly thereto, substantially as described.

2. An incandescing electric lamp having two opposite branched metallic filament-supports carrying a series of separate and independently-connected carbon filaments, each of which is supported by two opposite metallic branches of the said two supports, and all in the lamp-circuit simultaneously, substantially as described.

299,709. CAR-PLATFORM GATE. ANDREW J. WILLCUTT, Boston, Mass. Filed Mar. 17, 1884. (No model.)

Claim.—1. The combination of a car-platform railing, a gate hinged to the end of the car and adapted to swing outwardly toward the railing, and a stop-plate adapted for attachment to the railing, and provided with a stop adapted to limit the outward movement of the gate, and a shoulder to engage a spring lock-bolt on the gate, as set forth.



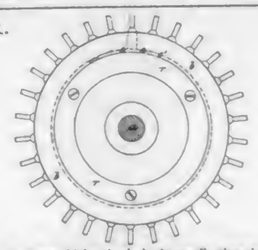
2. The combination of a car-platform railing, a gate hinged to the end of the car and adapted to swing outwardly toward the railing, and provided with a slotted plate, and a stop-plate adapted for attachment to the railing, and provided with a stop adapted to limit the outward movement of the gate, a shoulder to engage a spring lock-bolt on the gate, and a lug adapted to enter the slot in the gate, and thereby prevent the separation of the platform and gate, as set forth.

3. The improved plate *g*, having a gate-arresting stop or stops, and a clamping-lug, whereby it may be secured to one of the uprights of the car-platform railing, as set forth.

4. The improved plate *g*, having a gate-arresting stop or stops, a clamping-lug adapted to grasp one of the uprights of a car-platform railing, and a flange, 5, adapted to bear upon the top of said railing, as set forth.

5. The car-platform gate having a lock-bolt, *i*, and a slot, 7, combined with a plate, *g*, attached to the platform-gate, and provided with a shoulder adapted to engage the lock-bolt, and with a lug having an offset, 6, adapted to enter the slot 7 in the gate, whereby the railing is prevented from being separated from the gate, as set forth.

299,710. SARDINE-CAN. JULIUS WOLFF, New York, N. Y. Filed Apr. 8, 1884. (No model.)



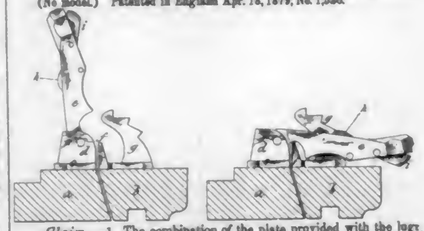
Claim.—1. A sardine-can having its top or bottom concaved and secured within the body of the can, as and for the purpose set forth.

2. In a sardine-can, the combination, with the body A, provided with the offsets *a*, of the concave top B, provided with the flange *b* and bead *c*, substantially as herein shown and described.

299,711. WHEEL. ROBERT ADAMS, Southwark, County of Surrey, England. Filed Nov. 6, 1883. (No model.) Patented in England Oct. 16, 1882, No. 4,922.

299,711.

Claim.—1. In a vehicle-wheel, the internally-threaded nut held in a stationary position in the disk of the hub, in combination with the spoke having a screw-threaded end adapted to the internal thread of the nut for tightening and repairing the spokes, substantially as described.



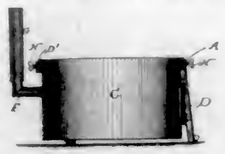
2. In a vehicle-wheel, the combination of the disk having an annular rim provided with perforations to receive the ends of the spokes, with the internally-threaded nuts applied to the rim and held against rotation, and the spokes having screw-threaded ends passing through the rim of the disk and screwed into the nuts, substantially as described.

3. The combination in a vehicle-wheel, of the disk, the internally-threaded nuts held against rotation around the periphery of the nuts, the spokes having screw-threaded ends screwed into the nuts, and an annular covering-plate arranged over the inner ends of the nuts, substantially as described.

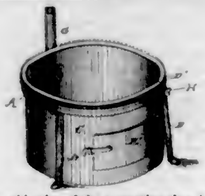
4. The combination, with the central disk of a vehicle-wheel having an annular grooved rim, of the internally-threaded nuts arranged in the groove, and provided with wings *c* to prevent their rotation, and the spokes having screw-threaded ends screwed into the nuts, substantially as described.

5. The combination, in a vehicle-wheel, of the center disk, the detachable internally-threaded nuts held against rotation around the periphery of the disk, and the wheel-spokes having screw-threaded ends screwed into the nuts, substantially as described.

299,712. FASTENER FOR MEETING-RAILS OF SASHES. ROBERT ADAMS, Southwark, County of Surrey, England. Filed Nov. 6, 1883. (No model.) Patented in England Apr. 18, 1879, No. 1,590.



Claim.—1. The combination of the plate provided with the lugs, the lever pivoted to said lugs, the pawl pivoted to said lever, and the plate provided with the fulcrum for the said lever to bear down on, and the ratchet-bar for the pawl to engage with, substantially as and for the purpose set forth.



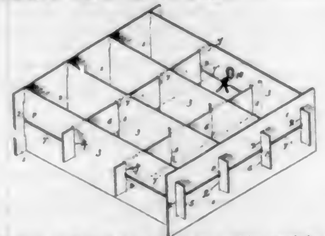
2. The combination of the plate provided with the lugs and spring-plate, the lever pivoted to said lugs, and having a pointed end to bear against said spring-plate, the pawl pivoted to said lever and operated by the spring-actuated thumb-piece, and the plate provided with the fulcrum for the said lever to bear down on, and the ratchet-bar for the pawl to engage with, substantially as and for the purpose set forth

3. The combination of the plate provided with the lugs, the lever pivoted to said lugs, and provided with a pinion at its lower end, the pawl pivoted to the said lever, and the plate provided with the toothed fulcrum to engage with the pinion of the lever, and the ratchet-bar for the pawl to engage with, substantially as and for the purpose set forth.

299,713. PORTABLE FURNACE. JOSEPH WALTER BARRET and GEORGE WASHINGTON MORRIS, Aroma, Ind. Filed Dec. 27, 1883. (No model.)

299,713.

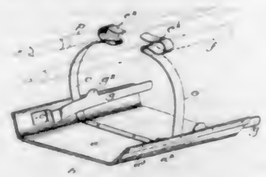
Claim.—The combination of the supporting-ring A, having feet B and set-screws H, and sheet-metal cylinder C, open at the top and bottom, and having the flange D', door E, and elbow F, substantially as set forth.



299,714. INTERNAL BOTTLE-STOPPER. ERNEST BAGNER, Findlay, Ohio, assignor of one-half to Vincent H. Coons, same place. Filed Dec. 8, 1883. (No model.)

Claim.—1. In an internal bottle-stopper, the combination, with the rubber valve and upper and lower metal washers having the Y-shaped stem with eyes at the ends of the Y, of the swinging spring-bow held in the eyes of the Y, substantially as specified.

2. In an internal bottle-stopper, the combination, with the rubber valve and metal washers, of the stem flaring outwardly at its upper end, and of the spring-bow secured to the enlarged portion of the stem and extending downwardly on both sides thereof, substantially as specified.

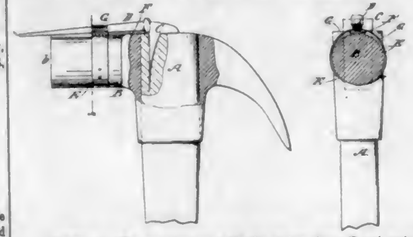


299,715. CELL-CASE FOR CARRYING EGGS, &c. THOMAS BACON, Jr., Laurel, Del. Filed Mar. 13, 1884. (Model.)

Claim.—1. A cell-case for eggs and other articles, consisting of the series of subdividing-partitions arranged to form the series of cells, some of the partitions parallel with each other having their longitudinal edges lying in different horizontal planes, and some of them having end tongues passed through slots in the outer partitions and a cord or string passing around the cell-case through perforations in the said projecting tongues and tied, said cord at the corners of the case passing around the same outside of the cells, substantially as described.

2. A cell-case for eggs and other articles, consisting of a series of subdividing-partitions arranged to form a series of cells, the ends of the partitions extending through the outside partitions, and a cord passed around the case through the extending ends of the partitions, and at the corners of the case passing around the same outside of the cells, substantially as and for the purpose set forth.

299,716. BLOTTING-PAD. CHARLES J. BAILEY, Newton, Mass. Filed Feb. 27, 1884. (No model.)

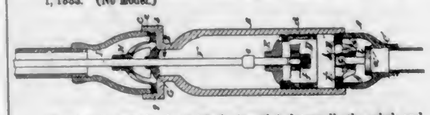


Claim.—1. As an improved article of manufacture, a blotting-pad provided with metallic spring-arms c c, adapted to be sprung apart at its ends to embrace the sleeve or arm and hold the pad in place, substantially as described.

2. A blotting-pad provided with a spring-clip having a holder for a pen or pencil, substantially as described.

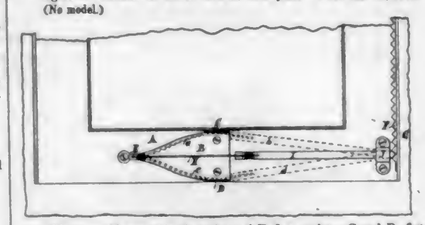
3. A blotting-pad provided with spring-fingers to enter the sleeve or cuff, to hold the pad in place, substantially as described.

4. A blotting-pad provided with a spring-clip, c, and spring-fingers *g*, the former to embrace and the latter to enter the sleeve or cuff, substantially as described.



299,717. NAIL-HOLDING ATTACHMENT FOR HAMMERS. GEO. F. BARBER, De Kalb, Ill. Filed Mar. 31, 1884. (No model.)

Claim.—1. The combination, with the spring-clamp E and spring-jaws G G, of the tongue F, attached to the spring-clamp, and constructed at its rear end to enter the handle of the hammer for the purpose of anchoring the clamp on the head of the hammer, substantially as specified.



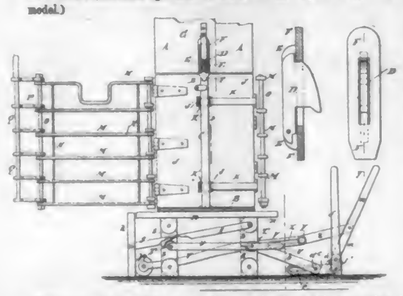
2. The combination, with the handle A and hammer-head B, of the wedge or stop C in the outer end of the handle, the removable spring-clamp E, constructed to partly encircle and hug the nose of the hammer, the nail-holding spring-jaws G G, attached to the clamp, and the tongue F, constructed to enter the outer end of the handle and to anchor the clamp to its place, essentially as and for the purposes herein set forth.

299,718. PUMP. EMORY BARNES, Mount Pleasant, Mich. Filed Oct. 1, 1883. (No model.)

Claim.—In combination with the barrel A, internally threaded, and the inverted dome A', externally and internally threaded, the spider D', provided at its top with an annular ring, E', exteriorly threaded, and a centrally-located socket, *c'*, formed in the hub *h*, situated between and held by the downward-projecting arms *i* of the spider, and the flat valve *b'*, having a stem working through said socket, all constructed and arranged substantially as described.

299,719. SASH-FASTENER. GEORGE S. BARNES, Boston, Mass., assignor of one-half to Elizur Barnes, same place. Filed Jan. 16, 1884. (No model.)

Claim.—The combination of stand E, finger-plates C and D, flat spring H, bolt I, guide J, and rack F, said spring being fastened at one end to said stand and at the other end to said bolt, substantially as and for the purposes set forth.



299,720. CONNECTION FOR GAS-TUBES. SAMUEL BARR, Providence, R. I. Filed May 23, 1883. (No model.)

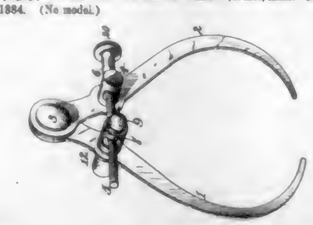
Claim.—1. The combination of the internal wire-supported flexible tubing, the casing surrounding the same at the end thereof, and the tube inserted within the end of the tubing inside of the wire support and extended below the lower end of the outer casing, substantially as described.

2. The combination of the flexible gas-tubing, the casing formed with an annulus between its ends and fitted over the end of the tubing, and the tube formed with a flaring end and fitted within the tubing, with the flaring end opposite the annulus of the casing and its other end extended below the lower end of the casing, substantially as described.

299,721. PRESS FOR SACKING BRAN, SAWDUST, &c. ARTHUR LEE BATSON, Morrisburg, Ontario, Canada. Filed Apr. 16, 1884. (No model.)

Claim.—1. In a sacking-press, the combination, with the casing A and the ends of the hoop-bar C, of the spring-catches D G, substantially as herein shown and described, whereby the sack cover-plate, when forced down by the follower, will be caught and held as the package is lowered from pressure, as set forth.

2. In a sacking-press, the combination, with the bottom plate, B, and the bent bar C, of the inner case, J, having hinged sides, and the outer skeleton case, M N O, having hinged sides, substantially as herein shown and described, whereby the sack will be securely held while being filled, as set forth.



3. In a sacking-press, the combination, with a side plate of the inner case, J, having recesses or slots J', and an arm of the bent bar C, of the free hinge-straps K, having offsets, K', and the button L, substantially as herein shown and described, whereby the said case will be securely fastened shut and held in place, as set forth.

4. In a sacking-press, the combination, with the skeleton case M N O, having hinged sides, of the series of cams P and their connecting-rod Q, substantially as herein shown and described, whereby the case can be readily locked and released, as set forth.

5. In a sacking-press, the combination, with the base-plate R, of the toggle-bars S, the connecting-bars U Z, the bent bar V, having roller W and slot X, and the lever *a*, substantially as herein shown and described, whereby the said toggle-bars can be readily opened to raise the said plate, as set forth.

6. In a sacking-press, the combination, with the toggle-bars S, of the connecting-bars U *b*, the connecting-bar *c*, having slot *e*, and the lever *f*, substantially as herein shown and described, whereby the said toggle-bars can be readily closed to lower the base-plate of the press, as set forth.

299,722. CALIPERS. STEPHEN H. BELLOWS, Athol, Mass. Filed Mar. 22, 1884. (No model.)

Claim.—1. In calipers, the combination of two legs or jaws, a stud mounted upon one thereof, a screw-threaded rod secured in such stud, a cylinder or case swiveled or mounted in or upon the other leg or jaw, and a nut for engagement with the rod swiveled or rotatably mounted and spring-seated within the cylinder or case, substantially as described.

2. In calipers, the combination, with a screw-rod mounted or secured, through the medium of a stud, upon one leg or jaw, of a nut for engagement therewith secured within a case or cylinder mounted upon the other leg or jaw and provided with an aperture, part of which is adapted to engage with and fit upon the screw-rod, while the remaining portion is constructed to be free therefrom and not impede the movement of the rod therethrough, substantially as described.

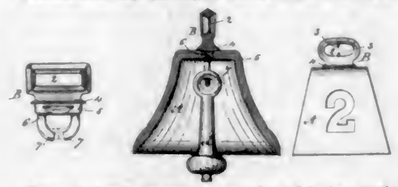
3. In calipers, the combination, with the screw-adjusting rod, of a nut having an aperture, part of which is adapted to take upon and engage with the rod, while part is constructed to be free therefrom, and means, substantially as described, for throwing the part adapted to engage with the rod out of engagement therewith, substantially as described.

4. In calipers, the combination, with the nut adapted to engage with the adjusting screw-rod, of a containing case or cylinder mounted upon one leg or jaw, and means, substantially as described, for controlling the position of the nut therein and its relation to the adjusting-rod, substantially as specified.

5. The combination, in calipers, of the stud 4, screw-rod 5, case 8, nut 9, having aperture 11, and spring 13, arranged and operating substantially as described.

299,723. CAR-COUPLING. THOMAS ELANDER, Boston, Mass. Filed Mar. 29, 1884. (No model.)

Claim.—1. In a car-coupling, the combination of a draw-head having a curved coupling-pin socket, a shoulder behind the socket, and a slot extending backwardly from the socket, combined with a curved pin adapted to enter said socket, and a weighted dog pivoted to the upper end of said pin and projecting backwardly from the pin into the slot, said dog being adapted to engage with the shoulder and support the pin in a raised position, and to be displaced by the link, so as to release the pin, as set forth.



2. The combination of a draw-head having a curved socket, a shoulder behind the socket, and a slot extending backwardly from the socket, combined with a curved coupling-pin, and an automatic supporting device or dog pivoted to the pin and projecting backwardly into the slot of the draw-head, said dog being adapted to automatically hold the pin and support it laterally in a raised position, to be displaced by the link, and to guide the curved pin in its forward and downward movement, as set forth.

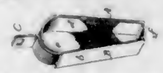
3. The combination, with a socketed and slotted draw-head, of a pin adapted to enter the socket, and a dog pivoted to said pin adapted to enter the slot, as set forth.

4. The combination, with a socketed and slotted draw-head, of a pin adapted to enter the socket, and a dog pivoted to said pin and adapted to enter the slot, and provided with a shoulder, 3, adapted to bear on the link, as set forth.

5. The combination, with the draw-head having the curved socket *c*, shoulder 5, and recessed slot *g*, of the curved pin *b* and the dog *f*, pivoted to said pin, and provided with the toe 2, shoulder 3, and offset 4, as set forth.

299,724. BELL. ELLISON L. BRAINARD, East Hampton, Conn., assignor to the Barton Bell Company, same place. Filed Dec. 27, 1883. (No model.)

Claim.—1. A malleable-metal loop-piece for a bell, having a mortise for the strap, a body portion for the metal of the bell to be cast around, and an open horn or projection for the reception of the clapper, substantially as set forth.

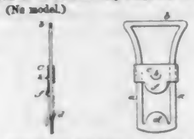


2. The malleable-metal loop-piece for a bell, having a mortise for the reception of the strap, points for penetrating and holding such strap, a body portion around which the metal of the bell is to be cast, and horns or projections for the reception of the clapper, substantially as set forth.

3. In a bell having a clapper suspended from a malleable loop or hook within the bell, the two horns with wide ends adapted to be closed together after receiving the eye of the clapper, whereby the clapper will be made to hang upon either horn, instead of between them, substantially as set forth.

4. In combination with the bell and clapper, a loop-piece having a flange that comes at the top surface of the bell, a mortise for the strap, a suspending device for the clapper, and a body portion around which the bell-metal flows in casting, substantially as set forth.

5. The combination, with the bell and clapper, of a loop-piece having a mortise for the suspending device, and an eye for the clapper, and a body portion that is perforated or recessed for the metal of the bell to pass into in casting, so that such loop-piece is held from moving in either direction, substantially as specified.



299,725. GARMENT-CLASP. MORRIS P. BRAY, New Haven, Conn., assignor of one-half to the Elm City Suspender Co., same place. Filed Mar. 3, 1884. (No model.)

Claim.—1. The herein-described garment-clasp consisting of the jaws A B, hinged together, provided with a spring between them tending to force the jaws together, the one jaw, B, extended above the pivot to form the flat tail *b*, the other jaw extended above the pivot to form the tail *d*, its upper end bent over and downward toward the jaw B in semicircular shape, its extreme end substantially meeting or in the same plane with the tail of the jaw B, the semicircular bend provided with a loop, C, at the center and in the vertical central plane, substantially as described.

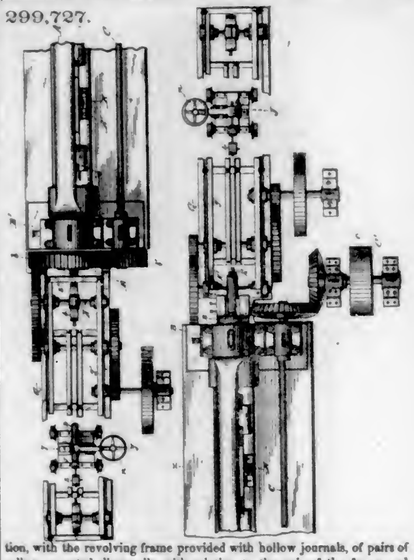
2. The herein-described garment-clasp, consisting of the jaws A B, hinged together, provided with a spring between them tending to force the jaws together, the one jaw, B, extended above the pivot to form the flat tail *b*, the other jaw extended above the pivot to form the tail *d*, and bent over and downward semicircular shape to substantially meet and stand in the same plane with the jaw B, the extension turned back upon itself to double the end of the extension, the extreme end of the extension turned up into a vertical central plane and provided with a loop, substantially as described.

299,726. GARMENT-CLASP. MORRIS P. BRAY, New Haven, Conn., assignor of one-half to the Elm City Suspender Co., same place. Filed Mar. 3, 1884. (No model.)

Claim.—The herein-described clasp, consisting of a frame composed of two parallel sides, *a a*, connected at one end by a bar for attachment to the strap, also connected at the opposite end, and there constructed with a tongue, *d*, projecting upward between the bars, combined with a slide, *c*, arranged to move upon the parallel sides of the frame toward and from the tongue, the said slide constructed with a tongue, *f*, corresponding to the tongue *d*, and so that as the slide approaches the lower end of the frame the one tongue will overlap the other, substantially as described.

299,727. MACHINE FOR STRAIGHTENING ROUND BARS OF METAL. LATHAN BRIGHTMAN, Youngstown, Ohio. Filed Nov. 9, 1883. (No model.)

Claim.—1. In a machine for straightening round bars of metal, the combination, with the rotating frame having hollow journals, of the diagonally-arranged pairs of rollers journaled in said frame, substantially as set forth.



2. In a machine for straightening round metal bars, the combination, with the rotating frame having hollow journals, of the obliquely-arranged rollers journaled in said frame, and guides secured in the frame opposite the respective rollers, substantially as described.

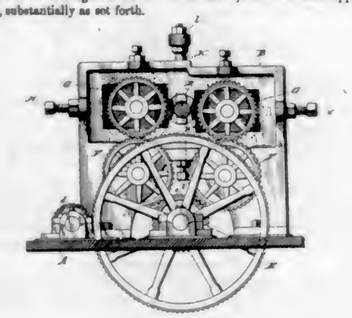
3. In a machine for straightening round metal bars, the combination, with the rotating frame having hollow journals, of the obliquely-arranged rollers, the guides, and the means for adjusting said rollers or guides (either or both) crosswise of the axis of the revolving frame, substantially as described.

4. In a machine for straightening round metal bars, the combination, with the revolving frame provided with hollow journals, of pairs of rollers having crowning faces and conical or conoidal journals, said rollers being mounted in the frame obliquely to the axis thereof, substantially as set forth.

5. In a machine for straightening round metal bars, the combination, with the revolving frame provided with hollow journals, of pairs of rollers mounted diagonally with relation to the axis of the frame and alternating at opposite sides of said axis, substantially as set forth.

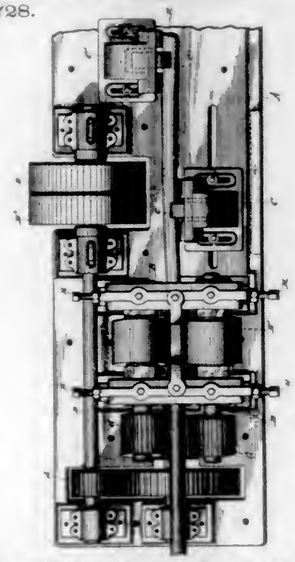
299,727.

6. In a machine for straightening round metal bars, the combination, with the revolving frame provided with hollow journals, of carriages having clamps adapted to support a bar in line with the hollow journals of the frame, a chain traversing beneath the carriages, and a hook secured to each carriage for engaging the chain, substantially as described.



7. In a machine for straightening round metal bars, the combination, with the revolving frame having hollow journals, of carriages provided with clamps adapted to support a bar in line with the hollow journals of the frame, chains traversing beneath the carriages, and a counterbalanced hook secured to each carriage, substantially as described.

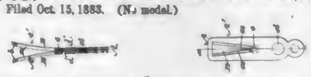
8. In a machine for straightening round metal bars, the combination, substantially as before set forth, of the feed-chain, the carriage provided with a bar-clamp, a hook to engage the chain, the revolving frame having hollow journals, and the rollers journaled obliquely in the frame to traverse the bar in spiral paths and draw it endwise, substantially as set forth.



299,728. MACHINE FOR STRAIGHTENING ROUND BARS OF METAL. LATHAN BRIGHTMAN, Youngstown, Ohio. Filed Nov. 15, 1883. (No model.)

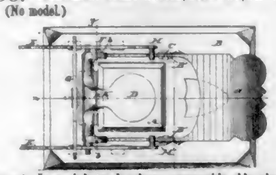
Claim.—1. In a machine for straightening round bars of metal, the combination of feed-rollers for revolving and feeding the bar and straightening-rollers so arranged as to bear against the bar at different points and from opposite sides, substantially as set forth.

2. In a machine for straightening round bars of metal, the combination of feed-rolls, adjustable guides adapted to hold the shaft in position between the feed-rollers, and adjustable straightening-rollers so arranged as to bear against the bar at different points and from opposite sides, substantially as set forth.



299,728.

3. In a machine for straightening round bars of metal or shafting, provided with feed-rollers for revolving and feeding the shaft or bar through the machine, straightening-rollers set in pairs in suitable bearings, and so arranged that different pairs of rollers will engage the shaft or bar at different points and from opposite sides, and with the bearing of one or more of the pairs of rollers made adjustable crosswise of the shaft, so that they may be made to press against and deflect the shaft, substantially as set forth.

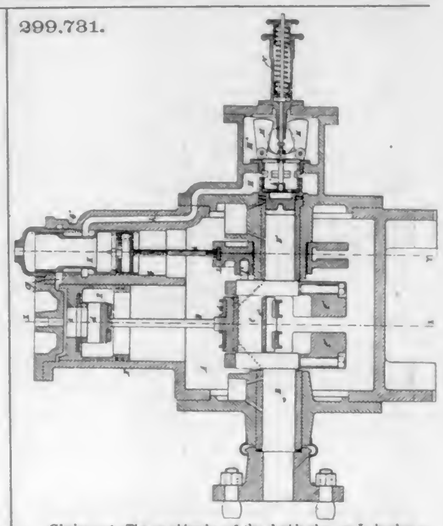


299,729. SLATE-PENCIL SHARPENER. ISAAC BROOKS, Pottstown, Pa. Filed Oct. 15, 1883. (No model.)

Claim.—1. A slate-pencil sharpener formed of two cast metallic plates, each having a circular depression, *b*, cutting-edges *a*, slots B, extending the length of the cutting-edges, and a handle portion, *d*.

2. Two cast metallic plates, each having a circular depression, *b*, cutting-edges *a*, slots B, handle portion *d*, and cavity *e*, forming an improved slate-pencil sharpener, substantially as set forth.

299,730. INKSTAND. ISAAC BROOKS, Pottstown, Pa. Filed Feb. 27, 1884. (No model.)



Claim.—1. In an inkstand, a base, removable side pieces, the inkwell and its cover, in combination with a binder having at bottom an eye which is passed through said base, and a wedge which is fitted in said eye, substantially as and for the purpose set forth.

2. In an inkstand, a cover of the ink-well pivotally connected with the frame, and provided with a pad which abuts against the binder or back piece of said frame, substantially as and for the purpose set forth.

3. An inkstand consisting of a rising, falling, and laterally-moving cover and an operating-lever therefor, a base and side pieces, said cover having a lug, and the side pieces—one or both—formed with a notch to receive said lugs when the cover is elevated, substantially as described.

299,731. MULTIPLE-CYLINDER ENGINE. PETER BROTHERHOOD, Lambeth, County of Surrey, England. Filed Nov. 24, 1883. (No model.) Patented in England May 18, 1883, No. 2,494.

299,731.

Claim.—1. The combination of the double sheaves L, having a T-shaped eccentric groove for the end of the valve-rod *k*, with a trunnion cast on one of the casing-heads, forming also an end bearing for the end B′ of the crank-shaft, all arranged substantially as described.

2. The combination of the double sheaves L, having T-shaped eccentric groove for the end of the valve-rod *k*, with a trunnion cast on one of the casing-heads, forming an end bearing for the end B′ of the crank-shaft, and said sheaves operated by a pin, *l*′, secured to the crank, substantially as described.

3. The combination of the crank-shaft of the engine, having an end bearing for the part B′ of said shaft, and forming a trunnion with the double sheaves L, provided with a T-shaped eccentric groove, and operated by a pin, *l*′, secured in the crank, as specified.

4. In combination with an engine having radiating cylinders, a bearing on one of the casing-heads for the end B′ of the crank-shaft, serving, with its outer surface, as a trunnion, upon which the eccentrics or sheaves for operating the valves are mounted, substantially as described.

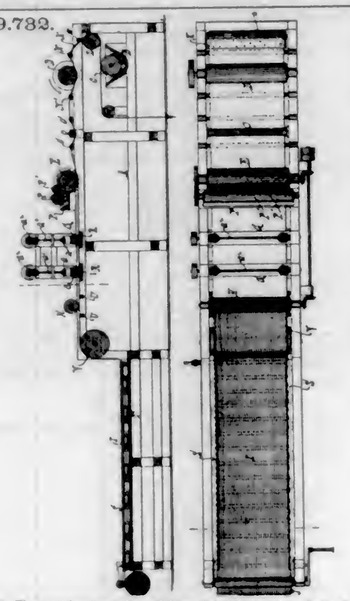
299,732. MACHINE FOR DECORATING OIL-CLOTH. ALEXANDER F. BUCHANAN, Montrose, N. Y. Filed Feb. 14, 1884. (No model.)

Claim.—1. The process of decorating oil-cloth which consists in first applying the ground-color, then rubbing said color into the fabric, then applying the top color, then blending the surface color, and, finally, drying the colored web, all substantially as set forth.

2. In a machine for decorating oil-cloth, the combination of the trough B for containing the ground-color, the rotating roller C for delivering the ground-color to the oil-cloth, and the revolving roller D for rubbing the ground-color into the oil-cloth, substantially as described.

3. In a machine for decorating oil-cloth, the combination of a trough, B, for containing the ground-color, the roller C for delivering the ground-color to the oil-cloth, the wiper K for removing foreign matter, and tending to rub in the ground-color, and the rotating roller D for rubbing in the ground-color, said wiper being arranged intermediate the roller for applying the ground-color and the roller for rubbing in each color, substantially as described.

4. In a machine for decorating oil-cloth, the combination of a trough, B, for containing the ground-color, the roller C for delivering the ground-color to the oil-cloth, the revolving roller D for rubbing in the ground-color, the roller E for applying the top color, and the spreader O for spreading the ground-color prior to the application of the top color, substantially as described.



5. The combination, substantially as hereinbefore described, of the ground-color roller, the rubbing-in roller, and the top-color roller or rollers.

6. The combination, substantially as hereinbefore described, of the ground-color roller, the rubbing-in roller, and the pattern-roller.

7. The combination, substantially as hereinbefore described, of the ground-color roller, the rubbing-in roller, the top-color roller or rollers, and the pattern-roller.

8. The combination, substantially as hereinbefore described, of the ground-color roller, the rubbing-in roller, the top-color roller or rollers, and the blending-brushes.

299,732.

9. The combination, substantially as hereinbefore described, of the ground-color roller, the rubbing-in roller, the top-color roller or rollers, the blending-brushes, and the pattern-roller.

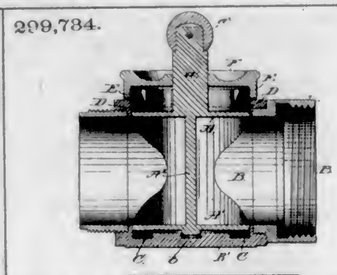
10. The combination, substantially as hereinbefore described, with suitable coloring devices, of the steam-coil arranged in a horizontal plane to receive the cloth as it leaves the coloring devices.

11. The combination, substantially as hereinbefore described, with suitable coloring devices, of the steam-coil arranged in a horizontal plane, to receive the cloth as it leaves the coloring devices, and the deflectors arranged to overlap the edges of the cloth upon the coil.

299,733. CYCLOMETER. ROWT. BURNS, Chicago, Ill., assignor of one-half to John S. Williams, same place. Filed Oct. 23, 1883. (No model.)

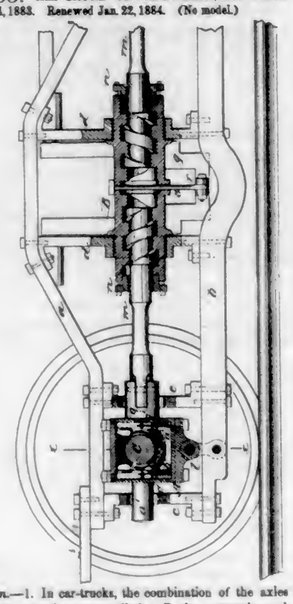
Claim.—1. A cyclometer adapted for insertion in the axle-nut cavity of vehicle-wheels, consisting, essentially, of two ratchet-disks having different number of ratchet-teeth, a lever and pawl common to both ratchet-wheels, and a fixed operating-cam axially arranged and connected to the axle or axle-nut, all essentially as herein shown and described.

2. In a cyclometer, as hereinbefore described, the combination of the ratchet-wheel *c*′, formed with a dial-face, C′, the ratchet-wheel *c*, provided with a hand or pointer, and cam-lever and pawl-operating mechanism, all essentially as herein described and shown.



3. In a cyclometer, a pair of registering ratchet-disks whose centers are in the same line as the center of the axle of the vehicle-wheel, and so arranged that the dial and pointer will face inward, for the purpose set forth.

299,734. CUT-OFF FOR VALVES. CORNELIUS CALLAHAN, Chelsea, Mass. Filed Oct. 6, 1883. (No model.)



Claim.—1. The cut-off composed of a case or shell and disks A A′ held together by a thin web, A^2, having its edges provided with packing, substantially as described.

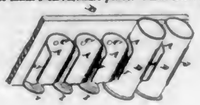
2. The combination, with the case or shell, which is closed at its bottom and provided with the packing-annulus C, of the valve composed of the disks A A′, and web A^2, having the packed working edges a^2, the said valve being stepped in the bottom of the shell or case, as described, and with the packing-annulus D and retaining-nut E, substantially as set forth.

299,734.

299,735. CAR-TRUCK. CHARLES E. CANDEE, New York, N. Y. Filed May 24, 1883. Renewed Jan. 22, 1884. (No model.)

Claim.—1. In car-trucks, the combination of the axles C, the oscillating boxes A, the screw-cylinders B, the connecting-rods *m r*, and the crank-shaft *q*, fitted for movement by the swing of the car, substantially as described, for operation as set forth.

2. In car-trucks, the combination of the box A, the jointed links *l*, the screw-rods *m*, and screw-cylinders B, substantially as shown and described.



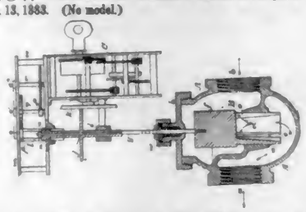
3. In car-trucks, the combination of the rods *u u*, connected to the car, the crank-shaft *q*, the connecting-rods *r*, the screw-cylinders B, the screw-rods *m*, and the oscillating boxes A, substantially as described, for operation as set forth.

4. The adjustable crank-arm *l*, combined with rock-shaft *q*, oscillating boxes A, and connections between the shaft and boxes, substantially as described.

5. The combination, in a car-truck, of the apertured pedestals c and boxes A, provided with arms *o o*′, substantially as shown and described.

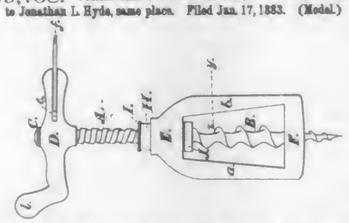
6. The combination, in a car-truck, of the screw-cylinders B and pedestals *d*, formed with bearings to receive the cylinders, substantially as described.

299,736. CARTRIDGE-HOLDER. NATHANIEL T. B. CARLIN, Kirkwood, Mo., assignor to Hans Nelson, same place. Filed Mar. 3, 1884. (No model.)



299,736.

Claim.—A cartridge-holder, A, having outturned edges J, and its bottom piece, I, bent outward, as shown, at the lower end of the holder.



299,737. FLUID-METER. WILLIAM G. CHAPIN, Brooklyn, N. Y. Filed Aug. 13, 1883. (No model.)

Claim.—1. The combination, to form a fluid-meter, of the shell constructed as shown, its valve B, provided with a weight, *f*, or a spring, a slotted cylindrical portion, *d*, and a stem, *g*, and means, substantially as shown, for indicating the rise and fall of the valve, all constructed substantially as set forth.

2. The combination, in a fluid-meter, of the shell A, constructed as shown, the loaded valve B and its stem, the hollow shaft or sleeve i on the valve-stem, provided with lugs *n*, the wheel *j*, the wheel or disk *k*, and means, substantially as described, for imparting rotary motion thereto, the shaft *l*, and pointer *o*, all arranged to operate substantially as set forth.

299,738. CORKSCREW. CHAS. CHENNOCK, New York, N. Y., assignor to Jonathan L. Hyde, same place. Filed Jan. 17, 1883. (Model.)

Claim.—1. The combination, in a corkscrew, of a screw having a left-hand and a right-hand thread, a handle running upon said left-hand thread, and a bridge having its top formed into a sleeve, through which said screw passes, and its base terminating in a circular collar, all substantially as and for the purposes set forth.

2. The combination, in a corkscrew, of a screw having a left-hand and a right-hand thread, a handle running upon said left-hand thread, and a bridge with converging sides, and having its top formed into a sleeve, through which said screw passes, and its base terminating in a circular collar, all substantially as and for the purposes set forth.

3. The combination, in a corkscrew, of a screw having a left-hand and a right-hand thread, a handle running upon said left-hand thread, and a bridge with wedge-shaped converging sides, and having its top formed into a sleeve, through which the screw passes, and its base terminating in a circular collar, all substantially as and for the purpose set forth.

4. The combination, in a corkscrew, of a screw having a left-hand and a right-hand thread, a handle running upon said left-hand thread and provided with a cutting-blade, and a bridge with converging sides, and having its top formed into a sleeve, through which said screw passes, and its base terminating in a circular collar, all substantially as and for the purposes set forth.

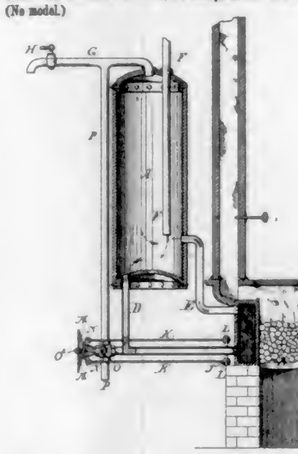
5. The combination, in a corkscrew, of a screw having a left-hand and a right-hand thread, a handle running upon said left-hand thread and provided with a cutting-blade pivoted to said handle, and a bridge with wedge-shaped converging sides, and having its top formed into a sleeve, through which said screw passes, and its base terminating in a circular collar, all substantially as set forth and described.

6. In a corkscrew, a handle with a wire-cutting blade, *f*, pivoted within a slot in said handle, substantially as set forth and described.

7. In a corkscrew, a bridge having converging sides or standards, substantially as set forth and described.

8. In a corkscrew, the bridge E, with wedge-shaped converging sides *a b*, substantially as set forth and described.

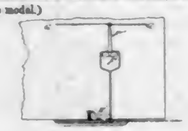
299,739. THREAD-SPOOL. WILLIAM J. CLARK, Birmingham, Conn. Filed Sept. 3, 1883. (No model.)



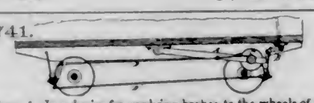
Brief.—An annular groove is formed around the head of the spool, in which is arranged a loose ring. The thread is drawn from the spool beneath said ring, which acts to hold said thread and prevent the accidental unwinding thereof.

Claim.—1. A spool constructed with an annular groove, *a*, around its head, combined with a ring, *b*, loose in said groove, and adapted to permit the thread from the spool to run off around the head within the ring, substantially as and for the purpose described.

2. A spool constructed with an annular groove, *a*, around its head, combined with an endless ring, *b*, made from thread or like flexible material arranged loosely in said groove, and adapted to permit the thread from the spool to run off around the head within the ring, substantially as described.



299,740. AUTOMATIC HOT-WATER REGULATOR. WILLIAM S. CLARK and EDWARD R. CLARK, Philadelphia, Pa. Filed June 28, 1883. (No model.)

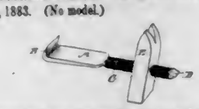


Claim.—1. In an apparatus for heating water by a fire adapted to be used and regulated for other purposes, the combination of an expansible tube through which water circulates by heat near the lower part of said heating apparatus, with a valve arranged to be automatically opened by the expansion of said tube and connected with a pipe for wasting hot water from the upper portion of the said water-heating apparatus, and thereby permitting an influx of cold water and automatically moderating and regulating the temperature of the water in said apparatus, substantially as set forth.

2. The combination of the boiler A and water-back C, connected therewith by circulating-tubes E and D, and arranged to be heated by the culinary-furnace B, with a cold-water-supplying pipe, F, hot-water-delivery pipe G, an expansible circulating-pipe, D, and fulcrums N, levers M, rods K, and valve O, arranged to automatically close and open in a waste-pipe, P, and regulate the temperature of the water in the apparatus, substantially as set forth.

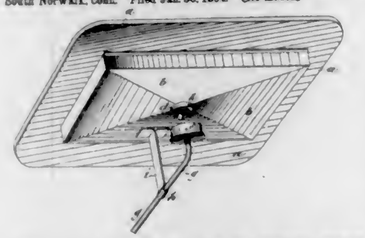
299,741. CAR-BRAKE. LYMAN S. COLSTON, Oberlin, Ohio. Filed Dec. 17, 1883. (No model.)

299,741.



Claim.—1. In a device for applying brakes to the wheels of steam-cars, a U-shaped frame or hanger, A, carrying a friction-wheel, C, in connection with a rock-shaft operated by upright lever B', and coupled with the end of hanger A, by means of arm B and chain or link, with locking spring-catch E, tripping device F, F', and G, or their equivalents, constructed and arranged substantially as and for the purpose stated.

2. In a device for applying brakes to steam-car wheels, the tripping device F F', with locking spring-catch E, and tripping-cords G G, or their equivalents, constructed and arranged substantially as described, and for the purpose stated.

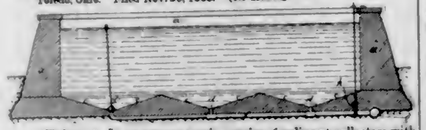


3. In automatic apparatus for applying brakes to wheels of steam-cars, the combination of friction-wheel C, hanger A, rod and chain D, lever E, rod D', right-angled lever B B', locking spring-latch E', tripping device F, F', and G, or their equivalents, all constructed and arranged substantially as shown and described, and for the purpose stated.

299,742. DOOR-SECURER, &c. EDWARD P. CONNER, Santa Rosa, Cal. Filed Aug. 23, 1883. (No model.)

Claim.—A combined door-lock and tool, formed of the flat plate A, having the right-angled and sharp-edged flange B, the thread C, the transverse cutting-ridge D, and the hammer-nut E, said tool having an end adapted to be used as a screw-driver, and one for drawing tacks, all as shown and described.

299,743. DRIP-PAN FOR SEWING-MACHINES. WM. CONNOLLY, South Norwalk, Conn. Filed Jan. 30, 1884. (No model.)

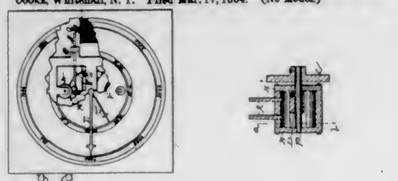


Claim.—1. A drip-pan for sewing or other machines, constructed with an inclined apertured bottom, and a fixed screw-neck, *d*, adapted to receive a drip cup, *e*, substantially as shown and described.

2. The combination, with the machine-table *a*, of an oil drip-pan, *b*, having an inclined apertured bottom, a discharge-neck, *d*, and an oil-receptacle, *e*, fitted on the neck, substantially as shown and described.

3. The combination, with the machine-table *a*, of an oil drip-pan, *b*, having an inclined apertured bottom, and a strainer, *c*, fitted over the discharge-neck *d*, substantially as shown and described.

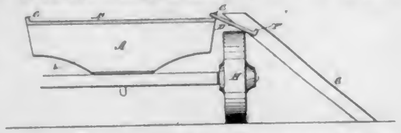
4. The combination, with the table *a* of a sewing or other machine, and the drip-pan *b*, provided with an inclined bottom having a discharge aperture or neck, of the cup *f*, for receiving the drip from the pan, and fitted to a pipe, *g*, leading to a receiver for the oil, substantially as shown and described.



299,744. MEANS FOR CLEANING RESERVOIRS. JOSIAH D. COOK, Toledo, Ohio. Filed Nov. 30, 1883. (No model.)

Claim.—1. In a water-reservoir, a series of sediment-collectors with inclined sides composing the bottom of such reservoir, in combination with pipes passing off from the lowest portions of such sediment-collectors, and suitable valves or stoppers in such pipes, whereby the materials at the lower portions of such collectors can be discharged, substantially as specified.

2. The combination, in a water-reservoir, of the inclosing-walls, ranges of sediment-collectors with inclined sides, forming the bottom of the reservoir, pipes opening into the lowest portions of the sediment-collectors to convey away the sediment by the action of the water, and cocks, gates, or stoppers to regulate the discharge of such sediment, substantially as set forth.



299,745. APPARATUS FOR MEASURING THE LINEAL FEET OF WORK DONE BY A WOOD-WORKING MACHINE. FRANCIS CROSBY COOKE, Whitehall, N. Y. Filed Mar. 17, 1884. (No model.)

Claim.—1. In a wood-working machine, a friction-wheel adapted to ride upon the wood, and provided with a mechanism for making and breaking an electric circuit, in combination with an electric circuit and electro-magnet actuated by said circuit, a registering-dial, indicating hand or hands, a spring or weight actuated train of wheels, and a connecting mechanism between said train of wheels and the armature of said magnet, whereby the movements of the wheels are controlled by the magnet, all the parts being arranged substantially as and for the purposes set forth.

2. The method of registering the number of lineal feet of work performed by a wood-working machine, consisting of actuating a circuit-breaker by contact with the wood to make and break an electric circuit at regular known space-intervals and registering or indicating the number of said intervals upon a spaced dial by one or more hands moved by a train of spring or weight actuated wheels controlled in their movements by the armature of a magnet operated by said circuit.

299,746. SKID-HOLDER. JOHN D. COPPES, Nappanee, Ind., assignor of one-half to Frank Coppes, same place. Filed Jan. 7, 1884. (No model.)

Claim.—1. A skid-holder having means for attaching it to a part of a wagon, and provided with projections between which one end of a skid is to be placed, substantially as shown and described.

2. A skid-holder having an approximately V-shaped form, and provided with a loop at its apex and with projections at its ends, substantially as and for the purpose specified.

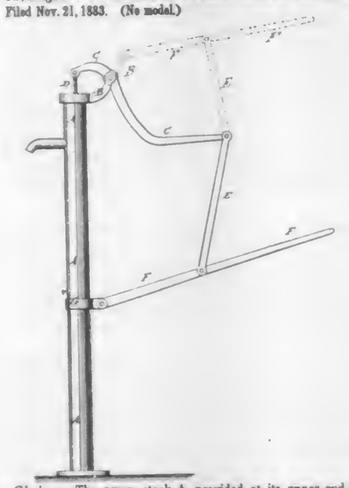
3. The combination, with a wagon-bolster having means of attachment at its ends, of a skid-holder adapted to be connected to said bolster and supported on a wheel of the wagon, substantially as and for the purpose set forth.

299,747. ABRASIVE BELT. FREDERICK W. COY, Boston, Mass. Filed Apr. 12, 1884. (No model.)

299,747.

Claim.—1. As a means for securing the ends of a strip or strips having an abrasive coating, a connecting-piece formed to fit the scarfed ends of said strip and provided with a central compressible rib, as set forth.

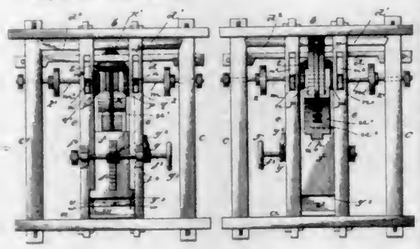
2. An abrasive belt composed of a strip or strips having an abrasive coating, and a flexible connecting-piece having a rib projecting between the proximate ends of the abrasive coating and incorporated into or upset upon said ends, as set forth.



3. An abrasive belt composed of a strip or strips having an abrasive coating and a flexible connecting-piece interrupting the continuity of the abrasive coating and adapted to be bent or folded, as set forth.

4. An abrasive belt composed of two strips having abrasive coatings and two flexible connecting-pieces interrupting the continuity of the abrasive surface, whereby the belt is adapted to be flattened without injury to to its abrasive surface, as set forth.

5. An abrasive belt composed of a coated strip, and a connecting-piece composed of a body, 2, and a textile covering, 3, having its central portion formed into a rib interposed between the ends of the abrasive coating and compressed or upset thereon, as set forth.



6. An abrasive belt composed of a strip or strips having an abrasive coating and a connecting-piece, *a*, secured to the ends of said strip and partially severed or divided to act as a hinge, as set forth.

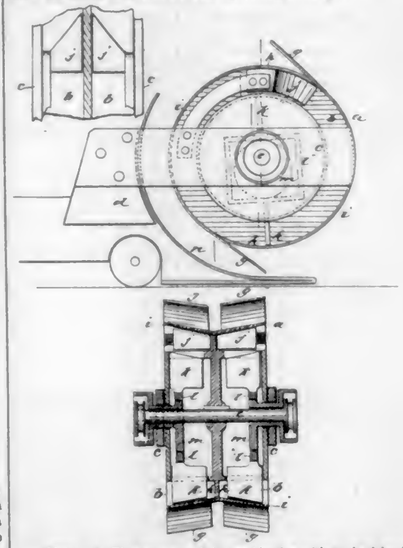
299,748. PUMP-HANDLE. JAMES ALEXANDER CRAIG, Philadelphia Pa., assignor to himself and Elizabeth Edith Barvagh, Merchantville, N. J. Filed Nov. 21, 1883. (No model.)

Claim.—The pump-stock A, provided at its upper end with a bracket, B, and at or near its center with a band, G, in combination with the pump-handle C, pivoted to said bracket and to the piston-rod D, a lever, F, pivoted at the band G, and a connecting-rod, E, pivoted to the outer end of the pump-handle and to the center of the lever F, substantially as set forth.

299,749. BRAN-PACKER. DAVID J. DAVIS, Newark, Ohio. Filed Sept. 17, 1883. (No model.)

Claim.—1. The combination, with the grooved studs *e e e e*, of the piston-box *f*, working vertically therein and provided with a rack-bar, and a shaft having its bearings in boxes secured to the two front studs *e e*, and provided with a pinion, pawl and ratchet, and a hand-wheel, substantially as specified.

2. The combination, with the power-screw *k*, having the miter-gear *l*, of the miter-gear *p* on the inner end of the shaft *m*, having its bearings in the post *c* and pivoted bar *n*, and the pivoted arm *q*, carrying the lever *r*, the trigger *t* in recess in the upper edge of the piston-box *f*, and the piston on said screw *k*, substantially as specified.



3. The combination, with the piston-box *f*, having the trigger *t'*, the piston *i*, and the power-screw *k*, having the miter-gear *l* at its upper end, of the horizontal shaft *m'*, having its bearings in the stud *c'*, and the pivoted bar *n'*, and the pivoted arm *q*, carrying the lever *r'*, substantially as specified.

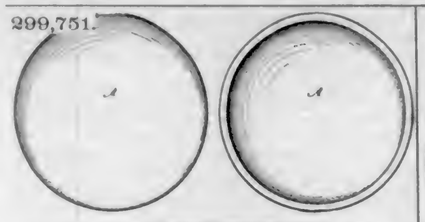
4. In a bran-packer, the combination, with the piston-box *f*, having the aperture *h* in its rear wall near the top, of the adjustable bran-spout *u u'*, having the ratchet and spring-pawl, substantially as specified.

5. The packing-box *v*, of the same size in cross-section as the piston-box *f*, provided with a door, and having half-staples or top slots, in combination with the grooved studs *e e e e* and the piston-box *f*, having a rubber gasket on its lower edge, substantially as specified.

299,750. SNOW-PLOW. JOHN Q. DAY, Red Cliff, Colo. Filed Sept. 24, 1883. (No model.)

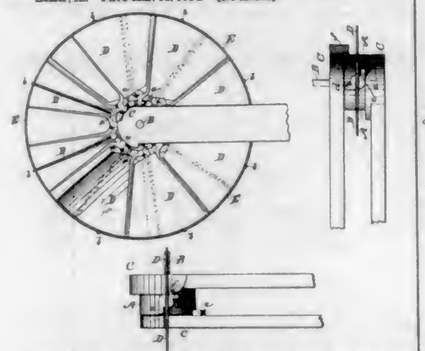
Brief.—A wheel with annular side grooves and dischargers has stop-gates mounted on a yoke revolving by stationary eccentrics. The rim of the wheel flares outward from the bottom of the grooves.

Claim.—1. The stop-gates *k*, in combination with a wheel having annular side grooves, *b*, shovels *g*, and dischargers *j*, said stop-gates being arranged for and provided with means to cause them to project at the lower part of the wheel to stop the snow in the grooves and withdraw at the upper part to pass the dischargers, substantially as described.



2. The stop-gates *k*, the yoke *l*, and the stationary eccentrics *m*, in combination with a wheel having annular side grooves, *b*, shovels *g*, and dischargers *j*, said stop-gates being arranged to project at the lower part of the wheel to stop the snow in the grooves and to withdraw in the upper part of said wheel to pass the dischargers, substantially as described.

3. In a snow-wheel having annular grooves *b* in the sides, shovels *g*, for gathering the snow, and the dischargers *j*, for throwing out the snow, the outer rim, *i*, arranged to flare from the bottom of the grooves outward, to facilitate the discharge of the snow, substantially as described.



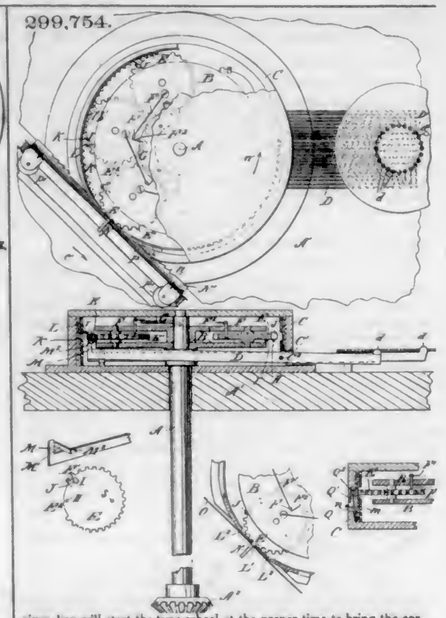
299,751. PLAQUE AND PANEL. LOUIS A. DE PLANQUE, Jersey City, N. J. Filed Mar. 15, 1884. (No model.)

Claim.—A plaque consisting of a piece of leather-board pressed into suitable shape, coated with a mixture of glue and whiting, and then provided with a coat of paint, substantially as herein shown and described.

299,751.

299,752. FEATHERING PADDLE-WHEEL. MICHAEL H. DEPUE, Homer, Ill. Filed Mar. 12, 1884. (No model.)

Claim.—The combination, in a wheel having a rim and hub, of radial blades journaled therein, the journal of each blade being provided with two transverse arms in the same plane, forming a single right angle on the external faces of the said arms tangent to the journal, the said arms being at equal distances from the center of the wheel, with cams fixed stationarily in the path of the said arms and beside the path of the journals, said cams being at equal distances from the center of the wheel, as shown and described.



299,753. TAG-HOLDER. WILLIAM DICKIE, Gillespie, Ill. Filed Apr. 15, 1884. (No model.)

Claim.—As an improved article of manufacture, the double-pointed tag hook or fastener herein shown and described, the same consisting of a double-pointed piece of wire, A, bent at opposite ends to form the spring-coils B B and loops C C, having pointed hooks D, the points of which are held by the tension of the spring-coils up against the same, substantially as and for the purpose herein shown and described.

299,754. TYPE-WRITING MACHINE. DARIEN W. DODSON, Town Line, Pa. Filed May 4, 1883. (No model.)

Brief.—Within a circular case, C, having a curved inking-pad, I, on its inner side, and slotted at the printing-point, a wheel with type-carrying teeth E' on the greater part of its periphery is pivoted between two disks secured to a constantly-rotating shaft, A. Depressing a key interposes a lug, M, on the key-lever in the path of a stud, H, on the under side of the type-wheel, which thus gets an initial movement on its own axis. This movement is kept up by contact of the type-teeth with the inking-pad, and regulated by engagement of triangular tooth J with curved toothed rack K at the beginning of the movement. Projections on key-levers and type on wheel are relatively so arranged that depression of a

given key will start the type-wheel at the proper time to bring the corresponding type opposite the slot L', through which the impression is made against bar N; type-wheel locked in normal position after printing by spring-pin F entering hole S, and released by bent end F² of spring riding up incline G; key-lever returned to position by stud I striking projection M²; letter-space given by means of rack N' on paper-carriage and tooth *m* on spring Q', which is pressed outward by type-wheel after printing. In the machine shown a series of duplicate type-wheels are used for speed.

Claim.—1. In a type-writer, the combination, with a revolving disk, of a type-wheel journaled on the outer rim of said disk, and having at the same time two independent horizontal motions—one on its own axis, and the other on the axis of the disk on which it is journaled—substantially as herein shown and described.

2. In a type-writer, the combination, with a casing, a revolving disk, and a type-wheel journaled on said disk, of a pad or cushion on the inner surface of the casing, substantially as herein shown and described, whereby the said pad or cushion is made to serve the double purpose of an inking-pad and also a means for revolving the type-wheel by frictional contact, as set forth.

3. In a type-writer, the combination, with the revolving disks, of one or more type-wheels journaled in the same, a pad or cushion partly surrounding the said disks, and of key-levers adapted to act on the said type-wheels, substantially as herein shown and described, and for the purpose set forth.

4. In a type-writer, the combination, with revolving disks, of one or more type-wheels journaled in the same, a circular inking pad or cushion partly surrounding the disks, a series of levers adapted to act on type-wheels, and of a spring adapted to be acted upon by the type-wheels, and provided with a tooth for acting on the teeth of the rack in the paper-holder, substantially as herein shown and described, and for the purpose set forth.

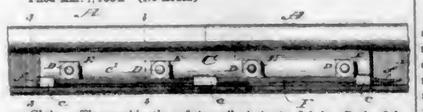
5. In a type-writer, the combination, with revolving disks, of one or more type-wheels journaled in the same, pins attached to springs for the purpose of locking the type-wheels in position in the disks, devices, substantially as described, for raising the said springs to release the type-wheels, an inking pad or cushion partly surrounding the disks, and levers for acting on the type-wheels, substantially as herein shown and described, and for the purpose set forth.

6. In a type-writer, the combination, with the revolving disks, of type-wheels journaled in the same, a segmental rack surrounding the disks, and a tooth on each type-wheel, which tooth is adapted to pass in between the teeth of the rack, substantially as herein shown and described, and for the purpose set forth.

7. In a type-writer, the combination, with the revolving disks, of type-wheels journaled in the same, an inking pad or cushion partly surrounding the disks, which cushion is provided with a vertical slot through

which the teeth carrying the type can pass, and of a bar held outside of the said slot, substantially as herein shown and described, and for the purpose set forth.

8. In a type-writer, the combination, with the revolving disks B B, of one or more type-wheels, E, journaled in the same, which type-wheels are provided with apertures *s*, with pins F, and with springs F', having bent ends F², and the semicircular cam-track G, substantially as herein shown and described, and for the purpose set forth.



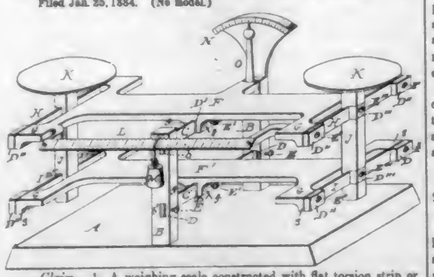
9. In a type-writer, the combination, with the disks B, of one or more type-wheels, E, journaled in the same, and provided with a downwardly-projecting stud, H, on the under surface, the inking cushion or pad L, partly surrounding the disks B, and the levers D, pivoted in such a manner as to adapt their upper ends to be raised to such an extent that the studs H will strike against the same, substantially as herein shown and described, and for the purpose set forth.

10. In a type-writer, the combination, with the revolving disks B, of a pad or cushion, L, partly surrounding the same, one or more type-wheels, E, journaled in the disks B, which type-wheels are each provided on the under side with a stud, H, and a beveled stud, I, and the key-levers D, provided at the inner ends with arms M, having arms M', provided at the outer ends with beveled teeth M², substantially as herein shown and described, and for the purpose set forth.

11. In a type-writer, the combination, with the disks B, of the inking pad or cushion L, partly surrounding the same, one or more type-wheels, E, journaled in the said disks, and the spring Q, provided with the head Q², and with the tooth *m*, substantially as herein shown and described, and for the purpose set forth.

12. In a type-writer, the type-wheel E, constructed, as herein shown and described, with a series of teeth, E', at the outer ends of which the types are fastened, and with a recess or blank space, E², substantially as set forth.

299,755. NUT-LOCK. ROY DODSON, Central, St. Louis County, Mo. Filed Mar. 1, 1884. (No model.)



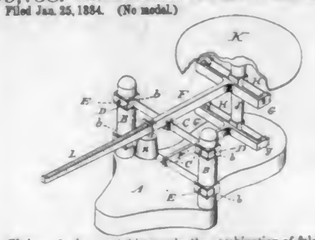
Claim.—The combination of the rails A A, the fish-bar B, the fish-bar C, having lips *c c*, the bolts D D, the nuts E E, and the spring locking-rod F, having the head *f* and the crooked end *f'*, substantially as and for the purposes described.

299,756. OYSTER-CLAMP. CUNNGHAM DRAKE, Philadelphia, Pa. Filed May 2, 1884. (No model.)

Claim.—The oyster clamp or holder consisting of the recessed bottom part, A, and short recessed top part, B, hinged together at C, the bottom part projecting beyond the top, as shown, substantially as and for the purpose set forth.

299,757. WEIGHING-SCALE. NAPOLEON DU BRUL, Cincinnati, Ohio. Filed Jan. 25, 1884. (No model.)

Claim.—1. A weighing-scale constructed with flat torsion strip or strips stretched horizontally and set up edgewise, substantially as and for the purpose specified.

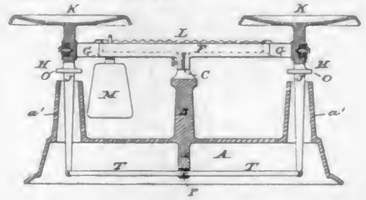


2. In a weighing-scale, the combination of a beam, a torsional rod horizontally secured to the end of the beam, and a vertical pan-support rigidly and directly connected to the torsional rod, substantially as and for the purpose set forth.

3. In a weighing-scale, the combination of horizontal beams centrally pivoted to torsion-rods, torsion-rods secured rigidly and directly to the ends of the beams, and pan-support connected rigidly and directly to the torsion-strips on the ends of the beams, as set forth.

4. In a weighing-scale, the combination of beams centrally pivoted, horizontal torsion-rods secured at the ends of the said beams, and pan-supports rigidly and directly connected to the end torsion-rods, and projecting downwardly below the lowest torsion-rods, to form stops, as set forth.

5. In a weighing-scale, the combination of a beam centrally pivoted and having extended arms at the end, a torsion-rod secured directly and rigidly to said arms, and a pan-support secured directly and rigidly to the end torsion-rod, as set forth.

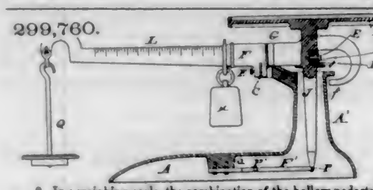


299,758. WEIGHING-SCALE. NAPOLEON DU BRUL, Cincinnati, Ohio. Filed Jan. 25, 1884. (No model.)

Claim.—1. In a weighing-scale, the combination of fulcrum torsion strips, bars, or rods, scale-beam, connecting-bar, sliding weight on the scale-beam on one side of the fulcrum, torsion strips, bars, or rods secured rigidly and directly to the pan ends of the scale-beam and connecting-bar on the other side of the fulcrum, and a pan-support rigidly and directly secured to the end torsion strips, bars, or rods, substantially as set forth.

2. In a weighing-scale, the combination of pivoted weight-beam, short connecting-bar, base, and a pan-support rigidly and directly attached to torsion strips, bars, or rods rigidly and directly attached to the outer ends of the weight-beam and connecting-bar, substantially as set forth.

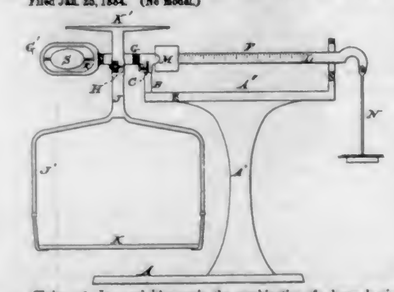
299,759. WEIGHING-SCALE. NAPOLEON DU BRUL, Cincinnati, Ohio. Filed Jan. 25, 1884. (No model.)



Claim.—1. In a weighing-scale, the combination of a base, a beam having its fulcrum-support acting torsionally, torsion strips, bars, or rods, secured rigidly and directly to the ends of the beam, pan-supports rigidly and directly fastened to the end torsion strips, bars, or rods, and link-rods connecting the lower portions of the pan-supports to the base, as set forth.

2. In a weighing-scale, the combination of a base, beam pivoted to oscillate on the base, torsion strips, bars, or rods fastened to the ends of the beam, pan-supports attached directly and rigidly to the end torsion strips, bars, or rods, and links connecting the pan-supports to the base, as set forth.

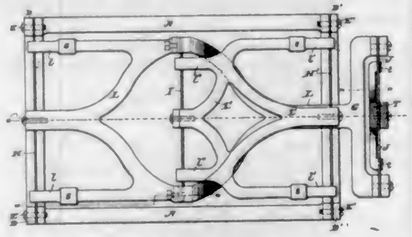
299,760. WEIGHING-SCALE. NAPOLEON DU BRUL, Cincinnati, Ohio. Filed Jan. 25, 1884. (No model.)



Claim.—1. In a weighing-scale, the combination of a base, a beam having a weight at one end, fulcrum-support for the beam acting torsionally, torsion strip, bar, or rod secured to the other end of the beam, pan-support rigidly secured to the end torsion strip, bar, or rod, and a single link-rod hinged to the base and stem of the pan-support, as set forth.

299,760.

2. In a weighing-scale, the combination of the hollow pedestal having lugs B, torsion strip, bar, or rod secured to said lugs, beam having a weight at one end and fastened to the torsion strip, bar, or rod, torsion strip, bar, or rod fastened to the other end of the beam, pan-support rigidly attached to the end torsion strip, bar, or rod, and link-rod pivoted to the base and stem, as set forth.



299,761. WEIGHING-SCALE. NAPOLEON DU BRUL, Cincinnati, Ohio. Filed Jan. 25, 1884. (No model.)

Claim.—1. In a weighing-scale, the combination of a beam having its fulcrum support acting torsionally, a torsion strip, bar, or rod fastened rigidly to the beam, and a platform secured directly and rigidly to and suspended from the torsion strip, bar, or rod, as set forth.

2. In a weighing-scale, the combination of a beam having its fulcrum-support acting torsionally, a torsion strip, bar, or rod secured by its ends rigidly to the beam, and a platform secured directly and rigidly to and suspended from the torsion strip, bar, or rod, and having a light supplementary pan above the beam, as set forth.

299,762. PLATFORM-SCALE. NAPOLEON DU BRUL, Cincinnati, Ohio. Filed Jan. 23, 1884. (No model.)

Claim.—1. In a platform-scale, the combination of a bed or frame, platform-levers, and torsional fulcrum bars or plates rigidly attached at their ends to the bed or frame, and at their centers to the platform-levers.

2. In a platform-scale, the combination of a bed or frame, platform-levers, torsional fulcrum bars or plates rigidly attached by their ends to the bed or frame, and torsional fulcrum bar or plate firmly secured and connecting the platform-levers.

3. The combination of a bed or frame, torsional fulcrum bars or plates, and a lever having projections to rest on the torsional fulcrum bars or plates, as set forth.

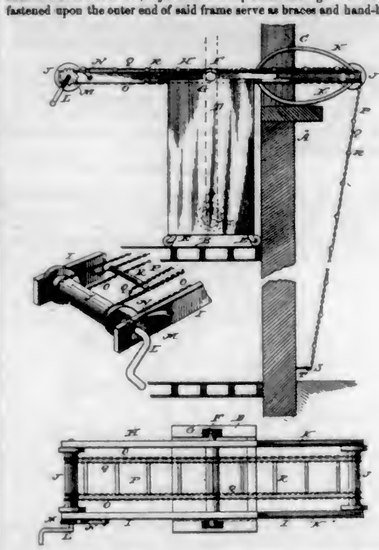
4. The combination of a bed or frame having flat torsion bars or plates, edge up, and platform-levers, as set forth.

5. The combination of platform-levers, torsion bar or plate fixed at its ends to one of the levers and at its center to the other, to connect them, and lugs or projections resting on said torsion bar or plate, as set forth.

6. The combination of the main lever, the beam-rod, and a torsion bar or plate connecting the main lever and the beam-rod, as set forth.

7. The combination of the platform-lever, beam-rod, flat torsion bar or plate connecting the platform-lever and the beam-rod, and lugs or stays to prevent oscillation or bending of the torsion bar or plate, as set forth.

299,763. BARB FOR WIRE FENCES. WILLIAM EDINBORN, St. Louis, Mo. Filed Sept. 26, 1883. (No model.)

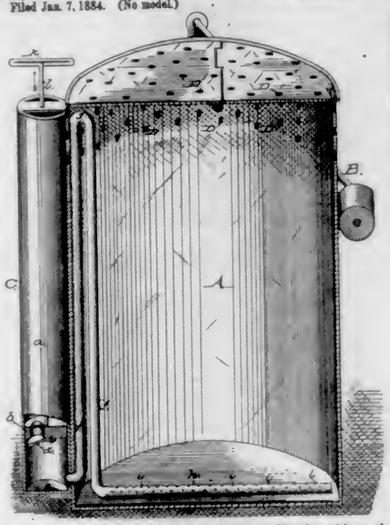


Claim.—1. A barb-blank in the form of a rhomboid, having a longitudinal slot extending from one end toward the center, substantially as described.

2. A three-pointed barb-blank in the shape of a rhomboid, consisting of two pieces of wire connected together by a thin web at one end, as set forth.

3. A three-pointed barb formed of two pieces of wire connected together at one end by a thin web, and having one of its points bent around to form a loop to surround a main wire, and at right angles to the body of the barb, as set forth.

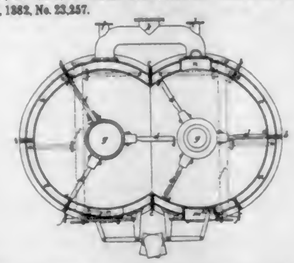
299,764. FIRE-ESCAPE. JAMES HOWARD ELLIS, MYERS WILSON, and FRANCIS TANNER, Wa'kerville, Ontario, Canada. Filed Mar. 11, 1884. (No model.)



Brief.—A reel-frame carrying two endless chains, to which the flexible ladder is secured, is journaled in a portable casing. Curved rods fastened upon the outer end of said frame serve as braces and hand-holds.

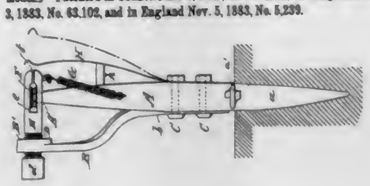
Claim.—1. In a fire-escape, the combination of a casing mounted upon casters and provided with bearings in the upper edges of its sides, and having its inner side adapted to be opened, a reel-frame rocking upon trunnions at the middle of its side pieces, and having arched upwardly and downwardly projecting rods upon its outer end, and a metallic flexible ladder having means for being wound upon or unwound off the reel-frame, as and for the purpose shown and set forth.

2. The combination, in a fire-escape, of a casing mounted upon casters and having bearings in the upper edges of its sides, a frame having trunnions at the middle of its side pieces and forming transverse bearings at its ends, an outer roller or reel journaled in the outer bearings in the frame, a roller or reel journaled in the inner end of the frame and having a crank and a ratchet-wheel at one end, a pawl engaging the ratchet-wheel, endless chains passing over the reels, a flexible metallic ladder secured at its upper end to the endless chains, and having hooks at its lower end, bails secured at the bottom of the wall of the building, below the end of the apparatus, and arched rods secured to the upper and lower edges of the outer ends of the side pieces of the frame, all constructed to operate as and for the purpose shown and set forth.



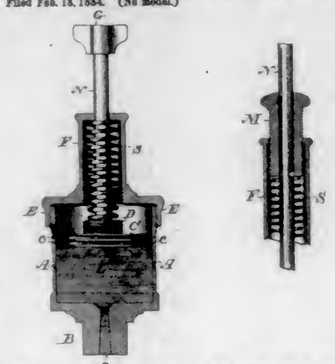
299,765. BAIT-FISH CAN. RICHARD K. EVANS, Washington, D. C. Filed Jan. 7, 1884. (No model.)

Claim.—1. The portable bait-can A, in combination with an air-pump, C, and a pipe to conduct the air from the pump to a point below the surface of the water in the bait-can, for the purpose set forth.



2. The can A and air-pump C, in combination with the pipe *f*, provided with the return-bend *g* and perforated section h, all constructed, arranged, and operated as described.

299,766. APPARATUS FOR DRYING AND PULVERIZING BLOOD, &c., FOR FERTILIZERS. JAMES FARMER, Salford, County of Lancaster, England. Filed Dec. 26, 1882. (No model.) Patented in England June 7, 1882, No. 2,663; in France Dec. 7, 1882, No. 152,436, and in Germany Dec. 9, 1882, No. 23,257.



Claim.—The combination of a jacketed casing of a twin cylindrical form with a pair of revolving beaters having scrapers in contact with the interior surface of the casing and differently pitched around the axes, substantially as described, whereby all the scrapers in conjunction in one revolution entirely scrape the inside surface of the casing.

299,767. MACHINE FOR SETTING AND SHARPENING SCYTHES. JEAN FAUDERE, Montignac de Lauzun, France. Filed May 1, 1884. (No model.) Patented in France June 2, 1883, No. 155,883; in Belgium Nov. 3, 1883, No. 63,102, and in England Nov. 5, 1883, No. 5,239.

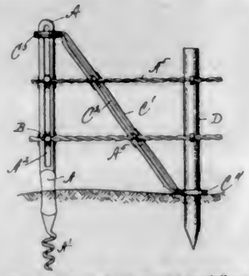
Claim.—The combination of the pointed stem A, having stops *a* and anvil A′, forked arm *b*, having bearings B′ at its upper end, adjusting-screws D, arms E, connected to the adjusting-screws, and having slots *f* and recesses *e*, grooved guide-rollers F, and springs G and H, the whole constructed and combined to operate substantially in the manner and for the purpose herein shown and set forth.

299,768. AUTOMATIC LUBRICATING-CUP. BARRETT W. FELTHOUSEN, Milwaukee, Wis., assignor to Wadhams, Magie & Co., same place. Filed Feb. 13, 1884. (No model.)

Claim.—1. The combination, in a lubricating-cup, of the receptacle A, piston C, provided with the stem N, and threaded shoulder D, raised upon its upper face about said stem, spiral spring S, and cover E, provided with the cylindrical chamber F, for the reception of spring S and guidance of said stem, substantially as and for the purposes set forth.

2. In a lubricating-cup, the combination of receptacle A, piston C, provided with stem N, rising from the center of its upper side, and with the annular grooves or channels *c c* about its bearing-face, spring S, cover E, provided with chamber F, for the reception of said spring S, and adjusting-nut M, perforated to receive and furnish a bearing for the stem N, substantially as and for the purposes set forth.

3. The combination, in a lubricating-cup, of the receptacle A, provided with neck B and feeding-passage *a*, diverging from a point near the top toward its base, piston C, provided with stem N, spiral spring S, cover E, provided with chamber F, and adjusting-nut M, substantially as and for the purposes set forth.

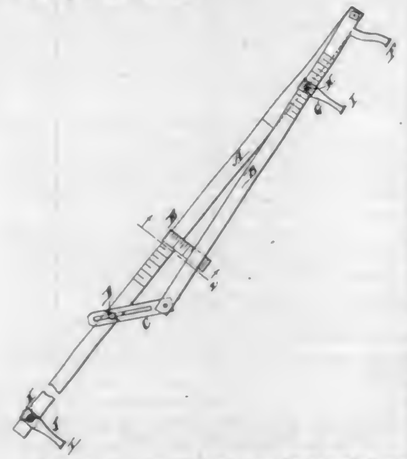


4. In a lubricating-cup, the combination of receptacle A, piston C, provided with stem N, spiral spring S, cover E, provided with chamber F, and perforated tension-nut M, for adjusting the tension of said spring and for the reception and guidance of stem N, substantially as and for the purposes set forth.

299,769. CLOTHES-DRIER. FRANK J. FERRELL, New York, N. Y. Filed Feb. 28, 1883. (No model.)

Claim.—The combination of the detachable bars *l l* with the arms *i i*, the head *h*, the rod *e*, the truss-bars *j j*, pivoted to the arms *i i*, and the notched flange *k*, substantially as set forth.

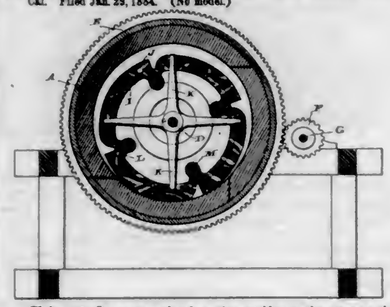
299,770. FENCE. EMIL FISCHER, Calliope, Iowa. Filed Nov. 14, 1883. (Model.)



Claim.—1. In a wire fence, the brace, substantially as specified, composed of the main portion slotted longitudinally, and the eyes formed on its opposite ends and at an angle to the main portion, substantially as and for the purposes specified.

2. The wire fence, substantially as hereinbefore described and shown, consisting of the cables, the post slotted vertically, the cable-clamps adjustable in said slots, the brace slotted longitudinally and having an eye on its upper end fitted over the post, and one on its lower end rested on the ground, cable-clamps adjustable in the said slot, and the brace-post having the cables secured to it and driven through the lower eye of the brace, substantially as specified.

3. In a wire fence, the combination, substantially as specified, of the post and the brace having its upper end secured to the post and its lower end secured to the ground, the said post and brace being slotted longitudinally and provided with wire-clamps adjustable in said slots, substantially as set forth.



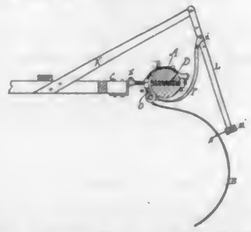
4. The combination of the cables, the fence-post, the strut-brace having its upper end secured to the post and its lower end to the ground, and the wire-clamps, constructed substantially as described, said wire-clamps being adjustable or movable longitudinally along said post and brace, substantially as set forth.

299,771. AXLE-BEVEL. FRANCIS WILLIAM FLYNN, Woodstock, Conn. Filed Apr. 17, 1884. (No model.)

Claim.—The improved axle bevel or gage herein described, consisting of the bar A, provided at one end with a sliding arm, J, and its clamp-screw K, sliding gage E near its center, bar B, pivoted to the opposite end of bar A from the arm J, and provided near its pivoted end with a fixed arm, F, a sliding arm, G, and clamp-screw H, and with a pivoted slotted arm, C, at its free end, and a clamp-screw, D, connecting the slotted arm with the bar A, substantially as shown and described.

299,772. ROTARY ORE-PULVERIZER. JOHN B. GAGNON, Oakland, Cal. Filed Jan. 29, 1884. (No model.)

Claim.—1. In an ore-pulverizer, the outside rotating case or shell having the solid or closed side B, the die A, and conical screen side C, in combination with an independent crushing and grinding wheel having projections L, the central shaft, D, and arms K, substantially as described.



2. The combination of a rotary case or shell, the crushing and grinding wheel or ring I, having shoes J and projections L, the radial arms K, and central shaft, D, substantially as described.

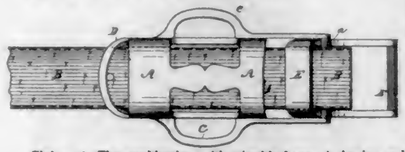
3. The crushing and grinding wheel or ring I, provided with projections L and shoes J, substantially as described.

4. The case or shell provided with an annular die, A, in combination with a loose crushing and grinding wheel, the shaft D, and suitable mechanism for rotating said case or shell and grinding-wheel at different speeds in the same direction, substantially as described.

5. The case or shell provided with the annular die A, in combination with a loose crushing and grinding wheel, I, provided with shoes J, projections L, and friction-rollers M, the radial arms K, and the shaft D, substantially as described.

299,773. HORSE HAY-RAKE. HORATIO GALE, Albion, Mich. Filed Nov. 3, 1883. (No model.)

Claim.—1. The combination, in a spring-tooth rake, of the rolling head B, carrying the teeth, the clearer-bar M, the swinging arms L, carrying said bar M, and the bars P, pivoted at their opposite ends to said head B and arms L, substantially as and for the purpose specified.



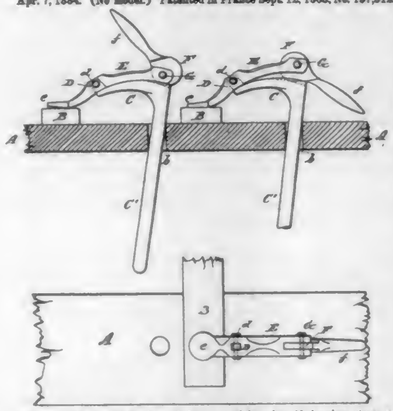
2. In a spring-tooth rake, in combination with a rolling rake-head, the arms K and L, the bar M, and the bars P, pivotally secured to said head at one end and adjustably pivoted at their other ends to the arms L, the parts being constructed, arranged, and operating substantially as and for the purposes described.

3. In a spring-tooth rake, in combination with a rolling rake-head adjustably pivoted to the thill-frame, the arms L, pivoted at their upper ends to the arms K, and carrying the clearer M N, the bars P, adjustably pivoted to said arms L, and curving around and pivoted to the forward under side of said rake-head, whereby the clearer may be adjusted to correspond with the lateral adjustment of the head and prevented from impinging against the rake-teeth, substantially as set forth.

299,774. WASHING AND PURIFYING SALT. SAMUEL S. GARRIGUES, Ann Arbor, Mich. Filed Jan. 30, 1884. (No specimens.)

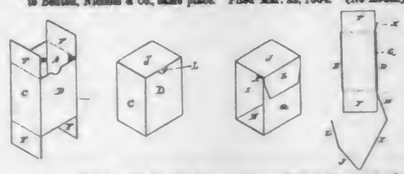
Claim.—The process herein described of washing and purifying salt, which consists in first placing the salt in storage-bins having perforated bottoms, then preparing a pure solution of salt in the proportion of one of salt to three of water, then allowing said solution in the proportion of four gallons of the solution to a barrel of salt to slowly percolate through the salt in the bins to be washed, the solution passing through the perforated bottoms of the bins, as set forth.

299,775. HARNESS-BUCKLE. JAMES ALEXANDER GAVITT, Walla Walla, Wash. Filed Nov. 26, 1883. (No model.)



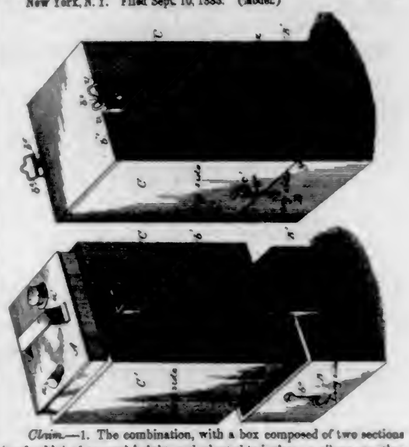
Claim.—1. The combination, with a buckle-frame, A, having end bar, *a*, of the curved tug-frame E, passing under the end bar and up through the buckle, and having the stud *c*, adapted to enter the perforations of the trace, substantially as described.

2. The combination, with the buckle-frame A, having loops C C and D and notches *e*, with spurs *f*, of the separate or independent base-bar *d*, held in said notches and riveted by the spurs, as shown and described.



3. The combination of the buckle-frame A, having loops C C and D and end bar, *a*, with perforated plate portion, and the tug-frame E, curved as described, and having stud *c*, adapted to pass through the trace, and the perforated plate beneath, substantially as shown and described.

299,776. CLAMP. JEAN GIRAUD, Candebec-les-Elbeuf, France. Filed Apr. 7, 1884. (No model.) Patented in France Sept. 12, 1883, No. 157,512.



Claim.—The combination of the curved bearing C, having stem or hank C' and projecting lips D at its outer end, arm E, pivoted upon and adapted to bear against the bearing C between its lips D, thus relieving the fulcrum-bolt *d* from strain, and cam or eccentric F, having handle *f*.

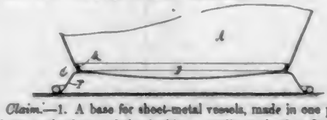
299,777. PAPER BOX. JOHN F. GOODING, New Haven, Conn., assignor to Benton, Nichols & Co., same place. Filed Mar. 22, 1884. (No model.)

Claim.—The herein-described paper box made from two parts, the one part forming the four sides of the box, two opposite sides having flaps projecting therefrom, which, when turned down, will partially close the respective ends of the box, the second part consisting of a strip in width corresponding to the width of the sides of the box from which there are no projections, and in length corresponding to the length of the said two sides plus the two ends of the box and the tucking-flap, the said second part bent and introduced into the box to bring the corresponding sides of the two parts together, one end portion of the second part covering the turned-in flaps of the first part, and forming the bottom, the other end portion of the second part forming the cover over the flaps turned in at that end, its flap fitted to be introduced between the two thicknesses of the opposite side, substantially as described.

299,778. BOX FOR CANS OF OILS, PAINTS, &c. JOHN GRAVES, New York, N. Y. Filed Sept. 10, 1883. (Model.)

Claim.—1. The combination, with a box composed of two sections (preferably) of unequal height, and adapted to inclose an oil-can or other receptacle, of the two opposite vertical standards *b'*, rigidly attached to the exterior of the lower section, and provided with the handles *b²*, adapted, when the case is opened, to sustain within the same the upper section in a swinging relation, and adapted, when the box is closed, to serve for the purpose of carrying the case, substantially as described.

2. In a case adapted to inclose cans for liquids, and constructed of two sections, C C' B B', of rectangular shape, longer on two horizontal opposite sides than on the other two horizontal sides, the combination, with the two opposite vertical standards *b'*, rigidly attached to the exterior of the shorter sides of the section B B', of the section C C', adapted either to fit or to swing loosely between the standards *b'*, accordingly as the longer sides C or the shorter sides C' are placed adjacent to the standards *b'*.



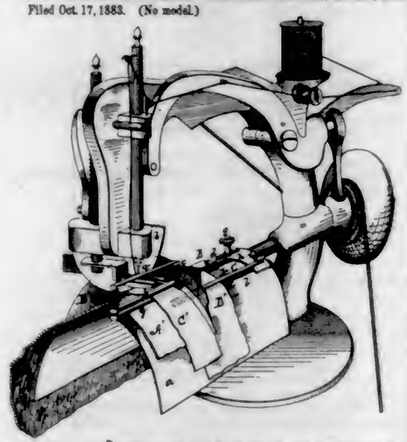
3. In a case adapted to inclose cans for liquids, and composed of two sections, the combination, with the screw-heads *c*, rigidly attached to two opposite longer horizontal sides of the upper section, of the vertical standards *b'*, secured to the lower section, and provided with the handles *b²*, adapted to sustain the upper section of the case in a swinging relation by means of the screw-heads *c*, and also provided with the longitudinal wedge-shaped grooves *b³*, adapted to interlock with the screw-heads *c'*, rigidly attached to the two opposite shorter horizontal sides of the upper section when the case is closed, the standards being thereby adapted to be kept from being pulled away from the sides of the case when the handles are used to carry the case, substantially as described.

4. In combination with a box adapted to hold cans for liquids, and consisting of two sections, B B' C C', and provided with the standards *b'*, the handles *b²*, adapted, when the two sections are closed or attached together by the hooks *b⁴* and screw-heads *c'*, for purposes of transportation, and also adapted, by means of the U-shaped bearings *b²* and the screw-heads *c'*, to sustain the section C C' in a swinging relation for purposes of pouring, substantially as described.

5. The combination, with a box adapted to hold cans for liquids, and provided with two screws, *c*, and two screws, *c'*, rigidly attached to the same, of standards *b'*, adapted, by means of U-shaped bearings of handles *b²*, to interlock with the screws *c'*, and also adapted, by means of the longitudinal wedge-shaped grooves *b³*, to interlock with the screws *c*, substantially as and for the purpose set forth.

6. The combination, with the can A and inclosing-case B B' C C', of the vertical standards *b'*, handles *b²*, having U-shaped bearings *b²*, wedge-shaped grooves *b³*, screws *c c'*, and hooks *b⁴*, substantially as described.

299,779. SHEET-METAL VESSEL. FREDERICK HABERMAN, New York, N. Y. Filed Apr. 17, 1884. (No model.)



Claim.—1. A base for sheet-metal vessels, made in one piece with the bottom, the foot, and the double upwardly-projecting flange at the junction of the bottom and foot to connect with the body of the vessel, substantially as shown and described.

2. The combination, with the body of a sheet-metal vessel, of the base made in one piece with the bottom, the foot, and the double upwardly-projecting flange at the junction of the bottom and foot connected to the body, substantially as shown and described.

3. The combination, with the body of a sheet-metal vessel diverging upwardly, of the base made in one piece with the bottom, the foot, and the double upwardly-projecting flange at the junction of the bottom and foot lapping against the inner surface of the body in the plane thereof for its connection therewith, substantially as shown and described.

299,780. MECHANISM FOR SIMULTANEOUSLY SEWING TO A HAT ITS BAND AND LINING. JOHN FISHER HAMILTON, Medfield, Mass. Filed Oct. 17, 1883. (No model.)

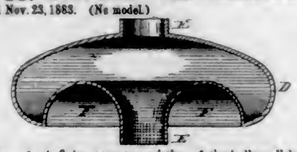
Claim.—1. In combination with the stitch-forming mechanism of a hat-sewing machine, the brim-guide consisting of the part *d*, having the shank A, and provided with means whereby it may be attached to the bed-plate of the sewing-machine, and the T-shaped part C, connected to the part *d* by a rule-joint, combined with the stop *a*, whereby the said part *c* may be securely clamped in its operative position, all as set forth.

2. In combination with the stitch-forming mechanism of a hat-sewing machine, the brim-guide provided with the shank A, having the slot *m* therein, the lining-guide composed of the two bars *k l*, connected together at their outer ends, and adapted at their inner ends to receive the shank A between them, the screw-bolt *h'*, passing from the bar *l* through the slot *m* and bar *k*, and the nut *i*, whereby the lining-guide is rendered laterally adjustable upon the brim-guide, as set forth.

299,781. STREET-CAR COUPLING. CHARLES HANSON, Rock Island, Ill., assignor of one-half to Frederick Applequist, same place. Filed Mar. 31, 1884. (No model.)

Claim.—1. In a street-car coupling, a single or double tree pivoted to a coupling-link, in combination with a pivoted draw-head cast with a protecting-hood and a platform at its front, and provided with a coupling-pin, substantially as and for the purpose set forth.

2. In a street-car coupling, a suitable casing containing a spring, and provided at its sides with shouldered plates and a grooved cap-plate, the whole connected to the under side of the car, in combination with a tongue having a flange working in the groove of the cap-plate and a bearing for the end of the spring, and having pivoted at its front end a draw-head with coupling-pin, substantially as and for the purpose specified.



299,782. SPRING-SHADE FIXTURE. STEWART HARTSHORN, Millburn, N. J. Filed Apr. 1, 1884. (No model.)

Claim.—A shade-fixture consisting of a spring shade-roller having a weighted shade and an automatically-acting pawl and ratchet, all arranged and operating substantially as and for the purposes set forth.

299,782.

299,783. FLYING TARGET. ALBERT H. HENNARD, Knoxville, Tenn. Filed Nov. 23, 1883. (No model.)

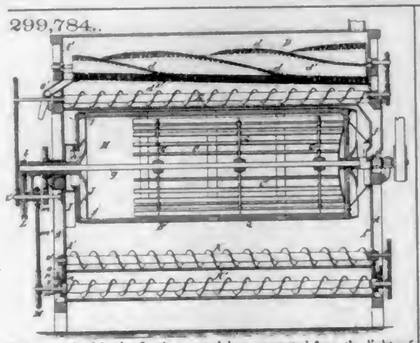
Claim.—1. A flying target consisting of the hollow disk concaved on its lower side and having flanges on its upper and lower portions to form journals, all substantially as described, and for the purpose set forth.

2. A flying target consisting of the curved portion D, provided with a side journal, and an integral concaved portion, F, provided with a journal, in combination with a trap or sender provided with the forked arms B and the curved arm A', whereby the target is held in said trap by its journals and periphery, and when forced or thrown out receives a spinning axial rotation through the air, substantially as described and set forth.

3. A flying target consisting of a concaved disk having side journals, E, as specified, in combination with a trap provided with an arm having an inside facing of soft elastic material, the outer and inner ends of said arm being straight, the central portion thereof being curved, and a straight bifurcated arm, B, pivoted to the inner end of the curved arm, substantially as described, and for the purposes set forth.

4. A flying target consisting of a concaved disk having side journals, E, as specified, in combination with a trap provided with an arm having an inside facing of soft elastic material, the outer and inner ends of said arm being straight, the central part thereof being curved, and a straight bifurcated arm, B, provided with a rear projection, C, said arm being pivoted to the arm A, and a spring interposed between said arms, substantially as described, and for the purposes set forth.

299,784. CENTRIFUGAL FLOUR-BOLT. AUGUST HEINE, Silver Creek, N. Y. Filed Dec. 10, 1883. (No model.)



Claim.—1. The combination, with a bolting-cylinder, of a preliminary separator composed of a tapering perforated trough and a tapering brush made lengthwise adjustable in said trough, substantially as described.

2. The combination, with a bolting-cylinder, of a preliminary separator composed of a tapering brush and a tapering perforated trough decreasing in area toward its discharge end, substantially as described.

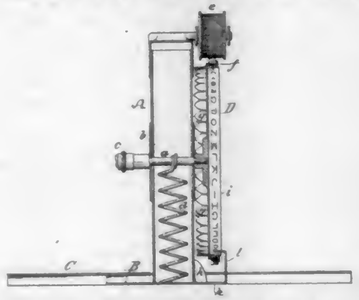
3. The combination, with a bolting-cylinder, of rotating beaters arranged in the head portion of the cylinder only, leaving a sifting chamber or space near the tail end of the cylinder, and a head or deflector surrounding the axis of the bolting-cylinder at its tail end, whereby the floating material is compelled to pass toward the bolting-surface in said sifting-chamber before escaping from the bolting-cylinder, substantially as described.

4. The combination, with a bolting-cylinder, of rotating beaters arranged in the head portion of the cylinder only, leaving a sifting chamber or space near the tail end of the cylinder, in which the valuable par-

299,784.

ticles contained in the floating material are separated from the light refuse by gravity and sifted out, and a central discharge through which the tailings escape from the bolting-cylinder, substantially as described.

5. The combination, with a bolting-cylinder, of rotating beaters arranged in the head portion of the cylinder only, leaving a sifting-chamber, H, near the tail end of the cylinder, a central discharge, A, for the tailings, and a head or disk, J, whereby the floating material is compelled to pass toward the bolting-surface before it passes through the discharge-opening *h*, substantially as described.



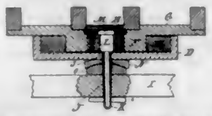
6. The combination, with the conveyers K K', chain belt *m*, and wheel M, of the standards O, provided with fixed bearings O', for one of the conveyer-shafts, vertical guides *n*, set-screw *p*, and the adjustable bearings N for the other conveyer-shaft, substantially as described.

7. A clothing for bolting-reels, composed of a bolting-cloth, Q, having longitudinal edge strips, a stretching device connecting said strips, and an auxiliary intermediate stretching device arranged lengthwise on the clothing, substantially as set forth.

8. A clothing for bolting-reels, composed of a bolting-cloth, Q, longitudinal edge strips, *q q*, of strong material, a lacing connecting said strips, an intermediate longitudinal strip, R, of strong material, and a lacing applied to said strip, substantially as set forth.

9. The combination, with the reel-frame, of a clothing composed of a bolting-cloth, Q, having longitudinal edge strips, a stretching device connecting said strips, and an auxiliary intermediate stretching device arranged lengthwise on the clothing, substantially as set forth.

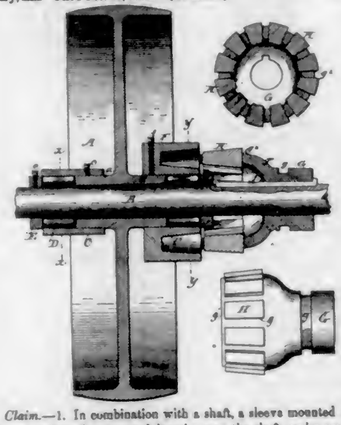
299,785. TYPE-WRITING MACHINE. GEORGE H. HERRINGTON and DAVID G. MILLIKEN, Wichita, Kans. Filed May 23, 1883. (No model.)



Claim.—1. The combination of the vertically-slotted hollow post A, the grooved fixed ruler C, the slide-base B, detachable from either end of said ruler, the type-wheel D on axis *a*, the upwardly spring-pressed slide-box *b*, carrying said axis, and the inking-pad *e*, journaled on a shaft fixed on top of the post, whereby there is formed a type-writer, adapted to be used as described.

2. In a type-writer, the combination, with the standard A, having the slotted base B, and the inking-roller *e*, secured to the upper end of said standard, of the type-wheel D, constructed substantially as herein shown and described, and journaled in yielding bearings on said standard, as and for the purpose set forth.

3. In a type-writer, the combination, with the hollow slotted standard A, the base B, and the inking-roller *e*, secured to the upper end of said standard, of the type-wheel D, axis *a*, sliding boxes *b*, and spring *d*, arranged within the post and secured to said axis and base, substantially as herein shown and described.



4. In a type-writer, the combination, with the hollow standard A and the vertically-movable type-wheel D, having letters or characters on its inner and outer faces, and provided with the lateral projections *g*, of the base B, provided with the guide *h*, the opening *k*, and the flange *l*, integral with the base-plate, and projecting over the rim of the type-wheel, substantially as herein shown and described.

299,786. CAR-TRUCK. JAS. NELSON HEED, Marysville, Pa., assignor of one-half to Daniel H. Fisher, same place. Filed Feb. 20, 1884. (No model.)

Claim.—The combination of the intermediate truck having a perforation, J, in the bolster and body, the car having a longitudinal slot, H, in the beam G, and means for forming a sliding joint with the bolster, and the king-bolt K, having squared portion L, adapted to fit in the slot H, substantially as shown and described.

299,787. FRICTION-CLUTCH PULLEY. HARRY W. HILL, Montgomery, Ala. Filed Feb. 23, 1884. (No model.)

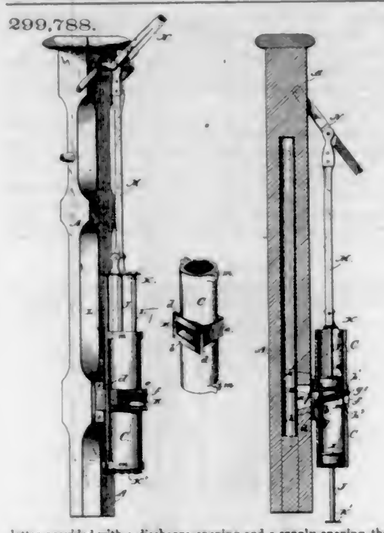
Claim.—1. In combination with a shaft, a sleeve mounted loosely thereon, a pulley also mounted loosely upon the shaft, and a receiving-member of a clutch, said sleeve and said member being fitted concentrically to the hub of the pulley, substantially as specified.

2. The combination of a shaft, a pulley mounted loosely thereon, a sleeve, and a receiving-member of a clutch fitted exteriorly to the hub of a pulley, and a movable member of a clutch, substantially as specified.

3. The combination of the pulley A, having a hub exteriorly finished, as at *a a*, the sleeve C, secured thereon, the friction-rollers D, collars E, and the member F, substantially as shown and described.

4. The receiving-member of a clutch, comprising a collar having a cup-shaped projection, *g'*, provided with wooden wedges located in and extending through the walls of the cup, substantially as specified.

5. The combination of the pulley A, sleeve C, collars E, member F, and movable member G, provided with wedges H, substantially as shown and described.



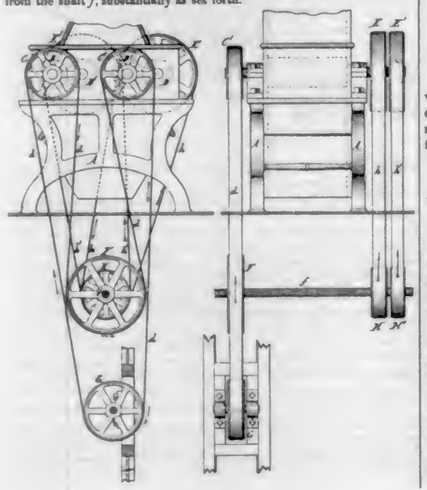
6. The combination of the pulley A, having hub exteriorly finished, as at *a a*, the sleeve C, secured to said hub-member F, segmental cages at both ends thereof, and friction-rollers D, within said cages, substantially as and for the purpose described.

299,788. DOUBLE-PISTON PUMP. GEO. W. HOLMES, Council Bluffs, Iowa. Filed Aug. 21, 1883. (No model.)

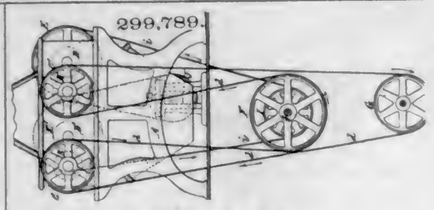
Claim.—1. The combination, with a pump-stock and a pump-cylinder, the latter provided with a supply-opening and a discharge-opening, the said opening being in the same horizontal plane, of the valve D, and the valve E, the latter pivoted in the cylinder between the two openings, and dividing the cylinder into two parts, and suitable pistons above and below the valve E, all of the above parts combined and operating substantially as set forth.

2. The combination, with a pump-stock and a pump-cylinder, the

299,788.

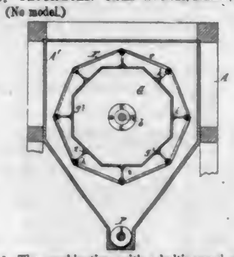


latter provided with a discharge-opening and a supply-opening, the said openings being in the same horizontal plane, of a valve pivoted in the cylinder between the said openings and dividing the cylinder into two parts, and adapted to be moved so as to close the supply and open the discharge opening to one portion of the cylinder and open the supply-opening and close the discharge to the other, and suitable pistons above and below the said valve.



3. The combination, with a pump-stock, the cylinder communicating therewith and provided with a square portion, *e*, having the supply and discharge openings formed therein, of a pivoted valve situated within this squared portion, and operating substantially as described.

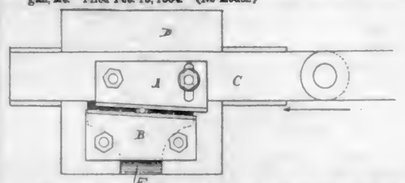
299,789. ROLLER-MILL. NOAH W. HOLT, Buffalo, N. Y. Filed Oct. 21, 1882. (No model.)



Claim.—In a roller-mill provided with two pairs of rollers, the combination, with one of the rollers of each pair provided with corresponding pulleys, C C', of a driving-shaft, *f*, arranged below the roller-mill, a pulley, F, secured to said shaft underneath the pulleys C C', an idler-pulley, G, arranged below the pulley F, and an open endless belt, *d*, running around said pulleys, and an open-belt-driving mechanism, whereby the remaining two rollers are rotated in an opposite direction directly from the shaft *f*, substantially as set forth.

299,789.

299,790. FLOUR-BOLT. NOAH W. HOLT, Buffalo, N. Y. Filed Mar. 11, 1884. (No model.)



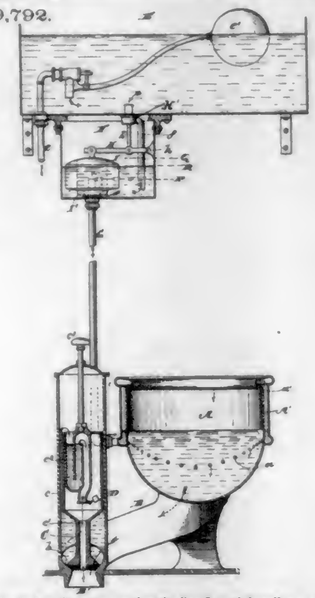
Claim.—1. The combination, with a bolting-reel, of a drum, G, secured within the reel, to revolve at the same speed and in the same direction with the reel, and having its sides *g'* arranged at an angle to the sides of the reel, substantially as set forth.

2. The combination, with a bolting-reel, of a drum, G, having tight heads *g g'*, and secured within the reel, to rotate in the same direction and with the same speed as the reel, and longitudinal ribs or buckets *i*, secured to said drum and projecting toward the inner surface of the reel, whereby some of the material is elevated and carried from the ascending side to the descending side of the reel, substantially as set forth.

3. The combination, with the shaft *b*, of the reel-heads C D, longitudinal ribs *d*, secured to said heads, drum G, provided with tight heads *g g'*, and secured to the shaft, and braces *h*, connecting the ribs *d* with said drum, substantially as set forth.

299,791. WIRE-CUTTING MACHINE. DARIUS HOUGHTON, Skowhegan, Me. Filed Feb. 18, 1884. (No model.)

Claim.—The combination of a fixed and a movable cutter arranged with their cutting-edges opposite and parallel and at an angle to the line of motion of the movable cutter, the movable cutter being arranged to move lengthwise along the face of the other cutter and to meet it, as and for the purpose set forth.

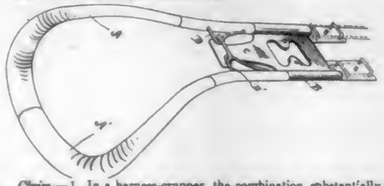


299,792. WATER-CLOSET AND PRESERVING THE SEALS OF THE TRAPS THEREOF. JAMES P. HYDE, New York, N. Y. Filed May 8, 1883. (No model.)

Claim.—1. In a device for preserving, maintaining, or restoring the seal in traps, closets, and the like, the combination, with a pipe connecting a tank with such trap below the sealing-line, of a concavo-convex bell attached to an inlet-valve, and having a cylinder to receive the upper end of the connecting-pipe, substantially as described.

2. In a device substantially as described, the combination, with a tank having a float-valve connection with the water-main, and a sub-tank having a valve connected with the main tank, of a pipe extending within and above the bottom of the sub-tank and connecting it with a basin below the sealing-line, and a bell adapted to surround the upper end of the pipe and serve as a balance air-chamber, substantially as described.

3. The combination of the supply-tank, the sub-tank, the bell-float I in the sub-tank, and the supply-controlling valve H', the bell-float and supply-valve being arranged, substantially as set forth, to close the sup-



299,792.

ply-valve before the water reaches the line Q, or siphon-line, as described.

4. The combination, with the elevated main tank E, of the sub-tank having an open top and suspended directly beneath the bottom of the main, to provide an air-space between the latter and the top edge of the tank, substantially as described.

299,793. HARNESS-CRUPPER. FERDINAND J. INGRESE, Libertyville, Ill. Filed Nov. 24, 1883. (No model.)

Claim.—1. In a harness-crupper, the combination, substantially as hereinbefore set forth, of the loop, divided as described, with the plate to which the two parts of the frame of the loop are journaled, the flat spring attached to said plate, and means whereby the spring, when depressed, turns the said part of the frame in opposite directions, thereby separating the two parts of the loop, substantially as and for the purpose specified.

2. The combination, in a crupper, the loop divided in two parts, of the spring adapted to turn the two parts in opposite directions, and means, substantially as described, between the two opposite ends of said divided loop, for locking the two parts together, substantially as and for the purpose specified.

3. The combination, with the metallic core divided in two parts, of the covering pinched between the edges thereof, substantially as shown and described.

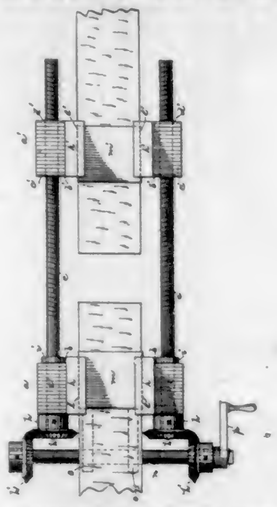
4. The combination, with the parts A A', journaled to the plate B, of spring C and ears D D', substantially as and for the purpose set forth.

5. The two parts A A' of a harness-crupper journaled on the plate B, and adapted to be turned together so as to form the loop, substantially as set forth.

299,794. FREIGHT-CAR DOOR-GUARD. SAMUEL IRVIN, Sedalia, Mo. Filed Apr. 11, 1884. (No model.)

Brief.—A slotted plate secured to a car-door is connected with a rod secured to the car by a headed bar having an eye which receives the rod, and a key inserted in a hole of the bar between the head and eye locks the door in its closed position.

299,794.



Claim.—1. In combination with a car and car-door, the plate, bar, and rod, the plate being secured to the door, the rod to the car, and the bar forming a connection between them, substantially as and for the purpose set forth.

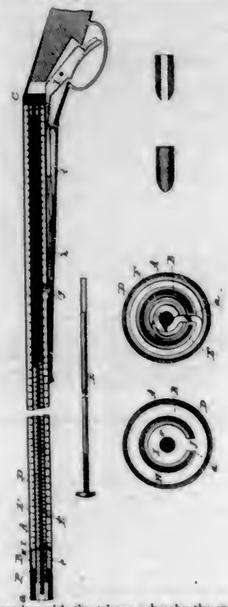
2. In combination with a car and car-door, the plate, bar, and rod, the plate being secured to the door, and having a slot to receive the head of the bar, and the rod being secured to the car and adapted to fit in an eye of the bar, substantially as and for the purpose set forth.

3. In combination with a car and car-door, the slotted plate secured to the door, the rod secured to the car, the bar having a head and an eye and connecting the plate and rod, and the key fitting in a hole made in the bar between its head and the plate, substantially as and for the purpose set forth.

299,795. BELT-STRETCHER. GARRISON H. JONES, Larwill, Ind., and JAMES M. CHILCOTE, Edgerton, Ohio. Filed Nov. 8, 1883. (No model.)

Claim.—1. The combination of the head-block *a*, provided with the parallel lugs *k k*, having inclined planes *l l* on their inner faces, the highest part of said planes being at the outer ends of the lugs *k*, and wedge *w*, substantially as shown and described, whereby the outer strain on the end of the belt in stretching it will tighten the wedge, as set forth.

2. The combination, with the stationary head-block *a*, provided with the orificed end, projecting blocks *c*, and lugs *k*, having inclined planes *l l*, constructed as set forth, and reciprocating head-block *a'*, of the same construction as head-block *a*, of the wedges *w w'*, bolts *c c'*, each threaded near one end, pinions A, and shaft *a*, carrying pinions *h' h'*, substantially as shown and described.



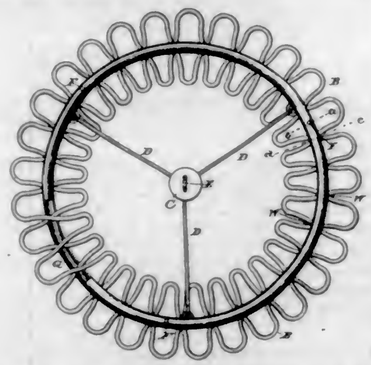
299,796. TOY GUN. JOB L. JOYCE, New Haven, Conn. Filed Apr. 11, 1884. (No model.)

Claim.—1. The combination of the two tubes A B, arranged the one within the other and fixed to the stock, the helical spring F between the inner and the outer tube, and the spring E within the inner tube, the outer end of the two springs united through a slot in the inner tube, and mechanism, substantially such as described, to engage said springs in their compressed condition, said mechanism in connection with the trigger whereby the spring may be released, substantially as described.

2. The combination of a tubular barrel, a spindle longitudinally located in said barrel and fixed at the breech end, a helical spring within the barrel around the spindle, and mechanism, substantially such as described, to engage said spring in its compressed condition, said mechanism in connection with the trigger whereby the spring may be released, substantially as described.

3. The combination of the outer tube, A, the inner tube, B, the spindle *c*, arranged longitudinally in the inner tube, fixed at the breech end, the spring F between the outer and inner tube, and spring E in the inner tube around the spindle, with mechanism, substantially such as described, to hold said springs in their compressed condition, said

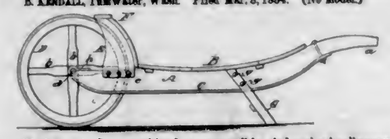
299,796.



mechanism in connection with the trigger whereby the springs may be released, substantially as described.

4. The combination of the outer tube, A, the inner tube, B, the spindle *c*, arranged longitudinally within the inner tube and fixed at the breech end, the spring F between the outer and inner tube, spring E within the inner tube, the double ring-shaped collar H I, and mechanism, substantially such as described, to hold said springs in their compressed condition and to release them therefrom, substantially as specified.

5. The combination of the outer tube, A, inner tube, B, spring F between the outer and inner tube, and spring E within the inner tube, the plug G at the muzzle end between said two tubes, and the cushion-spring P, substantially as and for the purpose described.

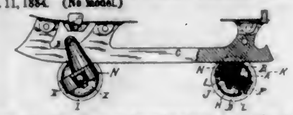


299,797. WHIP-RACK. WILLIAM P. KELLOGG, Troy, N. Y. Filed Feb. 17, 1883. (No model.)

Claim.—1. A whip-rack composed of a ring provided with a double row of oppositely-projecting wire loops and suitable means for supporting the ring, substantially as described, and for the purposes set forth.

2. A sectional ring, A, provided with slots N, in combination with a plurality of wire loops, B, and suitable means for fastening said sections together and supporting the same, substantially as and for the purposes set forth.

299,798. COMBINED WHEELBARROW AND SLED. FRANKLIN B. KENDALL, Tumwater, Wash. Filed Mar. 8, 1884. (No model.)

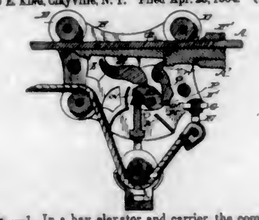


Claim.—1. In a combined or convertible sled and wheelbarrow, the sides A A of the barrow, constructed to run either end foremost when converting the vehicle into a sled, and provided with metal shoes or runners C, in combination with the removable wheel D of the barrow, and detachable legs G G, substantially as specified.

2. The detachable legs G G of the barrow, constructed with an upper slot, *f*, in combination with the sides A A of the wheelbarrow, having metal runners or shoes C, substantially as and for the purpose described.

3. The combination, with the sides A A, having runners C, of the uprights E, and cross hood-piece F, essentially as shown and described.

299,799. ROLLER-SKATE. BENNETT KINDELADE, Batavia, Ill. Filed Mar. 11, 1884. (No model.)

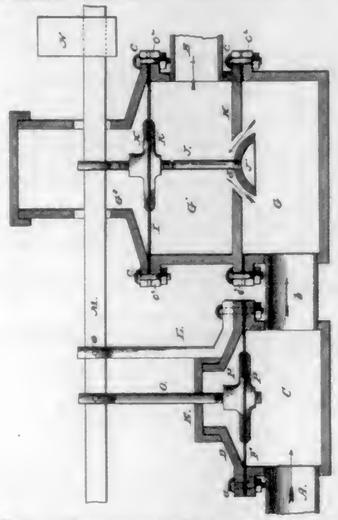


Claim.—1. An axle-pivot for roller-skates, consisting of the ball J, rigidly attached to the arms I I, and provided with pivots H K, which have bearings *z z*, respectively, in the plates A D, and the ball J, having concave seats G in said plates, as and for the purpose specified.

2. In an improvement in roller-skates, the case consisting of the plates A D, the plate D provided with the segment-flanges E E, screw-lugs F F, concave bearings *z*, in combination with the ball-axle J I I, and rubber L, as specified.

3. In roller-skates, the two-plated case A D, with the lugs F, countersunk to the thickness of the plate A below the upper margins of the flanges E, to allow plate A to come down to the arms I I, and the lug N, projecting down from the plate A and engaging the groove M' in one of the flanges E, to assist in preventing the plate D from rotating, as specified.

4. In roller-skates, the case A D, combined with the shank B, to form an attachment to a skate-runner or the foot-plate of a skate, as specified.

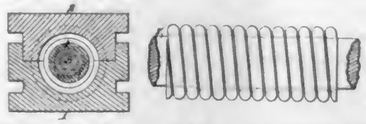


299,800. HAY ELEVATOR AND CARRIER. ARMON H. KING and ALFRED E. KING, Clayville, N. Y. Filed Apr. 23, 1884. (No model.)

Claim.—1. In a hay elevator and carrier, the combination of the stop-block having a beveled shoulder at its outer end and a shoulder at its inner end, with the carrier having the recessed catch-block provided with an upwardly-facing shoulder, the weighted trigger-block having the beveled upper end, the weighted catch-block having the upwardly-turned outer end, and the hoisting-block having the headed shank, the upper portion of the catch-block being the most eccentric, as and for the purpose shown and set forth.

2. The stop for the track of a hay carrier and elevator, consisting of the long block having a beveled shoulder at its outer end, a shoulder having a longitudinal rib at its inner end and a longitudinal groove in its upper side, the lower clamping-block having a slot in its outer end and provided with a laterally-projecting ear having a threaded perforation, and a laterally-projecting ear having a smooth perforation, the lower clamping-block having a laterally-projecting ear provided at its outer end with a downwardly and outwardly projecting hook, and a laterally-projecting ear having a threaded perforation, and the screw passing through the threaded perforations, all constructed and combined as and for the purpose shown and set forth.

299,801. GAS-REGULATOR. CHESTER S. KING, Smethport, Pa. Filed Jan. 19, 1884. (No model.)



Claim.—1. The combination, with a gas-regulator consisting of a suspended valve, a valve-stem, a diaphragm, and a valve-seat located above the valve, of a separate diaphragm arranged nearer the source of supply than the valve, and an external lever connected to both this diaphragm and the valve, to balance the latter against variations of pressure, substantially as shown and described.

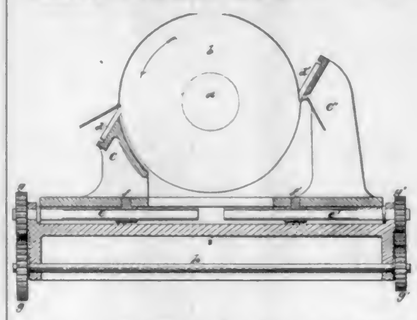
2. The chambers G G' G², having flanges at their edges, with open slots in the same at regular intervals, in combination with bolts *c*, diaphragm I, the valve, valve-stem, and valve-seat, as and for the purpose described.

3. The combination of the chamber C, pipe *b*, the connected chambers G G' G², with perforated partition H and diaphragm I, valve and valve-stem J J', lever M, standard L, stem O, and diaphragm F, as and for the purpose described.

299,802. PROCESS OF AND APPARATUS FOR MAKING SOLID RINGS OF PLASTIC COMPOUNDS. EMIL KIPPER, Adams, Mass. Filed Nov. 13, 1883. (No model.)

Claim.—1. The die composed of two sections constructed on the interior with a series of concentric grooves of semicircular form, and devices, such substantially as described, arranged in said die, for converting a spiral rod into detached concentric completed rings, as set forth.

2. The combination of the die composed of two sections constructed on the interior with a series of concentric grooves of semicircular form, and a spindle supported in the die, and provided with a series of forming-rings having annularly-grooved peripheries for converting a spiral rod into detached concentric completed rings, substantially as described.



3. The combination of the die composed of two sections constructed with a series of concentric grooves of semicircular form, the removable heads closing the ends of the die, the spindle supported centrally in the die by the heads, and the forming-rings on the spindle, provided with annularly-grooved peripheries, for converting a spiral rod into a series of detached concentric completed rings, substantially as described.

4. The process herein described of making solid rings from plastic material, which consists in first converting the material into spiral form, and then pressing it into concentric solid rings, substantially as specified.

5. The process herein described of making solid rings from plastic material, which consists in converting material into a spiral rod, placing it into a die having concentric annular grooves, and pressing the spiral rod into the grooves to convert it into concentric solid rings, substantially as described.

6. The process herein described of making solid rings of a plastic substance, which consists in enveloping a compound mandrel with the material to serve as a supply from which to mold rings concentrically in such die, substantially as specified.

299,803. CUTTING SHEETS OF XYLONITE AND OTHER PLASTIC COMPOUNDS FROM A CYLINDRICAL BLOCK. EMIL KIPPER, Adams, Mass. Filed Dec. 26, 1883. (No model.)

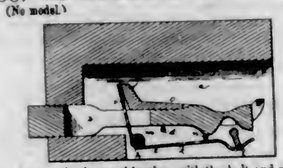
Claim.—1. The within-described method of cutting sheets of xylonite, celluloid, and like compounds, consisting in simultaneously cutting spirally from a roll of such material a series of sheets on a line at any angle to the axis of the roll, whereby are produced sheets of unequal thickness with their surfaces out of parallelism with each other, substantially as described.

2. In combination with a revolving mandrel suitable for carrying a cylinder of compound, and means for revolving the same, and for supporting and feeding the knives for cutting the cylinder into sheets, two knives, one of which has its edge set and maintained and fed at an angle to the axis of such mandrel, whereby sheets having edges of unequal thickness and surfaces inclined to each other may be cut spirally, substantially as described.

3. The method herein described of cutting sheets of xylonite, celluloid, and like compounds, consisting in simultaneously cutting spirally from a roll of such material a series of sheets flat or plain on one side and corrugated upon the other side, substantially as described.

4. The within-described method of cutting sheets of xylonite, celluloid, and like compounds, consisting in simultaneously cutting spirally from a roll of such material a series of sheets on a line at an angle to the axis of the roll, and having each at least one surface of the form of a series of inclines, substantially as described.

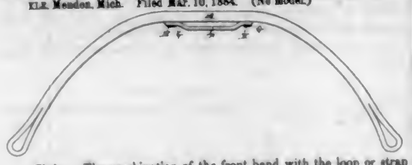
299,804. MANUFACTURE OF BRUSH-BODIES, &c., FROM PYROXYLINE COMPOUNDS. EMIL KIPPER and JARVIS B. EDSON, Adams, Mass. Filed Jan. 24, 1884. (No specimens.)



Claim.—1. The process herein described of making the bodies or backs of brushes and other articles, which consists in first producing a body or core from plastic xylonite or other pyroxyline compound of substantially the form and dimension of the finished article, and then attaching thereto a sheet or film of xylonite or other pyroxyline compound of the grade which it is desired to have the exterior of the article possess, as set forth.

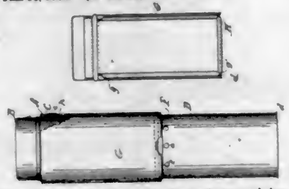
2. The process herein described of making the bodies or backs of brushes and other articles, which consists in first molding a body or core from plastic xylonite or other pyroxyline compound in a die or mold into substantially the complete and finished dimension and form, subsequently placing the body or core on a thin sheet or film of xylonite or other pyroxyline compound of the grade it is desired that the exterior of the article possess, and subjecting the whole to the action of a die or mold to unite the sheet or film and the core, as set forth.

3. The process herein described of making the backs of brushes and other articles, which consists in first molding a body or core of scraps or an inferior grade of plastic xylonite or other pyroxyline compound, then placing the body or core on a thin sheet of xylonite or other pyroxyline compound of the superior grade it is desired that the exterior of the article possess, and finally subjecting the whole to the action of a die or mold to unite the body or core and the exterior sheet or film, as set forth.



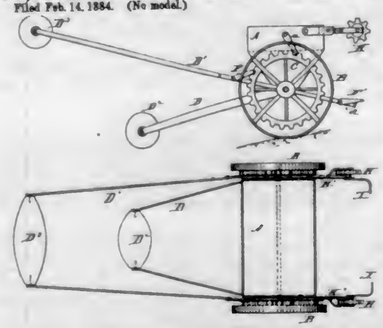
4. A body and back for brushes and similar articles, composed of a body or core of an inferior grade of xylonite or other pyroxyline compound having an attached exterior covering composed of a sheet or film of the superior grade of the said compound which it is desired that the article possess, substantially as described.

299,805. LOCK. JOHN J. KNAPP, Richland, W. Va. Filed Mar. 17, 1884. (No model.)



Claim.—In a lock, the combination, with the bolt and pivoted dog engaging the bolt, of the spring-lever having the coil tension-bearing secured upon a fulcrum-post within the lock-case, and having one of its arms engaging the short arm of the pivoted dog, and the other arm provided with a bead for engaging the lower end of the key-guard, and a stop-pin for preventing the latter arm from obstructing the key-hole, substantially as specified.

299,806. HARNESS-BRIDLE. LEVI J. KNAUSS and GEORGE W. HINKLE, Mendon, Mich. Filed Mar. 10, 1884. (No model.)



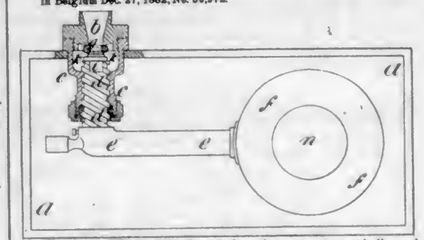
Claim.—The combination of the front band with the loop or strap B, which is made of rubber, and which is attached to the inner side of the front band, for the purpose of forming a guide for the winker-brace, substantially as shown.

299,807. POCKET MATCH-BOX. EZRA B. LAKE, Ocean City, N. J. Filed Jan. 18, 1884. (No model.)

Claim.—The combination, with the pocket match-box A, having the cap or lid B on one end, of the tubular light-protecting screen D, embracing and adapted to slide lengthwise of said box, and the non-conducting shield G, also embracing said box attached thereto, and constructed and arranged to inclose said screen, which is located between its inner surface and the wall of the box when said screen is not in use, substantially as described and shown

299,808. LIFE-SAVING VEHICLE. EZRA B. LAKE, Ocean City, N. J. Filed Feb. 14, 1884. (No model.)

Claim.—1. A life-saving vehicle consisting of a body or frame provided with wheels, and having buoyant or floating levers, which turn said wheels through the action of the waves and cause the vehicle to move, substantially as set forth.



2. The combination of the body A, mounted on wheels B B, with mechanism, operated by the action of the waves on suitable floating buoys, whereby said wheels are turned and the vessel propelled through the action of the waves.

3. The combination of the body A, mounted on wheels B B, to which are connected the toothed wheels C, with the floating or buoyant levers D D', carrying pawls which engage with the toothed wheels and effect the propulsion of the vehicle, as described.

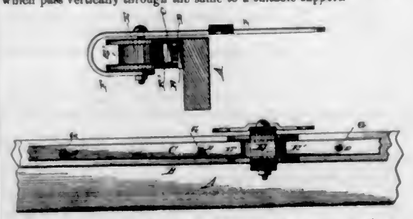
4. The combination, with the body A, provided with toothed propelling-wheels and devices for turning the same through the action of the waves, of an adjustable pinion adapted to engage the toothed propelling-wheels, and provided with means of operation, substantially as described.

5. The combination, with a marine wagon adapted to run or travel on the bar or shoal bottom, and provided with toothed propelling-wheels, and floating or buoyant levers for moving said wheels through the action of the waves, of mechanism, substantially as set forth, whereby said vehicle may be operated from the body of the wagon or by hand, as described.

299,809. STEAM-TRAP. HENRY LANCASTER, Manchester, County of Lancaster, England. Filed Dec. 11, 1883. (No model.) Patented in England Aug. 2, 1882, No. 3,663; in France Dec. 26, 1882, No. 152,846, and in Belgium Dec. 27, 1882, No. 59,972.

Claim.—1. The combination of the valve-seat, screw-spindle, and float of a steam-trap with a valve, *g*, loosely mounted on the screw-spindle and free to turn thereon, substantially as and for the purpose set forth.

2. The combination of the valve-seat, hollow float, and hollow screw-spindle having a reduced end, *d'*, and conical shoulder *d²*, with a valve mounted but free to turn upon the end *d'* and pressed to its seat by the turning of the said spindle, substantially as set forth.



299,810. MANUFACTURE OF ARTIFICIAL STONE. BERNARD LAUDE, New York, N. Y., assignor of one-half to Samuel B. Wellington, same place. Filed May 3, 1884. (No specimens.)

Claim.—1. An artificial stone composed of cement, pulverized iron slag, and water or other moistening material, as set forth.

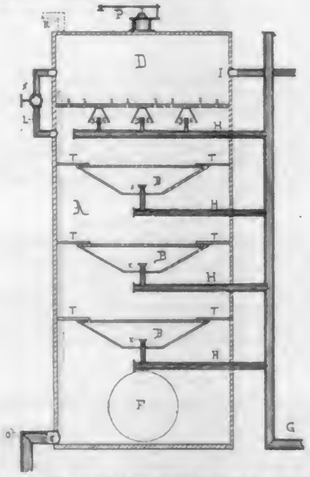
2. As a new article of commerce, cement and pulverized iron slag, mixed in suitable proportions in a dry state for transportation and use, as set forth.

299,811. TRACK FOR BARN-DOOR HANGERS. JOHN H. LAWRENCE, Sterling, Ill. Filed Nov. 2, 1883. (No model.)

Brief.—A track having a portion extending into the groove of a roller is built up of plates and intervening posts, and is secured by bolts which pass vertically through the same to a suitable support.

Claim.—In a track for barn-door hangers, the combination, with a suitable support or ledge, A, of a track to support the roller, having tongue to extend into the groove in the roller, built up of a plate, B, posts or bolsters D, and narrow plate or bench C, substantially as described.

299,812. ALBUM-SATCHEL. LOUIS LAZARUS, Allegheny, Pa. Filed Apr. 7, 1884. (No model.)



Claim.—1. In a satchel, the combination, with three or more boxes, each provided with partitions forming compartments, of hinges each having two or more joints, secured to the several boxes, substantially as and for the purpose specified.

2. The combination, with three or more boxes hinged together as a satchel, of a series of double hooks, substantially as described, and a series of pins, each double hook to engage two pins on different boxes, as shown and described.

3. The combination, with a series of boxes hinged together, each box having separate compartments and elastic straps across them, substantially as described, of one or more bags secured to said straps, as and for the purpose specified.

299,813. DEVICE FOR THE ABSORPTION OF THE GASEOUS PRODUCTS OF COMBUSTION. CHAS. J. LE ROY, Chicago, Ill., assignor to Le Grand S. Burton and Burton & Parker, all of same place. Filed Oct. 23, 1883. (No model.)

Claim.—1. The method of condensing the gaseous products of combustion, which consists in spraying them with water while detained under pressure, and subjecting them to increased heat during the latter part of the process, substantially as set forth.

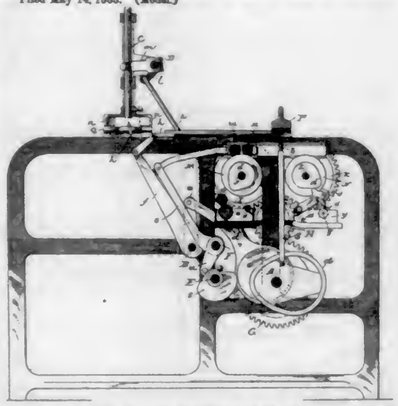
2. The method of condensing the gaseous products of combustion, which consists in spraying them with water while detained under pressure, and discharging steam upon the unabsorbed portion, substantially as set forth.

3. The method of condensing the ascending gaseous products of combustion, which consists in trapping them, as shown, by virtue of their levity, and spraying them with water while so trapped.

4. The method of disposing of the gaseous products of combustion, which consists in spraying them with water while detained under pressure, and discharging steam upon the portion uncondensed, and conducting the portion still remaining uncondensed back to the furnace, substantially as set forth.

5. In a device for condensing the gaseous products of combustion, the combination of a box or chamber open at the bottom with spray-pipes arranged to discharge within such box or chamber, substantially as and for the purpose set forth.

6. In a device for condensing the gaseous products of combustion, in combination, the downwardly-opening and upwardly-expanded smoke-traps B and the spray-pipes X, arranged to discharge within said smoke-traps, substantially as set forth.



7. In a device for condensing and absorbing the gaseous products of combustion, the combination of a smoke-receiving chamber, a box or boxes therein opening downwardly, and spray-pipes arranged to discharge within said boxes, substantially as and for the purpose set forth.

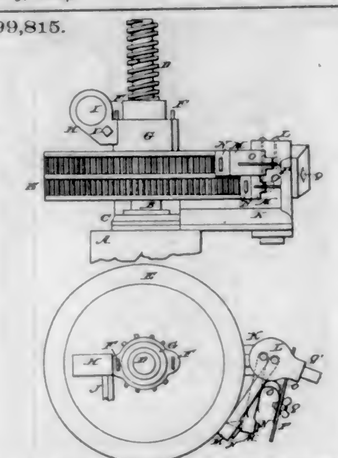
8. In a device for condensing the gaseous products of combustion, the combination of a condenser having a steam-chamber at the top, means for driving the smoke into such condenser, water-supply pipes thereto, waste-pipe therefrom, and smoke-arresting plates therein, substantially as set forth.

9. In a device for condensing the gaseous products of combustion, the combination of a condenser, means for driving the smoke thereinto, smoke-arresting plates therein, water-supply pipes thereto, and waste-pipe therefrom, an upper heating-chamber, and a safety-valve, substantially as set forth.

10. In a device for condensing or absorbing the gaseous products of combustion, a condensing-chamber, in combination with means for driving the smoke thereinto, smoke arresting and condensing boxes therein, water-spray pipes arranged to discharge within said boxes, and a waste-pipe leading from such condensing-chamber, substantially as set forth.

299,814. ENVELOPE-MACHINE. DANIEL M. LESTER, Norwich, Conn. Filed May 14, 1883. (Model.)

Claim.—1. In an envelope-machine, printing and gumming mechanisms, combined with devices for moving the blanks from the printing to the gumming mechanism, and with means, substantially as described, for imparting motion to the specified mechanisms, all substantially as described.



2. In combination with the vertically-reciprocating gummer and the plate for supporting the blanks to be gummed, the tilting levers or stops adapted to be swung aside by the passage of the blank to the plate, and to limit the movement of the gummer when no blank is received by the plate, all substantially as described.

3. In combination with the gummers *a a*, one or more tilting levers, *h'*, pivoted in the bed Q, and operating as and for the purpose set forth.

299,815. FRUIT-PRESS. DOMINGUE LILLE, Troncens, France. Filed Apr. 7, 1884. (No model.) Patented in France May 21, 1883, No. 155,630; in Belgium Oct. 6, 1883, No. 62,307; in England Oct. 11, 1883, No. 4,841; in Luxemburg Oct. 14, 1883, No. 310; in Sweden Oct. 15, 1883; in Italy Oct. 18, 1883, No. 16,021; in Denmark Oct. 22, 1883, and in Norway Nov. 10, 1883.

Claim.—1. In a fruit-press, the combination of the vertically-movable follower-stem having a screw-threaded upper end, a female-threaded disk or wheel connected with the cover of the press in such a manner as to be capable of revolving freely, a female-threaded collar placed upon and connected with the said disk, and having means, substantially as described, for the attachment of a sweep or lever, a fixed bracket having a pivoted disk, with means, substantially as described, for the attachment of an operating-lever, and a pair of levers pivoted to the said disk on opposite sides of its fulcrum, and having means, substantially as described, for alternately engaging the wheel resting upon the cover of the press-box, substantially as set forth.

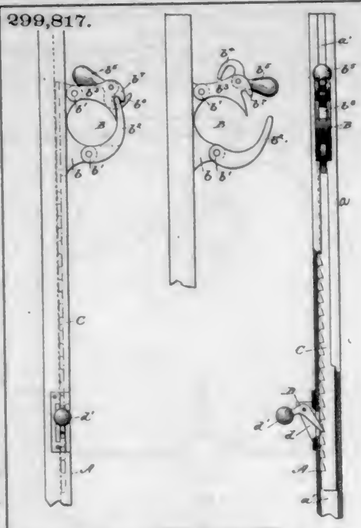
299,815.

2. In a fruit-press, the combination of the screw-threaded follower-stem, the cover, the double spur-wheel resting upon and connected with the cover, a fixed bracket, a disk pivoted to the latter, and having means, substantially as described, for the attachment of a lever, a pair of levers pivoted in the said disk on opposite sides of its fulcrum, and provided at their ends with spurs or dogs engaging the upper and lower gearing of the double spur-wheel, respectively, an arm or bracket, and springs attached to the latter and bearing against the outer sides of the levers, which are thereby held in engagement with the spur-wheel, substantially as and for the purpose herein set forth.

3. In a fruit-press, the combination of the cover, the screw-threaded follower-stem moving vertically through the same, an inturned flange formed annularly upon the cover, a female-threaded wheel or disk resting upon said cover, and having a flange extending under the flange of the latter, and the described mechanism for revolving the said wheel or disk with different degrees of speed and power, substantially as and for the purpose set forth.

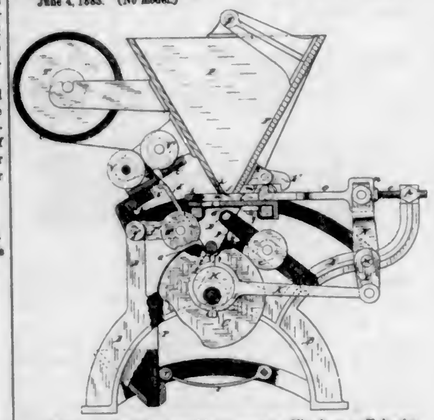
299,816. BRACELET-CLASP. HARRY C. LINDOT, Providence, R. I., assignor to John C. Harrington, same place. Filed Mar. 22, 1884. (No model.)

Claim.—The improved clasp for bracelets, consisting of the oppositely-arranged cups D D', combined with the bolt E, pin F, and spring H, secured to one arm of the bracelet, and the ring C, provided with an eye, *b*, secured to the opposite arm of the bracelet, substantially as described.



299,817. HAY-BINDER FOR WAGON-RACKS. JOEL MADISON, Farmington, Minn. Filed Mar. 17, 1884. (No model.)

Claim.—1. The toothed sliding bar C, provided with the hinged opening ring B, in combination with the standard A, provided with the slotted plate *a* and pawl D, constructed and arranged as and for the purposes substantially as set forth.



2. The hinged opening ring B, consisting of the segmental bar b^3, provided with the slot b^4, in combination with the segmental bar b^2, provided with the locking-hook b^5, having the weighted handle b^6, and the lug or lip b^7, constructed and arranged substantially as described, as and for the purposes set forth.

3. The combination of the hinged opening ring B, constructed as described, with the toothed bar C and the standard A, provided with the slotted plate *a* and the pawl D, constructed and arranged as and for the purposes substantially as set forth.

299,817.

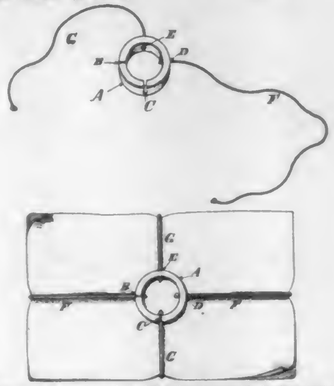
299,818. CIGAR-MACHINE. WILLIAM I. MANN, Braddock, Pa. Filed June 4, 1883. (No model.)

Claim.—1. In a cigar-machine, a scrap or filler hopper, E, having the swinging back F and slit *f*, in combination with suitable means for oscillating said back to facilitate the discharge of scrap, substantially as described.

2. In a cigar-machine, the combination of the hopper E, having swinging back F and slit *f*, and knife-edge *k*, with the reciprocating plunger *l*, having cutting-edge, whereby a single filler is cut off, substantially as described.

3. The combination of the swinging hopper-back F, having hook *k'*, with plunger *l*, having tappet *m'*, substantially as described.

4. The combination, with feed-rollers V V' and knives *b' c'*, of the hinged apron *d'*, substantially as described.



5. In a cigar binding or wrapping mechanism, the combination of a flexible band, means for forming said band into a pocket to receive the filler and one end of a binder, a segmental table, and a revolving sweep adapted, in its continuous revolution, to travel at regular intervals over said table under the band, to form the latter into a bight containing the filler and binder, and in its sweeping movement cause a rotation of the filler to take place, substantially as described.

6. In a cigar-machine, the combination of the sweep S, adapted for continuous revolution, suitable means for revolving the same, table Q, and band P, adapted to be intermittently formed into a bight or loop during a part of the continuous revolution of said sweep, and thereby rotate any body lying in said bight, substantially as described.

7. The combination, with cam C, of the pivoted arm *d*, carrying roller *c* and whip D, substantially as described.

8. The combination of band P, rotating shaft A, arm R, and revolving sweep S, having suitable means for revolving it, with the concave table Q, curved concentric with the axis of shaft A, substantially as described.

299,819. LETTER-FILE. GEORGE MASON, Catlettsburg, Ky. Filed Apr. 11, 1884. (No model.)

Claim.—The combination of the ring A, provided with notches and perforations, with cords F and G attached, substantially as and for the purpose described.

299,820. FIRE-PROOF CEILING. HENRY MAUREL, New York, N. Y. Filed Dec. 5, 1883. (No model.)

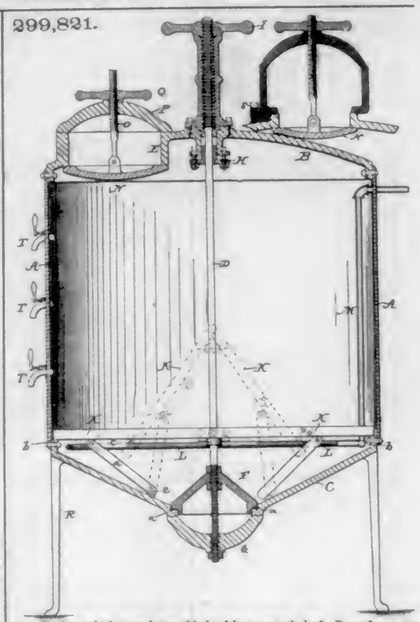
Brief.—Employs skewbacks with arch-blocks, the former having flanges provided with longitudinal passages, and meeting beneath the I-beams.

Claim.—1. The combination, substantially as hereinbefore described, with the beams and arch-blocks, of the skewbacks having flanges or extensions for protecting the under portions of the beams, provided with longitudinal spaces or passages.

2. The combination, substantially as hereinbefore described, with the beams and arch-blocks, of the skewbacks having the lower edges in planes below the beams, having flanges or extensions meeting under the beams, and having longitudinal spaces or passages in the entire lower portions thereof.

3. As a new manufacture, a skewback of the character hereinbefore described, having a flange or extension for protecting the under portion of a beam, provided with a longitudinal space or passage.

299,821. APPARATUS FOR RENDERING LARD, &c. DAVID W. MCELROY, Keokuk, Iowa. Filed Apr. 1, 1884. (No model.)

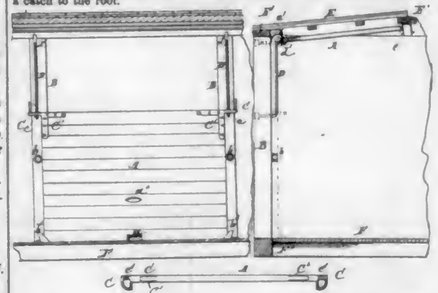


Claim.—1. In a rendering-tank or other analogous device, a false or supplemental bottom, substantially such as described, and of essentially the same diameter as the greatest internal diameter of the tank, as and for the purpose set forth.

2. In a rendering-tank, a false or supplemental bottom, on which the material to be treated is placed, said bottom being composed of two or more slotted or perforated and folding sections pivoted to an operating shaft or rod, and adapted to be raised and folded, so as to permit the refuse matter to fall into and through the bottom of the tank, as set forth.

3. In a rendering-tank, a false or supplemental bottom composed of two or more folding slotted or perforated sections pivoted to an operating-rod, as described, in combination with the links *c d*, as and for the purpose set forth.

4. In a rendering-tank, a false or supplemental folding or flexible bottom, substantially such as described, pivoted to an operating-rod, as set forth, in combination with the links *c d* and ledge *b*, as and for the purpose set forth.

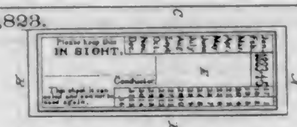


299,821.

5. A rendering-tank provided with a central shaft, D, and operating-wheel I, in combination with the folding bottom K and valve T, as set forth.

299,822. GRAIN-CAR DOOR. WILLIAM MCGUIRK, Chicago, Ill., assignor to himself and Frank Jagar, same place. Filed Mar. 25, 1884. (No model.)

Brief.—The door has on each end a loop or guide, in connection with rods and curved retaining-hooks, which are shaped to throw the loops or guides into a position for hanging up the door, which is held by a catch to the roof.



Claim.—1. A door having on each end a guide or loop, in combination with retaining hooks or supports, the main or body portion of which is bent or curved to throw the guide or loop into the holding portion thereof, and a catch for maintaining the door in an elevated position, substantially as and for the purpose specified.

2. A door having on each end a guide or loop, in combination with guideways or rods and retaining hooks or supports, the main or body portion of which is bent or curved to throw the guide or loop into the holding portion thereof, for hanging up the door, substantially as specified.

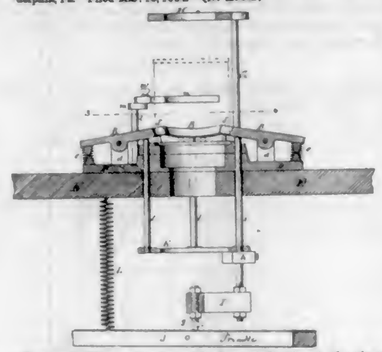
299,823. CONDUCTOR'S PASSENGER-CHECK. JAS. G. MCMICHAEL, Louisville, Ky. Filed Apr. 23, 1883. (No model.)

Claim.—The conductor's check described, having top A, with annual dates, the side C, with a table of the names of the months, side D,

299,823.

with a table of days, the request to keep the check in sight, and the blank space E, arranged both centrally and longitudinally of the check for official notes or memorandums, substantially as specified.

299,824. ROTARY STEAM-ENGINE. JAMES H. MCVAY, South Chicago, Ill. Filed Aug. 20, 1883. (No model.)



Claim.—1. In rotary steam-engines, a single central piston whose buckets are adjustable by set-screws, and the annular fabric packing in the ends of the piston, extending through the grooves in the ends of the buckets, as specified.

2. In rotary steam-engines, a single central piston combined with rotary cut-offs—one at each side thereof—which are adjustable to the piston, and the bearings *b c d* to the cut-offs being adjustable in the ends of the case, to compensate for the wear of the parts, as specified.

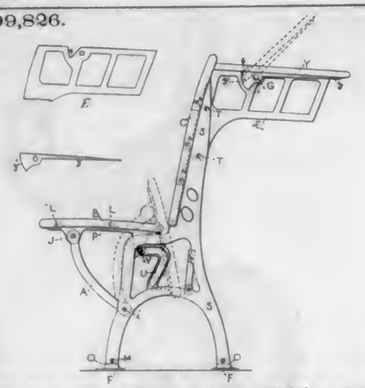
3. The slotted boxes *b*, attached to the outside of the case, in combination with the rotary partitions B B', adjustable bearings 6 7, and piston A, as set forth.

299,825. CAN-HEADING MACHINE. CHARLES R. MERRIAM, Philadelphia, Pa. Filed May. 10, 1884. (No model.)

Claim.—1. The combination of the base D, the ring A, the pivoted segments B, springs for acting thereon, the treadle J, and the can-depressing ring H, and segment-elevating rods *i*, controlled by said treadle, as set forth.

2. The combination of the ring A, the pivoted segments B, the operating-rods *i* therefor, the treadle J, and the ring K, carrying said rods and supported by but adjustable in respect to the treadle, as set forth.

3. The combination of the ring A, having dowel-pins *f*, with the segments B, having end recesses to which said dowel-pins are adapted when the segments are depressed, as set forth.

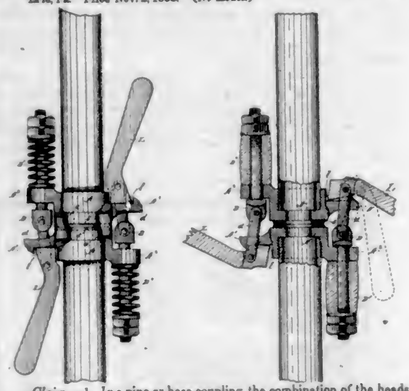


4. The combination of the ring A and segments B, means for operating said segments and depressing a can, and an adjustable gage, *n*, whereby said can is centered in respect to the ring and segments, as set forth.

299,826. SCHOOL DESK AND SEAT. CHARLES A. MERRILL, Grand Rapids, Mich. Filed Apr. 9, 1883. (No model.)

Claim.—1. The seat B, having pin V, and the arm A, pivoted at one end to the seat B and at the other to the standard S, in combination with such standard, having a continuous slot, as U, extending horizontally for a portion of its length, and then turning downward, and constructed to receive the pin V, whereby the seat is supported in either position and adapted to be folded backward and downward by one and the same operation, substantially as specified.

2. A standard for a seat or desk, provided with sets of interchangeable feet, as F, of varying heights, constructed to be detachably but firmly



299,826.

secured to the bottom of said standard, whereby said desk or seat may be fitted for the use of children of different sizes, substantially as described.

3. In a school-desk, the lid Y, provided with a support, *y*, having the extension *y'*, and hinged from beneath at G, in combination with the frame E, having recess *e*, substantially as described.

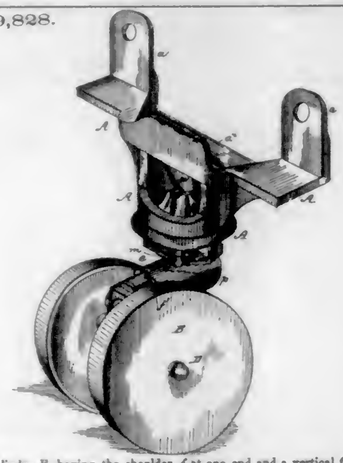
299,827. PIPE AND HOSE COUPLING. FREDERICK E. MERTENS, Erie, Pa. Filed Nov. 2, 1883. (No model.)

Claim.—1. In a pipe or hose coupling, the combination of the heads A A, having bearing-lugs A' A' and A^2 A^2, connected together by a link, with the cam-levers L L, adjusted substantially as shown, to act upon said bearings and against springs, substantially as shown.

2. In a pipe or hose coupler, the combination, substantially as shown, of the heads A A, having bearing-lugs A' A' and A^2 A^2, cam-levers L L, draw-bars D D, links *d d*, and springs D' D', said parts being arranged to operate together substantially as shown.

3. In a pipe or hose coupling, substantially as shown, the heads A A, provided with guide horns or lugs *a a*, projecting in front of the seating faces of said heads, and means, substantially as described, for fastening the heads together, for the purpose set forth.

4. In a pipe or hose coupling, substantially as shown, the combination, with the heads A A, of the lugs or projections A' A' A^2 A^2, the guide horns or lugs *a a a a*, the seats S S, draw-bars D D, links *d d*, springs D' D', and levers L L, all substantially as and for the purposes named.



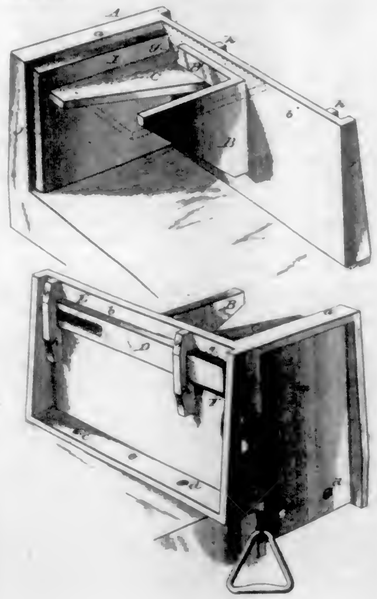
299,828. CASTER. JAMES T. MILLER, Urbana, Ohio. Filed Mar. 1, 1884. (No model.)

Clcim.—1. A two-wheeled caster in which the wheels are unconfined by housings, the bearings *b* of the wheels being independently mounted in the cylinder C', as and for the purpose set forth.

2. A caster the wheels of which are provided with independent bearings *b*, said bearings moving within a cylinder, C', through which and the bearings *b* the axle passes, as and for the purpose set forth.

3. In a caster, the combination, with the cylindrical bearing C, having a transverse cylinder, C', integral therewith, and stop-lugs *e e*, of

299,828.



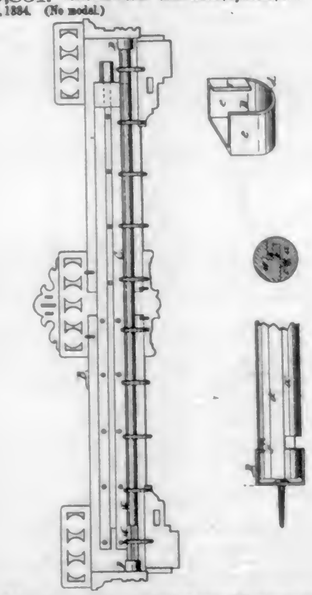
the cylinder F, having the shoulder *f* at one end and a vertical frame and roller-box at the other end, substantially as and for the purpose set forth.

4. In a caster, the combination, with the oscillating cylinder F, having a vertical frame, F', provided with a roller-box and two vertical journal-boxes, of the frame A, having the bearing *a'* for the shank of frame F', the journal boxes *g* being in rear of the pivot *h*, substantially as and for the purpose set forth.

5. In a caster, the combination, with the frame A and the vertical frame F', carrying the horizontal cylinder F, of the cylinder C, having the cylinder C' at right angles thereto, and the wheels having the bearings *b*, the cylinder C having a bearing in the cylinder F, and the wheels journaled in the cylinder C', substantially as and for the purpose set forth.

299,829. CLAMP. SAMUEL MITCHELL, Hornellsville, N. Y., assignor to the Shipping Package Company, same place. Filed Apr. 12, 1884. (No model.)

Claim.—1. The herein-described clamp or holder for use in manufacturing boxes, consisting of a frame composed of two sides joining each other at an angle corresponding to the desired angle of the box, a bracket projecting horizontally from the frame to sustain the applied side or board, a slide provided with a projecting arm to press the side or board of the box against the frame, a spring attached to and serving to retract the slide, and a band attached to the slide and serving to move it in opposition to the spring, all substantially as described and shown.



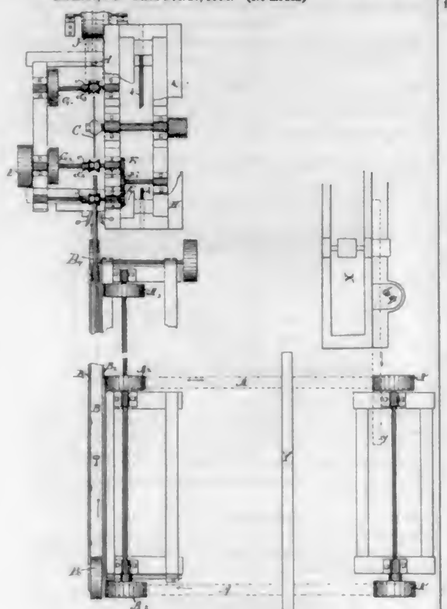
2. In a clamping device for use in box-making, the combination of a stationary upright plate or support having a plane face, a slide movable to and from said support and provided with a horizontally-projecting arm parallel with said face, a band attached to the slide, and a foot-piece attached to the band, all substantially as described and shown, whereby the operator is enabled to force the slide against the flat face of the board or box-side by the pressure of his foot, and to clamp said board between the face of the support and the arm, thereby taking out any bends or irregularities in its face.

3. In a clamp for use in nailing boxes, the combination of a frame having two sides joining each other at an angle, a slide provided with a projecting arm movable to and from one of said sides to press and clamp a board against the same, a bracket and ledge projecting from the other side to support the piece to be nailed, a spring attached to the slide at one end and to the frame at the other end to retract the slide, and a band attached to the slide and provided with a foot-piece, whereby the slide may be moved against the board in opposition to the force of the spring.

299,830. PROCESS OF OBTAINING HYDROCHLORIC ACID FROM THE RESIDUES OF AMMONIA-SODA MANUFACTURE. LUDWIG MOND, Northwich, County of Chester, England. Filed Jan. 9, 1884. (No specimens.)

Claim.—The method of producing hydrochloric acid from the liquors obtained in the manufacture of soda by the ammonia process, and containing chloride of ammonium and chloride of sodium, which consists in evaporating these liquors, separating therefrom the chloride of sodium, which salts out during the evaporation, and treating the remaining product by sulphuric acid, substantially as described.

299,831. CURTAIN-POLE. JOHN MOORE, Syracuse, N. Y. Filed Apr. 9, 1884. (No model.)



Claim.—1. In combination with an extensible curtain-pole, supporting-brackets provided with a grip adapted to engage the side of one end of the pole-section, substantially as and for the purpose set forth.

2. The combination of the pole-sections *a a*, each provided at its outer end with the transverse groove *n*, and the brackets D, provided with the flange *r*, adapted to engage the groove *n*, substantially as described and shown, for the purpose set forth.

3. The combination of an extensible window-cornice and extensible curtain-pole connected therewith, and adapted to adjust itself automatically with the adjustment of the said cornice, substantially as set forth.

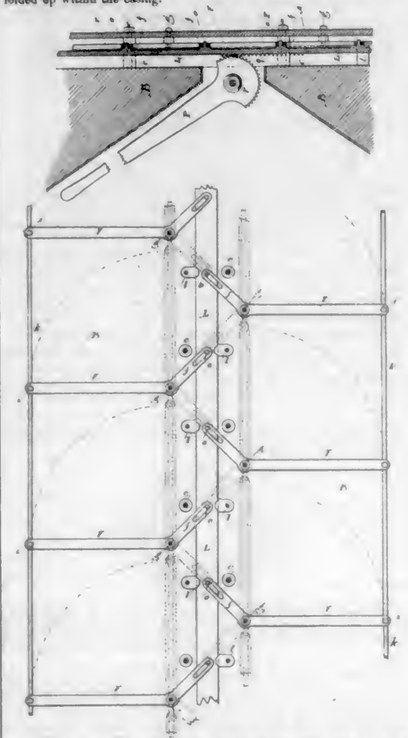
299,832. MACHINE FOR MAKING BED-SLATS. WM. H. MOORE, Gardiner, Me. Filed Feb. 27, 1884. (No model.)

Claim.—1. In a machine for splitting bed-slat bolts, the combination of the feed-belt delivering the bolts from the planer lengthwise to the feed-belt B, having guides on each sides, with the guides O and the rolls d' D' d^2 D^2 d^3 D^3 and saw C, whereby the bolt is delivered to and passed beyond the saw, and the spreader I to separate the split bolt, all substantially as set forth.

2. In a machine, as described, the combination of the endless feed-belt B, which is provided with side guides, B' B^2, whereby the bolt is delivered lengthwise from said belt, with weighted friction-rolls d' D' d^2 D^2 d^3 D^3, whereby said bolts are held in position, and the splitting-saw C, all as set forth.

3. The combination, in a machine, as described, of the feed-belt A, which carries the bolt sidewise from the planer, with the feed-belt B, having side pieces, B' B^2, and dog *b*, whereby the bolt is fed lengthwise to the splitting mechanism, all as set forth.

4. In a machine, as described, and in combination with the friction-rolls d' D' d^2 D^2 and splitting-saw C, the rolls d^3 D^3, having the separator d^3, and upright spreader I, having the groove *i* on each side of its face, whereby the two parts of the sawed bolt are separated and set sawed edge up, all as set forth.



5. In a machine, as described, the combination of the rolls d^3 D^3, having separator d^3, with the upright spreader I, having grooves *i* on each side of the base, substantially as described.

6. In a machine, as described, for making bed-slats, the combination of the rolls d^3 D^3, having separator d^3, and the upright spreader I, having grooves *i* on each side of the base, with a belt and planer, whereby the split bolt is separated and each part, sawed side up, delivered to the planer, to be smoothed, substantially as described.

7. In a machine, as described, for making bed-slats, the combination of the following elements, viz: a belt from the planer to deliver the planed bolts sidewise to the longitudinally-carrying belt, rolls to receive said bolt, which rolls are properly weighted to hold the bolt while it passes the splitting-saw, the saw, and devices for turning the parts of the split bolt sidewise, and a belt to deliver the bolt-pieces, sawed edge up, to a planer, as set forth.

299,833. FIRE-ESCAPE. JORDAN L. MOTT, Jr., New York, N. Y. Filed Apr. 5, 1884. (No model.)

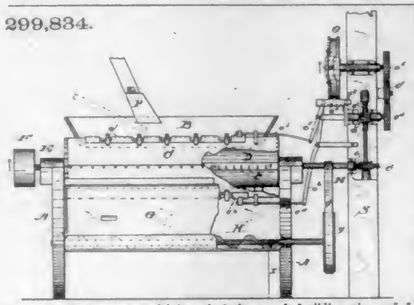
Brief.—A plate is bolted to the building at a certain distance therefrom, to which are pivoted two sets of ladder-rungs, one opening out of one side and the other out of the other side. The inner slotted ends of the rungs are attached to a vertically-movable rack-bar raised and lowered by a racked lever within the building, and by which the ladders are opened and closed. Spring-hinged doors inclose the ladders when folded up within the casing.

Claim.—1. The combination, with the stationary plate A, of the ladder-arms F, pivoted to said plate, and having slotted inner ends, the vertical rack-bar L, with studs entering such slotted ends, and mechanism for moving the rack-bar endwise to open or close the ladders, substantially as set forth.

2. The combination, with the rack-bar L, of the lever P, for moving the same endwise, the pivoted arms forming the ladder-rungs, the bar *k*, connecting the outer ends of the rungs, and the connections between the pivoted arms and the rack-bar, substantially as set forth.

3. The combination, with the plate A, of the shutter-strips *l*, hinged to such plate, the pivoted arms forming the ladder, the rack-bar and supports for the same, and the levers for giving end motion to such rack-bars, said levers acting in openings provided in the wall of the building, substantially as set forth.

299,834. HOMINY-MILL. MARTIN L. MOWRER, Newark, N. J. Filed Jan. 22, 1884. (No model.)



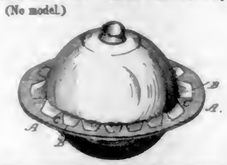
Claim.—1. In combination, a cam or grooved wheel, O, the grooved piece c^{31}, sliding piece c^2, provided with a pin, c^{30}, lever c^4, rod c^5, sliding plate c^3, and a cylinder, C, having openings therein, as set forth.

2. In combination, a cam or grooved wheel, O, the grooved piece c^{31}, sliding piece c^2, provided with a pin, c^3, lever c^4, rod c^5, sliding plate c', and a cylinder, C, having openings therein, as set forth.

3. In combination, a cam or grooved wheel, O, said groove being diverted from the normal plane thereof at a certain part of the periphery, as *o*, sliding pieces having projections moving in the groove in said cam, sliding plates c' and c^3, and means for connecting said sliding pieces and plates, substantially as set forth.

4. In combination, in a hominy-mill, a perforated receiving-cylinder, perforated sliding plates adapted to cover and uncover said perforations in the receiving-cylinder, a knife-cylinder arranged within said re-

299,834.

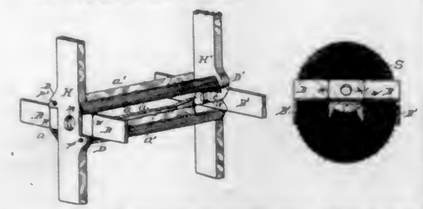


ceiving-cylinder upon a driving-shaft, levers c^7 c^7, sliding pieces c^8 c^8, provided with pins c^9 c^{10}, a cam, and mechanism, substantially as described, whereby the motion of the driving-shaft is communicated to said cam, for the purpose set forth.

5. In combination, in a hominy-mill, a grooved wheel, O, the groove therein being diverted from the normal plane thereof at a certain portion of the periphery, as *o*, the gear-wheels d^4 d^5, the slotted plate *m*, provided with holes therein, and an adjustable gear-wheel, all the said parts arranged and operating substantially as set forth.

6. In combination, a cylinder having longitudinal grooves, as *d*, therein, bars having slots in the sides thereof, and recesses d^2 in their bottoms, said bars being adapted to fit in said longitudinal grooves, and knives d^1, provided with lugs d^3, said knives being adapted to fit the slots and recesses in said bars, substantially as set forth.

299,835. FLYING TARGET. FRANK J. MOYER, Lockport, N. Y. Filed Feb. 1, 1884. (No model.)



Claim.—1. The combination, with a flying target, consisting of a shell molded of frangible material, of a rim or flange connected annularly to the said shell, and having a coating of waterproofing material, as set forth.

2. The combination, with a target-shell molded of frangible material, of a rim or flange having notches, which are filled by a portion of the material constituting the body of the shell, and tongues which enter the body of the said shell, thus forming a rigid connection between the said shell and flange, substantially as set forth.

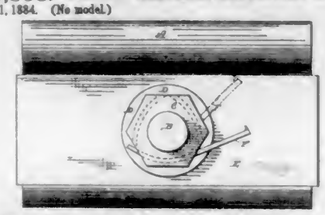
3. As an improvement in flying targets, the combination, with a shell or body of fusible and frangible material, of an annular rim or flange composed of light infrangible material connected to said shell by means of tongues or points entering the body of the latter, and waterproof material covering the joints, substantially as set forth.

299,836. BARBED-WIRE SPOOL. JOHN W. NADELHOFFER, Joliet, Ill. Filed Mar. 25, 1884. (No model.)

Claim.—1. The combination of the cross-head H, having the cross-bars *a a* rigidly attached thereto, and the cross-head H', having the cross-bars *a' a'* rigidly attached thereto, said cross-bars *a a'* being respectively provided with the lugs *c c'* and dowel-pins P and P', for the purpose of rendering the two heads H and H' separable from each other, and the cross-bars *a* and *a'* removable from the barbed-wire bale, as and for the purpose set forth.

2. A separable barbed-wire spool composed of the heads H and H', each provided with a pair of permanently-attached cross-bars, *a* and *a'*, and means for detachably securing the heads H H' and cross-bars B B', as and for the purpose set forth.

3. The combination of the cross-bars B and B', having apertures *m m'*, and ties W W, as and for the purpose set forth.



4. In a spool for spooling barbed wire, the removable cross-bars B and B', connected by means of the ties W W, as set forth, and adapted to secure the barbed wire, substantially as described.

299,837. WATER-PROOF WAFER FOR TORPEDOES. CHARLES NELSON, East New York, N. Y. Filed Nov. 30, 1883. (No model.)

Claim.—As a new article of manufacture, a wafer for toy torpedoes made water-proof by inclosing the fulminate in a flexible or yielding integument impervious to moisture, substantially as described.

299,838. NUT-LOCK. ALLEN NEUTASCHER, Mendota, Ill. Filed Mar. 11, 1884. (No model.)

Claim.—The combination of a nut having curved grooves made in its inner face with the curved key capable of being inserted into the groove after the nut is screwed down nearly or quite to its seat, which has its outer end to project a suitable distance beyond the side of the nut, and which may be provided at its outer end with a sharp point to catch in the surface of the article against which the nut is clamped, substantially as shown.

299,839. HAIR-CLIPPER. GEORGE H. NOBLE, Providence, R. I., assignor to the Brown & Sharpe Manufacturing Company, same place. Filed June 9, 1883. (Model.)

Claim.—The combination, with the cutter-plate and the operative connections of a hair-clipper, of the comb-plate provided with the cutter-teeth, and formed with the grooves extending across its under side, substantially as and for the purposes specified.

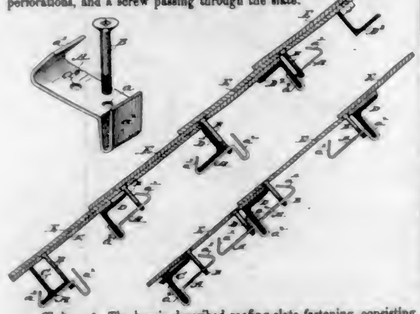
299,840. BOOT OR SHOE. LAWRENCE F. NORMAN, Boston, Mass. Filed Mar. 3, 1884. (No model.)

Claim.—1. In a boot or shoe, an inner sole and upper and a sole-holding welt attached directly thereto, the said welt being provided at its inner edge with a chamber, recess, or pocket for the reception of the edge of an outer sole, the edge of the welt being secured to the outer sole, which it overlaps, substantially as described, and for the purpose set forth.

2. The herein-described shoe, composed of an inner sole, upper, and narrow welt extended from the heel forward about the shank, fore part, and toe, and attached directly to the upper by stitches made through the welt, and an india-rubber outer sole cemented to the inner sole with its edges under the projecting inner and beveled or recessed edges of the welt, substantially as described.

299,841. SHEET-METAL SCREW-NOZZLE. MICHAEL O'CONNOR, New Brunswick, N. J. Filed Apr. 18, 1883. (Model.)

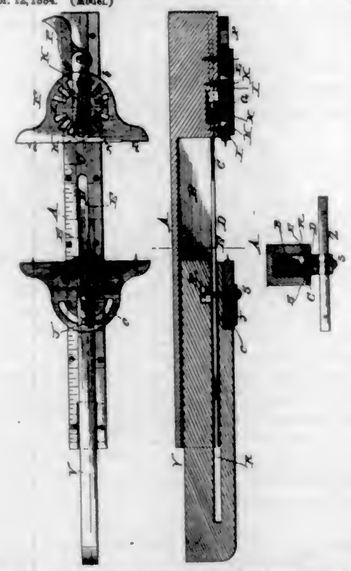
299,841.



Claim.—1. A screw-nozzle consisting of a body of taggers tin or other thin metal formed with suitable screw-threads, and a re-enforcing collar or band of heavier or stiffer metal introduced and secured within the body, substantially as described.

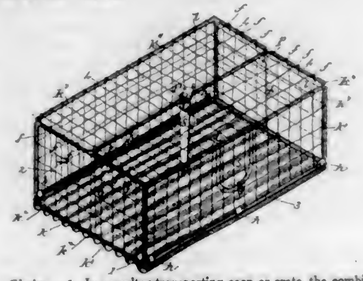
2. A screw-nozzle consisting of a body of taggers tin or other thin metal having a shoulder for attachment to a vessel and formed into a screw-thread upon the part of the body at a right angle thereto, and a re-enforcing band or collar having a shoulder and a body at a right angle thereto, introduced into and secured within the body of the nozzle, substantially as described.

299,842. ROOFING-SLATE FASTENING. BERNARD M. O'NEILL, St. Louis, Mo. Filed Mar. 7, 1884. (No model.)



Brief.—Consists of a plate having its ends crimped, two threaded perforations, and a screw passing through the slate.

Claim.—1. The herein-described roofing-slate fastening, consisting of the plate A, having the crimps *a'* and *a²*, and the two threaded perforations *a a²*, in combination with the screw B, as described.



2. The combination, substantially as described, of the slates E, the plates A, the screws B, and the laths, said plates having the two crimps and the two threaded perforations.

299,843. GAGE. CHARLES B. OSBORN, Canandaigua, N. Y. Filed Apr. 12, 1884. (Model.)

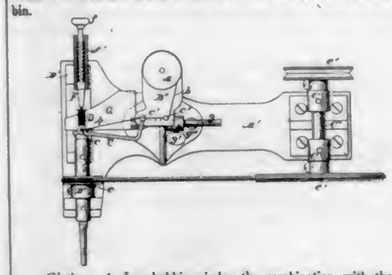
Claim.—A dado-guide consisting of the longitudinally-recessed rule, carrying a slotted guide-plate, a radially-adjustable clamp-jaw, and cam, the slotted extension-bar engaging the guide-plate, a second radially-adjustable clamp-jaw pivoted to said extension-bar, and devices for holding the extension-bar and clamp-jaws in position after adjustment, substantially as specified.

299,844. POULTRY-COOP. LYMAN S. PAINE, St. Louis, Mo. Filed Oct. 22, 1883. (Model.)

Claim.—1. In a poultry-transporting coop or crate, the combination, with the side, end, and top pieces, of a bottom, corrugated, as described, and the corrugations being open at one or both ends, whereby the coop is stiffened and its drainage facilitated, as set forth.

2. In a poultry-transporting coop or crate, the combination of the sheet-metal bottom 1, having a bordering rod or brace secured thereto, said rod being bent, as described, so that upon two opposite sides of the bottom it is higher above the same than upon the other sides, and the side and end pieces hinged, as described, to said rod, as set forth.

3. In a poultry-transporting coop or crate, the combination, with the bottom portion, 1, of the side, end and top portions, said portions consisting of frames and wire-netting, the frames being hinged together by the ends of the wire composing the netting, as set forth.



4. In a poultry-transporting coop or crate, the combination, of the bottom portions, 1, end portions, 2, hinged as described, side portions, 3, and top portions, 4, hinged to said side portions, said top portions having the ends of the netting-wires bent down to engage with the end portions and hold the latter in position, as set forth.

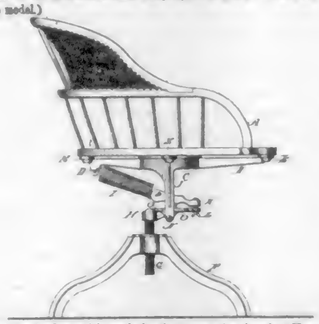
5. In a poultry-transporting coop or crate, the combination, with the bottom and side and end panels, of the top portion folding downwardly, and a folding or hinged brace, S, adapted to connect and stiffen the top and bottom, and to be held in place by a fastening, substantially as described.

6. In a poultry-transporting coop or crate, the combination, with the bottom 1, ends 2 2, and sides 3 3, of the folding top portions, 4 4, and brace S, connected with the bottom 1, reaching to the top portions at their line of junction, and constructed to be held by the locking device of the top portions, substantially as described, and for the purposes set forth.

299,845. BOBBIN-WINDER. EDWARD PARKINSON, Providence, R. I., assignor of two-thirds to Jabez E. Walcott and Frederick I. Marcy, both of same place. Filed June 28, 1883. (No model.)

Brief.—The device is designed to wind bobbins of sewing and other machines, and may be attached to and operated by the particular machine the bobbins of which it is employed to wind, or may be used independently for winding bobbins, being driven by any suitable motor. The guide-plate is narrow at one end, and adapted to be adjusted by means of a stem in a standard and set-screw to fit the width of the bobbin.

Claim.—1. In a bobbin-winder, the combination, with the bed-plate A', having the standards C', B', and D', of the driving-shaft C'', mounted upon the standard C', thread-guides and a swinging arm mounted on the standard B', the arbor E and spindle F, constituting a bobbin



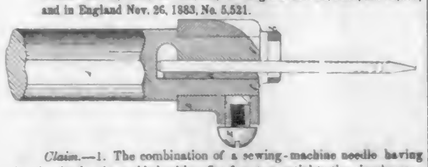
holder and turner, mounted on the standard D', band-wheels *c' c''*, mounted on the shaft C'', and the band-wheel *e*, mounted on the arbor E, as and for the purpose described.

2. The combination, with the bed-plate A', the standard C', mounted thereon, and carrying the shaft C'', having the band-wheels *c' c''*, and the standard B', carrying the thread-guides and swinging arm, of the standard D', carrying the spindle E, provided with the band-wheel *e*, and the spindle F, having the handle *f* and spring *f''*, arranged and operating as described.

3. The combination, with the bed-plate A' and the standards C' B', mounted thereon, carrying, respectively, the driving-shaft and the swinging arm and thread-guides, of the standard D', carrying the spindle and arbor, the pattern G, mounted on the stem *g*, and the standard *g''*, arranged to receive the stem, and provided with the clamp-screw *g'*, as and for the purposes set forth.

4. The combination, with the bed-plate A', having the standards C' and D', carrying, respectively, the driving-shaft and the bobbin holder and turner, of the standard B', provided with the bracket B'', spindle *b'*, thread-guides *c' c''*, and swinging arm C, provided with guide-eye *c*, and the pattern G, with its stem *g*, mounted in the standard *g''*, the coiled spring *h*, located beneath the said pattern, and the post *h'*, for retaining said spring in its operative position, substantially as described.

299,846. TILTING-CHAIR. HENRY PARRY, Milwaukee, Wis., assignor to the Milwaukee Chair Company, same place. Filed Sept. 3, 1883. (No model.)

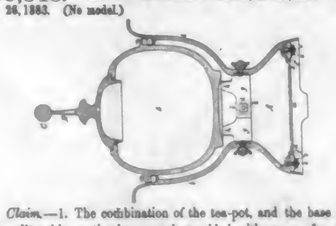


Claim.—1. In a tilting-chair, the supporting-bracket H, provided with downward-projecting lugs M, formed below the plane of its upper surface, and stops O O, formed on line with its upper surface, in combination with the bracket C, provided with radial arms D, pivotal arms J, and pivotal bolt N, whereby the said stops O are interposed between the pivotal bolt and the swinging end of said bracket, and adapted to support the seat at the extremity of its backward and forward movement, substantially as set forth.

2. The combination of bracket H, provided with pivotal bearing Q, lever K, centrally pivoted on said bearing Q, screw G, swinging arms J, bracket C, and arms D, formed in a single piece, and attached to said bracket H by pivotal bolt N, pivotal bolt N, and spring I, connected at one end with the rearward-projecting arm D, and at its other end with said lever K, all substantially as and for the purpose specified.

3. The combination of four-arm bracket C, provided with pivotal arms J, bracket H, provided with lugs M and stops O, adjusting-lever K, adjusting-screw L, and spring I, said spring being arranged beneath the rear supporting-arm of said bracket C, whereby the seat is shielded from contact therewith, the adjusting-screw of said lever K being located in front of the supporting-screw, whereby the tension of the spring is conveniently adjusted, all substantially as and for the purpose specified.

299,847. SEWING-MACHINE-NEEDLE CLAMP. JULES ETIENNE PICHARD, Paris, France. Filed Dec. 18, 1883. (No model.) Patented in France Nov. 3, 1883, No. 158,344; in Belgium Nov. 24, 1883, No. 63,321, and in England Nov. 26, 1883, No. 5,521.

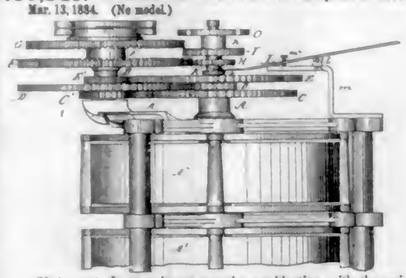


Claim.—1. The combination of a sewing-machine needle having its circular head provided with a flat face tangential to the circular section of its shank, with a needle-holder bored to receive the needle-head, and provided with a transverse slot, a flat plate held in the slot to bear against the flat side of the needle-head, and means for forcing the plate and needle-head together, substantially as described.

2. The combination of a sewing-machine needle having its circular head provided with a flat face, C', tangential to the circular section of its shank, with a holder having a slot to form limbs *f*, and bored to receive the needle-head, a flat plate, D, arranged in the slot to bear against the flat face of the needle-head, and devices for forcing the limbs together to grip the needle-head and press its flat face against the flat plate, substantially as described.

3. The combination of a sewing-machine needle having a circular head provided with a flat face, C', with a holder bored to receive the needle-head, and provided with a transverse slot to form two limbs, *f*, the ring B, attached to one of the limbs, and provided with a screw, E, and a flat plate arranged in the slot to bear against the flat face of the needle-head, and having shoulders engaging over the ring, substantially as described.

299,848. TEA-POT. NATHANIEL PLYMPTON, Boston, Mass. Filed Nov. 26, 1883. (No model.)



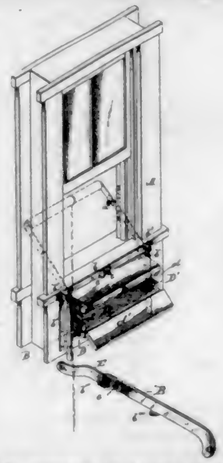
Claim.—1. The combination of the tea-pot, and the base with the posts adjustable on the latter, and provided with means for clamping them thereto, and with two slotted and curved arms lapping on each other, and having devices for clamping them together, all substantially as set forth.

2. The combination of the tea-pot and the base with the posts adjustable on the latter, and provided with means for clamping them thereto, and with two slotted and curved arms lapping on each other, and having devices for clamping them together, and stops, as described, for preventing the tea-pot and body from being tilted backward, all being substantially as represented.

3. The combination of the tea-pot body having perforated ears, as described, with the handle and its two hooked wire standards, the clasps applied thereto, and the guard projected from one of such clasps, all being substantially as set forth.

299,849. SPRING-MOTOR. JOHN B. POWELL, Philadelphia, Pa. Filed Mar. 13, 1884. (No model.)

Claim.—1. In a spring-motor, the combination, with the main gear-wheel, of two pairs of gears relatively different in size, and means, substantially as described, for alternately bringing into play the said pair of gears, as set forth.



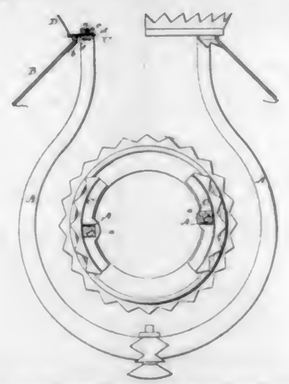
2. The combination, with the train of gearing of a spring-motor and two pairs of gear-wheels of relatively different size connected thereto, of a lever adapted and designed to bring said pairs of gear-wheels alternately into play, substantially as described.

3. The combination, with the gearing of a spring-motor, of the gear-wheels H and I, mounted upon the main shaft A, and adapted to be geared alternately with the gear-wheels F and G, mounted upon the supplemental shaft B, and the shifting-lever L, all constructed and arranged substantially as described.

299,850. FIRE-ESCAPE. HENRY REINCH, Quincy, Ill. Filed Mar. 15, 1884. (No model.)

Brief.—An improvement on Patent No. 281,136, dated July 10, 1883. A receptacle having a hinged front and cut-away sides for storing the roller, which is secured to the pivoted side arms.

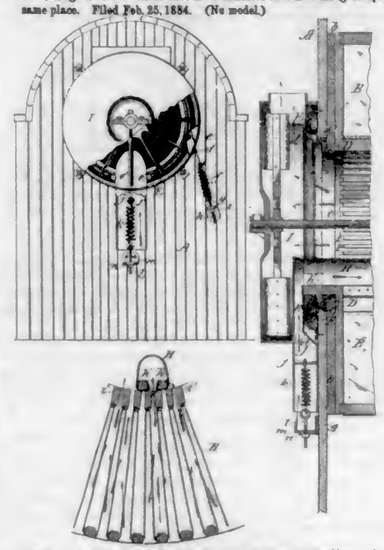
299,850.



Claim.—1. The receptacle or box provided with a hinged front and cut-away sides, in combination with a roller attached to pivoted side arms, substantially as shown.

2. In a fire-escape, the pivoted arms B, with upturned ends *b'''* and lug *b''''*, the arms E, pivoted thereto, and provided at their ends with a roller, and brackets *e*, attached to the window-casing, substantially as shown, and for the purpose set forth.

3. In combination with the pivoted arms B, having lugs *b''''*, the short arms E, pivoted as shown, and provided with a roller and a receptacle for the reception of the roller, having a hinged front, substantially as shown, and for the purpose set forth.



299,851. HANGING LAMP. JOHN T. RICH, Meriden, Conn., assignor to the Meriden Malleable Iron Company, same place. Filed Jan. 14, 1884. (No model.)

Claim.—1. In a hanging-lamp fixture, the combination of the frame A A, constructed to support the fount between its two arms, the segments C, set upon the arms of the frame and constructed with an outwardly and downwardly projecting flange, upon which the shade B will rest, and the crowning-ring D, set over the segments, and the segments and ring secured to the end of the frame by a single screw or bolt at the end of each arm, substantially as described.

2. In a hanging-lamp fixture, the combination of the frame A A, constructed to support the fount between its two arms, the segments C, set upon the arms of the frame and constructed with an outwardly and downwardly projecting flange, upon which the shade B will rest, and the crowning-ring D, set over the segments, the segments and ring secured to the end of the frame by a single screw or bolt at the end of each arm, the said segments constructed with a transverse slot, through which the screw or bolt passes, and whereby said segments may be adjusted to different diameters, substantially as described.

299,852. DUST-COLLECTOR. WILLIAM RICHARDSON, Milwaukee, Wis., assignor to the Milwaukee Dust Collector Manufacturing Company, same place. Filed Feb. 25, 1884. (No model.)

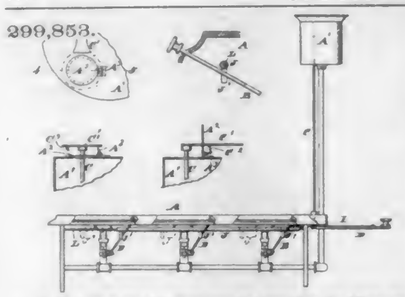
Claim.—1. In a dust-collector, the combination, with the revolving balloon B and the casing A, of the rings C, D, E, and F, the cord *d*, coil-spring *f*, threaded bolt *g*, bracket *h*, and adjusting-nut *i*, substantially as shown and described, and for the purpose set forth.

2. In a dust-collector, in combination with the balloon B, casing A, and inverted trough H, having longitudinal bars *h' h'*, the flue J, having pin *j*, the coil-spring *k*, threaded bolt *l*, bracket *m*, and nut *n*, substantially as shown and described, and for the purpose set forth.

3. In a dust-collector, the combination, with the balloon B, trough H, the flue J, fastening-pin *j*, spring *k*, bolt *l*, bracket *m*, and nut *n*, of the guide-pins *c' c'*, held in the casing A, substantially as shown and described, and for the purpose set forth.

4. In a dust-collector, the combination, with a revolving balloon, a case inclosing the same, and metallic rings fastened to each of said parts and interposed between their respective bearing-edges, of an annular band of felt or of any other flexible material interposed between said metallic rings and having one of its rims fastened to the case, while its other rim is suitably held against a projection of the ring of the balloon, so as to form an air-tight joint between the bearing parts, substantially as set forth.

5. In a dust-collector, the combination, with a revolving balloon, a case inclosing the same, and metallic rings fastened to each of said parts and interposed between their respective bearing-edges, of an annular band of felt or of any other flexible material interposed between said metallic rings, and having one of its rims fastened to the case, and an elastic binder adapted to keep the other rim of the annular band in constant contact with the projecting periphery of the revolving balloon-ring, substantially as set forth.



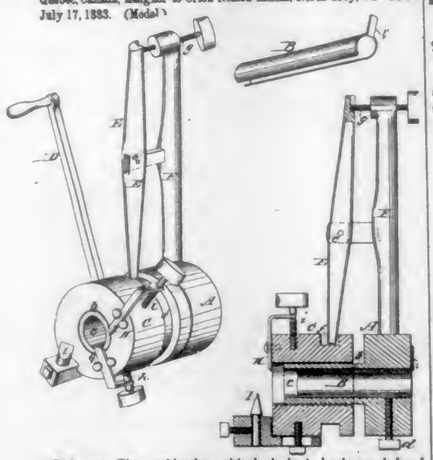
6. In a dust-collector, the combination, with a revolving balloon, a case inclosing the same, and an inverted trough held in the open center of said balloon, of a flue hung over each end of said trough, and connected to the sides of the case by an elastic binder, by means of which an air-tight joint is secured between the edges of the trough and balloon-bars, substantially as set forth.

299,853. GASOLINE-STOVE ATTACHMENT. JOHN RINGEN, St. Louis, Mo., assignor of one-half to Louis Stockstrom, same place. Filed Sept. 14, 1883. (No model.)

Claim.—1. In combination with the reservoir of a vapor-stove, a movable guard-plate adapted to control the filling-opening, and so connected with a burner-valve that on moving the guard-plate for the purpose of filling the reservoir the flow of the vapor to the burner will be cut off, while moving the guard-plate over the opening will not operate the valve.

2. The combination, with a burner and guard-plate shaft, of a sleeve or rod connected to the shaft, and having a projection operative to close the burner when moved in one direction, and inoperative to open the burner when moved in the opposite direction.

299,853.

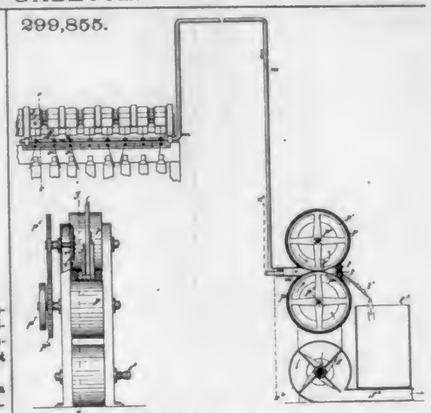


3. In a vapor-stove, a guard-plate for controlling the filling-opening of the reservoir, secured to the upper end of a rock-shaft, in combination with a lever for turning the shaft, and a suitable mechanism connected to the lever, whereby the supply-valves are turned off, but not opened.

4. In a vapor-stove, the combination of a vertical rock-shaft, a guard-plate secured to the upper end of the shaft, for controlling the oil-hole of the reservoir, a lever secured to the shaft, for operating it, and a sliding sleeve connected to the said lever and provided with projections which come against suitable valve-levers to turn off but not open the valves as the rock-shaft is turned, for the purpose set forth.

5. In a vapor-stove, the combination of a vertical rock-shaft, a plate secured to the upper end of the shaft, a lever secured to the shaft, a sliding sleeve supported on a stationary rod and provided with projections, an arm or rod for connecting the sleeve and lever of the rock-shaft, and the valve-levers to receive the impact of the projections by which the valves are turned off, but not on, all arranged and operating substantially as and for the purpose set forth.

299,854. VEHICLE-AXLE CUTTER. AUSTIN N. RUTTER, Abercorn, Quebec, Canada, assignor to Orion Nelson Elkins, North Troy, Vt. Filed July 17, 1883. (Model.)



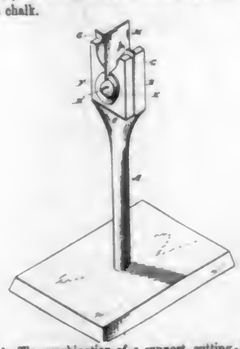
Claim.—1. The combination, with the body A, having neck *b* and aperture *c*, and the rotary head C, provided with cutters G H, of a sleeve, B, having a longitudinal slit, and provided with a handle, *b'*, serving the double purpose of limiting the inward movement of the sleeve and a means for operating the same, and screw *d*, passing through the slit of the sleeve and adapted to bear on the axle, substantially as described, and for the purpose set forth.

2. The combination, with the body A and head C, of the arm F on said body, the screw-stop *g*, and the feed-lever E, pivoted on a lateral stud of said arm and projecting into a groove of said head, as shown and described.

299,855. SCAVENGER MECHANISM FOR SPINNING, DRAWING, AND TWISTING MACHINERY. ELNATAN W. SARGENT, Lowell, Mass. Filed Sept. 24, 1883. (No model.)

Brief.—The flyings and broken ends of the yarn are received into the mouths of exhaust-pipes and conveyed to condensing-drums.

299,855.



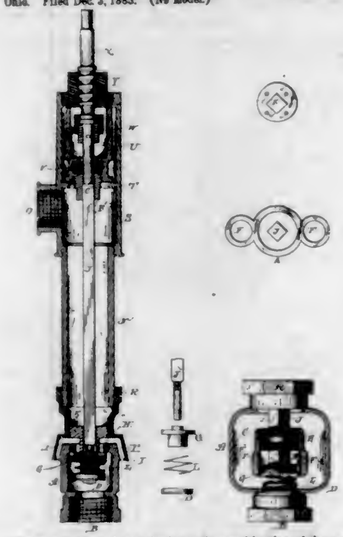
Claim.—1. The combination, with rollers between which pass rovings, slivers, or yarns, of an exhaust pipe or passage to receive the broken ends of the same, and means to create an exhaust-current or indraft of air through the said pipe, to operate substantially as and for the purposes set forth.

2. The front roller and exhaust-pipe and means to exhaust the air from or through the same, combined with condensing apparatus to condense the fibrous material drawn into and through the said pipe, substantially as described.

3. The front roller, *b*, and the exhaust-pipe provided with an open mouth opposite each roving, sliver, or yarn passing over the said roller, combined with means for producing an exhaust-current into and through the said pipe, and with a receptacle for the fibrous material drawn into and through the said pipe, substantially as described.

299,856. CHALK-SHARPENER. THEODORE SCHAFER, Marne, Ill. Filed Mar. 31, 1884. (No model.)

Brief.—The device is designed to sharpen chalk for tailors' use, and the partition-plate is used when it is desired to bevel only one side of the edge of the chalk.



Claim.—1. The combination of a support, cutting-blades that are secured thereto, and a partition-plate that is adapted to be secured upon the support between the blades, for the purpose set forth, substantially as described.

2. The combination of a support, cutting-blades that are pivoted together, a clamping device for securing them at any desired angle, and a partition-plate that is adapted to be secured between the blades, substantially as described.

299,857. PREPARATION OF COLLODION. ERNST SCHERING, Charlottenburg, Prussia, Germany, assignor to Bachrach & Bro., Baltimore, Md. Filed Nov. 21, 1883. (No specimens.) Patented in Germany Apr. 7, 1878, No. 2,660.

Claim.—A new and improved composition of matter intended for the preparation of collodion, as hereinbefore described, which is elastic and transparent while fresh, and becomes hard on drying, and is neither explosive on concussion nor spontaneously combustible, and is therefore free from danger in transportion.

299,858. FIRE-PLUG AND HYDRANT. HUGO SCHNEIDER, Cleveland, Ohio. Filed Dec. 3, 1883. (No model.)

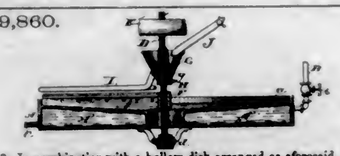
Claim.—1. In a plug or hydrant, the combination of the vertically-moving valve-rod, a valve which is rigidly secured thereto, a sliding valve which is placed loosely upon the valve-rod, a spring for separating the two valves, and a perforated plug which is placed in the upper part of the chamber, the valve-rod being provided with a shoulder for forcing the sliding valve downward when the stationary valve is closed, substantially as shown.

2. In a plug or hydrant, the combination of the water-chamber, the endwise-moving valve-rod having a stationary compression-valve secured to its lower end, with the sliding valve which is placed upon the rod, and a spring which is placed between the two valves, for the purpose of moving the sliding valve upward when the valve is left free to operate, substantially as set forth.

3. The combination of the stand-pipe N, the flange T, the valve-rod J being made angular where it passes through the plug, so as to cause it to revolve with it, the shell U, provided with the nut B' in its lower end, and the nut Y, the shaft being made square where it passes through the nut B', substantially as described.

4. In a plug or hydrant, the combination of the upper part, S, the stand-pipe provided with the flange T, the packing-shell U, the nut or plug Y, for forcing the shell down upon the flange, the valve-rod, and the screw-shaft X, substantially as shown and described.

299,859. HEEL-RING FOR SCYTHES. JOHN A. SCHWOB, Moundsville, W. Va. Filed July 12, 1883. (No model.)



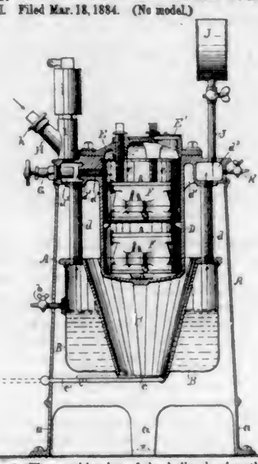
Claim.—The combination, with a swath having the recess *a*, of a scythe having a tang provided with a bent end adapted to enter said recess, a tang-ring recessed to form a shoulder, *d*, adapted to fit snugly against the back of the tang, and a wedge adapted to rest against the shoulder *d* of the ring, substantially as set forth.

299,860. PARAFFINE-FREEZER. WILLIAM C. SCOFIELD, Cleveland, Ohio. Filed Mar. 17, 1884. (No model.)

Claim.—1. A hollow disk provided with pipes to supply cooling-liquid to the chamber in the disk, and provided with suitable means for sprinkling liquid paraffine on the disk and automatically removing it when it is frozen, substantially as set forth.

2. A hollow disk provided with tubes for supplying liquid to the chamber thereof, and with the upper surface concaved and provided with an upwardly-projecting rim, and a vertical central opening through the disk, substantially as set forth.

299,860.



3. In combination with a hollow disk arranged as aforesaid, a vertical shaft located at the axis of the disk, and provided with an arm and scraper, preferably curved, as shown, and adapted to remove the frozen paraffine from the disk, substantially as set forth.

4. In combination with a hollow disk arranged as aforesaid, a vertical shaft and an arm and scraper, preferably curved, and adapted to scrape the frozen paraffine from the disk and discharge it through the central opening thereof, substantially as set forth.

5. In a paraffine-freezer, in combination with the hollow disk and revolving vertical shaft, as aforesaid, an adjustable funnel provided with a central sleeve embracing the shaft, and a tube to supply liquid paraffine to the funnel, and a sprinkling-pipe leading from the funnel to near the periphery of the disk, and from thence curved back of the scraper and perforated, so as to discharge the paraffine just back of the scraper, substantially as set forth.

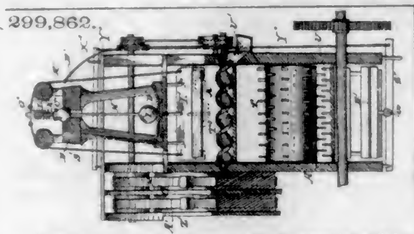
299,861. DENTAL VULCANIZER. FREDERICK W. SEABURY, Providence, R. I. Filed Mar. 18, 1884. (No model.)

Claim.—1. The combination of the boiler having the conical flue with the oven and the steam-pipes, all constructed and arranged substantially as set forth.

2. The boiler B, having the conical flue C, in combination with the oven D, having the flange *d''* and the pipes *d*, substantially as described.

3. The combination, with the case or body A, of the oven D, having the flange *d'*, provided with the channel *d³* and the chamber *d³*, the boiler B, having the conical flue C, and the tubes *d*, substantially as set forth.

4. The combination, with the boiler, the conical flue, the pipes *d*, and the oven provided with the channeled and chambered flange, of the feeder or spout H, substantially as described.



5. The combination, with the boiler and the conical flue, of the damper *c*, constructed and arranged substantially as described.

6. The combination of the case A, the oven D, having the chambered and channeled flange, the cover E, screws *e*, lid E', boiler B, conical flue C, damper *c*, pipes *d*, and the valve G, the pop-valve, gage, spout, and cocks *b k*, all arranged substantially as and for the purposes set forth.

299,862. THRASHING-MACHINE. CHARLES SHIRLEY, Luzerne, Iowa. Filed Dec. 20, 1883. (No model.)

Claim.—1. In a thrashing-machine, the combination of the drive-wheels, the thrashing mechanism operated by the said wheels, means for conveying the cut grain from the swath to the thrashing-cylinder, and the straw-carrier and separating-shoes suspended so as to remain level without regard to the position of the machine, as and for the purpose shown and set forth.

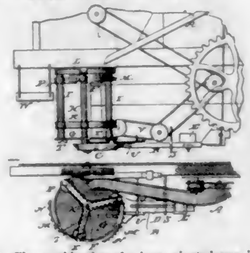
299,862.

2. In a thrashing-machine constructed with a thrashing-cylinder, means for conveying the grain from the swath to the thrashing-cylinder, carrying-wheels, and mechanism whereby said cylinder is operated from said wheels, the combination of a pendulum having a universal play, the straw-carrier and separator-shoes, and cords for suspending the said carrier and shoes within the machine-frame connected to the pendulum, the position of the pendulum regulating the position of the carrier and shoes, as and for the purpose shown and set forth.

3. The combination of an upright frame forming an annular concave socket or bearing, a weighted pendulum having a ball near its upper end rocking in the said bearing, vertical pulleys journaled upon the top of the frame, cords or chains attached to the upper end of the pendulum above the ball and passing over the pulleys, and a separator-shoe suspended from the ends of the said cords or chains, as and for the purpose shown and set forth.

4. The combination of an upright frame forming an annular concave socket or bearing at its upper end, a concave rubber-covered plate placed between the supports of the frame at their lower ends, a ball having a perforation passing through its center, a rod having a weight at its lower end and passing through the perforated ball, a washer resting upon the top of the perforated ball, a spiral spring wrapped around the upper end of the rod, a nut fitting upon the upper end of the rod and securing a perforated plate having eyes in its edges, palleys journaled to turn in a vertical plane at the top of the upright frame, and cords or chains attached to the eyed plate upon the upper end of the rod and supporting the separator-shoes at their lower ends, as and for the purpose shown and set forth.

5. The combination of a pendulum suspended at the upper end of an upright frame, a cord or chain attached to the upper end of the pendulum above the point of suspension and passing over a suitable guide-pulley, a shaft journaled transversely in the machine-casing above the straw-carrier, and having a pulley at its middle, to which the end of the cord or chain is attached, and upon which it winds, two pulleys or segments secured upon the ends of the transverse shaft, and having forwardly-projecting levers provided with sliding poises, a straw-carrier hinged at its inner end, and cords or chains secured to and winding upon the pulleys or segments, and secured at their lower ends to a cross-bar upon the straw-carrier, as and for the purpose shown and set forth.



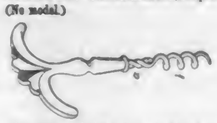
6. In a machine for taking the cut grain from the swath and thrashing it, the combination of the conveyers hinged at their upper ends, means for raising and lowering the lower conveyer, an arm hinged upon the side of the upper conveyer, having a notched and flanged edge, a bail secured upon the side of the lower conveyer, and a hook pivoted upon the side of the lower conveyer and having the outer side of its hooked end flanged, as and for the purpose shown and set forth.

7. The combination of two conveyer-frames hinged at their upper ends and inclined forwardly, means for adjusting them relatively to each other, means for raising and lowering them, the endless conveyer-aprons having flexible teeth upon their faces, and means for revolving the aprons with their facing portions in an upward direction, as and for the purpose shown and set forth.

8. The combination of the thrashing-cylinder and concave, the straw-carrier having the inclined bottom, the lower separating-shoe, the lower fan, the lower grain-conveyer, the lower head-conveyer, the double elevator having the lower end of the inner elevator opening into the grain-conveyer, and the lower end of the outer elevator opening into the head-conveyer, the grain-spout opening from the upper end of the inner elevator down to the upper separating-shoe, the head-conveying spout opening into the thrashing-cylinder from the upper end of the outer elevator, the upper cleaning-shoe, the upper fan, the grain-conveyer, the grain-spout, the tailings-conveyer, and the tailings-spout, all constructed and arranged as and for the purpose shown and set forth.

9. The combination of the lower separating-shoe having a socket or bearing upon the middle of its lower rear edge, the lever pivoted at its one end upon the bottom of the machine-casing, and having a bolt at its middle fitting and turning in the socket upon the shoe, a bar secured transversely upon the bottom of the shoe and pivoted at its center upon a pin upon the bottom of the machine-casing, a pendulum suspended upon the top of the machine by a univeral joint, and cords or chains passing over suitable pulleys attached to the upper end of the pendulum above the point of suspension, and attached at their lower ends to the free end of the lever and to one end of the transverse bar, respectively, as and for the purpose shown and set forth.

299,863. RAG HOLDER AND WEIGHER. CHARLES SHIRLEY, Lascarne, Iowa. Filed Mar. 20, 1884. (No model.)



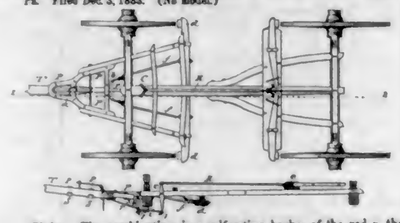
Claim.—1. The combination of a lever pivoted near its end under the discharge-spout, and having a sliding weight upon its long end, an upright secured in an inwardly-inclined position upon the short end of the lever, a bag-supporting frame having compartments for the bags to be filled, and turning upon the upright under the end of the discharge-spout, notched catches secured under each bag-compartment, a spring-catch secured at one end upon the upper side of the lever adapted to engage the notched catches, and a laterally-projecting arm upon the machine-frame adapted to strike the free end of the spring-catch when the long end of the lever is raised, as and for the purpose shown and set forth.

2. The combination of a lever pivoted near one end under the discharge-spout, and having a sliding weight upon its long arm, an upright secured in a slightly inwardly-inclined position upon the short end of the lever, a bag-supporting frame pivoted upon the upright, having means for securing the mouths of the bags open, and having outwardly-opening doors or bars, closing the outer sides of the compartments for the bags, provided with catches closing by being forced outward by the grain in the bags, and means for holding one compartment under the grain-spout at the time, and for allowing the frame to turn when the lever is tilted by the weight of the filled bags, as and for the purpose shown and set forth.

3. The combination of a lever pivoted near one end at the grain-discharging spout, and having a sliding weight upon its long arm, an upright secured to a slightly inwardly-inclined position upon the short arm of the lever, a bag-supporting frame consisting of a bottom plate, a central upright sleeve turning upon the upright, a number of uprights secured at equal distances at the edge of the bottom plate, and a corresponding number of radial arms having upwardly-pointing pins, curved arms having outwardly-pointing pins at their outer ends and pivoted upon the upper ends of the uprights, adapted to meet and engage with the perforated curved arms, curved arms hinged at the lower ends of the uprights, and having means for catching their free ends in catches upon the adjoining uprights, and means for holding one of the compartments formed by the uprights and the radial arms under the grain-spout at the time, and for releasing it when the lever is tilted by the weight of the filled bag, allowing the frame to turn and bring a new compartment under the spout, as and for the purpose shown and set forth.

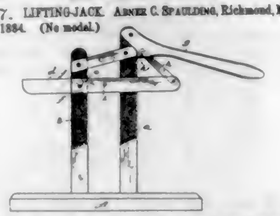
299,864. CORKSCREW. JOSEPH A. SMITH, Deep River, Conn. Filed Oct. 3, 1883. (No model.)

Claim.—A corkscrew consisting of a twisted shank and screw, having a handle cast upon the shank, substantially as specified.



299,865. RAZOR-STROP. RACHEL P. SMITH, Chicago, Ill. Filed Nov. 2, 1883. (No model.)

Claim.—1. The combination, in a razor-strop, of the flexible sides, the end blocks, B, hinged together so as to permit the sides to be expanded, and suitable intermediate mechanism for expanding said sides, substantially as specified.

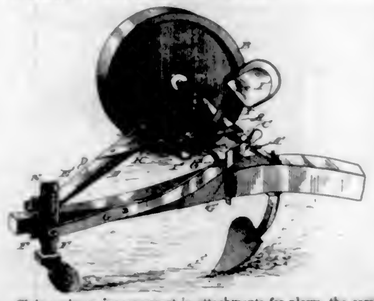


2. The combination, in a razor-strop, of the flexible sides, the hinged blocks, the surface-strap, the movable handle, and hinged plate, all arranged to operate substantially as specified.

299,866. WAGON-BRAKE. THOMAS W. SOUTHARD, Rose's Valley, Pa. Filed Dec. 3, 1883. (No model.)

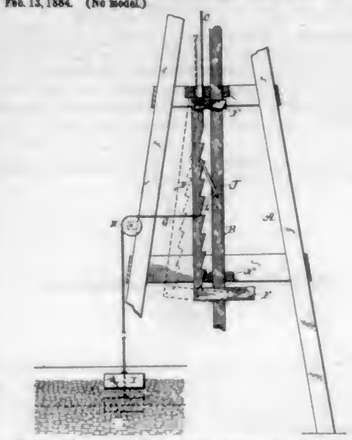
Claim.—The combination, in a self-acting brake, of the rod *r*, the lever *c*, the rod R, the hook *l*, the bail *b*, and the rods *f f*, all substantially as described.

299,867. LIFTING-JACK. ABNER C. SPAULDING, Richmond, Me. Filed Apr. 16, 1884. (No model.)



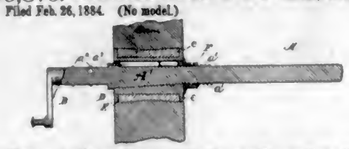
Claim.—1. A lifting-jack consisting of a base, front and rear standards supported thereon, a lifting-lever pivoted loosely in the front standards, a handle-lever, and a link connecting the same with the free end of the lifting-lever, substantially as described.

2. A lifting-jack consisting of a base and front and rear standards supported thereon, the open slots in the front standards, the lifting-lever adjustable in said slots, a hand-lever, and a link connecting said lifting and hand levers, substantially as described.



3. In a lifting-jack, the frame mounted in a suitable base, a lifting-lever, *d*, fulcrumed in the front posts of said frame and extending to the rear, and a hand-lever provided with an offset, *h*, and connected to lever *d* by a suitable link, the parts being arranged in relation to each other substantially as described.

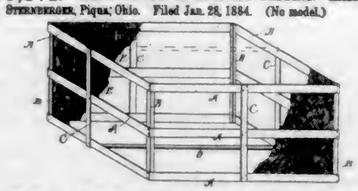
299,868. ATTACHMENT FOR PLOWS. MARLON J. STAFFORD, Wheatland, Ind. Filed Mar. 15, 1884. (No model.)



Claim.—As an improvement in attachments for plows, the combination of an auxiliary axle provided with a vertical bearing and having its outer extremity connected to the front portion of the attachment-frame by means of a suitable connecting brace or rod, a main hinged axle, upon the outer end of which the main wheel of the attachment is secured and adapted to be adjusted vertically in the vertical bearing of the auxiliary axle of the attachment, and a caster or roller of suitable size, the standard of which slides in a vertically-recessed bearing on the front end of the attachment-frame, and which is provided with a pivoted operating-lever having secured upon it, near its rear end, a lug or projection adapted to engage with the teeth of a suitable curved rack secured upon the side of the plow-beam, all constructed and arranged to operate substantially in the manner and for the purpose shown and described.

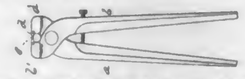
299,869. WINDMILL. JAMES OLIVER STATNER, Angola, Ind. Filed Feb. 13, 1884. (No model.)

Claim.—The combination, with the vertically-moving pumping-rod of a windmill and a connecting-latch which is loosely attached thereto, of a ratchet-bar which has both a vertical and a horizontal motion, and which is connected at its upper end by means of a cord, wire, or chain with the wind-wheel, and at its lower end with a weighted float, which is placed in the tank into which the water is pumped, substantially as shown and described.



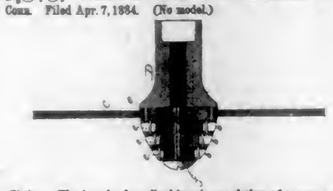
299,870. GRINDSTONE-HANGINGS. FRANK M. STEARNS, Berea, Ohio. Filed Feb. 26, 1884. (No model.)

Claim.—1. The combination, with the spindle provided with the elongated tapering raised seat, and with a threaded part joining the raised seat on the smaller end, of a sleeve formed in a single piece and provided throughout its entire length with a conical or tapering bore, which latter fits the seat on the spindle, and a nut for locking the sleeve on the raised seat, substantially as set forth.



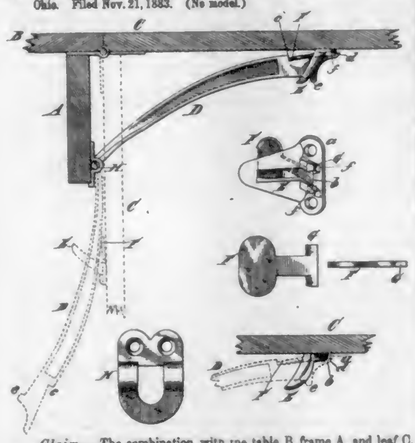
2. In grindstone-hangings, a spindle provided with a raised tapering seat, with a groove in the face of the seat extending longitudinally with the spindle, but terminating at either end inside of the raised seat, and with a threaded part joining the tapering seat on the smaller end, and provided with a nut, in combination with a sleeve with a tapering bore adapted to fit the tapering seat of the spindle, and provided with an internal longitudinal groove running from end to end of the sleeve, the wings E and the ribs *e*, and the key a^2, substantially as set forth.

299,871. CRATE FOR MATTRESSES AND BEDDING. HERMAN S. STERNBERGER, Piqua, Ohio. Filed Jan. 28, 1884. (No model.)



Claim.—A crate for transporting mattresses and like square-shaped articles, consisting of the side pieces, A, the corner-posts B, vertical braces C, the top and bottom cross-pieces, D, and the lining E, secured flatly and permanently to the inside of the frame, substantially as described.

299,872. CUTTING-PLIERS. ELISHA STEVENS, Middletown, CONN. Filed Sept. 1, 1883. (No model.)



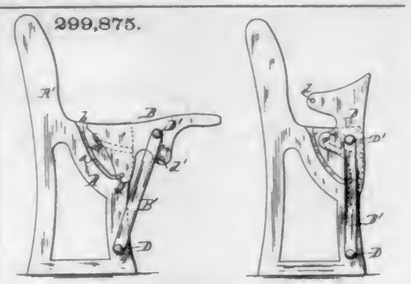
Claim.—In combination, in cutting-pliers, the pivoted levers, the heads of which are provided with shallow mortises open on front, rear, and top, with the limiting sides undercut and tapered from front to rear, and the removable cutting-blades without depthwise projecting bearing-shoulders, and shaped and tapered to fit said mortises, all substantially as described.

299,873. POLISHING-BRUSH. WILLIS A. STEVENS, Wallingford, CONN. Filed Apr. 7, 1884. (No model.)

Claim.—The herein-described brush, consisting of one or more metal disks, A, the periphery of the disks having holes or recesses to receive the doubled ends of tufts, the tufts doubled and introduced into said holes, and a pin, *e*, transversely through the disks and over the bend of the taft, substantially as described.

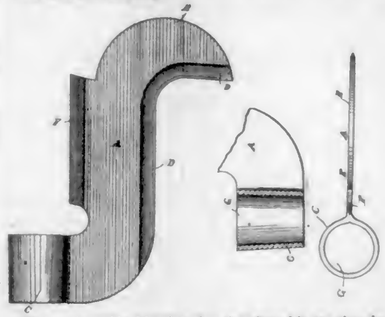
299,874. TABLE-LEAF SUPPORT. STEPHEN W. STILWELL, Dayton, Ohio. Filed Nov. 21, 1883. (No model.)

Claim.—The combination, with the table B, frame A, and leaf C, of the slotted bracket E, provided with depressions forming lugs *f*, the latch F, having pivotal bearings in the depressions made in the bracket, and the arm D, hinged to the frame A, and formed at its outer end with a shoulder, *e*, on its upper face, for the latch F to bear against, substantially as described.



299,875. FOLDING SEAT FOR SCHOOL-FURNITURE. IRVING L. STONE, Battle Creek, Mich. Filed Nov. 1, 1883. (No model.)

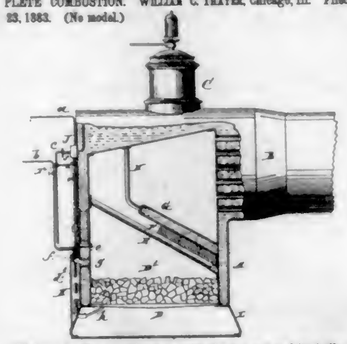
Claim.—1. The combination, with the standards and seat provided with grooves and pins fitting the grooves, substantially as described, of the links or braces connecting the standards and seat, as and for the purposes set forth.



2. The combination, with the standards, grooved substantially as described, of a seat provided with pins fitting the grooves in the standards, and links or braces connecting the standards and seat, as and for the purposes set forth.

3. The combination, with the standards provided with the grooves or slots opening outward in opposite directions, of the seat provided with pins fitting the grooves, and links or braces connecting the seat and standards, substantially as and for the purpose set forth.

299,875.



299,876. COMBINED BRUSH-HOOK AND AX. EDWIN H. SUBLETT, St. Louis, Mo., assignor to Simmons Hardware Company, same place. Filed Feb. 27, 1884. (No model.)

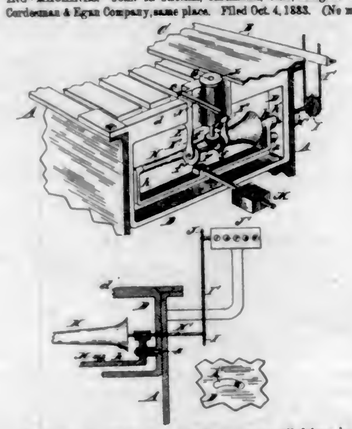
Claim.—A combined brush-hook and ax formed in one piece, having body A, hook B, cutting-blade D on one edge of the body, long cutting-blade F on the other edge of the body, and a projection, C, having a tapering socket or eye in advance of the long cutting-blade, as set forth.

299,877. METHOD OF AND MEANS FOR PRODUCING COMPLETE COMBUSTION. WILLIAM C. TRATER, Chicago, Ill. Filed June 23, 1883. (No model.)

Claim.—1. The combination, with the furnace and its boiler, of the steam-pipe *c*, leading from the dome of the boiler to the box J, and thence downward along the outside of the furnace, the superheating-tube *e*, connecting with pipe *c*, and extending across the inside of the fire-box, and thence to the outside and downwardly to the pipe *f*, contained within the air-chamber K, and the injector connecting with said pipe *f*, substantially as described.

2. The combination, with the furnace and its boiler, of the steam-pipe *c*, leading from the dome of the boiler, the superheating-tube *e*, connecting with pipe *c*, and extending transversely across the inside of the fire-box and then to the outside thereof, the pipe *f*, inside the heating-chamber K, and connecting with the pipe *e*, the injector having a steam-passage connecting with pipe *f*, and an oil-passage outside of the steam-passage, and an oil-tube connecting with said oil-passage, substantially as described.

3. The combination of the steam-pipes *c e*, oil-pipe *b*, dust-pipe *a*, the injector above the grate-bars, provided with the steam, oil, and dust passages communicating with said pipes, the steam-pipe *d*, and the injector below the grate-bars, communicating with said pipe *d*, substantially as and for the purpose set forth.



4. The combination of the steam-pipes *c e* and the injector above the grate-bars with the steam-pipe *d*, having the returns *d'* within the chamber K, and the injector below the grate-bars, substantially as and for the purpose set forth.

5. The injectors composed of the casting having the steam-passage and portion of the dust-passage formed in one piece therewith, and the outer shell adjustably secured to said casting, and held in place by the lock-nut, whereby the space adjustment between the blast-exits of the steam and dust passages and the alignment of such exits are preserved, substantially as and for the purpose set forth.

6. The method herein described of producing complete combustion and preventing the formation of visible smoke, consisting in injecting superheated steam, finely-divided carbonaceous material, and air in a broad sheet over the surface of the burning fuel, and at the same time injecting superheated steam and air under the body of the burning fuel, substantially as and for the purpose set forth.

7. The combination, in a steam-generator furnace, of the water-tubes E, fire slab or bricks F, and water-leg G, with injectors, substantially as specified.

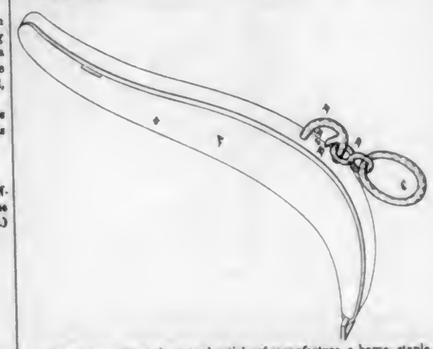
299,878. MEASURING AND REGISTERING DEVICE FOR PLANING-MACHINES. JOHN R. THOMAS, Cincinnati, Ohio, assignor to the Cordesman & Egan Company, same place. Filed Oct. 4, 1883. (No model.)

Claim.—1. A lumber-meter having a taper roll driven by an adjustable roller in frictional contact therewith, and which is in turn driven by a frictional roller traveling in contact with the lumber passing through the machine, substantially as herein set forth.

2. A lumber-meter operated by means of a taper friction-roller driven by an adjustable friction-roller, in combination with a registering apparatus driven by a transmitter on the shaft of the taper roller, substantially as herein set forth.

3. A lumber-meter adapted to be attached to the frame of a planer and operated by means of a roller in frictional contact with the lumber, which roller transmits motion to a second roller laterally adjustable with and driving a taper roll, the shaft of which taper roll transmits motion to a counting apparatus which registers the surface-feet of the lumber passing through the machine, substantially as herein set forth.

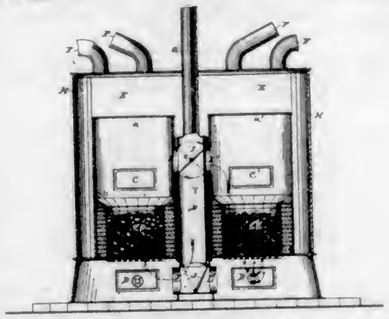
4. A lumber-measure having a taper roll, H, driven by the frictional contact of a pulley which is made laterally adjustable thereto, so as to increase or decrease the speed of the shaft of the taper roll to record the surface-measure of varying widths of lumber planed, substantially as herein set forth.



299,879. HEAD-COMB. STEPHEN A. TISDALE, Leominster, MASS. Filed Sept. 11, 1883. (No model.)

Claim.—1. A comb, hair-pin, or other like article having attached to or connected with it an ornament or ornaments by means of a spring adapted to support the ornament or ornaments above or out of contact with the hair, and to allow of free vibration of the same, substantially as shown and described.

2. In combination with a comb, hair-pin, or other like article, an ornament or ornaments attached thereto by means of a Z-shaped flat bent spring adapted to hold the ornament or ornaments above or out of contact with the hair or head-dress, and light enough to allow them to vibrate as the wearer moves about, substantially as shown and described.



299,880. HAME-STAPLE. JOHN TOERPER and FRANK KREIN, St. Louis, Mo.; said Toerper assignor to said Krein. Filed Sept. 22, 1883. (No model.)

Claim.—1. As an improved article of manufacture, a hame-staple of the form shown, having a single horn, B^3, to partition off a portion of the loop for the breast-strap ring, as set forth.

2. A hame-staple, B, having a small horn, B^3, to divide the tug-clip loop, a link having two eyes, and a breast-strap ring, one eye of the link being secured beneath the horn, and the other eye of the link receiving the breast-strap ring, all combined and arranged substantially as shown and described.

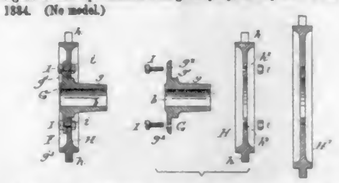
299,881. FURNACE. JOHN A. TOPLIFF, EDWARD S. CROSS, WILLIAM S. COX, and JOHN A. MCCOLLUM, Elyria, Ohio. Filed Aug. 6, 1883. (No model.)

Claim.—The combination, with two stoves or furnaces and a chimney, of a single flue provided with separate openings connecting with each of said stoves above and below their fire-grates and with said chimney, and dampers therein, substantially as described.

299,882. DEVICE FOR CONNECTING AND SUPPORTING THE SECTIONS OF DREDGER-DISCHARGE PIPES. ALEXEY W. VON SCHMIDT, San Francisco, Cal. Filed Jan. 22, 1884. (No model.)

Brief.—A sectional discharge-pipe is supported on pontons having end cleats for securing them together. The joint at the discharge end of the pipe is a ball-and-socket, the intermediate joints being of rubber hose clamped to the adjoining pipe ends. Strain on such rubber hose is prevented by lacing the ends of main-pipe sections together by ropes passing around hooks thereon.

299,882.



Claim.—1. A dredger-conduit consisting of sections of pipe supported upon pontons, and having its end sections near the point of deposit connected by ball-and-socket joints, its intermediate sections connected by flexible sections, substantially as described, and connected to the dredger by a flexible pipe.

2. A ponton for supporting dredger-pipe, consisting of the body C, provided with the cross-pieces *c*, and the cleats near the end for the attachment of ropes, substantially as described.

3. In a joint for dredger-pipes, the combination, with the contiguous ends of said pipe, of a section of rubber pipe clamped thereto, and the hooks secured near the ends of the pipe, adapted for the reception of cord, whereby the strain is taken off the rubber connection, substantially as described.

4. The combination, in a dredger-conduit, of the pipe B, connected by flexible joints, as described, and the pontons A, provided with cross-pieces *c*, and joined together by ropes or the like, substantially as described.

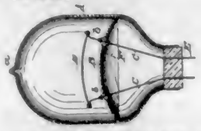
299,883. VELOCIPEDE. ALBERT E. WALLACE, Hartford, Conn., assignor to the Pope Manufacturing Company, same place. Filed Apr. 11, 1884. (No model.)

Claim.—1. A compound wheel for transmitting power, consisting in a central nave and a removable crown, essentially as set forth.

2. A nave of a wheel for transmitting power, constructed and adapted to be secured to a shaft, and to receive one or more crowns interchangeably, essentially as set forth.

3. A removable crown of a wheel for transmitting power, constructed and adapted to be secured interchangeably to and combined with a nave to connect it with a shaft, essentially as set forth.

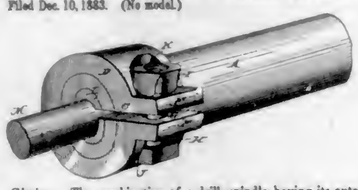
299,884. EGG-BEATER. JOHN EDWARD WELLING, Georgetown, Ky., assignor of two-thirds to Justice Webb and James E. Castril, both of same place. Filed Mar. 24, 1884. (No model.)



Claim.—1. The combination of the open cylindrical shell A, having the threaded bottom flange, B, removable cone bottom C, having threaded flange D, conical beater F, having the staff G, and cross-head H, and removable cover J, having the central flanged aperture, I, substantially as and for the purpose herein shown and specified.

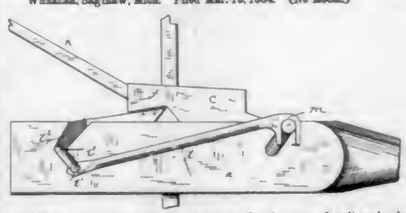
299,884.

2. In an egg-beater of the described class, the combination, with the cylindrical shell or casing A, of the removable cone bottom C, projecting into the cylinder, substantially as and for the purpose herein shown and specified.



299,885. ELECTRIC LAMP. ALEXANDER WEIN, St. Denis, Md., assignor to the Viaduct Manufacturing Company of Baltimore City. Filed Aug. 9, 1883. (No model.)

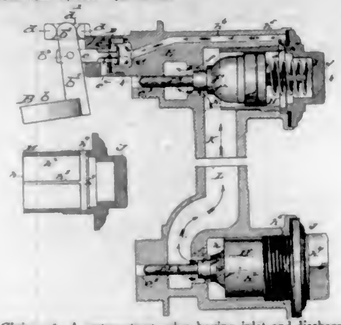
Claim.—1. An incandescing electric lamp having its filament-chamber separated from an attached closed chamber by a wall which has its surface outside of the filament-chamber covered by a metallic reflecting-covering, substantially as described.



2. In an incandescing electric lamp, the filament-chamber having a portion of its transparent inclosing wall provided with two outwardly-projecting teats through which the leading-in wires are sealed, said portion of wall having its outer surface provided with a metallic reflecting deposit through which said teats project and insulate the same from the leading-in wires, substantially as described.

299,886. DRILL-CHUCK. CHAS. S. WHITEBOOK, Springsville, N. Y. Filed Dec. 10, 1883. (No model.)

Claim.—The combination of a drill-spindle having its outer end tubular, and provided with two diametrically-opposite longitudinal slots, a chuck or clamp clamping the outer end of the drill-spindle, and having perforated lips for the reception of a screw-bolt, and having recesses in its outer sides near the lips for the reception of the head of the bolt and of the nut, a soft-metal bushing having two diametrically-opposite longitudinal slots, and a drill-bit, as and for the purpose shown and set forth.



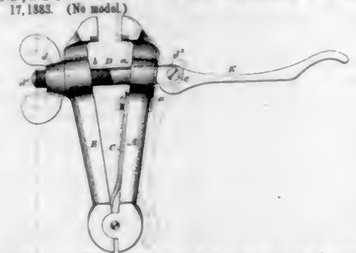
299,887. CLAMP FOR HOLDING WELL-POLES. BRAYTON WHEELER, Saginaw, Mich. Filed Mar. 15, 1884. (No model.)

Claim.—1. In a device for stopping the descent of well-poles in salt-wells when the draw-rope or drawing mechanism becomes broken, the combination, with the slotted frame, of the pivoted dogs having beveled biting edges provided with semi-oval recess in said biting edges, said dogs being pivoted on crank-shafts having bearings in the frame, the cranks of said shafts being connected by a hook-rod, one of the dogs being provided with projecting arms above its biting edge, and the other dog being pivoted on a removable shaft, substantially as specified.

2. The combination, with the slotted frame, the pivoted dog having the inwardly-projecting arms and the semi-oval recess in its biting edge, and the other dog pivoted to a removable crank-shaft, and having a semi-oval recess in its biting edge, of the rod for connecting the cranks of the crank-shafts and the lever for operating said dogs, substantially as specified.

299,888. WATER-CLOSET VALVE. PETER WEITZ, St. Louis, Mo. Filed June 19, 1883. (No model.)

Claim.—1. A water-closet valve having inlet and discharge passages above the main valve, and an outlet-passage leading from below this valve to a chamber, H, below the relief-valve, and also having a groove in the wall of chamber H, in combination with the main valve having its stem *f'* working loosely through the perforation *e'*, substantially as described.



2. The combination, in a water-closet valve, of the chamber H, the groove *h'* therein, the outlet h^4, the valve F, and the stem *f''*, having the part f^3, constructed substantially as described.

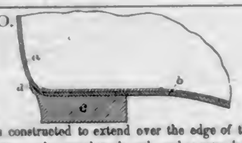
3. The combination of the chamber E, the passage h^4, the chamber H, having the groove *h'* and the outlet h^4, with the inlet and discharge passages, and the main valve F, substantially as described.

4. In a water-closet valve having inlet and discharge passages above the main valve, a chamber with an outlet below this valve, a groove, *h'*, a passage, h^3, a relief-valve, C, the extension *d''*, lugs *d d*, cap D, and a float-lever attached to the stem of the relief-valve, substantially as described.

5. In combination with a valve constructed with a side outlet-passage, h^3, leading from a chamber below the main valve having a groove *h'*, the relief-valve C, having a float-lever pivoted to its stem, substantially as described.

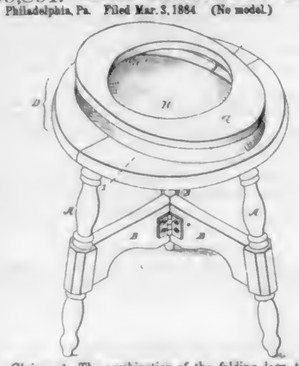
299,889. VISE. WILLIAM M. WHITING, Elizabeth, N. J. Filed Oct. 17, 1883. (No model.)

Claim.—1. The combination, with the pivoted jaws of a vise, of a threaded bolt whose axis coincides with a vertical plane passing longitudinally through the middle of both jaws, a nut turning upon said bolt bearing against one jaw, and a cam-lever pivoted to said bolt and movable in a vertical plane bearing against the other jaw, said nut and cam-lever being capable of either independent or conjoint action, as set forth.



2. The combination, with the pivoted jaws of a vise, of a threaded bolt whose axis coincides with a vertical plane passing longitudinally through the middle of both jaws, a nut turning upon said bolt bearing against one jaw, a cam-lever pivoted to said bolt and movable in a vertical plane bearing against the other jaw, said nut and cam-lever being capable of either independent or conjoint action, and a spring for keeping said jaws normally separated, as set forth.

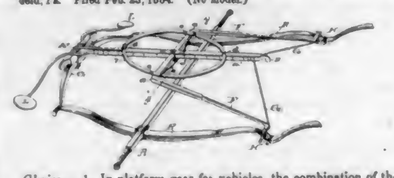
299,890. RUBBER BOOT. MOSES W WHITNEY, Bristol, R. I. Filed Apr. 23, 1883. (No model.)



Claim.—1. In a rubber boot, the combination, with the sole and counter, of a heel provided with a rearward and upward integral extending flange, as constructed to extend over the edge of the sole and lap onto the counter, and secured to the sole and counter by cementation.

2. A molded rubber heel provided with an integral flange extending upward around the rear of the heel, adapted for cementation to the bottom of the sole and to the counter, as described.

299,890.

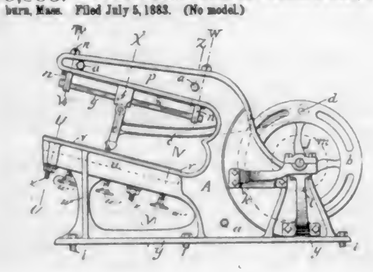


299,891. COMBINED COMMODE AND BIDET. ISAAC S. WILLIAMS, Philadelphia, Pa. Filed Mar. 3, 1884. (No model.)

Claim.—1. The combination of the folding legs, the annular top having an opening with internal flange, *f*, and the removable ring G, substantially as set forth.

2. The combination of the folding legs, the folding top D, having an opening with internal flange, *f*, the removable ring G, and the bidet-pan H, having a flange, *i*, as set forth.

299,892. VEHICLE PLATFORM-GEAR. CHARLES C. WILSON, Mansfield, Pa. Filed Feb. 23, 1884. (No model.)



Claim.—1. In platform-gear for vehicles, the combination of the center piece, D, and the side arms, F F, having the extensions *a'*, secured to the sides of said center piece, substantially as described.

2. In platform-gear for vehicles, the combination, with the center piece, of the side arms, front braces, and side springs, secured together at their forward ends by the shaft-couplings, substantially as described.

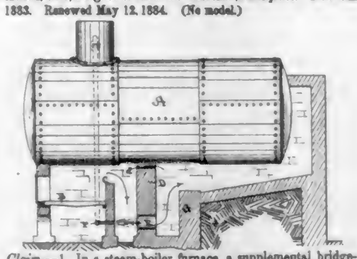
3. In platform-gear for vehicles, the combination of the center piece, side arms, fifth-wheel, and bottom brace with its ends fitting in notches in said side arms, substantially as and for the purpose set forth.

299,893. LEATHER-GLASSING MACHINE. WILLIAM H. WOOD, Woburn, Mass. Filed July 5, 1883. (No model.)

Claim.—1. The frame having the two parts or halves A B formed or secured one to the other at the points of connection, substantially as described, and with space between the same for the crank-wheel and pitman, substantially as specified.

2. The frame formed with two parts or halves A B, with space between the same for the pitman, with one of said halves formed with an offset or recess, *a'*, to receive the crank-wheel, substantially as specified

3. The frame formed with parts A B and with the guide-supporting arm *p*, bed-supporting arm *u*, and base *y*, the same being in each half or part of the frame, united as part and parcel of a unitary casting, substantially as specified.

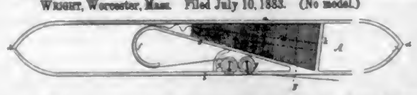


4. The frame formed with the halves or parts A B, with a seat or recess, *i*, correspondingly formed in each said halves at or near the lineal center of arm *p*, and adapted to receive and sustain the fusible metal *s* to support rod *h*, substantially as specified.

5. The cast-metal frame formed in two parts or halves, A B, with one half offset, as at *a'*, to receive wheel *b*, and with an upper arm, *p*, and bed-supporting arm *u*, arranged in a right line coincident with the outer plane of said wheel when arranged in said recess, substantially as specified.

6. In combination with the frame, formed as specified, and the crank-wheel, with its arbor, the hanger *k*, and standard *l*, secured to said frame, and arranged to form an outer bearing and support for said arbor, substantially as specified.

7. In a leather-surfacing machine, a cast-metal frame having halves A B, united as specified, with an interior space for the balance-wheel and pitman, and having the leather-supporting bed and the guides of the reciprocating head arranged in a right line with the plane of said wheel, substantially as specified.

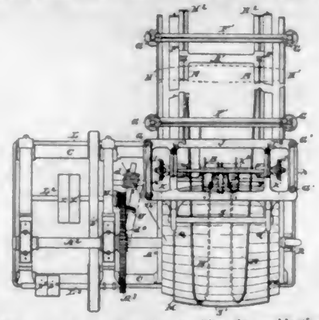


299,894. STEAM-BOILER FURNACE. GRANVILLE T. WOODS, Cincinnati, Ohio, assignor to Ezra W. Vanduzen, same place. Filed June 19, 1883. Renewed May 12, 1884. (No model.)

Claim.—1. In a steam-boiler furnace, a supplemental bridge-wall, D, in rear of the ordinary bridge-wall, arranged with apertures E below the grate-level, and a space, *d*, adjacent to the boiler, in combination with a blast-pipe, F, provided with nozzles arranged to discharge rearward through the apertures E, substantially as and for the purpose specified.

2. In a steam-boiler furnace, the ordinary grate and bridge-wall, the supplementary bridge-wall D, having apertures, as described, and a space adjacent to the boiler, the wall G in rear of wall D, and an inclined surface extending backward from the top of said wall, and a series of blast-pipes corresponding with the apertures in wall D, all the elements in combination, substantially as set forth.

299,895. SHUTTLE FOR WEAVING WIRE-CLOTH. GEO. FLETCHER WRIGHT, Worcester, Mass. Filed July 10, 1883. (No model.)



Claim.—1. The shuttle-body having at or near the middle of one wall an educt, *h*, and guide-rollers *g g* arranged therein, a cop-holding chamber along the opposite wall of the body, with the axis of such chamber oblique to that of the body, and a curved guide extending from the lesser end of such chamber nearly to the opposite wall of the body, such rollers and curved guide being for so directing the wire from the cop to and through the educt as to prevent kinking or accidental improper bending of such wire in passing from the cop through and out of the shuttle, substantially as set forth.

2. The shuttle having within it a cop-holding chamber formed in its body by its bottom and one of its walls, a partition extending across such body from one to the other of such walls, and another partition extending from or near one end of the first partition obliquely to and across the longer axis of the body and nearly to the opposite wall, and curved, as described, an educt arranged at or near the middle of one side, and friction-rollers disposed in said educt, all being substantially as set forth.

299,896. BARREL-MAKING MACHINE. SAML. WRIGHT, Egremont, County of Chester, England. Filed Feb. 26, 1883. (No model.) Patented in England May 12, 1882, No. 2,250, and July 28, 1883, No. 3,589; in France Nov. 10, 1882, No. 152,028, and in Canada Mar. 1, 1883, No. 16,424.

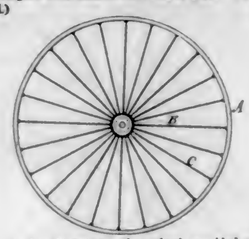
Brief.—The staves are fed to a collapsible form between end, side, upper, and adjustable lower guides, whereby they are bent to the proper bulged form. They are fed by a feeding-board placed behind the rearmost stave, which is pulled forward by ropes attached to it and passing over the staves, over and under the form, and over a spring-roller to a windlass. The form is surrounded by encircling arms, and the staves are partially trussed by the ropes. They are crozed while passing to the form.

Claim.—1. In a barrel-making machine, the combination, with a collapsible barrel form or drum and guide-hoops encircling said barrel form or drum, of a feeding-table composed of end, upper, and lower guide-bars, as described, and a rope or ropes, or their equivalent, attached to a feeding-board behind the staves, to be fed to the barrel form or drum, and passing around said barrel form or drum, whereby the staves are fed onto the barrel form or drum between said form or drum and the encircling guide-hoops and retained in position thereon, substantially as set forth.

2. In a barrel-making machine, a collapsible barrel form or drum, guide-hoops encircling said barrel form or drum, and tightening-pulleys, in combination with a feeding-table composed of end, upper, and lower guide-bars, as described, and a rope or ropes, or their equivalent, which pass around the barrel form or drum, and are adapted to draw or force the staves along the feeding-table and onto the barrel form or drum between said form or drum and the encircling guide-hoops, and also to partially truss the staves when on said barrel form or drum, substantially as set forth.

3. In a barrel-making machine, a feeding-table comprising end guide-bars, H' H', and lower intermediate guide-bars, H^3 H^3, in combination with an adjustable lower central guide-bar, N^3, and upper adjustable guide-bars, F F, substantially as set forth.

4. In a barrel-making machine, the combination, with a collapsible barrel form or drum, of top, bottom, and end guide-bars, means for adjusting the top guide-bars, cutters for shaping the ends of staves, top guide-rollers or their equivalent, and a rope or ropes, or the equivalent thereof, the arrangement being such that the staves, while being drawn toward the collapsible barrel form or drum by a rope or ropes, or the equivalent thereof, are subject to the action of the cutters which shape their ends, as above set forth.



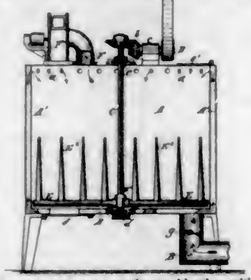
5. In a barrel-making machine, in combination with a collapsible form or drum and encircling guide-hoops, the top roller-shaft, K^3, bevsled rollers K, or their equivalent, the central lower guide-bar, N^3, fixed on the lower frame, J', and means for adjusting said guide-bar to suit the curvature the staves are required to take before entering between the collapsible barrel form or drum and its encircling hoops, substantially as set forth.

6. In a barrel-making machine, a collapsible barrel form or drum, and guide-hoops encircling said barrel form or drum, in combination with a feeding-table, a rope or ropes, or their equivalent, passing around the barrel form or drum, and adapted to draw or force the staves along said feeding-table onto said form or drum between it and the encircling guide-hoops, and means, substantially as described, for automatically regulating the tension of said ropes, whereby they are adapted to truss the staves upon said drum, substantially as set forth.

7. A collapsible barrel form or drum composed of four segments, *f f f' f'*, of which two opposite segments, *f f*, extend through a shorter circular arc than the two adjacent or connecting segments *f' f'*, in combination with the shaft A^2 of the drum, a collar, X', fixed to said shaft, a movable collar, X, adapted to slide on said shaft, links W W W W, connected at opposite ends to the fixed collar X' and the segments *f f f' f'* by pivotal connections, links W' W', connected at opposite ends to the sliding collar X and the short segments *f f* by pivotal connections, and links W^2 W^2, connecting the long segments *f' f'* to the sliding collar X, which links are pivoted to the segments *f' f'*, and are connected to the sliding collar X by pins working in slots W^4 W^4, formed in said collar, whereby the short segments are adapted to travel in advance of the long segments when the drum is being collapsed, substantially as set forth.

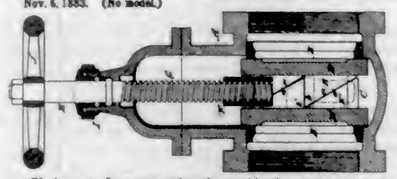
8. In a barrel-making machine, the combination, with a collapsible barrel form or drum and a feeding-table, of feeding-ropes E, winding-drum B, guide-roller D, shaft D', sliding pedestal D^2, fixing D^2, frame O, and springs E', all substantially as and for the purpose specified.

299,897. WHEEL FOR BICYCLES. WILBER S. WRIGHT, Philadelphia, Pa., assignor to Needham M. Wilson, same place. Filed Oct. 5, 1883. (No model.)



Claim.—1. In a bicycle or other wheel provided with spokes, a felly or rim composed of an endless ring of vulcanized fiber, substantially as set forth.

2. In a bicycle or similar wheel, the combination, with the ordinary felly, of an endless rim or tire of vulcanized paper fiber, as set forth.

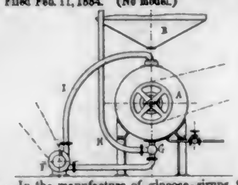


3. A bicycle or other wheel, consisting of the endless rim A of vulcanized fiber, a hub, B, formed of a single piece of the same material, and spokes C, substantially as set forth.

299,898. APPARATUS FOR DRYING FERTILIZERS. WILLIAM WRIGHT, New York, N. Y. Filed June 4, 1883. (No model.)

Claim.—In a drying apparatus, the combination, with a vessel for the reception of material to be dried, provided with a surrounding jacket for hot air which communicates with the interior of the vessel, and a pipe for supplying hot air to the vessel, of a stirrer in said vessel for agitating or moving the drying material, and an exhaust-fan connected directly with the interior of the vessel, and serving by its action to promote the circulation of heated air in the jacket and to convey away from the vessel the air entering from the jacket and the vapors emanating from the drying material, all substantially as and for the purpose herein described.

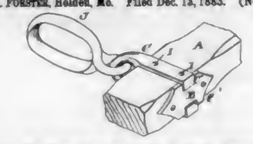
299,899. GATE-VALVE. JAMES ARTHUR, Jersey City, N. J. Filed Nov. 6, 1883. (No model.)



Claim.—1. In a gate-valve, the combination of two valve-disks having series of oppositely-arranged parallel inclined planes capable of engaging each other, stops for arresting the motion of one of the valve-disks, and a screw for sliding one disk upon the other, as described.

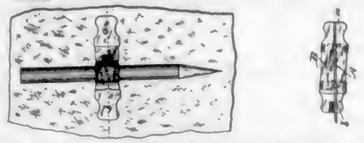
2. In a gate-valve, the combination of the valve-disk D, provided with inclined planes *a*, and adapted to receive the double-flanged lifter F, the valve-disk D', provided with inclined planes *a'*, and having stops K, and the valve-casing A, provided with abutments L, as specified.

3. In a gate-valve, the combination, with the body A, provided with parallel seats B, of the valve-disks D D', having oppositely-arranged series of parallel inclined planes *a a'*.



4. In a gate-valve, the valve-disks D D', provided with oppositely-arranged parallel inclined planes *a a'* and shoulders *b b'*.

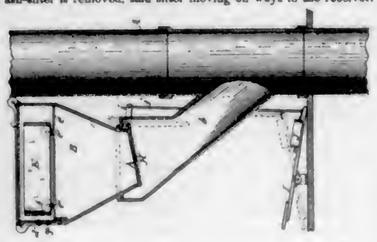
299,900. MANUFACTURE OF GLUCOSE. LÉON BARRIER, Besançon, France. Filed Feb. 11, 1884. (No model.)



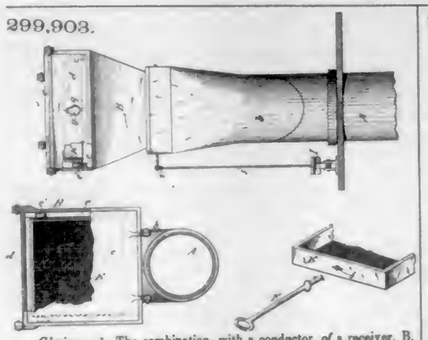
Claim.—In the manufacture of glucose-sirups, the improvement consisting in applying the processes of defecation used in sugar-works—such as the process of carbonation or treatment with carbonic acid—to the impure sirups obtained by the saccharification direct and under pressure of the amylaceous or other materials previously cooked, disintegrated, and diluted, the whole being substantially as hereinbefore set forth.

299,901. CLIP FOR NECK-YOKES, &c. EDWARD P. BARRETT and JOHN A. FORSTER, Holden, Mo. Filed Dec. 13, 1883. (No model.)

Claim.—The combination of a block, A, U-shaped clip C, having shoulders C' and interned ends C', and the plate B, having recesses B' to receive the clip ends, as set forth.



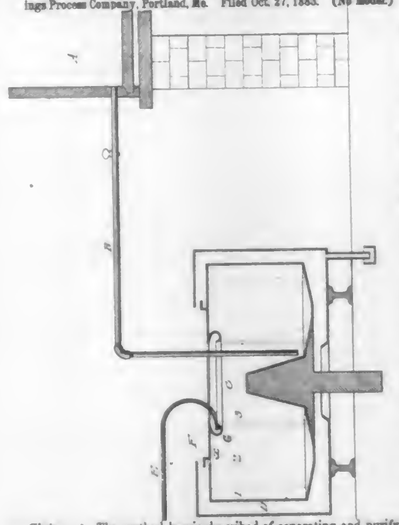
299,902. PENCIL-CLASP. JOB BATCHELOR, Camden, N. Y., assignor of one-half to Augustus G. Wood, same place. Filed Mar. 31, 1884. (No model.)



Claim.—The improved pencil-clasp, consisting of an elastic or spring central portion secured at one end to an attaching-pin and provided on its free end with a socket adapted to fit over the point of said attaching-pin, substantially as shown and described.

299,903. CONDUCTOR FOR ASHES, GARBAGE, &c. JAMES BERRY, Buffalo, N. Y., assignor of one-half to William I. Williams, same place. Filed Jan. 14, 1884. (No model.)

Brief.—A receiver connected with a conductor-pipe has a hinged cover at its upper end, and a valve at its lower end operated by a treadle and connecting-rod. The receiver also has a hinged door through which an ash-sifter is removed, said sifter moving on ways in the receiver.

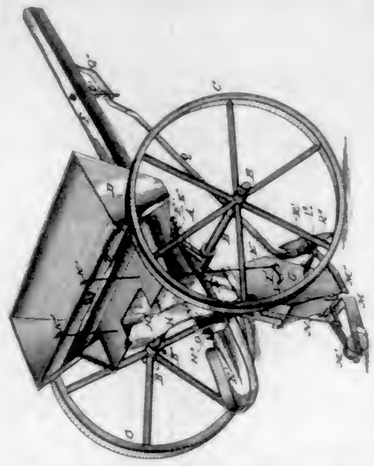


299,903.

Claim.—1. The combination, with a conductor, of a receiver, B, having a hinged cover, *c*, and hinged door *d*, and an ash-sifter, E, moving on ways formed in the receiver, and adapted to be introduced and removed upon opening the door *d*, substantially as set forth.

2. The combination, with a conductor-pipe, A, and receiver B, connected therewith, of a pivoted valve, H, treadle I, and rod *j*, substantially as set forth.

299,904. SEPARATING AND PURIFYING CERTAIN COMPOUNDS OF THE SCOURINGS OF WOOL. JOHN ALBERT WILLIAM BORCHERS, West Medford, Mass., assignor, by mesne assignments, to the Wool Scourings Process Company, Portland, Me. Filed Oct. 27, 1883. (No model.)



Claim.—1. The method herein described of separating and purifying the heavy insoluble component, the soluble component, and the lighter insoluble component of wool scourings by conducting the latter into a revolving basin having a tight bottom, a tight peripheral wall, and a flange tightly joined to and extending from said wall and partially covering said basin, said flange having an opening or openings, the soluble component passing out of the basin through said opening or openings without passing through the heavy insoluble component, and the lighter insoluble component passing out of the basin, each while the basin is revolving, substantially as described.

2. The herein-described soluble component for scouring wool, obtained by the method substantially as described.

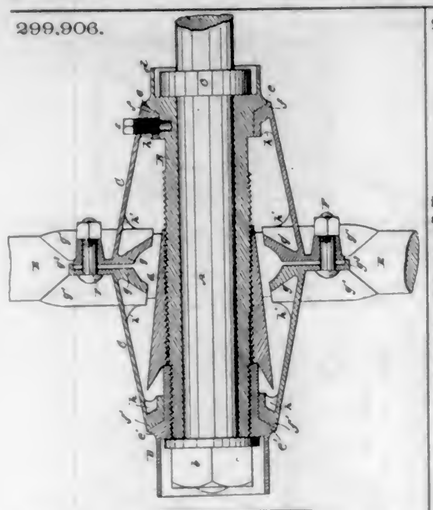
3. The construction and arrangement of a revolving basin for separating and purifying the three herein-described components of wool scourings into which the latter are conducted, said basin having a tight bottom, a tight peripheral wall, and a flange tightly joined to and extending from said wall and partially covering said basin, said flange having an opening or openings at such a distance from said wall that the soluble component may pass out from said basin through the opening or openings while the basin is revolving without passing through the heavy insoluble component, substantially as described.

299,905. CONVERTIBLE SEEDING-MACHINE. THEODORE L. BROOKS, Port Byron, N. Y. Filed Feb. 27, 1884. (No model.)

Claim.—1. The combination, with the main frame, of the seed-box, having one of its sides extended rearwardly to form a shelf, provided with a suitable opening through which the seed may pass, and provided with a suitable rear opening and a sliding cover for the same, to admit the seed to roll out freely upon the said shelf, a dropping device open at each end and provided with a central shaft having its ends bent at right angles, and having its inner surface corrugated at its lower end, a valve centrally secured upon the said shaft, and having its lower end corrugated on either side, a flexible tubing connecting the upper end of the dropping device to the shelf of the seed-box, a spiral spring for holding the valve in its closed position, and operating-cords extending up through suitable apertures in the seed-box shelf, and by means of which the valve of the dropping device is operated, as and for the purpose shown and set forth.

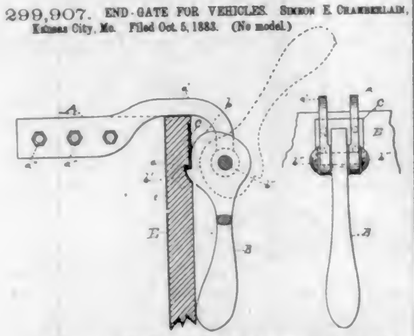
2. The combination, with the main frame, of the seed-box, having one of its sides extended rearwardly to form a shelf, provided with a suitable opening through which the seed may pass, and provided with a suitable rear opening and a sliding cover for the same, to admit the seed to roll out freely upon the said shelf, a dropping device open at each end, and provided with a central shaft having its ends bent at right angles, and having its inner surface corrugated at its lower end, a valve centrally secured upon the said shaft, and having its lower end corrugated on either side, a flexible tubing connecting the upper end of the dropping device to the shelf of the seed-box, a spiral spring for holding the valve in its closed position, and operating-cords extending up through suitable apertures in the seed-box shelf, and by means of which the valve of the dropping device is operated, an adjustable seat-support having upwardly-projecting teeth or racks on each of its side pieces, a double handle secured to the seed-dropping device, and provided with lugs adapted to fit between the teeth of the said racks, and a plow-beam secured removably beneath the tongue of the machine, and having secured upon its lower end a reversible shovel-blade, all constructed and arranged to operate substantially in the manner and for the purpose shown and described.

299,906. VEHICLE-WHEEL. JAMES J. BUSH, Tacoma, Wash. Filed Dec. 5, 1883. (No model.)



Claim.—1. In an adjustable and expanding vehicle-wheel, as described, the inner and outer flanges, *g g'*, of the half-hub sections C C, constructed to form tapering oval sockets g^2, in combination with the tapering oval-shaped spokes E and the bolts F, arranged to pass in between the spokes and free of them, substantially as specified.

2. The hub-sections C C, having inner and outer flanges, *g g'*, forming sockets for the spokes of the wheel, constructed or provided with outer annular lips or branch flanges, g^3, arranged to close the dividing-space between said hub-sections, essentially as and for the purpose herein set forth.

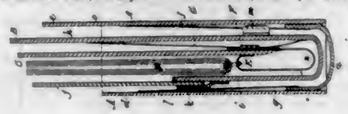


3. The set-screw *s*, in combination with the hub-sections C C, the box B, the hollow screw-cone G, and the axle A, substantially as specified.

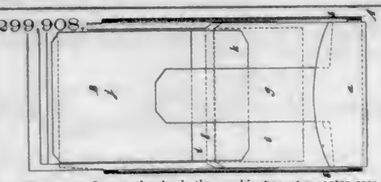
4. The metallic half-hubs C C, having bodies of shell-like construction stiffened internally by end brackets, *h h'*, and constructed with inwardly-bent outer end flanges, *f f'*, essentially as described.

299,906.

299,907. END-GATE FOR VEHICLES. SIMEON E. CHAMBERLAIN, Kansas City, Mo. Filed Oct. 5, 1883. (No model.)



Claim.—1. A locking device for the end-gate to a vehicle, consisting of a bar one end of which is adapted to be attached fixedly to the end-gate and its opposite end constructed with a curved arm, and an eccentric provided with a suitable lever pivotally attached to said curved arm below the point of attachment of the said bar to the vehicle, as and for the purpose specified.

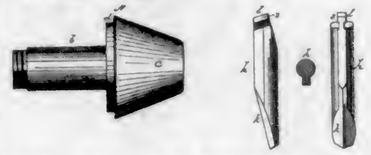


2. The combination, in a locking device for the end-gate to a vehicle, of a bar one end of which is adapted to be attached fixedly to the end-gate and its opposite end constructed with a curved arm, and an eccentric provided with a suitable lever pivotally attached to said curved arm below the point of attachment of the said bar to the vehicle, and a lip projecting beyond the curve of the eccentric, and between the same and the free end of the lever, which is adapted to engage with an offset on the side of the vehicle and lock the lever, in the manner shown and specified.

3. The combination, with the bar having an extended arm and adapted to be secured to the end-gate of a vehicle, and a lever one end of which is provided with an eccentric and pivotally attached to said arm, of a catch-plate having a suitable offset which is adapted to be attached to the side of the body of the vehicle, as and for the purpose specified.

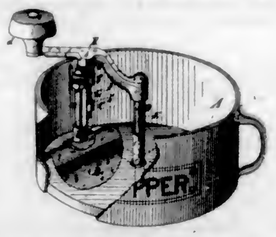
299,908. POCKET-BOOK. HENRY A. CRAPEN, New York, assignor to Edwin H. Brown, Brooklyn, N. Y. Filed Oct. 26, 1883. (No model.)

299,908.



Claim.—1. In a pocket-book, the combination of an outer case, an independent bottom secured therein, an inner case adapted to be slid into and out of said outer case, and a memorandum-paper holder within said inner case, adapted to be slid into and out of said inner case, substantially as specified.

2. In a pocket-book, the combination of an outer case, and an inner case adapted to be slid into and out of said outer case, with a slate, *j*, hinged thereto, substantially as specified.

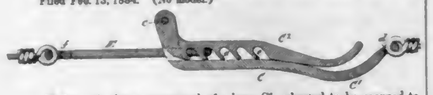


3. In a pocket-book, the combination of an outer case, an independent bottom secured therein, an inner case adapted to be slid into and out of said outer case, a holder for memorandum-paper within said inner case, a shoulder upon said memorandum-holder, upon which memorandum-paper may rest, and a loop for retaining memorandum-paper in the said memorandum-holder, substantially as specified.

299,909. DRILL-CHUCK. CHARLES E. CHURCH, Cleveland, Ohio. Filed Dec. 7, 1882. (No model.)

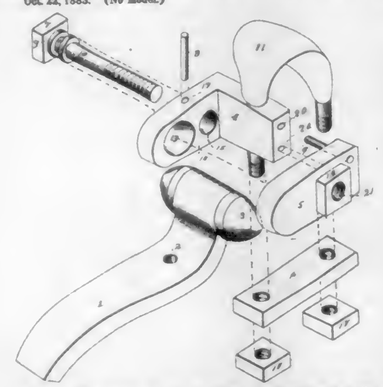
Claim.—The chuck-body A, consisting of the head C, having the peripheral shoulder *d* and stem *b* made integral therewith, and provided with the converging guideways *e*, in combination with the internally-threaded nut E, having an inner annular flange, *v*, the externally-threaded pressure-head D, provided with grooves *n* for the T-lugs *l*, the nut *r*, and the chuck-jaws *h*, beveled at *k*, and provided with the T-shaped lug *l*, all adapted to operate substantially as and for the purposes specified.

299,910. MACHINE FOR CUTTING MEAT AND VEGETABLES. SIMEON S. COOK, Woonsocket, R. I. Filed May 26, 1883. (No model.)



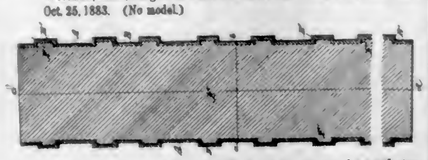
Claim.—1. In a cutter for meats, vegetables, and other substances, the combination of a vessel having its wall made by bending a piece or pieces of wood longitudinally into circular form, so that the grain of the wood will extend circumferentially, and a knife adapted to travel in contact therewith, and consisting of two wings diverging downwardly at an angle, substantially as specified.

2. In a cutter for meats, vegetables, and other substances, the combination of a circular vessel and a knife adapted to travel in contact with the wall of the vessel, and having two wings which diverge downwardly, and at their extremities are bent laterally outward, so as to present the edge in about a horizontal position, substantially as specified.



3. In a cutter for meats, vegetables, and other substances, the vessel A, the arm F, provided with the spindle E and stud G, the knife B, attached to the shaft *a*, the frame C, fitting on the stud G, and supporting the shaft *a* in a position beyond the arm F, and the spring H, all being so combined and organized that the knife will be forcibly pressed against the wall of the vessel, and when revolved around the vessel will derive a rotary motion from contact with the wall of the vessel, substantially as herein described.

299,911. FASTENING DEVICE FOR WIRE FENCES. EDWARD A. COOPER, Buffalo, N. Y., assignor of one-fourth to Frank Sibley, same place. Filed Feb. 13, 1884. (No model.)

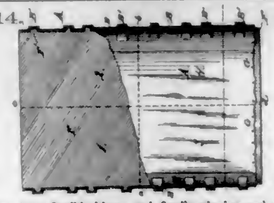


Claim.—A clamp composed of a jaw, C', adapted to be secured to one end of the wire, a jaw, C', pivoted to the jaw C', and provided on its inner side with a series of notches, *c*, and a bail, E, adapted to be engaged in said notches, and to be secured to the other end of the wire, the parts being combined substantially as set forth.

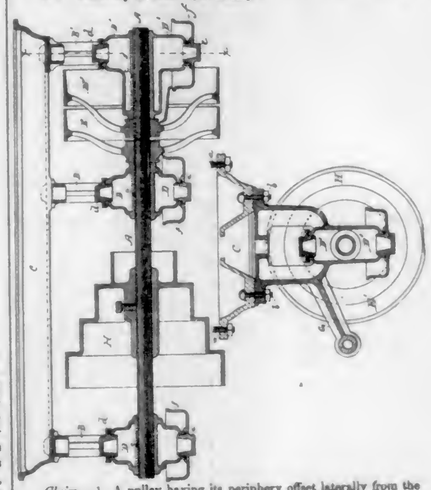
299,912. THILL-COUPLING. SAMUEL CRAIG, Holmesburg, Pa. Filed Oct. 22, 1883. (No model.)

Claim.—The herein-described coupling, consisting of the clip provided with the plate 4, having in one end the openings 20, arranged in vertical series, and the jaw 18, extended forward from the opposite end of plate 4, and provided with socket 13, and intersecting openings 15 19, the movable jaw provided with socket 13, and transverse threaded opening 21, the pins 6, extending from the rear end of the movable jaw in position to enter the openings 6, the bolt 10, inserted through openings 15 and turned through openings 21, and provided with an annular groove, 12, formed in position to register with opening 19, the pin 8, and the thill provided with lateral bosses 3, all arranged substantially as and for the purposes set forth.

299,913. PAPER BACK FOR BOOK-COVERS. JAMES A. CRANE, Westfield, Mass., assignor of one-half to Robert B. Crane, same place. Filed Oct. 25, 1883. (No model.)



Claim.—The hereinbefore-described art or process of manufacturing paper backs for book-covers, which consists in forming the backs in pairs from an endless or seamless tube composed of successive layers of paper over a shaped form or core by drying and shrinking the paper tube upon the form, cutting the dried and shrunk paper tube longitudinally across the middle, and finishing the backs, substantially in the manner and for the purpose shown and set forth.



299,914. BOOK COVER. JAMES A. CRANE, Westfield, Mass., assignor of one-half to Robert B. Crane, same place. Filed Oct. 25, 1883. (No model.)

Claim.—The hereinbefore-described art or process of manufacturing book-covers, which consists in forming the covers in pairs from an endless or seamless tube composed of successive layers of paper over a shaped form or mold by drying and shrinking the paper tube upon the form, cutting the dried and shrunk paper envelope lengthwise on both sides of the form, waterproofing the paper body thus formed, disconnecting or severing the rigid sides of the cover from the back and again uniting the same by a flexible hinge, and finally planing and finishing the sides and back, substantially in the manner and for the purpose shown and set forth.

299,914.

299,915. COUNTER-SHAFT. DE WITT CLINTON CURRIER, Carthage, N. Y. Filed July 30, 1883. (No model.)

Claim.—1. A pulley having its periphery offset laterally from the plane of its hub, but within the plane of its rotary central bearing, combined with a counter-shaft, and arranged rigidly upon an independent shaft in line with the counter-shaft, substantially as shown and described.

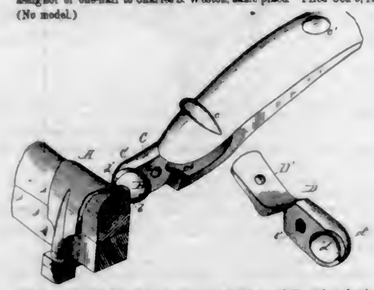
2. The hangers B, having cast therewith bearings for the shaft and an air-tight oil-chamber about the same, as and for the purpose described.

3. The hangers B, formed with bearings and an air-tight oil-chamber about the same, in combination with the filling-plug *d* and the discharge-plug *e*, having drip-cup *f*, as and for the purpose described.

4. The combination, with a shaft and its driving-pulley, of an independent shaft arranged concentrically in line therewith, and an idle-pulley fixed on said independent shaft side by side with the driving-pulley, as set forth.

5. The combination, with a driving-shaft and the independent short shaft arranged in line therewith and having a long bearing, as described, of the two pulleys E and E', fixed, respectively, upon the adjacent ends of said shafts, and having their arms bent or offset, so as to bring the periphery of the idle-pulley E in the plane of its bearing, as and for the purpose described.

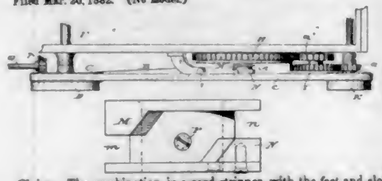
299,916. BARB-FENCE. ALEXANDER C. DECKER, Bushnell, Ill., assignor to Washburn & Moen Manufacturing Company, Worcester, Mass. Filed July 9, 1878.



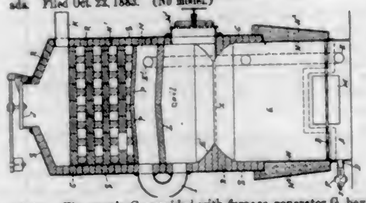
Claim.—1. The barbed fencing comprising the two twisted longitudinal wires and the barbs secured thereon, each barb consisting of a wire bent to form the two loops which receive each one of the longitudinal wires, the middle portion connecting the loops, and the points extending beyond the loops, said loops being both on the same side of the middle portion of the barb, substantially as described.

2. The combination, in a barbed fencing, of the twisted longitudinal wires and barbs secured thereon, each barb consisting of a wire bent to form the two loops which receive each one of the longitudinal wires, the long middle portion connecting the loops and spacing or holding apart the longitudinal wires between the twisted portions, and the points extending beyond the loops, substantially as described.

299,916.

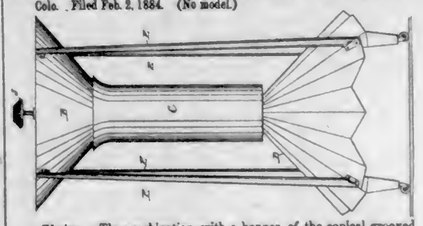


299,917. THILL-COUPLING. LAURISTON J. DERRICK, Uxbridge, Mass., assignor of one-half to Charles S. Weston, same place. Filed Oct. 6, 1883. (No model.)



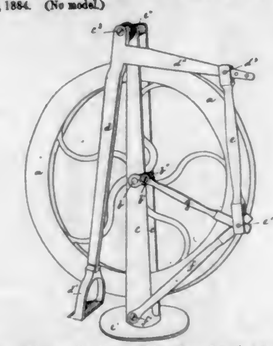
Claim.—In a thill-coupling constructed substantially as herein shown and described, and consisting of an axle-clip, A, having a vertically-enlarged front portion, *a*, from which projects a cylindrical neck, *b*, having formed integral therewith a ball, B, in combination with the members attached to the thills, consisting of a rigidly-attached member, C, with recessed or depressed portions c^2 and socket *d*, with segmental cut-away portion *d'* and perforation *e*, and member D, with a projecting portion, D', adapted to be within the recess c^2 under the end of the thill, the lower end of this member being of the same configuration as its opposite member, and provided with a screw-threaded perforation, *d'*, of less diameter than the perforation *e*, and bolts for securing the parts to each other, for the purpose set forth.

299,918. CARD-STRIPPER. JOSEPH M. DUNHAM, Holyoke, Mass. Filed Mar. 20, 1882. (No model.)



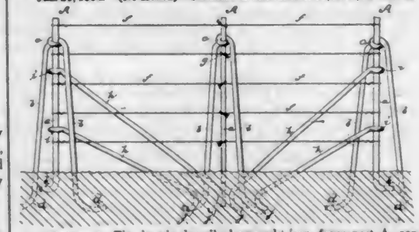
Claim.—The combination, in a card-stripper, with the fast and slow motion pulleys, the stripping mechanism, the belt, and the belt-shipper, of a sectional shipper-controlling cam provided with fast-motion and slow-motion swells adjustable with relation to one another, substantially as and for the purposes hereinbefore set forth.

299,919. GAS-GENERATOR. PETER ENGLISH, London, Ontario, Canada. Filed Oct. 22, 1883. (No model.)



Claim.—The cupola C, provided with furnace-generator G, beveled conductor G', and metallic casing N, water-jacket N^3, superheating-chamber H, provided with brick-work H', conducting-tube I, and central partition, L, substantially as shown and described, and for the purpose specified.

299,920. ORE-SAMPLING MACHINE. THOMAS T. EYRE, Decatur, Colo. Filed Feb. 2, 1884. (No model.)



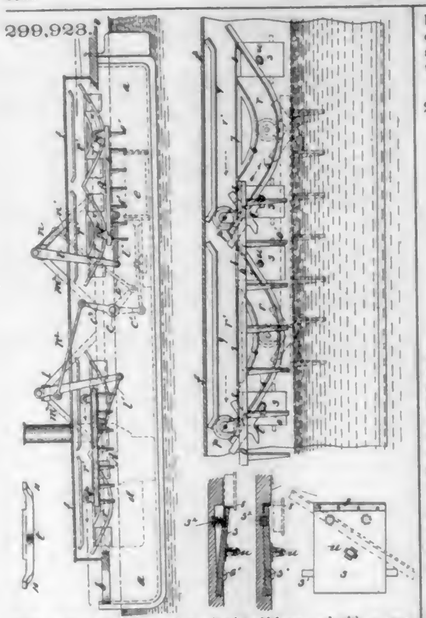
Claim.—The combination, with a hopper, of the conical grooved divider described, and a cylinder having a screw-thread, and a vertical shaft journaled to rotate in the said hopper upon the apex of said divider, substantially as and for the purpose specified.

299,921. TREADLE-MOTION. DAN P. FOSTER, Waltham, Mass. Filed Apr. 24, 1884. (No model.)

Claim.—The treadle-lever *d*, hinged at c^2 to the standard *c*, and having stirrup *d'* and arm *d''*, combined with the toggle-levers *e f*, connecting-rod *g*, and crank *b' b''* on the spindle *b*, substantially in a manner and for the purpose as set forth and described.

299,922. WROUGHT-IRON FENCE-POST. JACOB G. GUNMAN, St. Marys, Ontario, Canada, assignor to William N. Ford, same place. Filed Jan. 28, 1884. (No model.) Patented in Canada Jan. 30, 1882, No. 14,093.

Claim.—1. The herein-described wrought-iron fence-post A, consisting of the vertical rod *a*, provided with notches *e*, and the inverted-U-shaped lateral braces *b*, formed of a single rod, and having an eye, *c*, to receive the rod *a*, and provided with the feet *d*, substantially as herein shown and described.



2. In a fence-post, the combination, with the rods *a*, provided with the feet *k*, of the inverted-U-shaped lateral braces *b*, provided with the eye *c* and the feet *d*, substantially as herein shown and described.

3. The combination, with the post A, consisting of the vertical rod *a* and the inverted-U-shaped braces *b*, provided with feet *d*, of the braces A, provided with eyes *i* and feet *j*, substantially as herein shown and described.

299,923. MARINE PROPELLER. EVAN T. GRIFFITH, Brooklyn, N. Y. Filed Feb. 28, 1884. (No model.)

Claim.—1. In a propelling apparatus, the combination, with a reciprocating paddle-truck, of ways therefor, having the propelling or active path formed into two arcs or loops tangent to the water-line, with

299,923.

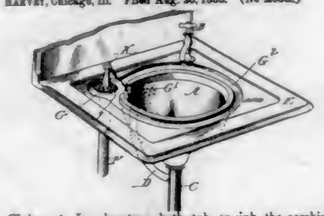
rollers on each end of the truck moving in said loops, and with an overlying straight way extending the length of both loops and intersected by each end of said loops, with suitable switching devices at the said points of intersection for shifting the truck-wheels from the rails of one set of ways to the other, and suitable means for imparting motion to the said truck, substantially as herein set forth.

2. In a propeller apparatus, the combination, with a reciprocating paddle-truck and a propelling and a return way in which the same is movable, of the pivoted switching-gates *s* 8, arranged at the intersections of the two ways, and cams or projections on the ends of the truck, arranged to actuate said switches at each end of the stroke, substantially as and for the purpose set forth.

3. The combination, with the reciprocating paddle-truck A, having wheels, of the return-way *r'* and propelling-ways *r*, formed with the straight rails 7 and curved or inclined rails 5, with the switch-plates *s*, having rails 8, arranged at the intersection of the two ways, and cam-shoes *t* on the ends of the truck for operating said switch-plates, substantially as herein set forth.

4. In a propelling apparatus, the combination, with the shaft *c* and an engine for revolving the same, of the pendulous levers *l l* and reciprocating paddle-trucks A, with cranks on the said shaft, links n^2, connecting said cranks and levers, and links *l'*, connecting said levers and trucks, substantially as herein shown and described.

5. In a propelling apparatus, the combination, with the main shaft *c* and an engine for imparting motion thereto, of two cranks, c^3 c^3, set reversely on said shaft, two paddle-trucks arranged to act reversely with the two pendulous levers *l l*, connected with said trucks, and links *n'* and n^3, connecting said cranks and levers in reverse order, whereby one truck will advance while the other retires, substantially as herein set forth.

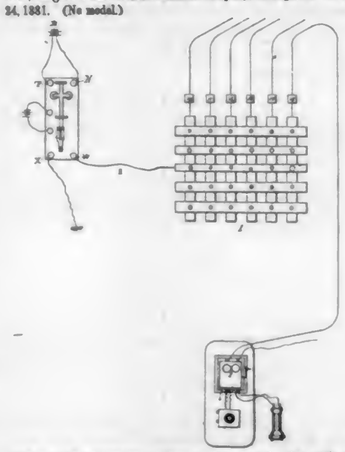


299,924. SKATING-RINK FLOOR. GEORGE COLE HARKINS, Salt Lake City, Utah, assignor of three-fourths to Manual L. Causey, Edward D. Egan, and Leila Kaighn. Filed Feb. 21, 1884. (No model.)

Claim.—1. The combination, in a skating-rink floor, of a foundation or base, A, composed of a compound or mixture of coarse, clean gravel with Portland cement, and water sufficient to make the mass cohere, and a top surface or dressing, B, consisting of a compound or mixture of fine, clean sand, Portland cement, water, and quicklime in the proportions specified.

2. The method of laying and forming a skating-rink floor which consists in spreading upon leveled ground a mixture or composition of coarse gravel and cement moistened with water sufficient to make the mass cohere, said foundation being laid in strips of suitable width and length, and covering the same with a surface or top-dressing composed of fine, clean, sharp sand, Portland cement, quicklime, and water in about the proportions specified.

299,925. AUXILIARY OVERFLOW FOR LAVATORIES. PATRICK HARVEY, Chicago, Ill. Filed Aug. 20, 1883. (No model.)

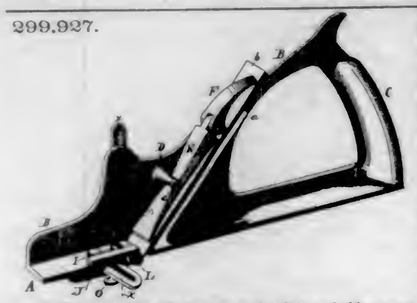


Claim.—1. In a lavatory, bath-tub, or sink, the combination of a basin, a waste-pipe, and an independent auxiliary overflow escape-conduit connecting with the upper part of the basin, but not with the waste-pipe, so as to relieve the basin when the waste-pipe and ordinary overflow are closed.

2. In a lavatory, bath-tub, or sink, the combination of a basin, a waste-pipe, a containing-slab having the groove in its upper surface, and an independent auxiliary overflow escape-conduit connected with the groove in the surface of the slab, but not with the waste-pipe, substantially as described and shown.

3. In combination with the slab of a wash-basin or sink, having a cavity, G, communicating by a groove or spout, G', with the wash-bowl, a conduit leading from such cavity apart from the ordinary waste-pipe, provided with a strainer, J, over the mouth of such conduit, and a chain stay secured to such strainer, substantially as set forth.

299,926. TELEPHONE SYSTEM. CHARLES H. HASKINS, Milwaukee, Wis., assignor to the Western Electric Company, Chicago, Ill. Filed June 24, 1881. (No model.)

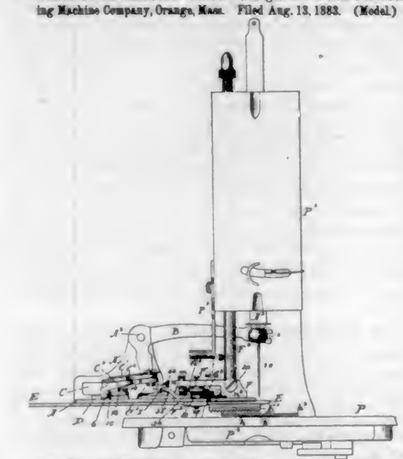


Claim.—In a telephone system, and in combination with the central-office switch-board thereof, a pole-changer adapted for continuous operation, bells adapted to be operated by reversed electric currents, electric circuits connecting said bells with the switch-board, and means for connecting the pole-changer to any line centering in said switch-board, substantially as described.

299,927. PLANE. SAMUEL E. HELLER, Cincinnati, Ohio. Filed Mar. 19, 1884. (No model.)

Claim.—1. The combination, in a plane, of the right-angled stock A B, having the flange *a*, and attached lateral boss D, constructed with a longitudinal groove on its under side, the cap E, having a lug, *e*, extending transversely across its upper face, and adapted to be slipped sidewise into engagement with the groove of the boss to prevent movement of the cap in the direction of its length, and the swinging cam F, pivoted to the upper end of the cap, for clamping the cutter *b* upon the flange *a*, substantially as described.

299,927.



2. The combination, with the plane-stock A B, formed with a groove, *c*, in one side of the part B, but not extending through it, of the adjustable gage G, slotted vertically and provided with the lug *d*, and the set-screw H, passed through the slot of the gage and tapped into the part B of the stock, substantially as described.

3. The combination, with the right-angled stock A B, having the boss I on the top face of the part A, of the gage-stock J, provided with lugs *l*, resting on the face of stock A, and the thumb-nut I_4, inserted through the stock J, and tapped into the boss I to secure stock J in position, substantially as described.

4. The combination of the right-angled stock A B, provided with the boss I on the face of the part A, the gage-stock J, provided with lugs *l*, resting on the face of stock A, and formed with the transverse gain *n*, and secured to the stock by screw I_5, the gage M, formed with slotted shank N, entering gain *n*, and screw O, for attaching gage M to stock J, substantially as described.

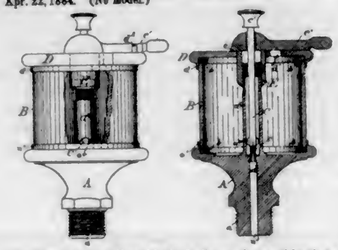
299,928. BUTTON-HOLE ATTACHMENT FOR SEWING-MACHINES. THOMAS S. HUNTINGTON, New York, N. Y., assignor to the New Home Sewing Machine Company, Orange, Mass. Filed Aug. 13, 1883. (Model.)

Claim.—1. The base-plate A, the elbow-lever, the pawl C^9, moved by it, the arm D, the cam D^2, moved by it, and the adjustable shouldered block carried by the said arm, combined with the feed-lever E and the pivoted fulcrum slide or plate F^2, to operate substantially as described.

2. The base-plate and the feed-lever toothed or serrated at its under side to engage the upper side of the material, and means to move the same longitudinally and laterally, combined with a rocking plate having its pivot-connection with the needle-throat *h'* on the throat-plate, substantially as described.

3. The bed-plate A, the elbow-lever, the carriage moved by it, the feeding-lever having teeth 29 30, a cam to vibrate it, the pinion to engage and move the said lever longitudinally, and a pawl and ratchet to move the said pinion, combined with a pawl, H, and with a barring-lever, I, having the toe 44 and depressions 45 46, and the lever 33 to engage it, to enable the longitudinal movement of the said feeding-lever to be suspended at will, substantially as described.

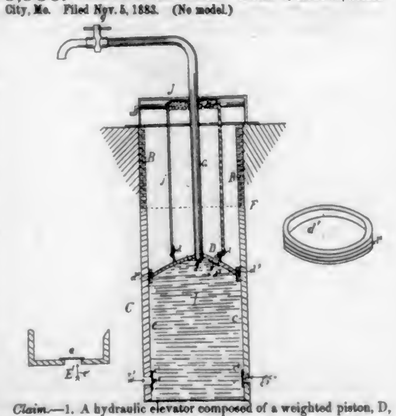
4. The base-plate A and the presser-bar, to which it is attached and held by it above the bed-plate of the sewing-machine, the toothed feed-lever E, the fulcrum-slide to receive it, the shaft to hold the said lever at the under side of the plate A, and the pinion G, combined with the lever 33, to move the said fulcrum-slide, substantially as described.



5. In a button-hole-stitching mechanism, a feeding-lever provided with feed-teeth on its under side to operate upon the upper side of the material to feed it, means to vibrate said lever, and the pinion to move it and the material forward, combined with a pawl and ratchet to move the said pinion tooth by tooth, and with a pawl, H, and barring-lever I, to actuate or leave at rest the said pawl and ratchet, which directly operate the said pinion, substantially as described.

6. The base-plate A, having a portion, A', upwardly turned and slotted, the bridge provided with a hole to receive the presser-bar, the elbow-lever, and the carriage moved thereby, the toothed feeding-lever provided with slot D^3, and teeth 29 30, arm D, block 13 thereon, and cam D^2, constituting a vibrator, and the pinion G, combined with a pawl, G^3, to move the vibrator, and means to rotate the said pinion, substantially as described.

7. The combination, with a button-hole attachment for sewing-machines and the bed-plate, of a conical needle-throat, *h'*, and the plate h^3, having a conical recess, and thereby seated on said throat to tip or rock thereon, substantially as described.

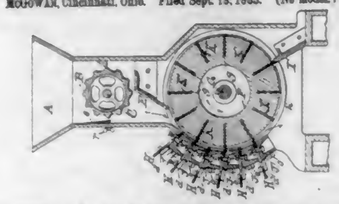


8. The combination, with a button-hole attachment and sewing-machine bed, of a throat-plate, its upwardly-extended throat having a conical tip, and the rocking plate seated or pivoted on said tip, substantially as and for the purpose described.

299,929. OIL-CUP. EDMUND LINKENHEIMER, Cincinnati, Ohio. Filed Apr. 22, 1884. (No model.)

Claim.—In an adjustable-feed oil-cup, the combination of the cap D, provided with orifice *d'* and stop-pin d^2, and the nut E, provided with shoulder *e* and arm *d'*, when arranged and operating substantially as and for the purpose described.

299,930. HYDRAULIC ELEVATOR. GEORGE Q. MCGOWN, Golden City, Mo. Filed Nov. 5, 1883. (No model.)



Claim.—1. A hydraulic elevator composed of a weighted piston, D, concave on its lower side, having an orifice, *g'*, hole d^4, hooks *d d*, and tube G, in combination with walls C, having inlet-valves, as and for the purpose set forth.

2. A weighted piston, D, concave on its lower side, having an orifice at its center, and hooks *d d*, combined with a tube, G, having a faucet, *g*, and a well, A, having walls B C, the part C having smooth inner sides, *c c*, valves c^3 c^3, and a bottom, E, all arranged and constructed substantially as shown and described, for the purpose set forth.

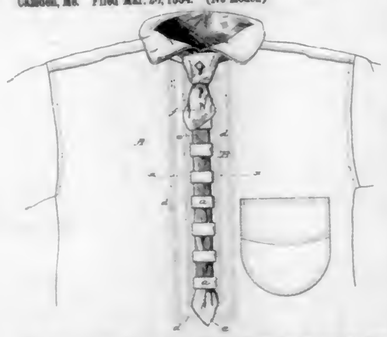
3. A weighted piston, D, concave on its lower side, having an orifice, g', at its center, tube G, bole d^4, hooks d d, and an encircling-band having a groove, d^3, in which is placed a rubber band, d^2, combined with walls C, substantially as shown and described.

299,931. MACHINE FOR HULLING COTTON-SEED.

THEODORE J. MCGOWAN, Cincinnati, Ohio. Filed Sept. 13, 1883. (No model.)

Claim.—1. In a hulling-machine, a hulling-cylinder consisting of a longitudinally-grooved body, F, heads L, provided with overhanging annular flanges A, and blades K, seated in the grooves of the cylinder and projecting beneath the flanges A, as shown and described.

2. In a hulling-machine, a hulling-cylinder consisting of body F, having longitudinal slots g and recessed ends, knives K, seated in said slots, and end plates or heads, L, bolted to the ends of the body F, and provided with flanges h i, the former overhanging the ends of the knives, and the latter seated in the recessed ends of the body F, as shown.



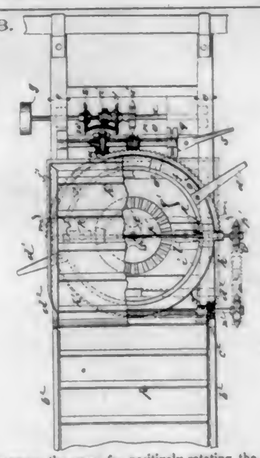
3. A hulling-cylinder consisting of body F, having longitudinal slots g and recessed ends, knives K, seated in said slots, heads or plates L, secured to the ends of the body F, and provided with annular flanges h i, the former overhanging the outer edges of the blades, and the latter seated in the recessed ends of the body, and set-screws b, passing through flanges i and bearing against the inner edges of the knives, substantially as and for the purpose set forth.

4. A hulling-cylinder consisting of body F, having longitudinal grooves g, knives K, seated in said grooves, heads L, secured to the ends of the body F, and provided with the slots or openings k and annular flanges h i, projecting inward, respectively, over the outer and inner edges of the knives, and set-screws b, passing through the flanges i and bearing against the inner edges of the knives, as and for the purpose explained.

5. In a hulling-machine substantially such as shown and described, a concave composed of bars J, slotted knives H, bolts n, passing through the knives and bars, and bolts d, seated in the knives, and provided with eccentrics, arranged, as shown, to bear against the bars J, whereby they are adapted to withdraw the blades or limit their inward movement, substantially as set forth.

299,932. SHIRT.

CHARLES K. MILLER and GEORGE H. CLEVELAND, Camden, Me. Filed Mar. 20, 1884. (No model.)



Claim.—A shirt having an entire or closed front provided with a series of transverse strips or loops arranged centrally on said front, combined with an inserted ornamental strip or tie, the whole being constructed and arranged as shown.

299,933. STRAW-STACKER.

SAMUEL M. MILLER and EMANUEL F. BROWN, Nebraska, Ohio. Filed Nov. 20, 1883. (No model.)

Claim.—1. The combination, with a thrashing-machine, of a turn-table, a straw-elevator partaking of the turning movement of the table, a driving-shaft capable of adjustment toward and from the table to engage and disengage the same for positively rotating the turn-table or permitting it to stand stationary or be freely turned, substantially as described.

2. The combination, with a thrashing-machine, of a turn-table, a straw-elevator partaking of the turning movement of the table, a shaft adjustable toward and from the table to engage and disengage the same, a driving-shaft, gearing for rotating the adjustable shaft, a shifting-clutch for reversing the motion of the gearing, and a clutch-shifting lever, substantially as described.

3. The combination, with a thrashing-machine, of a turn-table, a circular toothed rim thereon, a straw-elevator partaking of the turning movement of the table, a shaft engaging the toothed rim, a driving-shaft, reversing gear-wheels on the driving-shaft for revolving the shaft which engages the rim, a shifting-clutch between the reversing gear-wheels, and a clutch-shifting lever automatically operated by the turn-table to reverse the turning movement of the latter, substantially as described.

4. The combination, with a thrashing-machine, of a straw-elevator, a straw-conveyer intermediate of the elevator and the machine, and capable of moving around in a circular path, together with the elevator, gearing for so moving the intermediate conveyer and elevator, and an automatically-operated clutch for reversing the circular movement of the intermediate conveyer and elevator, and continuously moving them back and forth to uniformly distribute the straw, substantially as described.

5. The combination, with a thrashing-machine, of a turn-table, a straw-elevator partaking of the turning movement thereof, a traveling conveyer supported on the turn-table intermediate of the machine and the elevator, gearing for turning the table, and an automatically-operated clutch for reversing the movement of the table and continuously moving the straw-elevator back and forth in a circular path, substantially as described.

6. The combination, with a thrashing-machine, of a turn-table, a straw-elevator partaking of the turning movement of the table, a traveling conveyer supported on the table intermediate of the machine and the elevator and movable around with it, a driving-shaft capable of adjustment toward and from the table to engage and disengage the same, for positively rotating the turn-table, intermediate conveyer, and the elevator in a circular path, or permitting them to stand in a stationary position or to be freely turned to any desired position, substantially as described.

7. The combination, with a thrashing-machine, of a turn-table, a straw-elevator partaking of the turning movement of the table, a traveling conveyer supported on the table and moving around with it and the elevator, a shaft adjustable toward or from the table to engage and disengage the same, gearing for rotating the said shaft, a shifting-clutch for reversing the motion of the gearing, and a clutch-shifting lever, substantially as described.

8. The combination, with a thrashing-machine, of a turn-table, a circular toothed rim thereon, a straw-elevator partaking of the turning movement of the table, a traveling conveyer supported on the table intermediate of the machine and the elevator and moving around with the elevator and the table, a shaft engaging the toothed rim, a driving-shaft, reversing gear-wheels on the driving-shaft for revolving the shaft engaging the rim, a shifting-clutch between the reversing gear-wheels, and a clutch-shifting lever automatically operated by the turn-table to reverse the turning movements of the latter, substantially as described.

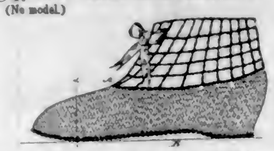
9. The combination, with a thrashing-machine, of a turn-table, a circular bed serving as the sole support for the table, and on which the latter is adapted to turn, a guide-flange for confining the table on the bed, a straw-elevator partaking of the turning movement of the table, a traveling conveyer supported on the table intermediate of the machine and the elevator and moving around with said table and elevator, a counter-shaft, p', extending continuously across the table, and having a pinion, q^2, bearings on the table supporting the ends of said counter-shaft, a vertical driving-shaft, s', and a drive-wheel, q', on the vertical shaft, substantially as described.

10. The combination of the turn-table f, the rack m, worm n, shaft o, wheel t, worm u, shaft v, and bevel-wheel w, with the driving-shaft x, reversing-wheels y z, shifting-clutch a', weighted shifting-lever b', and the arms d', arranged to shift said reversing-lever automatically, substantially as described.

11. The weighted clutch-shifting lever b' and the slotted fulcrum-plate e', in combination with the clutch a', reversing-wheels y and z, driving-wheel w, and the shifting-arms d' on the turn-table, substantially as described.

12. The combination, in a straw-stacker for thrashing-machines, of the turn-table f, separator b, and the carrier h^5, located on the turn-table, pivots v', and legs x', enabling the carrier to be set up and rested against the separator, substantially as described.

13. In a straw-stacker for thrashing-machines, the combination of the turn-table f, the carriers h' and p, driving-shaft p', the drive-wheels o', a^2, and n', a suitable chain, the vertical shaft s', chain-wheels t' and u', and a chain, substantially as described.



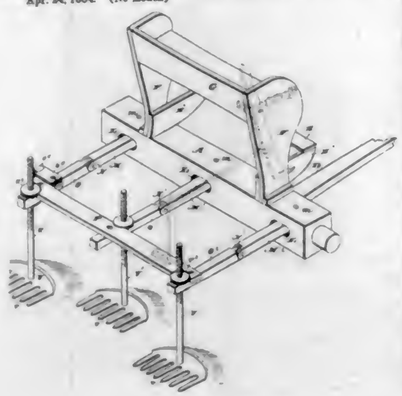
14. The combination of the jointed straw-carrier frame b^3, slotted bearing-plates c^3, roller-shaft r', carrier p, arranged on it, slotted bearings d^3, and the turn-table, substantially as described.

15. The combination of the turn-table f, guard-rim A, and bed g, with the brackets k and rollers j, working in a rabbet, i, on the inner periphery of the turn-table, whereby the turn-table is held in position on the bed, substantially as set forth.

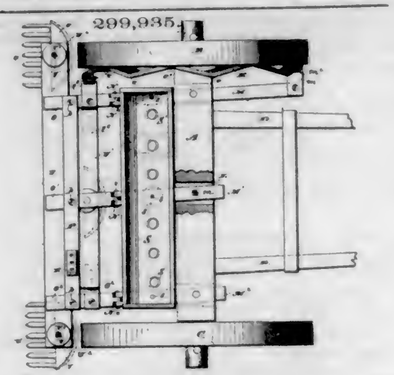
16. The combination, with the turn-table f, its segmental toothed rim, and mechanism, substantially as described, for automatically oscillating the same, of the shaft o, provided with worm n, and mounted at one end in a sliding box, q, operated by the pivoted lever s, whereby the toothed rim and worm may be disconnected to cause the automatic oscillation of the turn-table to cease when it is desired to discharge the straw in one place, substantially as set forth.

299,934. SHOE.

JOHANNA MÜLLER, Philadelphia, Pa. Filed Apr. 2, 1884. (No model.)



Claim.—1. A shoe having its upper and sole formed of knitted material, the stitches of the upper being united by knitting to those of the sole, substantially as and for the purpose set forth.



2. An improved shoe having a knitted upper and a knitted sole connected therewith, formed with a ribbed surface.

299,935. CULTIVATOR.

RICHD. B. NORMENT, East Lake, Fla. Filed Apr. 24, 1884. (No model.)

299,935.

Claim.—1. In combination with the series of vibrating arms, the bars hinged to the rear ends of the arms, the frame carrying the knives supported upon these bars, means for imparting a vibrating motion to the arms and bars, and means for raising and lowering the knife-frame, substantially as shown and described.

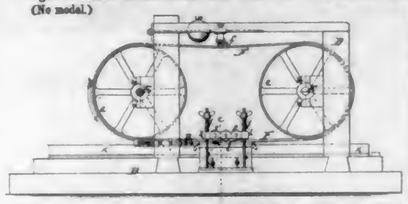
2. In combination with the series of jointed vibrating arms and the bar connecting their rear ends, the cultivator-knives, suitably supported at or near the rear ends of the arms, means for causing the arms to vibrate, and means for raising and lowering the rear ends of the series of arms to raise and lower the knives, substantially as shown and described.

3. In combination with the series of jointed vibrating arms connected together and carrying the knife-frame, the wave-track on one of the drive-wheels, the roller at one end of the series of arms, adapted to engage the wave-track on the wheel, and means for swinging up the rear ends of the jointed arms and the attached frame, to carry the roller out of engagement with the wave-track and stop the vibration of the bars and frame, substantially as shown and described.

4. In combination with the vibrating bar or arm M, pivotally attached to the main axle or frame, and carrying on its forward end a roller adapted to engage a wave or cam track on one of the drive-wheels, vibrating arms M′ M^2, the bars O O′ O^2, hinged to the vibrating arms, a roller carried on the arm O and adapted to engage the wave-track on wheel, the knife-frame supported upon and carried by the bars O O′ O^2, and the connecting bar or rod between such bars, substantially as shown and described.

5. In combination with the series of vibrating arms consisting of the portions pivoted to the axle or frame on vertical pins, and the bars hinged to the rear ends of such portions, the connecting-rod between the bars, the cultivator-knife frame supported on the end bars of the series, the standard attached to the connecting bar or rod, the adjusting-lever, and suitable connecting means between the standard and lever, substantially as and for the purpose described.

6. In combination with the series of vibrating arms for carrying the vibrating knife-frame, the fertilizer box or hopper provided with suitable discharge-openings supported upon and pivotally connected with the arms, so as to be reciprocated or shaken as the arms vibrate, substantially as and for the purpose described.



7. In combination with the series of vibrating knife-carrying arms consisting of the horizontally-vibrating portions M M′ M^2 and the bars O O′ O^2, from which are supported the knives, the fertilizer box or hopper provided with suitable discharge-openings supported on and attached to portions M M′ M^2 by means of pivot bolts or pins, substantially as and for the purpose described.

8. In combination with the arm M, passing through and pivoted in the axle A, and carrying at or near its front end a roller adapted to engage the wave-track E on the wheel B, the arms M′ M^2, also pivoted to the axle, the bars O O′ O^2, hinged to the rear ends of the arms, the connecting-bar I′ between them, and the board U, carrying the cultivator-knives, and supported from bar O^2 by standard T^2, and from bar O by standard T, bent over the bar, and carrying the roller t^3, adapted to engage the wave-track on wheel B, substantially as and for the purpose described.

9. In combination with the horizontally-vibrating knife-frame and means for vibrating it, the series of horizontal knives carried by the frame, each provided with a series of teeth or tines projecting from its rear side, substantially as and for the purpose described.

10. In combination with the vibrating knife-frame, and means for vibrating it, the horizontal knives, made sharp on their front sides, having the teeth or tines extending from their rear sides, and provided with the shanks extending upward and attached to the frame, substantially as shown and described.

299,936. CAPSULE-MACHINE. GUSTAV OTTO, Jersey City, N. J., assignor to Robert H. McCutcheon, New York, N. Y. Filed Mar. 13, 1884. (No model.)

Claim.—1. In a capsule-machine, the spindle-carrying frame B, having parallel rods *a a*, combined with the swiveled spindles A A, that are hung in said rods, substantially as described.

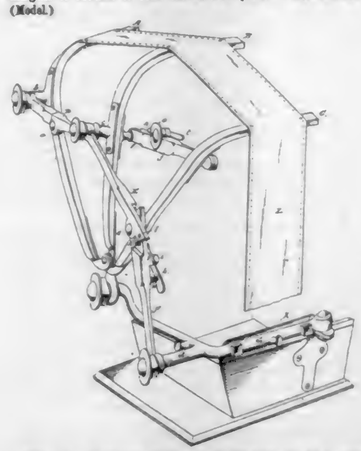
2. In a capsule-machine, the spindle-carrying frame B, having parallel rods *a a*, combined with the swiveled spindles A A, that are hung in said rods, and that are provided with the pulley enlargements *d*, substantially as described.

3. In a capsule-machine, the spindle-carrying frame B, having parallel rods *a a*, combined with the swiveled spindles A A, that are hung in said rods, and that are provided with the pulley-enlargements *d*, having circumfential grooves for guiding purposes, as specified.

4. The combination of the endless belt F with the platforms *l*, guide-rails *k*, and pressure-rollers *g*, substantially as and for the purpose described.

5. The combination of the endless belt F with the rollers *g*, springs *j*, platforms *l*, springs *n*, and rail or rails *k*, all arranged, substantially as described, for oiling the ends of spindles A A, that are swiveled in frames B, substantially as described.

6. The combination of the belt F^3 and rail or rails k^3 with the cushioned knives G G, for use on frames B, having swiveled spindles A, substantially as described.

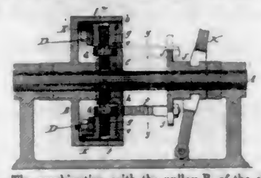


7. The combination of the belt F^3 and rail or rails k^3 with the adjustable cheek-pieces *r r* and with the cushioned knives G G, substantially as described.

8. In a capsule-cutting machine, the knives G G, made sectional, substantially as herein shown and described.

9. The combination of the belt F^3 with the rollers g^3, adjustable roller-frame k^2, rail or rails k^3, sectional cushioned knives G G, and adjustable cheek-pieces *r*, for use on frames B, carrying swiveled spindles A A, substantially as and for the purpose herein shown and described.

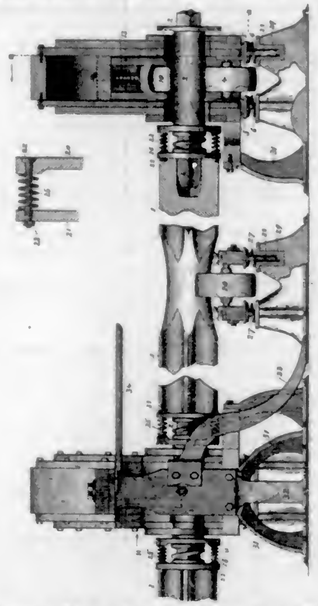
10. The combination of the hook *t*, and means, substantially as described, for reciprocatiog it, with the gripping-plates *u* and *w*, and means, substantially as described, for bringing them together, and with the frame B, having the spindles A A, substantially as specified.



299,937. CARRIAGE-TOP. CHARLES L. PRITCHARD, Dubuque, Iowa, assignor of one-half to John Kuntz, same place. Filed Nov. 26, 1880. (Model.)

Claim.—1. A carriage-brace for the purpose set forth, consisting of the parts E F, pivoted together to break upward, said pivoted ends being provided with holes *l*, and adapted to be opened and closed by means of the lever *h*, having a projection, *k*, and the spring *n*, all constructed, arranged, and operating substantially as described and shown.

2. The combination, with the perforated convex shifting-rail G, of the concave metal strip K, provided with bolts *v v'*, whereby the two are held together, and between which the back quarter-curtain is clamped and held between the said rail and strip without being perforated, substantially as described and shown.



299,938. FRICTION-CLUTCH. THOS. RYAN, Lockport, N. Y., assignor of one-half to William McLean, same place. Filed Mar. 11, 1884. (No model.)

Claim.—The combination, with the pulley B, of the clutch-head C, having guide-lugs D, segments E, provided with stems *a*, sliding in the lugs D, adjusting-screws *g*, extending from the hub *c* of the clutch-head to the segments E, gear-wheels G, secured to the screws *g* between the hub *c* and the lugs D, rack-bars I, meshing with the wheels G, and a movable sleeve, J, to which the rack-bars are attached, substantially as set forth.

299,939. WITHDRAWN.

299,940. SHAFTING AND BEARING. THOMAS SUTTON, Cheboygan, Mich., assignor of one-half to George F. Raynolds, George E. Frost, and William McArdle, all of same place. Filed Apr. 17, 1884. (No model.)

Claim.—1. The shafting constructed, substantially a herein set forth, in sections 1 and interposed journal-sections 2 3, for the purpose set forth.

2. The combination, with the journal-sections 2, of the bearing-rolls 4 and their housings 5, and springs 6, substantially as and for the purpose set forth.

3. The combination, with the journals 3, of the anti-friction rolls 4, 9, and 10, surrounding the said journals, so as to support the same, and provided with springs to yield to sudden shocks or strains and restore the journals to their normal position.

4. The combination, with the journals 3, of the anti-friction bearing-rolls and their housings guided in vertical and horizontal direction, as described, to yield to strains and shocks and restore the journals to normal positions.

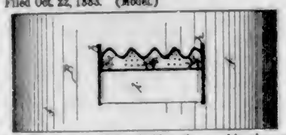
5. The combination, with the shaft-sections 1 and journals 2, of collars 20 21 and connecting-bolts 22, as and for the purposes set forth.

6. The combination, with the shaft-sections 1, journals 3, and collars 20 21, of springs 24 25, as and for the purposes set forth.

7. The combination, with the shafting 1 2 3, constructed in sections, as herein described, of bearing-rolls 26 for supporting the centers of the main shaft-sections, as herein shown and described.

299,941. BACK-BAND BUCKLE. ROBERT D. TUCKER, Booneville, Miss., assignor of one-half to Pink Washington McCarley, same place. Filed Dec. 21, 1883. (No model.)

Claim.—In a back-band buckle, the frame A, having recessed lug A', middle bar, B, and teeth C, in combination with hook D, pivoted thereto, substantially as described, and for the purposes set forth.



299,942. ART OF CONSTRUCTING SEAMS OF SHEET-METAL VESSELS. FRANCIS A. WALSH, Chicago, Ill. Filed June 11, 1883. (No model.) Patented in Canada Aug. 4, 1883, No. 17,414.

Claim.—1. The improvement in the art of constructing seams which consists in placing within the can-body an end provided with a wall, *i*, whereof a part, *l*, projecting beyond the can-body, is turned down in one or more successive steps, substantially as specified.

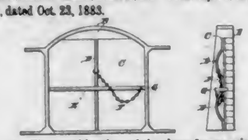
2. The improvement in the art of constructing a seam for sheet-metal vessels which consists in placing within the body an end provided with wall *i*, whereof a part, *l*, projects beyond the can-body, and then turning said part outward and down against the can-body, and then turning said part and a part or all of the wall *i* outward and down against the can-body, substantially as specified.

299,943. EMBROIDERY-HOLDER. JONATHAN B. WEST, Rochester, N. Y. Filed Oct. 22, 1883. (Model.)

Claim.—In an embroidery-holder, the combination, with a two-headed spool, A, of an inclosing cylindrical box, B, provided with a flange, *g*, at one end, and with slots *h h* in the rim, through which a portion of the embroidery may be exposed to view, the spool fitting into and forming the heads of the box, substantially as and for the purpose herein specified.

REISSUES.

10,483. SASH-FASTENER. EWELL B. ATTWELL, Leesburg, Va., assignor to Attwell Manufacturing Company, Covington, Ky. Filed Aug. 27, 1883. Original No. 260,271, dated June 27, 1882.



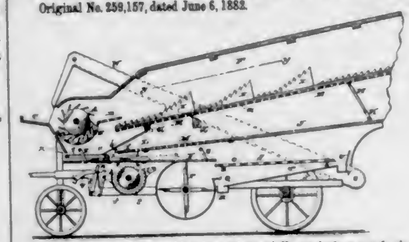
Claim.—1. The combination, as herein set forth, of a pair of individual sash-fastners, F F, and a removable key, K, each of said individual sash-fasteners comprising a spring-projected fastener-dog, *d*, having an orifice, *o*, to receive and coact with the shaft of said key, and supplemental pivots *p*, working in slots *w* in a metallic housing, to support the individual fastener-dogs independently of said key, substantially as specified.

2. In a sash-fastener of the class herein set forth, the combination, with a pair of spring-projected fastener-dogs having flanged heads, of recessed tubular bushings *u* within the socket-holes in the edges of the respective sashes, to prevent accidentally unfastening either sash, as herein specified.

3. In a sash-lock, the combination of the housing and its segmental slots, the spring-projected dog pivoted in said slots, and the removable key engaging the dog and forming the pivot upon which the latter is oscillated to release the window, substantially as described.

4. In combination with the movable window-sashes and the frame therefor, two spring-projected dogs hung in independent housings upon supplemental sustaining-pivots, and a removable key operating upon both dogs, substantially as described.

10,484. COKE-OVEN DOOR AND FRAME THEREFOR. JOHN HERRON and ROBERT T. WRAY, Dunbar, Pa. Filed Apr. 1, 1884. Original No. 237,285, dated Oct. 23, 1883.



Claim.—1. The combination of the door-frame with a brick filling which is built therein, the air passage or flue between the top of the filling and the top of the frame, and a removable door or plate, C, substantially as shown.

2. The combination of the metallic frame, the brick filling which is built therein, the metallic door C, and an air-inlet through which the air passes into the oven, substantially as described.

3. The door-frame provided with the flanges K, a refractory brick filling which is built inside of the frame, and the door C, substantially as specified.

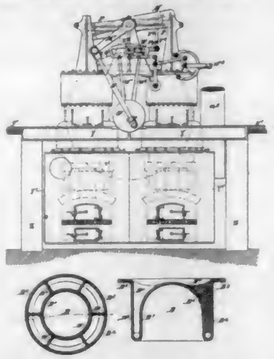
10,485. COMBINED GRAIN-THRASHER AND CLOVER-SEED HULLER. CHARLES H. HORTON, Wellington, Ohio. Filed Jan. 9, 1884. Original No. 259,157, dated June 6, 1882.

Claim.—1. The combination, substantially as before set forth, of the separator consisting, essentially, of a series of flat perforated strips arranged side by side, each strip being provided with a series of independent triangular straw-carriers having toothed upper edges, the cranks supporting the inner ends of the strips, and oscillating arms supporting the outer ends of said strips, all of the above parts combined and adapted to operate substantially as set forth.

2. The combination, with the vibrating separator, consisting of a series of parallel perforated strips, each provided on its upper face with a series of independent triangular straw-carriers having toothed upper edges, of the cranks supporting the lower inner ends of the strips, the oscillating arms pivoted at their upper ends to the strips and near their lower ends to fixed fulcrums, and the vibrating bottom secured at its rear end to the oscillating arms below their fulcrums and at its forward end to oscillating links.

3. The combination, substantially as before set forth, of the vibrating bottom having a perforated section, the shaker, the fan, the tailings-spout V, the elevator W, the conveyer X, discharging above the perforated section of the vibrating bottom, and means for opening communication between the elevator and the conveyer.

4. The combination, with a concave and an inclined perforated apron forming a continuation of said concave, of the separator consisting of the flat perforated strips, the front ends of which rest under said apron, each strip being provided with a series of independent triangular straw-carriers having toothed upper edges, the cranks supporting the lower ends of the strips, and the oscillating arms supporting the upper ends thereof, substantially as set forth.



5. The combination, with the separator E and shaker N, of the vibrating bottom J, constructed with a removable perforated section, M, as and for the purpose specified.

6. The combination, with a thrashing-cylinder and concave, of the shaker N, having the ways *u*, the clover-screen *t*, mounted thereon, and

the clover-huller *d f*, substantially as and for the purpose set forth.

7. The combination, with the frame, of a clover-huller, *d f*, adjustably connected therewith, a shaker, N, having an aperture, and a removable section, *s*, for covering said aperture, as shown and described.

10,486. HOT-AIR ENGINE. STEPHEN WILCOX, Brooklyn, N. Y. Filed Apr. 17, 1884. Original No. 289,432, dated Dec. 4, 1883.

Claim.—1. In a hot-air engine, the inner cylinder, C, furnished on both its inner and outer surfaces with means, substantially as described, for circulating a current of water in the upper portion thereof, in combination with the inner piston, D, and annular outer piston, E, as herein specified.

2. In a hot-air engine, the inner cylinder, C, and outer cylinder, G, having means, substantially as described, for circulating a single current of water through both cylinders C and G, in combination with each other and with the inner piston, D, and annular piston E, as herein specified.

3. In a hot-air engine, the cylinder C between the working-piston and the changing-piston, constructed with double cast-metal water-chambers in the upper part, and a double sheet-metal chamber inclosing a non-conductor in the lower part, substantially as herein specified.

4. In a hot-air engine, the cylinder G, having its upper portion of cast metal in two thicknesses, forming a chamber adapted to receive a current of water, and its lower portion of less thickness, faced with a rigid non-conducting material, as herein specified.

5. In a hot-air engine, the inner cylinder, C, and outer cylinder, G, inner piston, D, with its rod *d*, and annular piston E, with its rods *e e*, in combination with each other, and with slides and suitable cross-heads, and with links connecting these cross-heads to cranks mounted oppositely on the shaft O, as herein specified.

6. In a hot-air engine, in combination with the working-piston D and changing-piston E, the regenerator J, mounted in a passage, I, outside of both, substantially as herein specified.

7. In a hot-air engine, the regenerator J and cooler K, in combination with each other, and with the passage I and removable bonnet I', adapted to allow their ready removal, and with the working-piston D and annular piston E, mounted concentrically in suitable cylinders, as herein specified.

8. In a hot-air engine, the changing-cylinder G, having a passage, *g'*, extending around above the heater, and forming a connection between the bottom space, *z*, connected through the thin space in the heater B, and the upper space, *y*, connected through the cylinder or passage H, as herein specified.

9. In a hot-air engine, the working-pistons D D, connected to the same beam, M, in combination with the cylinder C C therefor, and the two annular changing-pistons E E, with the inclosing-cylinders G, concentric to C, and having a connecting-passage, X, between the upper portion of the working-cylinders, for the rapid and easy transfer of the air above the piston, as herein specified.

10. In a hot-air engine, the link W, with its rods W' W², operated as shown, in combination with the block V² and suitable mechanical connections to a changing-piston, E, arranged to serve as herein specified.

11. In a hot-air engine, the combination of two pairs of working-pistons, with their respective working means M' M' and links N N, arranged to act on the shaft O', located between the cylinders G G, as herein specified.

12. The heater B and cylinder C, in combination with each other and with the girders Y, arranged to relieve the heated parts from strain, as herein specified.

13. The cross-girders Y, in combination with the heaters B and cylinders C and their several attachments, and with supporting-walls Z, arranged to present a clear passage between the latter, substantially as herein specified.

14. The partition *y'*, arranged relatively to the furnace and to the working parts of the engine, substantially as herein specified.

15. The webs or stays B', connecting the inner shell, B', with the outer shell, B², of the heater, in combination with a base-casting, H, formed with corresponding divisions, as herein described.

16. In combination with the heater B of a hot-air engine, the air-heating pipes S, conducting through the escaping hot gases the air to support the combustion in the furnace, substantially as herein specified.

17. The economizer S, for returning to the furnace a portion of the heat in the gases escaping therefrom, and the regenerator J, for the alternately absorbing and giving out of heat in the compressed air, in combination with each other and with the working parts of an air-engine, arranged for joint operation as herein specified.

18. In a hot-air engine, the casing Y', inclosing the furnace and making the whole conveniently portable, in combination with means, Y, for supporting the engine by its upper portion, as herein specified.

DECISIONS
OF THE
COMMISSIONER OF PATENTS
AND OF
UNITED STATES COURTS IN PATENT CASES.

DECISIONS OF STATE COURTS.

Kentucky Court of Appeals.

AVERY & SONS v. MEIKLE & CO.

Decided March 27, 1883.

1. A trade-mark is a sign or symbol primarily confined, exclusively, to the indication of the origin or ownership of the goods to which it is attached, and it may be composed of any name, device, line, figure, mark, word, letter, numeral, or combination or arrangement of any or all of these, which will serve the sole purpose of a trade-mark, and which no other person can adopt or use with equal truth.
2. Terms which designate merely the name, quality, kind, size, number, or elements of an article, or have become its proper appellation, or that merely describe it or direct the mode of its use, or purely generic or geographical terms, and the necessary and common uses in which the English language and Arabic numerals are employed by the people to express the truth, their ideas and feelings, are common property which all may use, but which none can appropriate exclusively to himself as a trade-mark.
3. A trade-mark becomes the exclusive property of one only when he has, prior to any one else, appropriated and used it to indicate the origin, ownership, and quality of an article to which it is attached. Its value rests on reputation and on its implied guaranty that the article is of a certain quality. Its object is to prevent one person from selling his goods as those of another of established reputation to the injury of that other.
4. When plaintiff shows that he has adopted a legal trade-mark, that it has been infringed, and that actual, probable, or possible damages have or may result from its infringement, he is entitled to relief usually in the form of an injunction and an account of profits.
5. Where no patent is held by the owner of plows, any one may make plows in exact similitude, may brand the name of the manufacturer and the place of the manufacture on such part of the plow as he pleases, taking care so to use the brand as not to deceive the public into the belief that the plow is the manufacture of another.
6. Although certain letters and numerals may have come to indicate to the public the origin or ownership of appellant's plows, as they did not appropriate them by adoption, use, or claim as a part of their trade-mark, they cannot be treated as a part of it simply because they appear capable of serving the same purpose.
7. Courts of equity afford a remedy against the infringement of a trade-mark or of the trade reputation of its owners, on the principle of protecting property, of promoting fair dealing, and of protecting the public. Where a trade-mark itself has been infringed, neither fraud nor the inferior quality of defendant's article need be proved. But where a property right, not amounting to a trade-mark, has been infringed, it is essential to show fraudulent intent. But courts of law require proof of deceit, fraudulent intent, or special damage (unless damage is presumed) in both cases.
8. Where the action is brought to restrain the fraudulent usurpation of plaintiff's trade reputation, plaintiff need not make out a legal title to an exclusive trade-mark, by the usurpation of which defendant has done the wrong. It is enough that defendant sells his goods as those of plaintiff, either by the use of plaintiff's trade-mark or any other means, that such fraudulent sales result or are likely to result in damage to plaintiff. It is the purpose or design of the act that constitutes the wrong, and though a man may use any letters and figures (which are common property) to indicate the size, quality, and description of his goods, yet he cannot do this in such way as to mislead others into the belief that goods made by himself were made by another.
9. If one, with a bad motive, exercises his rights in a lawful and proper way, and injury results, there is damage without legal injury; but if with a bad motive he exercises his rights in an unlawful manner, there is both damage and legal injury.
10. As to what facts constitute infringement of a trade-mark or trade reputation, no rule can be formulated that will embrace every act of infringement, and the original and alleged imitation are of primary importance. The resemblances need not be such as would mislead an expert or could not be easily detected, if each case must depend mainly on itself. But resemblances and differences between the original and the spurious were seen together. It is enough if such resemblances exist as would lead an ordinary purchaser to suppose he was buying the genuine article, and not an imitation. If the differences are only colorable, and there is no reason for the resemblances, except the purpose of deceiving the purchaser of one article into the belief of its being the manufacture of another, the court will presume a fraud was intended.
11. Though the particular combinations of letters and figures used by appellees were not entitled to protection as part of appellants' trade-mark, yet it appearing that appellees copied those combinations, not for the purpose of indicating the size and quality of their plows, but for the purpose of misleading the public into the belief that appellees' plows were of a kind made by appellants, having an established reputation and large sale, *Held*, appellees are liable to appellants for damages resulting from loss of trade in consequence of such copying and to an injunction restraining the further sale of such plows.

APPEAL from Louisville Chancery Court.

Messrs. W. O. & J. L. Dodd, Mr. John Mason Brown, Mr. P. B. Muir, and *Mr. John Marshall* for the appellants.

Mr. W. Lindsay, Mr. Geo. M. Davie, and *Mr. James S. Pirtle* for the appellees.

Opinion of the court by Chief Justice Hargis.

The appellants brought this action to restrain the infringement of their trade-mark and to prevent the fraudulent usurpation of their trade reputation by the appellees, and to compel them to account for resulting profits. The appellants are manufacturers of plows in the city of Louisville. They brand on the right side of the beam their trade-mark, which is composed of a Maltese cross, with the letters "A V E R Y" distributed in its center and arms. Immediately above the cross are the words "Trade Mark," and below it is the word "Copyrighted." To the left of it are the words "B. F. Avery's, Patented," and to its right "Louisville Steel, July 11, 1871." The steel series of their plows are branded on the top and near the rear of the beam "Pony," "AO," "BO," and "CO," and their cast series at the same point with "½," "1," "2," "3," and "8."

Upon the top of the fore part of the beam of each series are stenciled the cautionary words "Keep all taps screwed up." The appellants' trade-mark, which they printed and referred to in their catalogues and described in their advertisements, is composed of the Maltese cross, with the name "A V E R Y" distributed in its arms and center, surrounded by the words "Trade Mark" above and "Copyrighted" below it.

The appellees, who are also engaged in the manufacture of plows in the city of Louisville, dismantled plows of appellants' steel and cast series, and with great accuracy copied every important and ordinarily noticeable part of them. They then began the structure of two series of plows, one steel and the other cast, so much like appellants' that an ordinary person could not tell the one from the other. They also imitated, almost to perfection, the interchangeable metal points of appellants' plows. They branded the steel series "PO," "AO," "BO," "CO." The "PO" was followed by the word "steel," and "Louisville" was placed on top of the beam. Their cast series was branded "½," "1," "2," "3," "8." Upon the top of the front part of the beam of each series were stenciled the cautionary words, "keep all taps screwed up." These letters, numerals, and the words of caution were of the same size and character of type, and placed in precisely the same position on their plows as on those of appellants. The plows were varnished as appellants' were varnished. The resemblance of appellees' plows to those of appellants was complete, the only substantial difference being that the appellees placed on both sides of the beam their trade-mark, which consists of an oblong figure and diamond whose angles project over the lines of the oblong, with the letter "M" in the center of both, and encompassed by the name, "Thos. Meikle & Co." above, and "Louisville, Ky.," below. The appellees held a consultation before they attempted the imitation above described, and after due deliberation and quieting Mr. Meikle's conscience, in the rough but significant language of one member of the firm, who seems to be its guiding spirit, they determined, "come what may, to take the bull by the horns." Then the work of dismantling and imitation began. Soon their newly-dressed and formed series of cast and steel plows were thrown upon the market, and a business of thirty plows per day sprang up to nearly one hundred per day. These increased sales were made to a considerable extent to jobbers, whose names were substituted for appellees' trade-mark and its surroundings, and stenciled on the beams where their trade-mark and name had stood. These jobbers did not pretend to be the originators or manufacturers of the plows, and it appears that many persons have been deceived, and unable to distinguish the imitation from appellants' plows.

In order to make the imitation series the appellees abandoned their brands, "A," "B," "C," "D," and "F," on their cast and the numerals "0," "1," "2," "3," "4," "5," and "6" on their steel plows, which they had been using, and substituted appellants' brands in their stead, placing the letters on the steel and the numerals on the cast series, so as to correspond precisely with appellants' mode of using them.

Whether the conduct of the appellees amounts to an infringement of appellants' trade-mark, or an injury to their legal or equitable rights, is the question to be considered. The object of trade-mark law is to prevent one person from selling his goods as those of another, to the injury of the latter and of the public. It grew out of the philosophy of the general rule that every man should so use his own property and rights as not to injure the property or rights of another, unless some priority of right or emergency exists to justify a necessarily different manner of use. The intermediate instrument of prevention, which the law protects in its office, is called a "trade-mark," which an owner of goods may adopt and use to indicate their origin or ownership, and to distinguish them from goods of a similar nature belonging to somebody else. This right of adoption and use is subject to various limitations and qualifications. A trade-mark is a sign or symbol primarily confined exclusively to the indication of the origin or ownership of the goods to which it may be attached, and it may be composed of any name, device, line, figure, mark, word, letter, numeral, or combination or arrangement of any or all of these, which will serve the sole purpose of a trade-mark, and which no other person can adopt or use with equal truth. Fancy names, whether invented or arbitrary, the names of places, words, where applied to a new process by the inventor; the name of an article, which alone designates its origin or ownership; letters and numerals combined in unusual and peculiar forms, or with other parts composing trade-marks, have been held, under the particular circumstances of the various cases where their exclusive appropriation and use were in question, to be trade-marks or component elements thereof. See *Congress Spring Co.* v. *High Rock Spring Co.*, (45 N. Y., 290;) *Burnett* v. *Phalon*, (3 Keys, 594;) *Marsh* v. *Billings*, (7 Cushing, 322;) *Woodward* v. *Lazar*, (21 California, 444;) *Ford* v. *Foster*, (L. R., 7 Ch., 611;) *Taylor* v. *Carpenter*, (3 Story, 458;) *Davis* v. *Kendall*, (2 R. I., 566,) in which the words "Eureka Shirt," "Persian Thread," "Vegetable Painkiller," "Congress Spring," "Cocoaine," "New Era," "Revere House," "What Cheer House," were held subject to exclusive appropriation as trade-marks.

In the cases of *Wotherspoon* v. *Currie*, (5 H. L., 508,) *McAndrew* v. *Bassett*, (10 Jur., N. S., 550,) *Seixo* v. *Provezende*, (L. R., 1 Ch. Ap., 192,) *Newman* v. *Alvord*, (49 Barb., 588,) the words "Glenfield Starch," "Anatolia Liquorice," "Seixo Wine," "Akron Cement," were protected as trade-marks. For the word "original" as a trade-mark, see *Cocks* v. *Chandler*, (L. R., 11 Eq., 446.) Numerals in the cases of *Boardman* v. *The Meridian Britannia Co.*, (35 Conn., 402,) *Gillott* v. *Esterbrook*, (47 Barb., 455,) were held to be, in connection with the manufacturer's name, a lawful trade-mark.

Browne on Trade-Marks, section 87, says:

> The mark may consist in the name of the manufacturer or the merchant, (provided it be written, printed, branded, or stamped in a mode peculiar to itself,) in a seal, a letter, a cipher, a monogram, or any other sign or symbol that can serve to distinguish the products of one man from those of another. It may be any symbol or emblem, however unmeaning in itself.

Terms which designate merely the name, quality, kind, size, number, or elements of an article, or have become its proper appellation, or that merely describe it, or direct the mode of its use, purely generic and geographical terms, and the necessary and common uses in which the English language and Arabic numerals are employed by the people to express their ideas and feelings and to tell the truth, are common property which all may use, but which none may exclusively appropriate as a trade-mark or acquire as

absolute individual property. Many authorities have been examined, and might be here cited, to establish each clause of this general statement of the law, but it is not necessary to do so. It must not be overlooked, however, in these exclusions, that a trade-mark is indirectly the guaranty of the quality of an article to which it is attached, as well as of its origin and ownership, for in all cases the trade-mark, in indicating the origin by necessary implication, represents the quality of the article, which is the true source of its reputation in the market. There is no abstract right in a trade-mark. It is property only when appropriated and used to indicate the origin or ownership of an article or goods. And its real value consists in the confidence and patronage of the public, secured through its instrumentality in acquainting them with the origin and ownership of an article which thus gains reputation for its superior qualities. Of this reputation its owner cannot be deprived without his consent, either by the use of forbidden means or the illegal employment of things otherwise lawful. When a workman or manufacturer has, by skill, care, and fidelity, manufactured a good article, it becomes of the utmost importance to him that its origin and ownership should be known, and the law points out to him the means and how he may appropriate them to indicate this important fact, and when he adopts and uses them, and his reputation is thereby built up, it is to him the most valuable of property rights. Sound policy which dictates the protection of the public from imposition, the security of the fruits of labor to the laborer, the encouragement of skillful industry, and, above everything, the inculcation of truth and honor in the conduct of trade and commerce, and the requirement that all the contractual relations of life—natural, abstract, and relative—shall be honestly observed, demands that such a reputation, so gained, shall be free from the grasp of piracy and its infringement accorded the safest and best remedy for redress known to the courts of equity. And this is the law of both principle and authority. Therefore the lawful adoption and use of a trade-mark is the invocation of the law applicable to it by the originator or owner of an article for the protection of his reputation as such. When this essential state of facts is shown by a complainant, and that his trade-mark has been infringed, and actual, probable, or possible injurious consequences are or may be the result of the infringement, he is entitled to relief, which is usually granted by injunction and an account of profits.

Having premised these general rules of the law of trade-mark, the field of investigation we shall first explore is, whether the appellants' trade-mark embraces either the word "Pony," the letters "AO," "BO," "CO," or the numerals "½," "1," "2," "3," "8," or the shape and construction of their plows. We will dispose of the last point first. The shape and construction of the plows do not form any part of the trade-mark of the appellants further than their subjection to the use of the mark to indicate their origin and make it necessary to render the trade-mark property, for, as held in *Candee, Swann & Co.* v. *Deer & Co.*, (54 Ill., p. 461,) where no patent is held by the owner of plows, "any one, therefore, has a perfect right to make plows in their exact similitude, even to 'the curve of the mold-board' and 'the tip of the handles'—in the minutest as well as in the most important points—all have a right to manufacture them, no matter where the maker may reside, and has the right to put the name of the place where manufactured, as well as his own name, on such part of the plows as he pleases, taking care, however, so to use the brand as not to deceive the public, so as not to create a belief that the plow is the manufacture of another." Other cases, which express it differently, are to the same effect. *Fairbanks* v. *Jacobus*, 14 Blatchford, 339. The evidence shows that as early as the year 1868 the word "Pony" was adopted and used by Kelley, of Texas, on a small one-horse plow, which he was then engaged in the manufacture of, and that the appellants did not adopt or use it prior to 1871. Hence they have not the merit of first appropriation, which is necessary to the exclusive right to the word "Pony," even as a trade-mark. But where the evidence, as in this case, establishes that the word "Pony" is used to indicate quality and size—to wit, a small steel plow—it cannot for such use become a trade-mark. And it does not matter that "Pony" is not in itself the sign of the idea of size or quality, for if it was substituted for the words which would convey such meaning, and used by appellants for that purpose, they could not have acquired, even by prior adoption, an exclusive right to the use of the word "Pony." *Amoskeag Manufacturing Co.* v. *Spear*, Cox T. M. C., 102. Many years before the appellants adopted "AO," "BO," "CO," it was customary to use letters and combinations of letters to indicate quality, size, and series of plows. "CO" was in use before appellants used it, but whether they used the combination of these letters first or not the evidence shows that they used it to indicate the size and quality of the steel series. As to the numerals "½," "1," "2," "3," "8," they were used by appellants to denote the size and quality of their cast series. This is the evidence, and although the letters and numerals on both series may have come to indicate to the public the origin or ownership of appellants' plows, as they did not appropriate them by adoption, use, or claim as a part of their trade-mark, they cannot be treated as a part of it simply because they appear capable of serving the same purpose.

The printed catalogues and advertisements of the appellants do not claim that these letters or numerals form any part of their trade-mark, yet all through them attention is called to the Maltese cross, and the words in and immediately around it as their trade-mark. Had "AO," "BO," "CO," and "½," "1," "2," "3," and "8," or any of them, formed a part of appellants' trade-mark, it is unreasonable and contrary to human experience to suppose that the fact would have been ignored for years and excluded from their carefully prepared and printed annual catalogues and advertisements. The cautionary words "Keep all taps screwed up" are not the subject of a claim to exclusive use, as has been held and well settled in the cases of *Falkinburg* v. *Lucy*, (Cox, T. M. C., 465-6,) *Gillott* v. *Esterbrook*, (Id., 350,) *Gilman, &c.* v. *Hunnewell, &c.*, (122 Mass., 149,) and because they are words of caution which the appellees may use with equal truth, sincerity, and from a necessity common to the use and handling of plows. The alphabet, English vocabulary, and Arabic numerals are to man, in conveying his thoughts, feelings, and the truth, what air, light, and water are

to him in the enjoyment of his physical being. Neither can be taken from him. They are the common property of mankind in which all have an equal share and character of interest. From these fountains whosoever will may drink, but an exclusive right to do so cannot be acquired by any. And the appellants having drawn from the common fountain, the letters and numerals named cannot claim an exclusive right to them or their use.

Having disposed of the appellants' alleged title to the exclusive use of the letters "AO," "BO," "CO," the word "Pony" and the numerals "¼," "1," "2," "3," "8," we are brought face to face with an exceedingly important question, whose solution will settle the merits of this controversy. It is whether courts of equity will afford a remedy against the invasion of and injury to a trade-mark or the trade reputation of its owners, which he has acquired through the trade-mark itself, or its accompanying *indicia*, which represents only the quality, size, character, description, or caution in the use of the article to which the trade-mark is attached. The ground of jurisdiction is one thing, and the evidence or fact of infringement is another. Courts of equity proceed "on the principle of protecting property alone" and the promotion of honesty and fair dealing. The protection of the public alone is not sufficient ground for the jurisdiction. However, it is an element which enters, and ought to enter, into every case. The property really consists in the exclusive right of a manufacturer or owner to sell his products or goods as his own, and in being protected in the exercise of that right by the exclusion of all others from its enjoyment, either by selling theirs for his, or causing others to do so. It is not necessary to a recovery in equity where the trade-mark itself, in whole or part, has been appropriated, to prove fraud or an inferiority of quality of the article of the defendant. This principle is based on the ground that a trade-mark when in use is property itself. *Edelston* v. *Edelston*, 1 DeG. J. & S., 185. But when the infringement of the property right has been committed by other means than the appropriation of the trade-mark itself, it is essential, even in equity, to show a fraudulent intent, otherwise there could be no safety in the use of those things which are common to all, and which cannot be exclusively appropriated, as to them no legal injury can flow from their innocent, ordinary, or proper use. At law special damage, unless damage is presumed, deceit, or fraudulent intent must be proved in all cases to warrant a recovery. This is not, as we have stated, universally so in equity, but it is common both in law and equity where the infringement is perpetrated by other modes and means than the use of any part of a trade-mark itself. The remedy at law is not adequate in all cases to the protection of this species of property commonly known as "trade reputation," because no injunction can be had against a continuation of the injury, and nothing but nominal recovery unless special damages are shown. *Blofield* v. *Payne*, 4 B. & Ad., 410. The deficiency of the remedy at law has caused the courts of equity to take jurisdiction of this class of cases and extend protection to this great right of property in whose exercise the public are deeply interested, and in whose maintenance the commercial honor and trade integrity of our fair State are profoundly concerned. The ascertainment and explanation of that jurisdiction will be followed by the discussion of the law of infringement and the analysis and application thereto of the facts of this record.

In the rather noted case of the *Leather Cloth Co.* v. *American Leather Cloth Co.*, (House of Lords, reported in Cox, T. M. C., 688,) on which the appellees rely for the remarkable doctrine that no protection can be given unless the appellants show they have a technical trade-mark, all or some part of which has been appropriated and used by the appellees to their injury, the Lord Chancellor reversed the Vice Chancellor because the plaintiff's alleged trade-mark was not a trade-mark, and it contained misrepresentations amounting to a fraud upon the public. In criticising the views of the lower court, the Lord Chancellor stated the doctrine to be—

> First. The goods of one may be sold as the goods of another without giving to that other person a right to complain, unless he sustains, or is likely to sustain, from the wrongful act some pecuniary loss or damage. * * * Second. It is not requisite for the exercise of the jurisdiction there should be fraud or imposition practiced by the defendant at all.

The last proposition was laid down with reference to a trade-mark proper, and is undoubtedly the law. The first proposition is equally sound, and is applicable, whether there is a trade-mark shown to have been dismembered or not, if the goods of one have been intentionally and fraudulently sold as the goods of another, and he has sustained damage, or the former threatens to continue his acts, which the court is bound to conclude will result in damage. This extension of the Lord Chancellor's unnecessarily restricted views is justified by what was said in the House of Lords, on appeal in the same case, by Lords Cranworth, Kingsdown, and the Lord Chancellor himself.

Lord Kingsdown declared it to be the law, and no one disputed it, that the defendants—

> Had no right, directly or indirectly, to represent that the article which they sold was manufactured by Crocketts, or by any person to whom Crocketts had assigned their business or their rights. They had no right to do this either by positive statement or by adopting the trade-mark, * * * or by using a trade-mark so nearly resembling that of plaintiffs as to be calculated to mislead incautious purchasers.

He makes a manifest distinction between making a positive statement and usurping a trade mark as a means of infringement.

Lord Cranworth said that "the Lord Chancellor observes that the ground on which courts of law and courts of equity have interfered in the case of trade-marks has not been well defined, and has not been made to rest on any satisfactory principle;" that he did not think it necessary to go into the question whether the trade-mark, if it could be one, of appellants, as used by them, was entitled to protection, as it was a question of some nicety, for he thought "it clear that there was in this case no infringement." The Lord Chancellor concluded by saying he was satisfied "that I assigned for my decision in the court below a ground narrower than I might have taken as the basis of that judgment," and admitted that he did not "enter into the consideration of the wider view of the subject, which has been so forcibly urged by my noble and learned friends," and concluded that the appellant had no trade-mark at all; that it was nothing more than an advertisement, which had not been substantially imitated by the appellees.

It results from these observations that the grounds of jurisdiction were laid down too narrowly by the Lord Chancellor, and in a manner not necessary to the decision of the case, and that so far from that case contracting the jurisdiction of the courts of equity to the narrow limits of an action at law, or within the bounds prescribed by the instruments with which the wrong may be done, it virtually concedes the jurisdiction to protect the complainants, had they come with clean hands, and shown that the defendants, either directly or indirectly, by positive statement or adoption of a known or rightfully possessed and used trade-mark, represented the article they sold as manufactured by the complainants, and that they had sustained or were likely to sustain damage by reason of the wrongful act.

After repeating the principle that no man has a right to sell his own goods as the goods of another, nor to dress himself in colors and symbols to which he has no exclusive right, and thereby personate another, or represent that he is selling the manufacture of such other, while in reality he is selling his own, the master of the rolls, in *Craft* v. *Day*, (Cox T. M. C., 657,) said:

> The rights which any person may have to the protection of this court does not depend upon any exclusive right which he may be supposed to have to a particular name or to a particular form of words. His right is to be protected against fraud, and fraud may be practiced against him by means of a name, though the person practicing it may have a perfect right to use that name, provided he does not accompany the use of it with such other circumstances as to effect a fraud upon others.

This doctrine was quoted and approved in the case of *Stone* v. *Carlan*, (13 L. R., 360; Cox T. M. C., 116,) where the false pretenses of the defendant are made the basis of the relief, and the badges, symbols, and similar carriages, all of which might have been properly used, as they were not exclusively the property of the complainant, were held to have been so used, under the circumstances of that case, as to amount to fraud, although it is clear that the name of the hotel, "Irving Hotel" or "Irving House," was the only thing among the complainant's signs and symbols that could be treated as exclusively appropriated by him as a trade-mark within the meaning of the law.

So, in the case of *Knott* v. *Morgan*, (2 Keen, 213,) the words "Conveyance Company" and "London Conveyance Company," and other words used by complainants were held to be common property, and therefore not the subject of exclusive right, yet the court said:

> They have a right to call upon this court to restrain the defendant from fraudulently using precisely the same words and devices which they have taken for the purpose of distinguishing their property, and thereby depriving them of the fair profits of their business by attracting custom on the false representation that carriages really the defendant's belong to and are under the management of plaintiff.

What were those words and devices? They were not trade marks, just as "AO," "BO," "CO," "Pony," and "¼," "1," "2," "3," and "8" are not trade marks, yet their combination and use, not to designate the defendants' omnibuses and business, but to imitate the plaintiff's, and thereby attract his custom and take his profits, were held to be illegal.

The case of *Lemoine* v. *Canton* (2 E. D. Smith, 343) was where the complainant had abandoned one trade-mark and adopted another, and a verdict for nominal damages was sustained in his favor against the defendant, who had assumed the discarded trade-mark, and thereby sold his calf-skins as the manufacture of the complainant, the court saying:

> It makes no difference whether that object was effected by counterfeiting the trade-mark which he uses at present or one that he formerly used.

In that case, certainly, title to the trade-mark by which the fraud was committed was not shown, and it was not necessary to show it.

The Supreme Court of the United States used this language in *McLean* v. *Fleming*, (96 U. S., 254:)

> Nor is it necessary, in order to give a right to an injunction, that a specific trade-mark should be infringed; but it is sufficient that the Court is satisfied that there was an intent on the part of the respondent to palm off his goods as the goods of the complainant, and that he persists in so doing after being requested to desist.

The Court, with approval, cites the case of *Woolam* v. *Ratcliff* (1 Hen. & M., 259) in support of their opinion.

Such is the ruling of the Supreme Judicial Court of Massachusetts in the case of *Thompson* v. *Winchester*, (19 Pick., 214.) Thompson invented certain medicines, which he designated "Thompsonian Medicines," and the evidence offered by him to make out his case was to the effect that the defendant had prepared medicines of an inferior quality, and had sold the same as pure Thompsonian medicines, and as and for medicines prepared by plaintiff himself. The court rejected this evidence, and the jury, under instructions, in accord with that ruling, found for defendant; but the supreme court reversed the case, and said "that if the defendant made and sold medicines, calling them 'Thompsonian Medicines,' and sold them, or placed them in the hands of others to sell, as and for medicines made and prepared by the plaintiff, so that persons purchasing the same supposed and believed that they were purchasing the medicines made and prepared by the plaintiff, it was a fraud upon the plaintiff and an injury to his rights, from which the law will presume some damage," citing *Sykes* v. *Sykes*, (3 B. & C., 541,) which is to the same effect. The words "Thompsonian Medicine" had become their proper appellation, and therefore not subject to exclusive appropriation, and the defendant had the right to prepare medicines of an inferior quality and call them by that name, yet he was held responsible for selling his medicines as those of the plaintiff. This case illustrates the rule suggested in the beginning of this opinion—that at law the plaintiff, who has an exclusive right to a trade-mark, has no right to recover where the trade-mark alone has been taken, unless special damages be shown—and that, whether he has a trade-mark proper or not, if, by fraudulent means and with fraudulent intent, the defendant sells his goods as and for those of the plaintiff, the law will presume some damages, and he "will be entitled to recover nominal damages at least, and something more, if he can make it appear that he has sustained more than nominal damages." It is plain, from these authorities, that the damage at law does not grow out of the mere adoption of a trade-mark, but it arises from the fact that sales have been made by defendant of his goods as and for the plaintiff's goods. This results in damages, either by curtailing the amount of plaintiff's sales or substituting inferior goods for his, which injures his reputation. For this damage he has his remedy, because it grows out of a legal injury.

In *Singleton* v. *Bolton* (3 Doug., 293) Lord Mansfield said "that if the defendant had sold a medicine of his own under the plaintiff's name or mark, that would be a fraud for which an action would lie;" but he nonsuited the plaintiff because he and defendant used the name of the original inventor, which had become evidently the proper appellation of the ointment, and because "no evidence was given of the defendant having sold it as if prepared by the plaintiff."

The case of *Morgan, Sons & Co.* v. *Troxell* (Cox Man. T. M. Cas., 414) is important because no trade-mark was there dismembered and the parts appropriated for the accomplishment of the fraud, yet the court granted relief, saying:

> We deem it, then, to be well settled that, to justify the interference by injunction of a court of equity, it is sufficient that there is a fraudulent intention of palming off the defendant's goods as those of the plaintiffs, and that such intention is being carried into execution.

In *Perry* v. *Truefitt* (6 Beavan, 66) Lord Langdale said:

> I think that the principle on which both the courts of law and equity proceed in granting relief and protection in cases of this sort is very well understood. A man is not to sell his own goods under the pretense that they are the goods of another man. He cannot be permitted to practice such a deception nor to use the means which contribute to that end.

In *Singer Manufacturing Co.* v. *Brill* (Superior Court, Cincinnati, Cox Man. T. M. Cas., 409) the judge delivering the opinion said:

> It is competent for one engaged in business to protect that business and the reputation he may acquire by more ways than one, and the law will not allow a man, when called to account for an infringement of an adopted means of protection, to defend by answering that the complainant has still other marks or means whereby to protect himself that he has not interfered with. And accordingly it has been held that 'it will make no difference that the plaintiff has also a trade-mark which has not been taken by the defendant.' (*Braham* v. *Bustard*, 1 Hen. & M., 447.)

The Supreme Court of New York, 1872, in *Cook* v. *Starkweather*, (Cox M. T. M., p. 221,) held—

> That whether the plaintiffs were or were not entitled to the exclusive use of the words "Valley Whisky" or "Old Valley Whisky," which was not clearly established, the course of conduct adopted by the defendants was intended and calculated to deceive, and the plaintiffs were therefore entitled to an injunction.

Kenney v. *Basch* is analyzed by Cox M. T. M., page 364, where it is said:

> The plaintiff being a manufacturer of cigarettes, on which he used a label containing a device of sun's rays, the words "St. James," and symbol "¼," the defendants sold other cigarettes with a label containing the words "St. James Parish Perique Cigarettes," (of which the words "St. James" were much more conspicuous,) and the symbol "¼" in the same style as the plaintiff's, but the labels were in other respects different. Injunction granted to restrain the defendants from using the device of the sun's rays

and also the symbol "½" and words "St. James," alleged to be the plaintiff's trade-marks, on the ground that, whether the plaintiff had or had not an exclusive right in the marks, the defendant had so acted to deceive.

Judge Van Brunt places the jurisdiction on the ground of fraud upon the public, even at the suit of a plaintiff who has not the exclusive right to the use of the words, numerals, or symbols. While we think fraud upon the public may enter into the ground of jurisdiction, it, of itself, in our judgment, is not sufficient, unless some probable or possible injury to the plaintiff is shown. If the plaintiff cannot show that his rights or interests are injured or taken from him, he can have no standing in court, for strictly he represents the public no more than any one else. The confusion which prevails in the argument against the jurisdiction in this case results from assuming that in all cases the complainant must make out a legal title to an exclusive trade-mark by means of which or some part of which the defendant has done the wrong and injury to his rights. The authorities do not sustain this assumption, but, on the contrary, are numerous and strong that the wrong consists in one person fraudulently selling his goods as and for those of another, either by the use of the other's trade-mark or *indicia* or by any means whatever, if such fraudulent practices result or are likely to result in damage to the complainant. In fact, none of the cases at law which we have examined require the plaintiff to prove the existence of a trade-mark strictly and his title thereto in order to recover for the fraudulent sale by another of his goods as those of the plaintiff. There is good reason in support of this principle. Suppose A has earned a great reputation for making and selling plows, which he does not mark at all, but which are known in the market by their perfection in shape and finish, and B makes a plow precisely like it in appearance, but not one-fourth so valuable intrinsically, could B go about, with impunity, for his own gain, to injure A and deceive the public, selling his plows as and for those of A by orally misrepresenting them as A's plows? We are inclined to the view that A would have his action for this deceit and fraud, which would, if not checked, finally break down his reputation for making a good article. This view is not, however, in its full breadth, necessary to the decision of this case, but it illustrates the reason which underlies the well-understood jurisdiction of courts of equity, which they now exercise in preventing the unjust work of deceit, misrepresentation, and fraud by intercepting their gains and restraining the use of their chosen weapons. As the object of the courts of equity is to prevent one man injuring another's rights by selling his goods as those of the other, why not prevent all fraudulent misrepresentation, whether oral, by signs, symbols, trade-marks, labels, words, or figures, by which that wrong is accomplished? The injury is the same, no matter how nor by what means it may be done, and the responsibility should attach when that injury is deliberately and fraudulently committed. This limitation must be observed, that if the means used are such as are common to all or not exclusively appropriated by another, and injury follows which is not the result of design and improper use of those means, no remedy exists. There may be a design in adopting lawful means to absorb another's trade reputation, yet if those means are the common property of all and are used in a lawful manner, and damages ensue, it would be *damnum absque injuria*. But where such means are perverted and so combined and used as to represent the goods of one as the manufacture of another, and for the purpose of selling them as such, there is no room to doubt the power of a court of equity to grant relief. Care should be taken not to interfere with the freedom of trade or to foster monopolies on the one hand, nor to refuse relief in a proper case where the cry of monopoly and interference with trade is deceptive on the other. The fraud is most frequently accomplished by the illegal use of names, forms, words, and numerals which ordinarily belong to the common stock and are not the subject of exclusive appropriation. Instead of employing them in their proper sphere to designate number, size, elements, quality, description, or give directions or caution, they are selected because of the known innocent purposes they generally serve, and combined so as not to represent quality or other particles within the scope of their lawfully-prescribed functions, but to cause the goods or articles to which they are attached to be purchased by the public as the make or manufacture of another, thus violating that great generic rule, which lies at the foundation of all law, that a man must so use his own property as not to injure the property of another. The logic of this position would be conclusive even were it without the support of authority.

Mr. Justice Gray, in *Gilman* v. *Hunnewell*, (122 Mass., 150,) and the master of the rolls, in *Croft* v. *Day*, (7 Bevan, 84,) said that each case of trade-mark, and what is proper to be done in each, depends upon its own circumstances. These observations of those learned judges belong to the necessity of such cases, for were the rules of law applicable to trade marks so fixed and invariable as to try all future cases by the past alone, the wary and cunning would by evasion soon abrogate their efficiency. This suggestion is aptly sustained by the present case, where each particle simulated is the common fund of all for the attainment of the ends they commonly subserve.

The law says you may use anything which is the common property of all, or that cannot be exclusively appropriated, but you must use it to convey the ideas which it commonly expresses and of which it is the accepted sign. You must use it to tell the truth, the whole truth, and nothing but the truth. You cannot, under pretense of exercising a common right of use, and by reason of the fact that the means used represent the quality and size of your goods, so use them that while they perform this simple and innocent purpose apparently of representing quality and size, caution and description, you cause them to do more, to represent your goods as those of another, and, by the seeming fairness which follows the selection of a legal or innocent instrument or means, escape the consequences of an illegal use thereof. This would be stealing the livery of heaven to serve the devil in. This would be perverting the privileges and uses of our language under the pretense of describing one's own to take another's from him. Can such illegal use be made of written or oral language because it is no harm to use that language about matters not foreign to its objects? Quality, size, description, caution, elements, &c., may be indicated or named by the use of the words, letters, and numerals described above. This is the appellee's right, but it is not because the words, letters, and figures do that that he is complained of, for he has the right to use them for those purposes. But the complaint is that these letters and figures have been used not to do this alone, which was rightful, but they have been used for an ulterior purpose. The appellees selected the same letters, the same words, the same numerals, and put them in the same colors and upon the same places on their plows as were used by appellants on their plows. For what? To represent quality and size alone! Who could believe it? Why not take type from a different font? Why not take other numerals that would serve the same purpose better? Why adopt as a number "1," "1," "2," "3," "8?" Why "AO," "BO," "CO," "PO?" No answer can be given except that a man intends the natural consequences of his own act, and the consequences of this act are to take appellant's trade, built up on his reputation, and transfer it to appellees by using that reputation to sell appellees' plows. This departure from the easy and common way of using those letters and figures and the adoption of a troublesome, costly, and painfully-prepared imitation, both of plows and letters, is attempted to be excused on the alleged ground that appellees were making better plows than appellants. This excuse is so transparent a subterfuge to escape the effects of their conduct that it deserves to be mentioned because of its boldness only, and as an illustration of the intent of appellees. Would they take to pieces one of appellants' plows, then make theirs like it, brand them at the same point and in the same way, paint them alike, make the same interchangeable metal points, abandon their old letters and adopt the letters and numerals of defendants, if they were making a better plow, and thus run the risk of confusion with

inferior plows? Who would thus dig a ditch to fall into himself? The eyes of capital, trade, and commerce are too keen not to see and avoid such folly. No man in his senses would commit it, and we cannot believe the appellees did so. If they did not, then the reason assigned by them for this elaborate imitation is false, and we must look for another and true reason, which may be easily found, for it lies upon the surface; it is pointed out by the experience of the race. Those letters and figures on the skillful imitations, unless we deny the evidence of our senses, the plows having been exhibited to us, were used to enable appellees to sell their plows as and for those of the appellants, and thereby injure their trade reputation, lessen their sales, and share their profits and customers. The question must not be confined to what the appellees used, but how and for what purpose they used the *indicia* copied from appellants' plows. If so restricted, the case is plain, for what they used they had the right to use, but the manner in which they used these letters and figures constitutes the wrong. They have used lawful things in an illegal way. Instead of using them to designate quality and size merely, which is allowable, they did not content themselves, but under the pretense of designating quality and size, which the letters and figures really do, they "pressed them into another service" by placing them at points and in positions on their plows that corresponded with the manner of their use by appellants. For this reason the appellant's trade-mark could not perform its legitimate functions; its power of designating their make of plows was lessened, and to that extent their trade, coming to them from their reputation, as evidenced by their trade-mark, was destroyed, and the way opened for appellees to claim that loss as their gain, thus usurping the trade reputation of appellants by the artful manner of using and combining artificial signs common to all as signifying quality and number generally.

Appellees' counsel cite the following text in support of their view: "If through the lawful and proper exercise by one man of his own rights a damage results to another, even though he might have anticipated the result and avoided it," it is *damnum absque injuria*. (Cooley on Torts, 31.) This is sound law; but if he uses his lawful rights and property in an unlawful or improper manner, then, if damage follow, it is damage with injury where he so uses his own as intentionally to injure another. This no man has a right to do, and this is the distinction which appellees' counsel fail to recognize. It is also said that a bad motive may render a bad act worse, but it cannot render a lawful act unlawful. This is also true; for if a man with a bad motive exercises his rights in a lawful and proper way, and injury ensues, it is damage without legal injury; but if he, with a bad motive, exercises his rights in an unlawful manner, and injury is thereby done to another, there is damage and a legal injury. For, instead of exercising his rights in order to their legitimate and full enjoyment, which he may do although it injures another, if he so exercises his rights as not only to enjoy them himself, but to do more, to go beyond and use them in such a manner as to intentionally and fraudulently injure another man's right, it is wrong in principle, condemned by authority, and unsupported by a single analogy, fairly and logically applied. The whole argument of appellees' counsel is based upon the false assumption that a legal injury cannot be done by the improper use of lawful means, and that the very act in question is legal. There is a difference between lawful means and the unlawful use of those means. A bad intent, it is indubitably true, cannot render a legal act worse, but this rule must not be misapplied. A bad intent cannot render legal means or things illegal, nor can it render a legal act worse, but a bad intent does make an illegal act done by the use of legal things a good deal worse. This position of the appellees illustrates the difficulty which courts of equity meet in the enforcement of justice in cases of this character. While the limitation to the exclusive use of the language confines the selfish monopolist to those words, letters, numerals, and symbols which indicate the origin and ownership of his goods, and which no other person can use with like truth, there is a qualification to the manner in which the residue or common stock may be used. No part of it can be diverted from its ordinary functions and perverted to the work of piracy. Though innocent in itself to communicate ideas and represent the product of all labor, its quality, kind, and most minute and general description, they are the most dangerous means with which to misrepresent the goods of one as and for those of another, for it is hard to see the difference at first blush between the lawful and unlawful use of that common stock which it is conceded belongs equally to mankind.

Confounding the legality of the means used with the charge alleged in the bill, we are met with the skillful excuse that a bad motive never renders a legal act worse, and particles which, when properly used for lawful purposes would be harmless, are piled up one after another in such a disconnected way as obscures the effect of their combined power until the innocent instruments, having done the work of invading appellants' trade reputation, are made the defense to their own misuse. But whether arising from the common stock or that which is exclusively appropriated, the use must not be fraudulently abused and the rights of others wrongfully taken from them; hence we say that courts of equity have jurisdiction, no matter what the means may be, if perverted from their true objects, by which one manufacturer represents and sells his goods as and for those of another.

The general rule as to what constitutes infringement is attempted to be laid down in various cases; but it will be found that no rule can be formulated that will anticipate and embrace every act of infringement. So each case must depend mainly upon itself for the rule and proof of this essential prerequisite to recovery. It is not necessary that the resemblance produced should be such as would mislead an expert or such as would not be easily detected if the original and the spurious were seen together. It is enough that such similitude exists as would lead an ordinary purchaser to suppose that he was buying the genuine article, and not an imitation. S. C., 129 Mass., 325.

Although the mark might not deceive if placed side by side with the plaintiffs' mark, it was calculated to obtain for the defendants' goods the same name as that by which the plaintiffs' were known and to deceive an ordinary purchaser who had not an opportunity of comparing the marks. (*Mores* v. *Sargood, Ewen & Co.*, Cox, M. T. C., 636.)

"It is a mistake to suppose that the resemblance must be such as would deceive persons seeing the two trade-marks placed side by side," as was said by Judge Clifford. *Manufacturing Co.* v. *Trainer*, 101 U. S., 64.

In the case of *McAndrews* v. *Bassett* much importance was attached to the fact that the defendant had laid aside the mark he had previously used and took up that of the complainant. The Lord Chancellor said:

The fact of its adoption by the defendants is itself pregnant with proof that they regarded it as a thing desirable to be done. They thenceforth use it in preference to what they previously used, and the reason is clearly to be collected from the letter which was the occasion of the first introduction to them of the mark and the occasion of their adopting it. 10 Jur., N. S., 550; Cox's T. M. Cases, 573.

In every case [says Vice-Chancellor Wood in the *Taylor Persian Thread Case*] the court must ascertain whether the differences are *bona fide*, in order to distinguish the one article from the other; whether the resemblances and the differences are such as naturally arise from the necessities of the case, or whether, on the other hand, the differences are simply colorable, and the resemblances are such as are obviously intended to deceive the purchaser of the one article into the belief of its being the manufacture of another person. Resemblance is a circumstance which is of primary importance for the court to consider, because if the court finds, as it does almost invariably find in such cases as this, that there is no reason for the resemblance, except for the purpose of misleading, it will infer that the resemblance was adopted for the purpose of misleading. *Taylor* v. *Taylor*, 2 Eq. Rep., 290; Cox's M. T. M. Cases, 70.

In *Seixo* v. *Provizende* it was said:

If a purchaser, looking at the article offered to him, would naturally be led, from the mark impressed on it, to suppose it to be the production of the rival manufacturer, and would purchase in that belief, the court considers the use of such a mark to be fraudulent. But I go further. I do not consider the actual physical resemblance of the two marks to be the sole question for consideration. If the goods of a manufacturer have, from a mark or device he has used, become known in the market by a particular name, I think the adoption by a rival trader of any mark which will cause the goods to bear the same name in the market may be as much a violation of the right of that rival as the actual copy of his device. L. R., 1 Chy., 192; Cox's M. T. M. Cases, 146.

Vice-Chancellor Malins said:

The rule of the court is, that a man who has adopted a distinguishing mark has a right to be protected against any other person adopting one sufficiently like it to mislead an unwary public.

In the same case, upon appeal, the Lord Chancellor, in 1872, said:

Though no one particular mark is exactly imitated, the combination is very similar, and likely to deceive. It is true that there is no proof that any one has been deceived, or that the plaintiffs have incurred any loss; but where the similarity is obvious, that is not of importance. *Abbott* v. *Bakers' and Confectioners' Tea Association*, Cox, M. T. C., 213.

In the justly-celebrated opinion of Judge Duer, in the *Amoskeag Man. Co.* v. *Spear*, he said:

In an imitation of the original mark upon an article or goods of the same description, the name of the proprietor may be omitted, another name, that of the imitator himself, may be substituted; but if the peculiar device is copied, and so copied as to manifest a design of misleading the public the omission or variation ought to be wholly disregarded. Its object, we may be certain, was not to communicate the truth, but to escape the penalty of falsehood. A fraud is intended, an unlawful gain is meant to be realized; but it is believed or hoped that an injunction may be avoided and claim for profits or damages be repelled. The fraud, however, if a court of equity is true to its principles, will be suppressed and its fruits be intercepted or restored. My conclusions on this branch of the subject are that an injunction ought to be granted whenever the design of a person who imitates a trade-mark, be his design apparent or proved, is to impose his own goods upon the public as those of the owner of the mark, and the imitation is such that the success of the design is a probable or even possible consequence. *Amoskeag Manufacturing Co.* v. *Spear*, 2 Sand., S. C., 599; Cox T. M. Cases, 95.

"Even if the wholesale buyer is not misled, but the small retailer or the consumer is, the right of action exists," was the language used in *Dixon Crucible Co.* v. *Guggenheim*, (2 Brewster, Penn., 335.) See also *Clark* v. *Clark*, (25 Barb., 76,) and *Brooklyn White Lead Co.* v. *Masury*, (Ibid, 416.)

In the case of *Coats* v. *Holbrook*, Vice-Chancellor Sanford said:

A man is not to sell the goods or manufacture of B under the show of pretense that they are the goods or manufactures of A, who, by superior skill or industry, has established the reputation of his articles in the market. The law will permit no person to practice a deception of that kind, or to use the means which contribute to effect it. He has no right and he will not be allowed to use the names, letters, marks, and other symbols by which he may palm off upon buyers as the manufacture of another the article he is selling, and thereby attract to himself the patronage that, without such deceptive use of such names, &c., would have inured to the benefit of that other person who first got up or was alone accustomed to use such names, marks, letters, or symbols. *Coats* v. *Holbrook*, 2 Sand. Chy. R., 594; Cox's T. M. Cases, 221.

The court said in *Gillott* v. *Esterbrook, supra:*

The design to defraud by manufacturing and packing pens in all respects similar to the plaintiff's, excepting only in the use of the name, appears very plainly. I cannot reason so artificially as to disguise this conclusion from myself.

The language of Lott, Senator, in *Taylor* v. *Carpenter* shall close our quotations on the manner infringements have been made and the means and acts which have been declared to be infringements. He said:

Honest competition relies only on the intrinsic merits of the article brought into market, and does not require a resort to a false or fraudulent device or token. That certainly cannot deserve the appellation which studiously gives to the product of pretended superior skill the name and exact resemblance and imitation of the article with which it professes to compete. A disguise is not usually assumed for an honest object. It is a mark more characteristic of deception and fraud. It defeats the very end and object contemplated by legitimate competition, the choice to the public to select between the articles sold, and operates as a deception and imposition on the dealer. 2 Sand. Chy. Rep., 613; S. C. Cox T. M. Cases, 45.

What is lacking in authority to reach every case of infringement may be easily supplied from the never-failing fountain of justice, where principle finds universal application. What are the facts of this case? The appellees have not used a single letter, figure, or word that belongs to appellants' trade-mark proper, yet by the exact similation of the plow in every perceivable point exposed to an ordinary observer and purchaser, and the use of the same coloring and staining, the same relative position of the letters and figures as employed and used by the appellants, avoiding the literal appropriation of any part of their trade-mark, the appellees have obscured their own and appellants' trade-mark, but at the same time sought to avoid detection and responsibility in doing so, and to cause their plows to be taken for and purchased as those of appellants. Thus by skillful combination of legal particles, taken one at a time and in the aggregate, leaving the mere trade-mark untouched, they have so confused its force and effect as to destroy its office and real efficiency to distinguish the appellants' plows from all others.

1. The appellees laid aside their own letters and numerals, which they commonly used to indicate the size, series, and quality of their plows, and literally took up those of the appellants.

2. They quit lettering cast and figuring steel plows, and reversed that order and adopted the order of use by appellants.

3. They consulted and deliberated before adopting the letters and numerals or imitating the construction of appellants' plows.

4 After the deliberation they so imitated the construction, numerals, and lettering of appellants' plows that nothing but the reading of their trade-mark and close inspection could distinguish the difference.

5 They made large quantities of plows, leaving off their own trade-mark and name, and substituted therefor the names of jobbers, who were well known in the market to be venders and not makers of plows, making it in their hands therefore impossible, without the aid of expert knowledge, to tell the difference between a Meikle and Avery plow, as they both had the same *indicia* and were constructed alike, the maker's name being altogether suppressed.

6. They have employed small salesmen to sell their plows, who place them on the market one-half dollar cheaper than the Avery plow, and so advertise them as to be taken for those of the appellants.

The combined force of this evidence is irresistible. It shows an intentional infringement, and not only possible injury, but such facts from which the law presumes some injury at least to be the necessary consequence. If such infringement as this be not enjoined and the profits resulting from it returned, then trade-mark law will never accomplish its prime object, named in the first sentence of this opinion on that branch of the subject we have discussed. The trade-mark and trade-reputation pirate always undertakes the difficult task of sailing between the Charybdis and Scylla of the law, but he should never be allowed a successful voyage. If, on the one hand, he escapes the rock by not infringing through the instrumentality of the trade-mark itself, he will not, on the other, if courts of equity are true to the principles of their own existence, be allowed a safe passage by the use of any means of deceit or false representations known to the inventive brain of man. Courts of law and equity have finally become possessed of jurisdiction, through the unfolding process of adjudication, ample to protect a trade-mark, which may be used by all to distinguish their goods from others; to prevent the sales of the goods of one as being those of another by means of fraud and misrepresentation in the use of marks, signs, words, numerals, or symbols; to afford redress for such sales of goods which are a misleading imitation of those of another, for whose manufacture they may be sold, where intentional false representations or fraud, from which damage the sales are made by the use of a trade-mark, or direct or indirect, is presumed and its extent may be proven. In all cases, however, the conduct or adopted means of the imitator must be such as does or would probably deceive the ordinary mass of purchasers.

In conclusion, we repeat that this law grows out of the common principle of justice that the rights of each should be so used as not unnecessarily to injure those of others whose skill has made their goods valuable in their reputation that finally compensates them for their enterprise, industry, and fidelity. We are therefore of the opinion that the relief prayed for should have been granted.

The thanks of the court are tendered to the able counsel on both sides of this case for the great assistance they have rendered us in our efforts to arrive at a conclusion in strict obedience to authority and principle.

Wherefore the judgment is reversed and cause remanded for further proceedings consistent with this opinion.

Attorneys.

DEPARTMENT OF THE INTERIOR,
OFFICE OF THE SECRETARY,
Washington, D. C., June 4, 1884.

SIR: I am directed by the Secretary to inform you that he has ordered that Theodore F. Dewey, of Osborne, Ohio, be not recognized from and after this date as attorney in the prosecution of any claim or other matter before the Department of the Interior or any bureau thereof.

I am, sir, very respectfully, your obedient servant,
GEO. M. LOCKWOOD,
Chief Clerk.

The Commissioner of Patents.

Issue of June 10, 1884.

DESIGNS.

15,046.—CHURN-FRAME.—*Theodore Dickman* and *John W. Elliott*, Wapakoneta, Ohio. Application filed March 15, 1884. Term of patent 14 years.

15,047.—HANDLE FOR SPOONS OR FORKS.—*Charles Sanford Dikeman*, Newburyport, Mass., assignor to *The Towle Manufacturing Company*, same place. Application filed April 23, 1884. Term of patent 7 years.

15,048.—SPOON-HANDLE.—*Alexander Dominick*, New York, N. Y. Application filed April 25, 1884. Term of patent 7 years.

15,049 and 15,050.—JEWELRY-PIN.—*Theodore W. Foster*, Providence, R. I. Applications filed March 17, 1884. Term of patents 7 years.

15,051.—DIPPER.—*William O. Freeman*, Louisiana, Mo. Application filed June 9, 1883. Term of patent 14 years.

15,052.—PIANO-CASE.—*Anton Gunther*, Toronto, Ontario, Canada. Application filed February 11, 1884. Term of patent 3½ years. Registered in Canada February 19, 1884, No. 4.

15,053.—END FRAME FOR CAR-SEATS.—*Henry S. Hale*, Philadelphia, Pa. Application filed February 14, 1884. Term of patent 14 years.

15,054 to 15,057, inclusive.—OIL-CLOTH.—*Charles T. Meyer* and *Victor E. Meyer*, Bergen, N. J., assignors to *Edward C. Sampson*, New York, N. Y. Applications filed April 26, 1884. Term of patents 3½ years.

15,058.—WINE-GLASS.—*Gustav Otto*, Hoboken, N. J. Application filed March 22, 1884. Term of patent 3½ years.

15,059.—HEATING-STOVE.—*Andrew S. Phelps*, Chicago, Ill., Application filed November 19, 1883. Term of patent 14 years.

15,060.—PENCIL-CASE OR SIMILAR ARTICLE.—*Edward Todd*, New York, N. Y. Application filed April 12, 1884. Term of patent 7 years.

15,061.—LAMP-FIXTURE.—*Giovanni Sieckenberger*, New York, N. Y. Application filed March 24, 1883. Term of patent 7 years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upwards are registered under the act of March 3, 1881.]

11,227.—CORSETS.—*Theodore C. Bates*, Worcester, Mass. Application filed March 22, 1884.
"The arbitrary word 'IRONCLAD.'"

11,228.—CIGARS AND SMOKING AND CHEWING TOBACCO.—*George W. Cochran & Co.*, Washington, D. C. Application filed May 8, 1884.
"The arbitrary word-symbol '1836. THE OLD GUARD. 1884,' in connection with the representation of an armory."

11,229.—SMOKING AND CHEWING TOBACCO.—*G. W. Gail & Ax*, Baltimore, Md. Application filed May 6, 1884.
"The word-symbol 'LOOM' and the pictorial representation of a loom."

11,230.—SMOKING AND CHEWING TOBACCO.—*G. W. Gail & Ax*, Baltimore, Md. Application filed May 6, 1884.
"The word-symbol 'GOLDFINCH' and the pictorial representation of a goldfinch, which may be used either separately or in connection with each other."

11,231.—SMOKING AND CHEWING TOBACCO.—*G. W. Gail & Ax*, Baltimore, Md. Application filed May 7, 1884.
"The word-symbol 'ALLIGATOR' and the pictorial representation of an alligator, which may be used either separately or in connection with each other."

11,232.—SMOKING AND CHEWING TOBACCO.—*G. W. Gail & Ax*, Baltimore, Md. Application filed May 7, 1884.
"The word-symbol 'L'ROAD' and the pictorial representation of an elevated railroad."

11,233.—SMOKING AND CHEWING TOBACCO.—*G. W. Gail & Ax*, Baltimore, Md. Application filed May 7, 1884.
"The word-symbol 'KING BLUE BEARD' and the pictorial representation of Blue-beard, which may be used separately or in connection with each other."

11,234.—CIGARETTES.—*William S. Kimball & Co.*, Rochester, N. Y. Application filed May 12, 1884.
"The word 'EXCELSIOR.'"

11,235.—TOILET-SOAP.—*James S. Kirk & Co.*, Chicago, Ill. Application filed May 8, 1884.
"The arbitrarily-selected word 'EUTOCA.'"

11,236.—LAUNDRY-SOAP.—*James S. Kirk & Co.*, Chicago, Ill. Application filed April 10, 1884.
"The word 'ARCADE.'"

11,237.—LAUNDRY-SOAP.—*James S. Kirk & Co.*, Chicago, Ill. Application filed April 11, 1884.
"The arbitrarily-selected word 'COSMO.'"

11,238.—LAUNDRY-SOAP.—*James S. Kirk & Co.*, Chicago, Ill. Application filed April 21, 1884.
"The words 'OUR UNION.'"

11,239.—SIRUP, SUGAR, AND MOLASSES.—*David Nicholson*, St. Louis, Mo. Application filed March 31, 1884.
"The representation of a bunch of thistles, an eagle, and a lion."

11,240.—CIGARS.—*Rosendo Rendules*, Havana, Cuba. Application filed May 12, 1884.
"The designation 'LA GRATITUD.'"

11,241.—CIGARS AND CIGARETTES.—*Herman Segnitz & Co.*, Milwaukee, Wis. Application filed May 8, 1884.
"The arbitrary words 'ON TOAST.'"

11,242.—BUILDING-STONE.—*The Belknap & Dumesnil Stone Company*, Louisville, Ky. Application filed January 14, 1884.
"The words 'BOWLING GREEN.'"

11,243.—LAUNDRY-SOAP.—*James S. Kirk & Co.*, Chicago, Ill. Application filed April 8, 1884.
"The word 'ARGENTA.'"

11,244.—LAUNDRY-SOAP.—*James S. Kirk & Co.*, Chicago, Ill. Application filed April 9, 1884.
"The words 'GOLD OF OPHIR.'"

11,245.—BLACK RIBBONS.—*Walter H. Lewis*, New York, N. Y. Application filed March 22, 1884.
"A design composed of a wreath, the arms of Italy and France, and the ribbon and order of the Legion of Honor."

11,246.—FAMILY FLOUR.—*Edmund H. Readshaw*, Danville, N. Y. Application filed March 4, 1884.
"A monogram composed of the letters 'E H R.'"

11,247.—BOLTING-CLOTH FOR MILLING PURPOSES.—*C. Schindler-Escher*, Zurich, Switzerland. Application filed August 4, 1883.
"The representation of a lion standing upright and holding a shield."

11,248.—METALLIC AND PAPER SHELLS FOR BREECH-LOADING FIRE-ARMS.—*Union Metallic Cartridge Company*, Bridgeport, Conn. Application filed April 26, 1884.
"The letters, marks, or characters 'X X.'"

11,249.—SHELLS COMPOSED OF PAPER WITH A METALLIC BASE.—*Union Metallic Cartridge Company*, Bridgeport, Conn. Application filed April 26, 1884.
"The letters 'S. G.'"

11,250.—MATERIAL FOR PLUMPING AND SOFTENING THE UPPERS OF BOOTS AND SHOES.—*Samuel A. White*, Boston, Mass. Application filed March 20, 1884.
"The arbitrary word 'GUMOLIA.'"

11,251.—CARTRIDGES FOR BREECH-LOADING FIRE-ARMS.—*Winchester Repeating Arms Company*, New Haven, Conn. Application filed May 5, 1884.
"The word 'CASSADY.'"

11,252.—CORDIALS AND LIQUORS.—*Les Héritiers de Marie Brizard & Roger, M. B. Glotin, Achard & Glotin*, Bordeaux, France. Application filed March 19, 1884.
"An ornamental border and the signature 'MARIE BRIZARD & ROGER' in fac-simile."

11,253.—BUTTER, CHEESE, AND OTHER DAIRY PRODUCTS.—*Charles E. Marvin* and *Edward A. Cammack*, Rochester, Minn. Application filed March 24, 1884.
"The word 'CRESCENT' and the figures or characters of a crescent and a star."

11,254.—CHERRY BRANDY.—*Edouard Fernod*, Couvet, Switzerland. Application filed December 12, 1883.
"The words 'EDOUARD PERNOD À COUVET,' a white cross on a sixteen-cornered red ground, an ornamental interlacing and border lines, and crown of rays or wave-lines radiating from the central ornamental interlacing lines."

11,255.—PACKAGE-DYES.—*Frank A. Ransom*, Dunellen, N. J. Application filed December 27, 1883.
"The arbitrarily-selected word or term 'RAINBOW.'"

LABELS.

4,139.—Title: "DR. ARNOLD'S MALARIA CURE."—*Calvin M. Arnold*, Harrisburg, Pa. Application filed May 17, 1884.

4,140.—Title: "CALENDULA LOTION."—*C. H. Dalrymple*, Morristown, N. J. Application filed May 19, 1884.

4,141.—Title: "MAY'S DYSPEPSIA CURE."—*J. Mortimer Daniels*, Scranton, Pa. Application filed April 9, 1884.

4,142.—Title: "FIG PASTE."—*Jas. M. Lore & Co.*, Kansas City, Mo. Application filed May 19, 1884.

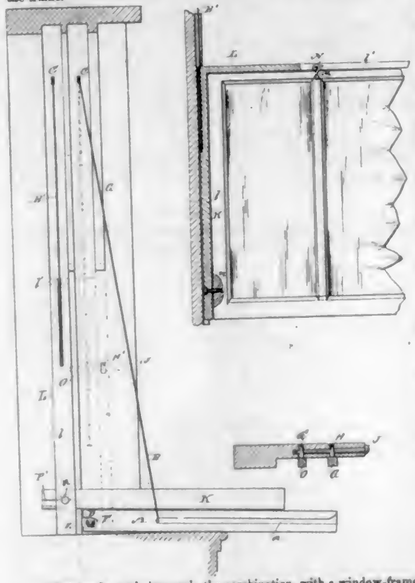
4,143.—Title: "LYON'S SARSAPARILLA."—*George R. Lyon*, New London, Conn. Application filed April 29, 1884.

4,144.—Title: "LYON'S COUGH SYRUP."—*George R. Lyon*, New London, Conn. Application filed April 29, 1884.

4,145.—Title: "HOP OINTMENT."—*George R. Lyon*, New London, Conn. Application filed May 3, 1884.

4,146.—Title: "MAKER'S COMPOUND VEGETABLE COUGH SYRUP."—*Willis A. Maker*, Worcester, Mass. Application filed April 24, 1884.

4,147.—Title: "ALETRIS CORDIAL."—*Rio Chemical Company*, St. Louis, Mo. Application filed May 19, 1884.

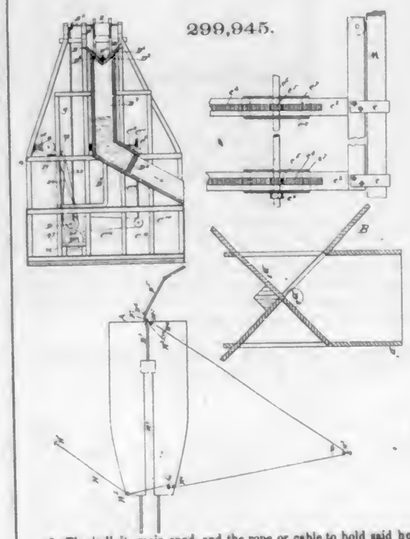


4,148.—Title: "TARRANT'S FIG PASTE."—*Thomas W. Tarrant*, Kansas City, Mo. Application filed May 15, 1884.

PATENTS

GRANTED JUNE 10, 1884.

299,944. WINDOW-SASH. LOUIS L. ARNOLD, Chicago, Ill. Filed July 17, 1883. (No model.)



Brief.—A U-frame with sash-cords secured to its side pieces fits a window-frame with removable stop-beads, and carries a sash with a hook to engage the top piece of and recesses to engage pins on the side pieces of the U-frame, enabling the sash to be swung forward and taken out of the frame.

Claim.—In a window-sash, the combination, with a window-frame, sash-cords B', and the removable parting-stripe O, of the sliding frame I, composed of the side pieces, *l*, and top cross-piece, *l'*, and provided with the pintles *n*, and the sash K, having its side bars provided with the recesses P', to receive the pintles *n*, substantially as herein shown and described.

299,945. DREDGE. JOHN A. RALL, Oakland, Cal. Filed Aug. 31, 1883. (No model.)

299,945.

Brief.—A rope for swinging the vessel on a rear main spud runs from an anchor to one side of the vessel around a gipsy on the vessel, around a pulley on an anchor on the other side, around a pulley at the stern, to a capstan. An auxiliary spud is carried by crane-arms sliding in brackets turning on a vertical shaft, and having means to run such arms out or in. Rocks, &c., may be discharged into a well beneath the hopper by opening valves in its bottom instead of through the discharge-pipe; or by placing a cover over the well such matter may be delivered to the side.

Claim.—1. The hull, its main spud, and the rope or cable and anchors to hold it outside the hull, and distant from one end of the latter, said cable being connected with the said hull near its other end, combined with a gipsy to act upon the said rope or cable, and move the said hull from side to side, substantially as described.

2. The hull, its main spud, and the rope or cable to hold said hull, secured at each side of but distant from the hull, the said cable being made to wind freely with relation to one of the anchors by means of a pulley, as described, combined with a capstan mounted on the hull and adapted to hold taut the working end of said rope or cable, substantially as described.

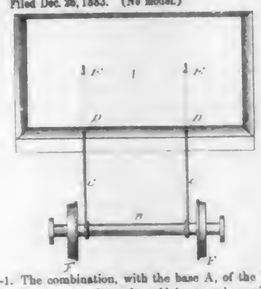
3. The hull, its main spud, the rope or cable H, and anchors H' H², to hold it outside the hull, the pulley connected with the anchor H², and the capstan to receive the unanchored end of the rope or cable, combined with a gipsy to act upon the said rope or cable and swing the hull about the said spud as a center, substantially as described.

4. The hull, its main spud, the rope or cable H, the anchors, and pulley connected with anchor H², combined with the pulley H', located near the main spud, and with a capstan to receive about it the free end of the said rope or cable, combined with means, substantially as described, to act upon said rope or cable and swing the hull about the said spud, substantially as described.

5. The hull, its main spud, the rope or cable, the anchor to fix one end of the rope outside of the hull, the anchor provided with a pulley and located at the opposite side of the hull, the capstan to hold the other end of the said rope, and a gipsy and means to move it positively to act upon and swing the said hull about the said spud, combined with the bucket-chain and buckets thereon, and with means to operate the said chain and buckets, substantially as and for the purposes set forth.

6. The hull, the crane, and the auxiliary spud, and means to lift the said spud, combined with means to slide the crane, substantially as described.

7. The hull, the crane adapted to slide in pivoted guides, and the auxiliary spud, combined with means to slide the said crane, and with means to lift the spud, substantially as described.

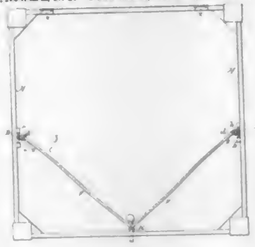


8. The hull and the main spud, combined with a pivoted sliding spud-carrying crane, and with means to operate the said crane, substantially as described.

9. The hull and the elevated hopper provided with a discharge-outlet, combined with valves or gates at the bottom of the hopper, substantially as described.

10. The hull and the elevated hopper provided with the discharge-outlet and the valves or gates at the bottom of the hopper, combined with the well into which the material discharged through the said valves or gates drops, substantially as described.

11. The hull, the elevated hopper provided with the discharge-outlet, and the valves or gates at the bottom of the hopper, combined with the roof-shaped cover against which the material dropped through the said valves or gates may strike, substantially as described.



299,946. PAPER-WEIGHT. CHARLES JOHN RUSSELL BALLARD, Orland, Cal. Filed Dec. 26, 1883. (No model.)

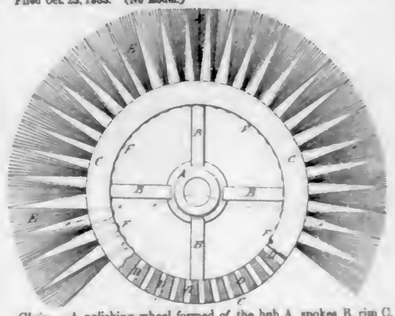
Claim.—1. The combination, with the base A, of the spring-arms C C, secured at their inner ends to the said base, and provided at their outer ends with friction-rollers, substantially as specified.

2. In a paper-weight, the combination, with the base A, having the perforations D and E, of the spring-arms C, secured at their inner ends to the said base, and at their outer ends to an axle, B, carrying friction-rollers, substantially as specified.

299,947. SHOW-STAND FOR CLOAKS AND OTHER GOODS. JOB BARDSLEY, Newark, N. J. Filed Oct. 6, 1883. (No model.)

Claim.—1. In a stand for showing cloaks and other goods, the hinged top M, in combination with the frame A, toothed segmental racks D D, carried by opposite sides of the top, the pivotally-secured links *d d*, which encompass the racks and engage the teeth thereof, and lever N and rods F F, for simultaneously moving the links on their bearings, so as to disengage them from the racks when desired.

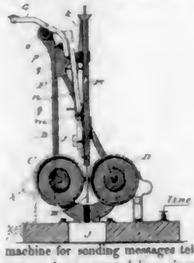
2. In a show-stand for cloaks and other goods, the hinged top, in combination with the segmental racks D, links *d*, actuating-rods F, and lever N, substantially as set forth.



3. The lever N, mounted upon the plate *w*, and having a weighted inner and a hook-shaped outer end, in combination with the rods F, links *d*, segmental racks D, and the top M, substantially as set forth.

4. A show-stand consisting of the cloth-covered top, frame A, with its legs and casters, the racks D, links *d*, rods F, and lever N, substantially as set forth.

5. In a stand for exhibiting cloaks and other goods, the hinged top M, in combination with the frame A, toothed segmental racks D D, links *d d*, having arms *e e* and stops *z z*, the bearings *b b*, and means for simultaneously moving the links on their bearings to free them from the racks when desired.



6. In a stand for showing cloaks and other goods, the hinged top M, in combination with the frame A, the toothed segmental racks D D, having projections *i i* on their lower end, the links *d d*, having arms *e e*, the bearings *b b*, and means for simultaneously moving the links on their bearings to free them from the racks when desired.

299,948. POLISHING-WHEEL. HENRY BINTZ, New York, N. Y. Filed Oct. 23, 1883. (No model.)

Claim.—A polishing-wheel formed of the hub A, spokes B, rim C, having radial holes D, and bristle bunches or "knots" E, arranged continuously about said rim, all of said parts being cast in one piece, as and for the purpose specified.

299,949. TELEGRAPHIC TRANSMITTER. NICHOLAS J. BISHOPRICK, Brooklyn, N. Y. Filed Oct. 4, 1883. (No model.)

Claim.—1. A machine for sending messages telegraphically, composed of rotary contact-surfaces arranged in a circuit, previously-prepared fixed telegraphic symbols or characters consisting of a conducting medium expressive of the symbols, or any of them, arranged in a non-conducting body, and means to bring such symbols or characters into operative connection with said rotary surfaces, substantially as and for the purpose described.

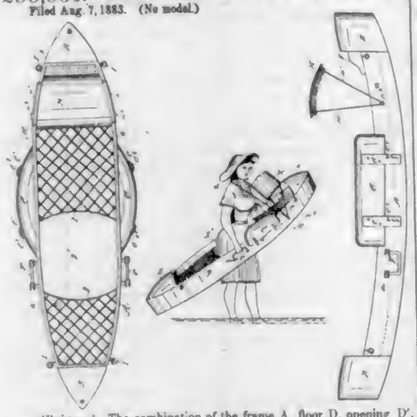
2. In a telegraphic transmitter, an insulated grounded rotary conductor and a rotary transmitting-conductor geared therewith, the two rotating in opposite directions, combined with a superposed hopper, and previously-prepared telegraphic symbols arranged therein, and means to bring said symbols to said conductors, one by one, as they are required, to form words, substantially as set forth.

3. The combination, substantially as shown and described, of the rotary contact-surfaces placed in an electric circuit, a hopper containing a series of compartments, non-conducting blocks or type containing electrically-conductive telegraphic symbols or characters arranged in said compartments systematically, a series of levers provided with holding and releasing devices for such blocks or type, and keys corresponding with the symbols in each of said compartments, arranged to operate the levers, as set forth.

4. The improved type for transmitting telegraphic symbols, consisting of a non-conducting body and a conducting medium expressive of such symbol or symbols arranged in the same and extending through on both sides, substantially as shown and described.

299,950. BALANCED SLIDE-VALVE. LOUIS JAMES MASKEY BOYD, Annapolis, Md. Filed Jan. 22, 1884. (No model.)

Claim.—1. The combination, with a slide-valve provided with adjustable bearings, of a piston connected with the valve, and having one side thereof in communication with the exhaust-cavity of the valve and the other side subjected to steam-pressure, and devices for transmitting the motion of the piston to the valve and thereby causing the latter to rest on its adjustable bearings, substantially as set forth.



2. The combination, with a slide-valve provided with adjustable rollers, of a piston connected with the valve, one side of the piston being in communication with the exhaust-cavity of the valve and the opposite side exposed to steam-pressure, and devices connecting the piston and roller-frames, substantially as set forth.

3. The combination, with a slide-valve provided with adjustable rollers, of a piston connected with the valve and having one side thereof in communication with the exhaust-cavity of the valve and its opposite side exposed to steam-pressure, and levers connected at one end to the piston, and their opposite ends constructed and arranged to engage the roller-frames and brackets on the valve, substantially as set forth.

4. The combination, with a slide-valve provided with adjustable roller-bearings, of a piston connected with the valve, and levers arranged with their outer ends engaging the roller-frames, and their inner ends connected to a rocking yoke on the piston-stem, substantially as set forth.

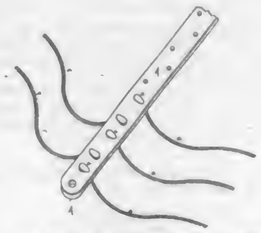
5. The combination, with a slide-valve constructed with cavities, each provided with a passage leading to the exhaust-cavity of the valve, and piston fitted to said cavities, of adjustable roller-frames fitted in openings at the corners of the valve, and levers connecting said piston and roller-frames, substantially as set forth.

299,951. HAMMOCK-CANOE. EDWARD H. BROWN, New York, N. Y. Filed Aug. 7, 1883. (No model.)

Claim.—1. The combination of the frame A, floor D, opening D', air-chambers B, adjustable and detachable floats C, handles F, band G, and pillow K, all being constructed substantially as described, and for the purpose set forth.

2. In a combined hammock and canoe, the combination of the frame A, floor D, opening D', pillow K, air-chambers B, adjustable and detachable floats C, and rings I, substantially as and for the purpose set forth.

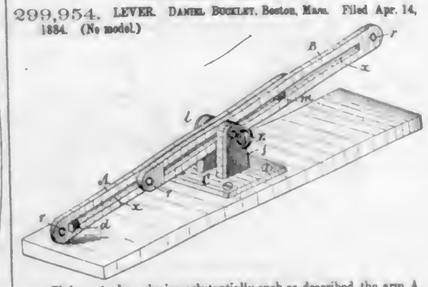
3. In a combined hammock and canoe, the combination of the frame A, floor D, opening D', pillow K, shade H, mounted on supports H', air-chambers B, adjustable and detachable floats C, rings I, handles F, and band G, all being constructed and adapted to operate substantially as shown and described.



299,952. INSTRUMENT FOR CUTTING FLY-NET STRINGS. RALPH BROWNSON, St. Paul, Minn., assignor of one-half to Peter R. L. Hardenbergh, same place. Filed Nov. 13, 1883. (No model.)

Claim.—1. The base A, having spirally-arranged holes, pins *a*, adapted to be inserted into said holes, and a spiral knife, B, supported by said pins, substantially as described.

2. The combination of a base, A, having spirally-arranged holes, pins *a*, fixed stud *b*, and knife B, substantially as and for the purpose set forth.



3. The combination of a base, A, having spirally-arranged holes, pins *a*, fixed center stud *b*, and fixed outer stud *d*, whereby one end of the string is formed with an enlarged end, *g*, substantially as and for the purpose specified.

299,953. FLY-NET. RALPH BROWNSON, St. Paul, Minn., assignor of one-half to Peter R. L. Hardenbergh, same place. Filed Nov. 13, 1883. (No model.)

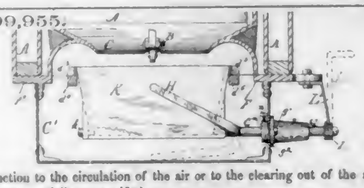
Claim.—In a fly-net, the combination, with the supporting strap or straps, of strings *a a*, having enlarged ends *c c*, substantially as and for the purpose herein specified.

299,954. LEVER. DANIEL BUCKLEY, Boston, Mass. Filed Apr. 14, 1884. (No model.)

Claim.—1. In a device substantially such as described, the arm A, provided with the slot *x* and studs *m d*, and the arm B, provided with the slot *x* and studs *i*, in combination with a clamp for clamping said arms together and journaling or pivoting them, substantially as set forth.

2. In a device substantially such as described, the screw-bolt D, provided with the round elongated head *z* and flattened portion *t*, in combination with the nut E, having the round elongated body *v*, for journaling and clamping the arms A B, substantially as specified.

3. In a device substantially such as described, the standard C, provided with the bolt D and nut E, adapted to clamp and journal the arms A B, substantially as set forth.



4. The improved extensible lever herein described, the same consisting of the arm A, provided with the slot *x*, studs *d m*, and holes *r*, the arm B, provided with the studs *i*, slot *x*, and holes *r*, the screw-bolt D, having the rounded head *z* and flattened portion *t*, the nut E, having the rounded body *v*, and the support C, provided with the standards *l f*, constructed, combined, and arranged to operate substantially as specified.

5. In a device substantially such as described, the arms A B, provided with the holes *r*, for attaching auxiliary arms to lengthen the lever, substantially as set forth.

299,955. LOCOMOTIVE ASH-PAN. JAMES G. BUTTERFIELD, Sioux City, Iowa. Filed Dec. 24, 1883. (No model.)

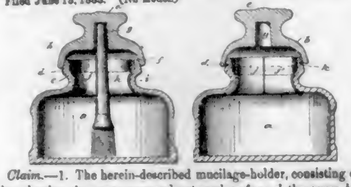
Claim.—1. The combination, in a locomotive-boiler, of the grates with the downwardly-curved deflecting-plates, the ash-pit, and the ash-pan inside the same, having flaring sides, and suspended from the frame under said deflecting-plates, the space between the bottom of the ash-pan and the bottom of the ash-pit being free and clear, so as to offer no ob-

299,955.

struction to the circulation of the air or to the clearing out of the ash-pit, substantially as specified.

2. The combination of the grates with the downwardly-deflecting plates, ash-pit, ash-pan inside the same, provided with offsets d d' at its corners, and ears d^2 d^3 and supporting-lugs d^4 d^5, projecting from the frame, said lugs d^4 being provided with offsets d^6, and being made long enough to permit the ash-pan to slide back on said offsets sufficiently to allow the front end of said ash-pan to drop off its supporting-lugs in order to remove the same, substantially as specified.

3. The combination of the grates with the deflecting-plates, the ash-pan having flaring sides and suspended beneath the same from the frame, and a crank-shaft projecting out through the side of the ash-pit, and having a bent or curved arm for opening and closing the door of the ash-pan, substantially as specified.



4. The combination of the ash-pan and its door with a crank-shaft provided with a bent or curved arm for opening and closing the door, and a spring-catch adapted to engage with the crank-arm for locking or holding the door closed, substantially as specified.

299,956. TUNING-FORK. SAMUEL BRIERLY BUTTERWORTH, Franklin Falls, N. H. Filed Oct. 24, 1883. (No model.)

Claim.—In combination with the tuning-fork, the scale-bar fastened thereto, and the movable yoke adapted to embrace and slide upon such fork and bar, and provided with means of clamping it to the bar, substantially as set forth.

299,957. MUCILAGE-HOLDER. EDWIN R. CAHOON, Newark, N. J. Filed June 13, 1883. (No model.)

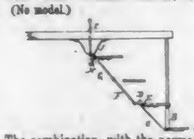
Claim.—1. The herein-described mucilage-holder, consisting of the bottle a, having the cover-engaged external surface, d, the cover b, having the lip f, to engage the said surface to make an air-tight joint, and a wiper, j, in the mouth of the bottle, substantially as shown and specified.

2. In a mucilage-holder, the combination, substantially as shown and described, of the bottle a, having the external surface, d, prepared to make an air-tight joint with the cover, the cover b, having the lip f, to engage such prepared surface, the brush h, fitted inside the cover to enter and be inclosed within the bottle, and the wiper j, standing upright in the mouth of the bottle, as set forth.

3. In a mucilage-holder, the combination, substantially as shown and described, of the vitreous bottle a, having the surface d ground to make a tight joint with the cover, the vitreous cover b, having the ground lip f, to engage such surface d, the brush h, made tight in said cover, the split tube j, standing upright in the mouth of the bottle and extending to or beyond the level of the mouth of the bottle, and constituting a wiper for the brush, as and for the purpose set forth.

4. The herein-described mucilage-holder, adapted to prevent the evaporation of liquid mucilage and the accumulation of hardened gum within and around the mouth thereof, the same consisting of the bottle a, having a ground surface, d, to engage with the cover, and having a wiper, j, in the mouth of said bottle, and a cover, b, inclosing the wiper, and having a ground surface to engage and form an air-tight joint with the ground surface of the bottle, and a depending brush secured to said cover, arranged and operating substantially as set forth.

299,958. OIL-PRESS. WILLIAM P. CALLAHAN, Dayton, Ohio. Filed Mar. 29, 1884. (No model.)



Claim.—1. The combination, with the division-plates or boxes of the oil-press, of metal meal pans or mats composed of a lower perforated plate, an upper perforated and corrugated plate, and interposed interstitial material, whereby an air-chamber is formed between the two plates.

2. The combination, with the division-plates or boxes of an oil-press, of metal meal pans or mats composed of a lower perforated plate, an upper perforated and corrugated plate, and interposed wire-cloth in one or more layers.

3. An oil-press mat or meal-pan composed of a bottom plate whose under side is guttered, whose upper surface is corrugated with perforations from the depressions of the corrugations and opening into the gutters, a superimposed perforated and correspondingly-corrugated sheet-metal plate, and interposed wire-cloth in one or more layers, substantially as described.

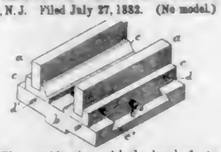
4. An oil-press mat or meal-pan composed of a bottom plate whose under side is concave transversely, and provided with gutters or channels whose upper surface is corrugated from side to side with perforations from the depressions of the corrugations and opening into the gutters, which perforations are countersunk or enlarged at their lower ends, a superimposed perforated and correspondingly-corrugated sheet-metal plate, and interposed wire-cloth in one or more layers, substantially as described.

299,959. CAR-STEP. J. HENRY CARVER, Philadelphia, Pa. Filed Mar. 3, 1884. (No model.)

Claim.—1. The combination, with the permanent car-steps, of the folding step A, supported at its sides by the swinging pendants B B and from the rear by a brace or fixture, C, said brace or fixture having its upper end arranged with a hook or catch to engage with a corresponding hook or catch, E, on the rear of the step from which the folding step is hung, substantially as and for the purposes set forth.

2. The combination of the brace C, furnished with a hook or catch, as described, rod F, crank G, crank H, rod I, folding step A, and permanent steps, all arranged substantially as described.

3. The herein-described device for raising and sustaining the rod I, consisting of the spring J, or its equivalent, substantially as set forth.



299,960. VENTILATOR FOR WINDOW-SASHES. EDWARD WELLS CRADWICK, Edgartown, Mass. Filed Jan. 21, 1884. (No model.)

Claim.—1. The improved ventilator, substantially as hereinbefore described, consisting of the two perforated plates provided with connection-screws, and with lugs screw-threaded to engage with them, and of the perforated slide-valve, and the screw-threaded knob and shank, arranged and adapted essentially as represented.

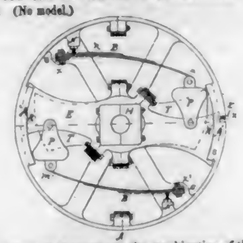
2. The ventilator consisting of the two perforated plates provided with connection-screws and with lugs, screw-threaded to engage with them, and of the perforated slide-valve, its spiral spring, and the screw-threaded knob and shank, all adapted and arranged substantially, and to operate as and for the purposes set forth.

299,961. BEARER FOR TRANSFER-PRESSES. HERBERT W. CHAPMAN, Newark, N. J. Filed July 27, 1883. (No model.)

Claim.—1. The combination, with the head of a transfer-press, and the bearers for the transferring-arbor, of a friction-clamp or holder constructed to hold the bearers removably and reversibly in their required position, substantially as herein shown and described.

2. In the head of a transfer-press, the combination, with a suitable base, of parallel holders adjustably secured thereto, and means for clamping or securing the bearers removably to the holders, substantially as set forth.

3. In the head of a transfer-press, the combination of a base, parallel holders movably fitted to a guide therein, ways or bearers secured in the holders, and an adjusting-screw for setting the holders to and from each other, substantially as herein set forth.



299,962. WRENCH. JOHN COMBS, Rushville, Ohio, assignor of one-half to Charles A. Thomas, same place. Filed Mar. 18, 1884. (No model.)

Claim.—1. A ratchet-wheel wrench consisting of a handle having one of its ends cut out half-round, a pawl set in the side of the handle, a circular block flanged and ratcheted upon its periphery, and provided with a central opening, and a spring-band arranged about the circular block and over the pawl and fixed to the handle, substantially as described, and for the purpose set forth.

2. A ratchet-wheel wrench consisting of a handle having one of its ends cut out half-round, and one of its sides at this end provided with a groove adapted to receive a pawl and hold it from lengthwise and lateral movement, in combination with a circular block flanged and ratcheted upon its periphery, and provided with a central rectangular partitioned opening having grooves upon its longer faces, a follower adapted to work in said opening and grooves, a screw, and screw-threaded sleeve or thumb-nut for operating said follower, and a spring-band whereby the circular block, handle, and pawl are secured and rendered operative, substantially as described.

299,963. CUT-OFF GOVERNOR. HUGO COOK, Lima, Ohio. Filed May 23, 1883. (No model.)

Claim.—1. In a cut-off governor, the combination of the following elements, to wit: a fixed pulley or carrying frame on the main shaft, a reciprocating arm carrying the valve-mover, and an oscillating cam controlled by springs and centrifugal weights and actuating the reciprocating arm, substantially as and for the purpose set forth.

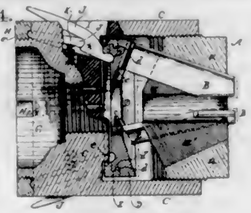
2. In a revolving cut-off governor, the leaf-springs B B, each secured at one end to the wheel and at the other end pivoted to the weight, the oscillating plate or arm E, and the weights pivoted thereto, all combined and operating substantially as stated.

3. In a revolving cut-off governor, the combination of the oscillating arm or plate E with the weights P, pivoted thereto, the leaf-springs, each secured at one end to the wheel and at the other pivoted to the weights, and the set-screws s, placed, as described, so as to bear on the leaf-springs, as set forth.

4. The oscillating cam E, provided with studs r and friction-rollers R, in combination with the reciprocating carrier T, having inclined surfaces a a, arranged and operating substantially as and for the purpose described, in a revolving cut-off governor.

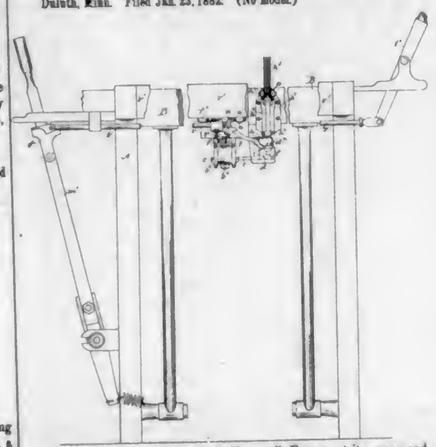
5. In a revolving cut-off governor, an oscillating cam-plate controlling the eccentricity of the valve-mover, provided with means, substantially as described, for arresting and locking the valve-mover in its concentric position upon the shaft, substantially as set forth.

6. In a revolving cut-off governor, a locking-pin, z, arranged in the periphery of the carrying-pulley, in combination with the oscillating cam E, provided with a recess, z', substantially as set forth.



7. In a revolving cut-off governor, a reciprocating carrier controlling the eccentricity of the valve-mover, in combination with means, substantially as described, for adjusting and limiting the normal limit of its reciprocation, substantially as set forth.

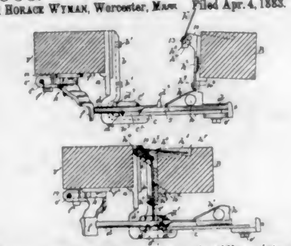
299,964. CHUCK. CUSHMAN W. CRARY, Chicago, Ill. Filed Nov. 10, 1883. (No model.)



Claim.—1. A chuck in which are combined an internal sliding ring in connection with the jaws, a set of levers, J J, the shell, and an external sliding ring for depressing the said levers, substantially as and for the purposes specified.

2. The combination, in a chuck, of the threaded head A, the sliding rings D and E, constructed and arranged together, substantially as specified, and in connection with the jaws, the pins F F, the springs G G, the external sliding ring L, the shell C, internally threaded to correspond to the threaded head, and a set of levers for advancing the said ring L, substantially as and for the purposes specified.

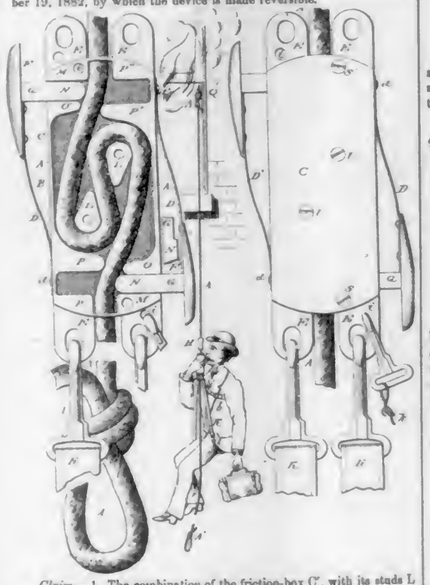
299,964.



299,965. SMOKE-CONSUMING FURNACE. ALEXANDER CRAWFORD, Duluth, Minn. Filed Jan. 23, 1882. (No model.)

Claim.—A hollow tapering bridge-wall, E, open at its upper and lower ends, said bridge-wall being hollowed out or cut away to form a concave upper end, in order that all parts shall be equidistant from the boiler, and provided at its lower end with a ledge to support one end of the grate, in combination with pipes G' G², communicating with said bridge-wall near its lower end, resting on the grate and extending the entire length of the same, substantially as set forth.

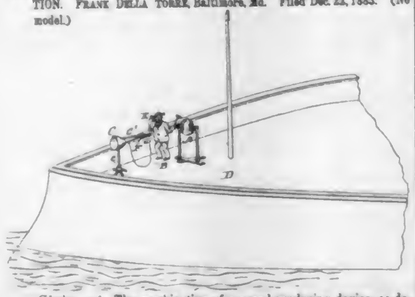
299,966. WEFT STOP-MOTION FOR LOOMS. GEORGE CROMPTON and HORACE WYMAN, Worcester, Mass. Filed Apr. 4, 1883. (No model.)



Claim.—1. The breast-beam, the rod-guiding plate provided with a curved or twisted surface, and means to support the said plate from the breast-beam, and the knocking-off rod d, provided with a suitable projection to co-operate with said surface and turn the knocking-off rod about its axis, combined with the lay, an attached plate, a weft-feeler supported by the said plate, and intermediate devices under the control of the weft-feeler to operate the rod d and move it forward when the weft fails, substantially as and for the purpose described.

2. The lay, the weft-feeler, a frame in which it is pivoted, and a drop-rod pivoted directly to the head of the weft-feeler, the knocking-off rod provided with projections d' d^3, and a plate provided with a suitable curved or twisted surface to support, guide, and effect the partial rotation of the said knocking-off rod, and suitable means to support the said plate, combined with the shipper-handle, and suitable intermediate mechanism between it and the knocking-off rod, to operate substantially as described.

299,967. FIRE-ESCAPE. OSCAR F. DAVIS, Topeka, Kans. Filed Aug. 14, 1883. (No model.)



Brief.—An improvement on Patent No. 269,268, dated December 19, 1882, by which the device is made reversible.

Claim.—1. The combination of the friction-box C', with its studs L and its two brakes, N G and N' G', and levers D and D' at each end and upon the opposite edges of the friction-box, all constructed and operating as and for the purpose hereinbefore set forth.

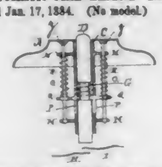
2. The combination of the friction-box C', constructed as hereinbefore described, having a friction device upon both ends and sides, with a rope, A', having a loop and knot, A, at each end, operating as and for the purpose hereinbefore set forth.

299,968. MEANS FOR DISCLOSING OBSTACLES TO NAVIGATION. FRANK DELLA TORRE, Baltimore, Md. Filed Dec. 22, 1883. (No model.)

Claim.—1. The combination of a sound-producing device, as described, and a microphone sound-collecting device pivotally supported and provided with wires for transmitting sound to a suitable receiver, with a compass, substantially as and for the purpose described.

2. The combination of a sound-producing device, as described, a microphone sound-collecting device pivotally supported, a telephonic receiver, and an electric battery, a compass, and a time-piece, all located upon the same vessel and under control of one operator, substantially as and for the purpose described.

299,969. AXLE-NUT. WILLIAM FAHY, Berlin, Wis. Filed Aug. 30, 1883. (Model.)



Claim.—1. A washer or plate rigidly affixed to the face of axle-nuts, substantially as and for the purpose specified.

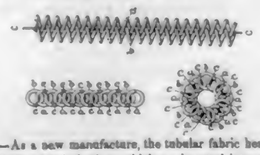
299,969.

2. The combination, with the axle-nut A, of the washer or plate B and the rivets or bolts C C, with suitable corresponding holes, D D, for such rivets or bolts, through the nut and plate, substantially as and for the purpose specified.

299,970. AUTOMATIC FIRE-ALARM. HERBERT N. FELTNER, Providence, R. I. Filed Jan. 17, 1884. (No model.)

Claim.—The combination, with the spring-actuated arm D, free to be moved to make electrical contact when desired, of the cross-head Q, operating upon the arm D, the rods *a*, springs R, and soft solder *z*, substantially as set forth, whereby the melting of the solder will cause the contact to be made, substantially as described, and for the purpose specified.

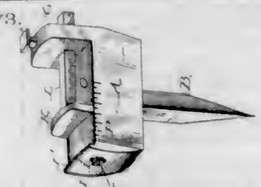
299,971. BOOT-TREE. JOHN W. D. FIFIELD, North Brookfield, Mass. Filed Mar. 29, 1884. (No model.)



Claim.—1. In a tree, the combination, with the detachable foot-piece, of a detachable sole-piece to operate substantially as and for the purpose described.

2. The foot-piece and detachable sole-piece combined with a locking device to hold the same together after they have been inserted into the fore part of the boot or shoe being treed, substantially as described.

3. In a tree for boots and shoes, a foot-piece provided with a tongue combined with a detachable sole-piece provided with a groove, substantially as described.

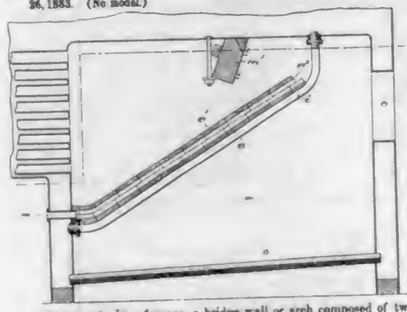


299,972. FABRIC FOR JEWELRY. FRANK FONTREAU, Attleborough, Mass. Filed Jan. 20, 1883. (No model.)

Claim.—As a new manufacture, the tubular fabric hereinbefore described, consisting of spiral wires, which are inserted into each other laterally and connected by tie-wires, the same being circular in transverse section, substantially as set forth.

299,973. HAND-TOOL FOR SHOE-MAKERS. WILLIAM D. FRANK, Elizabethville, Pa. Filed Dec. 14, 1883. (No model.)

299,973.



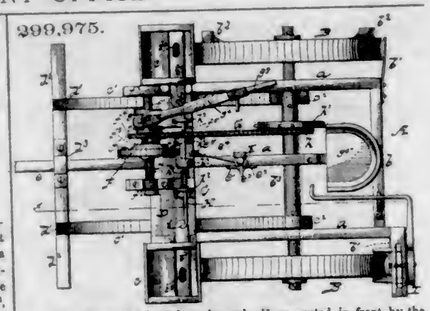
Claim.—1. A shoe-maker's hand-tool consisting of a bed, A, provided with a shank, B, for insertion in the handle, having a seat, D, at one end, with a recess, E, and threaded hole F at the opposite end, a perforated lug, G, cast integral with the bed, and a set-screw, H, in combination with the removably-secured gage K, or its equivalent, and the removably-secured plate I, with its bead I', oblong slot I^2, and lug I^3, substantially as and for the purpose specified.

2. In combination with a shoe-maker's hand-tool, as described, the detachable creasing or beading plate I, having lip and bead I' of the usual construction, and provided with an oblong adjusting-slot, I^2, and a tongue or lug, I^3, fitting the recess E of the bed A, and removably secured thereto by the set-screw J, substantially as and for the purpose set forth.

3. In a shoe-maker's hand-tool, as described, and as a shank and burnishing-iron, the combination of the bed A, gage M, plate I, divisions P, shank N, and screws H and J, as shown, and for the purpose set forth.

299,974. FURNACE. LYMAN P. FRENCH, Boston, Mass. Filed Oct. 26, 1883. (No model.)

Claim.—1. In a furnace, a bridge-wall or arch composed of two independent thin layers of unperforated fire-brick, each layer being of substantially uniform thickness throughout, and the layers being separated from between them, the said chamber communicating with the air outside of the furnace and opening at one end of the layers of brick into the furnace, substantially as described.



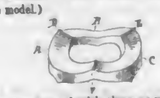
2. The bridge-wall inclined from the lower front wall of the fire-box rearwardly and upwardly, the said wall being composed of two independent layers of bricks, each layer being of substantially uniform thickness, and the two layers being separated by an air space, which opens into the furnace at the upper edge of the wall and communicates with the air external to the furnace at the lower portion of the said wall, substantially as described.

3. The bridge-wall inclined from the lower front wall of the fire-box rearwardly and upwardly, the said wall being composed of two layers of bricks separated by an air-space which opens into the furnace at the upper edge of the wall and communicates with the air at the outside of the furnace at the lower portion of the said wall, combined with the deflecting-wall depending from the crown-sheet in front of the upper edge of the said bridge-wall, the lower edge of the said deflecting-wall being below the level of the upper edge of the said bridge-wall, substantially as described.

4. The bridge-wall extending from the lower front portion of the fire-box below the flues rearwardly and upwardly toward the crown-sheet, the upper edge of the said wall being substantially parallel with the crown-sheet, combined with the deflecting-wall, depending from the crown-sheet in an inclined forward and downward direction, and having its lower edge parallel with and below the level of the upper edge of the bridge-wall, substantially as described.

299,975. CORN-PLANTER. EDWIN GAGER, Norwalk, Ohio. Filed Feb. 27, 1884. (No model.)

Claim.—1. In a corn-planter, the combination, with the frame A, axle b^2, and drive-wheels B B, having concaved peripheries and markers, of the frame C, pivoted to the axle b^2, connected in front by the transverse bar D, and the side bars, *c'* *c'*, extending forward and curved downwardly, and having the cross-bars d^2 d^3, connected to one another by the U-shaped bar d^4, straddling the tongue of the machine, and having the runners or furrow-openers secured to the outer ends of the cam-wheel, the sprocket-wheels having the clutch, the rods H H', provided with the block, the springs upon the rods, the slides, one arranged above the other in the hoppers, the standards h^2 h^3, semicircular rack-standard *e'*, secured to the frame A, lever E, pivoted to this standard, rod *e'*, connected to the lever, and broad transverse bar D, clutch-lever g^2, sprocket-wheels on the axle, and endless chain connecting the same to the sprocket-wheels on the shaft *f'*, the whole operating as herein shown, described, and for the purposes specified.



2. In a corn-planter, the combination of the parts herein shown and described, consisting of the main frame A, the axle b^2, carrying the sprocket-wheels, and the drive-wheels, concaved on their periphery, the markers, the standard *e'*, lever E, rod *e'*, the pivoted frame C, constructed as described, and having the transverse bar D, the cam-wheel, clutch, and sprocket-wheels on the shaft *f'*, journaled in the bearings f^2 f^3, rods H H', having the blocks and springs, the feed-slides arranged one above the other in the seed-boxes, standards h^2 h^3, clutch-lever g^2, and brake I, the whole operating as described, and for the purposes specified.

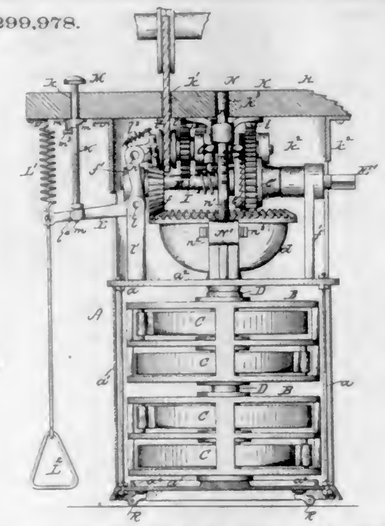
299,976. BOX FOR MATCHES. GEO. H. GALE, Bayonne City, N. J. Filed Mar. 14, 1884. (No model.)

Claim.—A match-box comprising a cover-case, A, a drawer or slide, B, made shorter than the cover-case, and a strip, C, made narrower than the drawer B, hinged at one end to the same, and constructed to rest on and extend beyond the opposite end of the drawer, substantially as and for the purposes set forth.

299,977. WASHER. OWEN F. GARVEY, Pawtucket, R. I. Filed Dec. 13, 1883. (No model.)

Claim.—A washer formed with three or more concaved sections on its bearing-surfaces, the said sections being united by sharp points, as D E F, substantially as set forth.

299,978. SPRING-MOTOR. GEORGE F. GODLEY, Philadelphia, Pa. Filed Feb. 28, 1884. (No model.)



Claim.—1. In a spring-motor having horizontal shaft E with wheel *e'*, the bracket G, having a train of wheels, I, and horizontally located adjoining said shaft, substantially as and for the purpose set forth.

2. A spring-motor having a winding and driving shaft, E, and a bracket, G, having multiplying-wheels I, and arranged at right angles to and above said shaft, substantially as shown and described.

3. In a spring-motor, a top frame-plate, a^2, having bearings for shaft E, and supports *g* for bracket G, having wheels I, substantially as shown and described.

4. In a spring-motor, the bracket G, having train of multiplying-wheels I, the end shaft of which is provided with driving or transmitting mechanism, substantially as shown and described.

299,978.

5. In a spring-motor, the bracket G, having a train of wheels, I, the end wheel, i^2, of which is adapted to transmit the power of the motor and serve as a brake-wheel, substantially as shown and described.

6. A spring-motor having an end or last transmitting wheel or gear, which forms part of the brake for the motor, substantially as shown and described.

7. A spring-motor provided with a graduated-surface brake, substantially as and for the purpose set forth.

8. A spring-motor provided with a brake-shoe, and means for varying or graduating its surface-contact, substantially as and for the purpose set forth.

9. A spring-motor having a brake-shoe which is normally in engagement or braking-contact, and mechanism attached to said shoe to vary or graduate the extent of its braking-surface, substantially as shown and described.

10. A spring-motor having a brake-shoe, actuating-spring and lever therefor, and means for graduating the surface of frictional contact of said shoe, substantially as shown and described.

11. A spring-motor having a self-lubricating brake-shoe, substantially as set forth.

12. A spring-motor having a brake-shoe packed with plumbago or other lubricant, substantially as and for the purpose set forth.

13. In a spring-motor, the combination of wheel i^2 and brake-shoe H, having retracting-spring l^3, lever L, spring L', and mechanism for moving said lever, as and for the purpose set forth.

14. A spring-motor having a brake-shoe, with operating-lever and means for automatically locking said lever in its adjusted position, substantially as and for the purpose set forth.

15. A spring-motor having a brake which is adapted to be released by hand or foot pressure, substantially as shown and described.

16. A spring-motor having a brake-shoe and lever provided with a sliding or rotating push-rod, substantially as and for the purpose set forth.

17. In a spring-motor, the combination, with a brake-lever, of a push-rod having mechanism for locking it and said lever in varying positions, substantially as and for the purpose set forth.

18. In a spring-motor, the combination of brake-lever L, spring L', and push-rod M, having pin m^3 and inclined surface m^2, substantially as shown and described.

19. A spring-motor winding mechanism having a visual signal, substantially as shown and described.

20. A spring-motor having its winding mechanism in gear with a visual or audible signal, substantially as and for the purpose set forth.

21. In a spring-motor, the combination of wheel *d*, having lug *d'*, the wheel n^3, rod *n*, and bracket N', substantially as and for the purpose set forth.

22. In a spring-motor, the combination of wheel *d*, having lug *d'*, the wheel n^3, rod *n* with lugs n^4, bracket N', and alarm O, substantially as and for the purpose set forth.

23. A spring-motor having sectional mandrels with recessed ends and separable supporting-pins D^6, substantially as and for the purpose set forth.

24. A spring-motor having sectional mandrels with recesses D^5 in their ends, oil-ducts D^4, washers D^7, and rounded-end pins or supports D^6, substantially as shown and described.

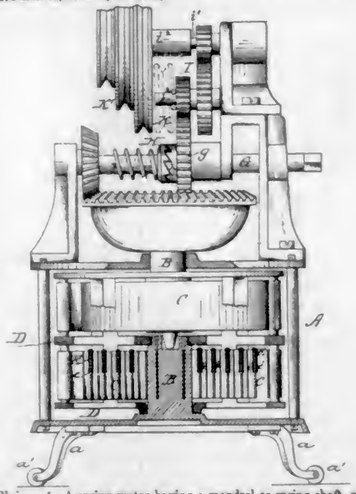
25. A spring for motors having an S-shaped inner end, substantially as shown and described, for effecting a tangential engagement with the mandrel of the motor, as set forth.

26. In a spring-motor, the combination of mandrel D, having a tangentially-arranged S-shaped vertical slot, and springs C, having correspondingly-shaped inner ends, substantially as and for the purpose set forth.

27. In a spring-motor, a mandrel having tangentially-arranged irregular slots, and springs having inner ends shaped to conform to the mandrel-slots, substantially as shown and described.

28. A spring-motor provided with springs of different grade of temper, substantially as described.

29. In coiling motor-springs, the combination of the coiled metal spring with a handle of asbestus, as and for the purpose set forth.



30. A spring-motor having a casing for its springs and a cap or cover for its winding and driving gear, substantially as shown and described.

31. In combination with a spring-motor, the detachable cap K, as and for the purpose set forth.

32. In a spring-motor, the combination of cylindrical frame *a*, having a top plate, a^2, with case or cover K, and bottom plate, a^3, having rollers or casters R, substantially as shown, and for the purpose set forth.

33. A spring-motor having gear-wheels the webs of which have perforations *s*, filled with a packing of rubber or elastic material, substantially as shown and described.

299,979. SPRING-MOTOR. GEORGE F. GODLEY, Philadelphia, Pa. Filed Mar. 24, 1884. (No model.)

Claim.—1. A spring-motor having a mandrel or spring-shaft, provided with axial slots for connection with the inner ends of nests of intercoiled volute or band springs, substantially as and for the purpose set forth.

2. A spring-motor having a mandrel, a cage, and two or more volute springs, forming a nest of intercoiled springs arranged in the same or substantially the same plane, and having inner and outer detachable end connections with said mandrel and cage, substantially as shown and described.

3. A spring-motor having two or more volute or band springs located in or substantially in the same plane, and provided with opposite detachable end connections, substantially as shown and described.

4. A spring-motor having a sectional mandrel, a revolving cage, and two or more volute or band springs, forming a nest of intercoiled springs, substantially as shown and described.

5. A spring-motor having a sectional shaft or mandrel, a revolving cage, and nests of band or volute springs, provided with independent and opposing end connections, substantially as shown and described.

6. In a spring-motor, the elastic blocks E, substantially as and for the purpose set forth.

7. A spring-motor having the coils of its springs provided with elastic blocks E, substantially as and for the purpose set forth.

8. The method herein described of increasing the capacity of the

springs of a motor and avoiding friction between the coils of the springs, which consists of interposing a compressible or a resilient body between the coils of the spring at suitable intervals throughout its length, substantially as set forth.

9. A spring-motor having on its winding or driving shaft a clutch the parts of which have noiselessly acting or working contact-faces, substantially as shown and described.

10. In a spring-motor, the combination, with shaft G, of the clutch H, having flexible teeth-facings h', substantially as and for the purpose set forth.

11. A spring-motor having a series of multiplying or power-transmitting shafts, and a changeable pulley, K', adapted to be applied to any of said shafts, substantially as and for the purpose set forth.

12. A spring-motor having multiplying-gearing I, with shafts extended at i^3, as and for the purpose set forth.

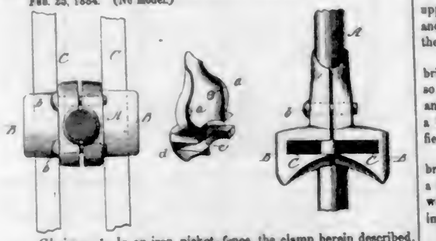
13. A spring-motor cage composed of oblong, radial, or diametrical plates having end fastening-bolts and central mandrel-openings, substantially as and for the purpose set forth.

14. A cage for spring-motors, and comprising oblong bars or plates *d d*, having end supports, *l*, and central mandrel-openings, substantially as shown and described.

15. The cage D, composed of curved plates *d*, having end supports, *l*, and mandrel-openings, substantially as shown and described.

16. The cage D, having two apartments and end supports, *l*, and two or more springs in each apartment, and having outer end connections with said supports, substantially as shown and described.

17. In a spring-motor, the cage D, having different apartments, in combination with two or more springs in each said apartment, and having end connections with the cage, substantially as shown, and for the purpose set forth.

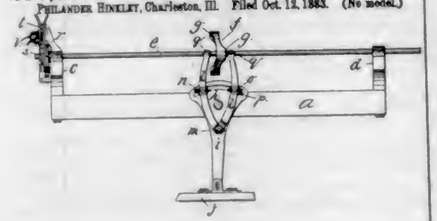


18. A spring-motor comprising a mandrel and a revolving cage, provided with nests of intercoiled band or volute springs, substantially as and for the purpose set forth.

19. In a spring-motor, the combination of revolving cage D, composed of plates *d* and supports *l*, and the nests of volute springs C, substantially as shown and described.

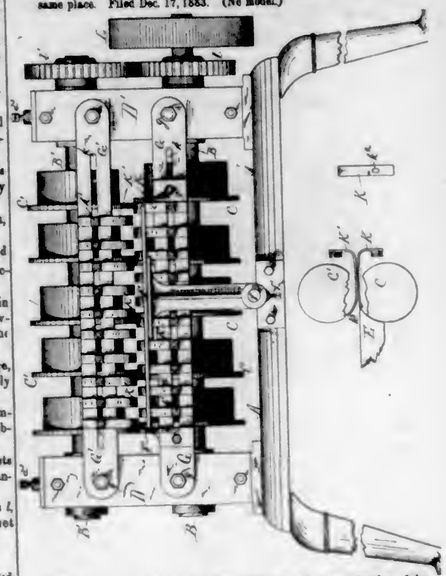
20. A spring-motor having a sectional mandrel, provided with nests of intercoiled volute springs, and located one above the other, substantially as shown and described.

21. In a spring-motor, a cage composed of plates *d* and supports *l*, for the reception of band-springs, substantially as and for the purpose set forth.



299,980. IRON FENCE. MARSELIUS HIGBORN, Chicago, Ill. Filed Feb. 25, 1884. (No model.)

Claim.—1. In an iron picket-fence, the clamp herein described, consisting of the duplicate parts B B, each having the slot *d* and holes *a a*, and having its face *c* made hollow to receive and embrace the picket, substantially as and for the purpose specified.



2. The combination, in an iron picket-fence, of the clamp, consisting of the duplicate parts B B, each having the slot *d*, the hollow face *c*, and holes *a a*, the pickets A A, and parallel side rails, C C, arranged opposite to each other, with an intervening space to receive said pickets, said rails being secured at either end to suitable posts, in manner substantially as and for the purposes specified.

299,981. CHECK-ROWING ATTACHMENT FOR SEED-PLANTERS. PHILANDER HINKLEY, Charleston, Ill. Filed Oct. 12, 1883. (No model.)

Claim.—In a check-rowing attachment for seeding-machines, the combination of cam-disk *f* and vibrating lever *i*, having arms *l l* pivoted thereto and adjustable thereon, thereby forming an adjustable forked extension of said lever, substantially as and for the purpose specified.

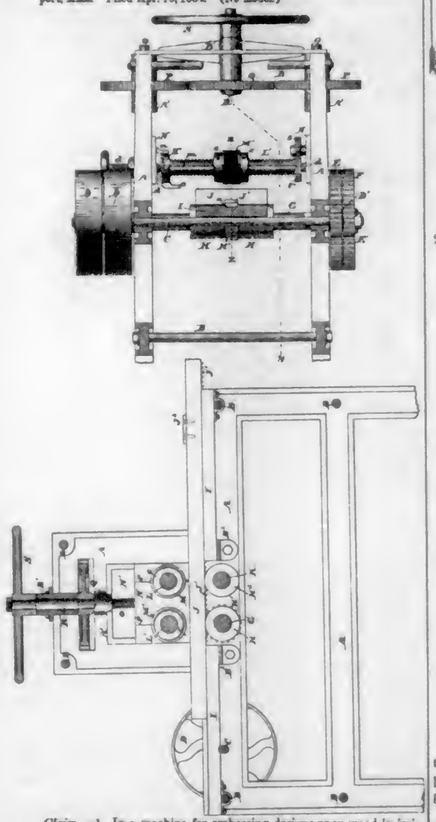
299,982. SHEET-METAL-CUTTING MACHINE. JOHN G. HODGSON, Chicago, Ill., assignor to Edwin Norton and Oliver W. Norton, both of same place. Filed Dec. 17, 1883. (No model.)

Claim.—1. In a sheet-metal-slitting machine, the combination of the upper and lower rotary cutters with bridges or guides extending under and between the cutters, so as to support the sheet at the point where the cutting is being done, substantially as specified.

2. The combination of the upper and lower rotary cutters with bridges extending through the machine under and between the cutters, so as to support the sheet at the point where the cutting is being done and strip the slitted blanks from the cutters as they issue therefrom, and a feed-table provided with a guide on one side, substantially as specified.

3. The combination of the upper and lower rotary cutters with bridges extending through the machine under and between the cutters, a feed-table provided with a guide on its side, and a receiving-table, whereby the sheets are held and supported in the same plane while passing through the machine, substantially as specified.

4. The combination of the upper and lower rotary cutters with spring-bridges extending through the machine under and between the cutters, substantially as specified.



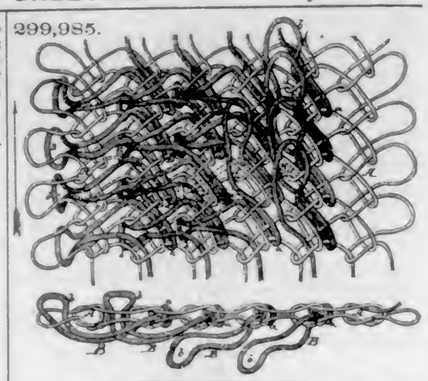
5. The combination, with the upper and lower rotary cutters, of the slotted bars G G' and bridges K K', secured to said slotted bars, and extending through the machine under and between the cutters, substantially as specified.

299,983. PAPER FOR BOILER-COVERING. DANIEL L. HUGHES, Milwaukee, Wis. Filed Aug. 24, 1883. (No specimens.)

Claim.—The method of making paper and cloth non-combustible for steam-pipes, consisting, first, in saturating the same with silicate; second, coating the same when dry with a compound formed of black oxide of magnesia, two parts; zinc-white, two parts; silicate soda, four parts; linseed-oil, one part; and, third, coating the covering when dry with silicate soda, all substantially as set forth.

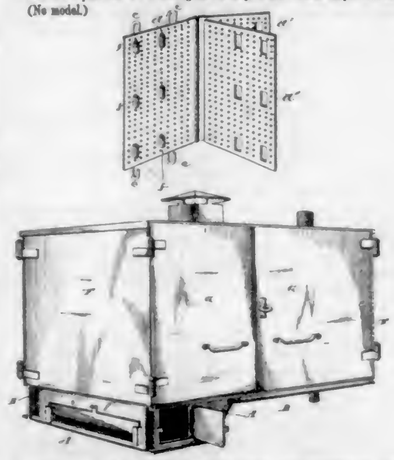
299,984. WOOD ORNAMENTATION. JOHN P. JAMESON, Cambridgeport, Mass. Filed Apr. 16, 1884. (No model.)

Claim.—1. In a machine for embossing designs upon wood in imitation of carving, two die-rolls connected together by gears and arranged to revolve in unison and to act upon the surface to be ornamented in succession, and provided the one with cutting-knives to outline the design by cutting the fibers of the wood, and the other with projecting surfaces adapted to depress certain portions of the wood bounded by said outlines, substantially as described.



2. In combination with a moving table or bed carrying the stop to be ornamented, the die-roll M, provided with the cutting-knives *h*, adapted to cut the fibers of the wood to outline thereon the design, and the die-roll M', provided with the projecting surfaces *i* and *j*, all arranged and adapted to operate substantially as and for the purposes described.

3. The combination of the die-roll M or M', adjustable around the shaft L or L', provided with the groove *m*, the collar T, provided with the index-fingers *n* and *o* and the set-screw *l*, and the block N, provided with the line *p*, all arranged and adapted to operate substantially as described.



299,985. FABRIC FOR TRIMMINGS. WARREN P. JENNINGS, Brooklyn, N. Y. Filed July 23, 1883. (Model.)

Claim.—The fabric A, having the purling-loops B, fastened at the ends *a* to the ground fabric, while the ends *b* are tacked through the interstices of the ground fabric, but capable of being drawn out of said interstices, substantially as herein shown and described.

299,985.

299,986. FRUIT-EVAPORATOR. ABNER M. JERVIS, Jonesborough, assignor of two-thirds to Robert H. Dungan, Madison L. Peoples, and Landon C. Peoples, all of Washington County, Tenn. Filed Sept. 13, 1883. (No model.)

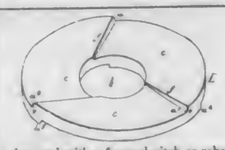
Claim.—1. In a fruit-tray for evaporators, the combination, with two hinged leaves, one of which is provided with hooks, and a leaf interposed between the hinged leaves, of devices for locking the leaves together, substantially as set forth.

2. In a fruit-tray for evaporators, the combination, with two perforated leaves hinged together, hooks secured to the opposite ends of one of the said leaves, and a perforated leaf interposed between the hinged leaves, of devices for locking the leaves together.

3. In a fruit-tray for evaporators, the combination, with the perforated leaves, one of which is provided with bolt or rod keepers, of bolts or rods adapted to be passed through the keepers, substantially as set forth.

4. The combination, with a suitable heater, of the removable standards and end walls, and doors secured to the end walls.

5. The combination, with a suitable heater, of standards, end walls secured to the standards, and doors secured to the end walls.

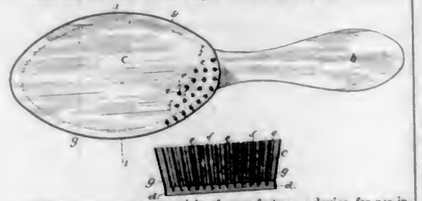


6. The combination, with a suitable heater, an oven, and the removable standards C, provided at their upper ends with perforations, of the transverse rods D, seated in the perforations of the standards, and the tray-supporting rods E, resting on the transverse rods, and provided with bent ends, substantially as set forth.

299,987. NUT-WASHER. WILLIAM A. JORDAN, New Orleans, La. Filed Feb. 18, 1884. (Model.)

Claim.—1. The nut-washer L, constructed with inclines c and catches a a' a^2 on one face side, and with reversely-set but like inclines c' and catches a^3 a^4 a^5 on the opposite face side, substantially as described.

2. The nut-washer L, provided with reversely-set but like-constructed catches on both of its face sides, made with a tapered and bev-



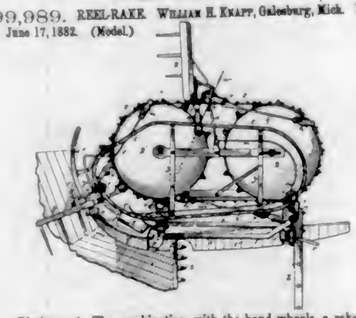
299,987.

eled or sloping edge, and with a forward pitch or rake, substantially as and for the purpose described.

3. The nut-washer L, provided with catches, as a a' a^2, and inclines c on one of its face sides, and with reversely-set but like-constructed catches, as a^3 a^4 a^5, and inclines c' on its opposite face side, in combination with the nut B and bolt B', substantially as and for the purpose described.

299,988. MANUFACTURE OF BRUSHES. FREDERICK J. KALDENBERG, New York, N. Y. Filed Sept. 24, 1883. (No model.)

Claim.—1. As a new article of manufacture, a device for use in drilling brush-blanks, consisting of a block adapted to be secured to said blank, and provided with a series of perforations corresponding to the holes required to be made in said blank, as and for the purpose set forth.



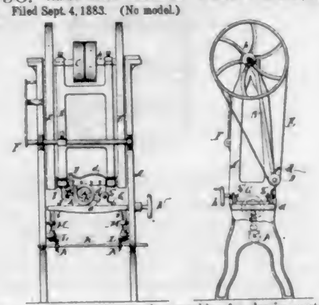
2. A guide-block for use in drilling brush-blanks, formed of metal, and provided with perforations for receiving the drill, the said block being recessed at the bottom to receive the brush-blank, as and for the purpose set forth.

3. A guide-block for use in drilling brushes, composed of soft metal, and having tubes of steel or equivalent hard metal embedded therein, as set forth.

4. The method herein described for constructing a guide-block for use in boring the holes in the backs of brushes, which consists in first inserting metal pins into the cavities, then inclosing the pins by metal tubes, and finally filling up the interstices between such tubes with molten lead, as set forth.

5. The perforated guide-block herein described, consisting of the outer band of metal, *g*, and tubes *f* of steel to receive the drill, the body of the block being formed up of soft metal in a molten state, as and for the purpose set forth.

299,989. REEL-RAKE. WILLIAM H. KNAPP, Galesburg, Mich. Filed June 17, 1882. (Model.)



Claim.—1. The combination, with the band-wheels, a rake-band and rake, and a cam guide-rod, located and adapted as set forth, of a rake-support consisting of the friction-rollers and a bar composed of two parts swiveled together, one end of said swiveled bar being jointedly connected with the rake-head, and the other end supporting the friction-rollers, the latter adapted to play upon opposite and different sides of the guide-rod during the transit of the rake around the band-wheels, all substantially as specified and shown.

2. The device for both unlocking and turning the rake, consisting of the trip-plate in combination with the yielding gate connected therewith, both of said parts constructed and adapted to operate substantially as set forth.

3. In a reel-rake, the combination, with band-wheels located at an angle to a horizontal plane, and a cam guide-rod located substantially in the position to said band-wheels shown, of a rake-band, rakes, rake draw-bars, and rake-supports adapted to engage and play upon said guide-rod during the transit of the rakes, all substantially as specified.

299,990. CHAIR-SEAT MACHINE. WILLIAM F. LAMSON, Detroit, Mich. Filed Sept. 4, 1883. (No model.)

Claim.—1. The combination, in a machine for shaping seats, of a rocking table for holding the work, a frame carrying cutters, mechanism for moving the frame back and forth to cause the cutters to traverse the work, and devices connecting the moving frame with the table for rocking the latter as the frame moves back and forth.

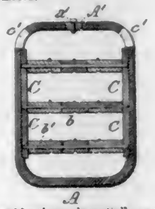
2. In a machine for shaping wooden seats, the combination, with an oscillating frame provided with suitable cutters, of a tilting table, and mechanism for operating said cutters and for causing said cutters to traverse the work, substantially as described.

3. In a machine for shaping wooden seats, the combination, with an oscillating pendulum-frame provided with suitable cutters, of a tilting table, and mechanism for operating said cutters and for causing the cutters to traverse the work, said frame connected with said table by means of a carrier, I, the construction being such that the table will be tilted to correspond with the movement of the oscillating frame, substantially as described.

4. The combination, with a suitable fixed frame, of an oscillating pendulum-frame provided at its free end with a shaft having cutters attached thereto, an adjustable table, *a*, and tilting table G, located thereon, and adapted to be tilted to conform to the movement of the oscillating frame as the cutters traverse the work, and mechanism for driving said cutters and for causing the oscillating frame to traverse the work, substantially as described.

5. The combination, with a fixed frame, of a table, *a*, mechanism by which it may be adjusted, a tilting table secured to said table *a* by suitable pivotal bearings, an oscillating pendulum-frame provided with suitable bearings in said fixed frame, and connected with the tilting table by suitable carriers, said oscillating frame provided with rotary cutters and mechanism for operating the same, and means for causing the rotary cutters to traverse the work, the construction being such that the cut of the knives will be equalized and the table made to conform to the swing of the pendulum, substantially as described.

6. In a machine for shaping seats, the combination of a tilting table for holding the work, a frame carrying cutters, mechanism for moving the frame back and forth to cause the cutters to traverse the work, and means for continuously tilting the table by the movement of the frame carrying the cutters, substantially as described.

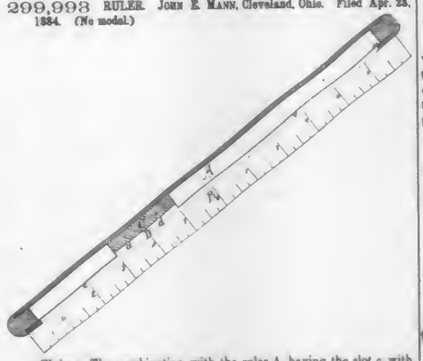


299,991. MINING-DRILL AND METHOD OF FORMING POWDER-CHAMBERS IN ROCK, &c. WILLIAM H. LYTLE, Montezuma, Colo. Filed July 20, 1883. (No model.)

Claim.—1. An expansible rock-drill consisting of a solid or tubular shank or stock and two or more flexible cutters provided with teeth or sharp edges across their bottoms, and adapted to be operated independently to make a bore in a rock, and also in combination with a wedge or cone shaped expander to enlarge the diameter of a bore, in the manner and for the purposes set forth.

2. The above-described method of forming a powder-chamber in a rock or a subterranean chamber in any solid strata in the earth, which mode or method consists in first sinking a bore of equal diameter, and then withdrawing the drill and placing a wedge or cone shaped drill-expander loosely upon the bottom of the bore, and operating a reciprocating drill having flexible or expansible points or cutters over and around the cone-shaped expander, substantially as shown and specified.

299,992. CONDUIT FOR TELEGRAPH-WIRES. WILLIAM MAGNER, Philadelphia, Pa., assignor of one-half to John M. Doyle, same place. Filed Apr. 27, 1883. (No model.)



Claim.—1. The combination, substantially as set forth, of a conduit or casing and a series of wire or cable supports, each resting upon standards fitting in grooves in the sides of the conduit.

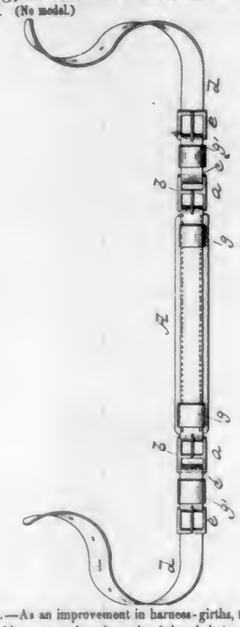
2. The combination, substantially as set forth, of a conduit or casing having vertical grooves or recesses on its sides, a series of sectional standards fitting in said grooves or recesses, and a series of shafts, each carrying a roller or rollers, said shafts being arranged vertically one above another, and each being retained in position by the standards which support the shaft next above it.

3. The combination, substantially as set forth, of a conduit or casing having vertical internal grooves or recesses, a series of standards fitting in said recesses and supporting a series of roller-shafts, a series of openings each giving access to one of said grooves, a series of caps or covers closing said openings, and a longitudinal opening or slot and cover for the introduction and removal of wires or cables.

4. The combination, substantially as set forth, of an elbow or quarter-turn conduit, a series of vertical guide-rollers arranged at or across the line of the turn, and a series of horizontal supporting-rollers arranged at either side of said line.

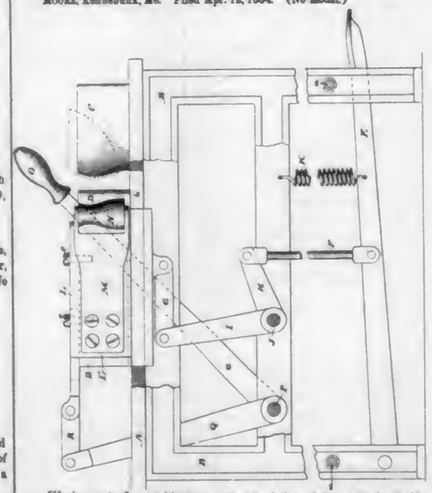
299,993. RULER. JOHN E. MANN, Cleveland, Ohio. Filed Apr. 23, 1884. (No model.)

Claim.—The combination, with the ruler A, having the slot c, with beveled edge *a*, of the blade B, having notches *b b'*, and the extension D, provided with spurs *d d*, substantially as described.



299,994. WOODEN-SOLED BOOT. SAMUEL MCCULLOUGH, Toronto, Ontario, Canada, assignor to Thomas Kennedy, Jr., Henry Charles Fortier, and William Henry Best, all of same place. Filed Jan. 2, 1884. (No model.)

Claim.—1. As an improved article of manufacture, a shoe provided with a metal binding around the sole, covered with a double strip of leather, with the rounded edge of said double strip uppermost, to give a beaded appearance to the shoe, substantially as described.

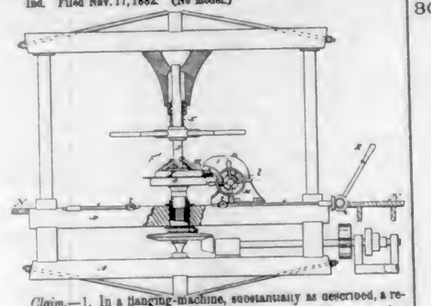


2. In a boot having a wooden sole lasted to the upper, the shank C, made of leather or other flexible material, and having a flange, *a*, formed on its front end, in combination with the band E, provided with the flange *e*, arranged to bind the shank C to the sole B, substantially as and for the purpose specified.

299,995. HARNESS-GIRTH. JAS. MCGUIRE, Benson, Vt. Filed Oct. 20, 1883. (No model.)

Claim.—As an improvement in harness-girths, the combination, with the buckle *a*, secured to the ends of the girth A and provided with the cross-bar *c*, of the thill-straps *d*, one end secured to said cross-bar *c*, and the buckle *e*, the free ends of the straps *d* adapted to pass around the thills, the whole constructed and arranged as shown, described, and for the purposes specified.

299,996. MACHINE FOR SHAPING HEEL-STIFFENERS. GEO. F. MOORE, Kennebunk, Me. Filed Apr. 12, 1884. (No model.)



Claim.—1. In combination with a heel-shaped former and a mold adapted to fit and inclose the rear portion of said former and clamp the blank thereto, said former and mold being arranged to be reciprocated toward and from each other, a device adapted to turn a flange upon the stiffener and press it hard upon the former, and a pair of pressure-surfaces curved longitudinally to fit the vertical curves of the sides of the former and adapted to be moved toward and from each other and the former, and to press and hold the blank to the former at or near the point where the flange-turner acts upon the blank to turn the flange, substantially as described.

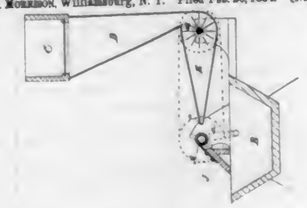
2. In a machine for shaping heel-stiffeners, the combination of a heel-shaped former, a reciprocating plunger provided with a mold or recess in its front end to fit and inclose the rear portion of the former, a reciprocating flange-turner, and a pair of yielding pressure-surfaces curved longitudinally to conform to the vertical curves of the sides of the former, arranged to be moved with said flange-turner and adapted to press and hold the blank to the former at or near the point where the flange-turner acts upon the blank to turn the flange, substantially as and for the purposes described.

3. In a machine for shaping heel-stiffeners, the combination of the former C, the reciprocating plunger D, provided in its front end with a mold or recess to fit or inclose the rear portion of said former, the reciprocating plate L, provided with the V-shaped notch L', the springs M M, and the rolls N N, all arranged and adapted to operate substantially as described.

299,997. FLANGING-MACHINE. MATTHEW R. MOORE, Indianapolis, Ind. Filed Nov. 17, 1882. (No model.)

Claim.—1. In a flanging-machine, substantially as described, a revolving former mounted on an arbor, as B, a clamping-follower having a universal joint to accommodate inequalities in the sheet to be acted upon, and a flanging-roller, *m*, with means, as the devices indicated by K I L, for changing it from a horizontal to a vertical position in proximity to the edge of the former, all combined and operating substantially as and for the purposes set forth.

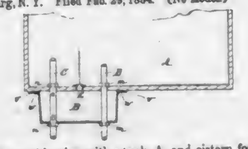
2. In combination with the arbors B and D and with interchangeable formers C, the follower F, having a universal joint with D, to accommodate inequalities in the sheet to be acted upon, the hand-wheel E, toothed rocking piece K, carrying roller *m* and pinion *l*, and hand-wheel L, as and for the purposes set forth.



3. In combination with the arbor B, carrying a former, C, a centering device composed of adjustable arms, and suitable mechanical connections controlled by a lever for operating inward simultaneously to bring the said arms against the blank to be centered upon the former, as set forth.

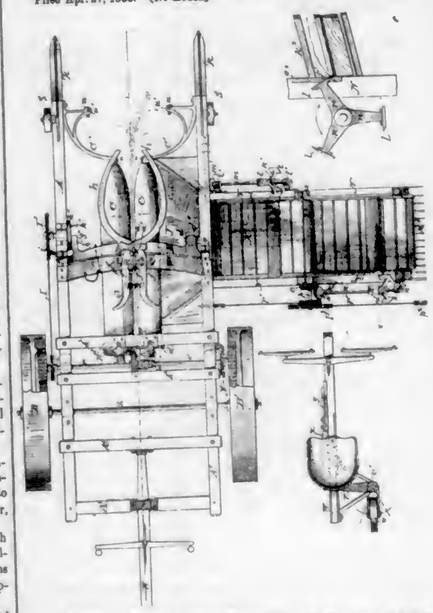
4. The arms P, having anti-friction rollers, in combination with means, as the devices indicated by O Q R, for operating said arms simultaneously and equally, and with the arbor B, having power connections and interchangeable formers, as C, of different sizes, all arranged and operating as and for the purposes set forth.

5. In combination with the former C, post H, sliding piece I, and toothed rocking piece K, the flanging-roller *m*, hung upon a stud rigid with said piece K, and means, as pinions *l* and hand-wheel L, for moving said roller at will, as set forth.



6. In combination with the follower F, as described, the pivoted hooks F', adapted by their gravity to lie back upon the follower, or to fall under the flange of the finished head to remove the same from the former, as specified.

299,998. MACHINE FOR MAKING CORES FOR CASTINGS. JOHN G. MORRISON, Williamsburg, N. Y. Filed Feb. 26, 1884. (No model.)



Claim.—The combination, with the revolving core-bar A and stationary cutter J, of the revolving wing-wheel G and funnel-shaped horizontal pipe E, with contracted mouth or opening *n*, substantially as and for the purpose described.

299,999. CISTERN FOR SERVICE-BOXES. JOHN G. MORRISON, Williamsburg, N. Y. Filed Feb. 29, 1884. (No model.)

Claim.—In combination with a tank, A, and cistern for service-box B, provided with the usual pipes, C and D, with nuts *n* and *m*, the rib or projection *v*, cast on the tank A, and surrounding the flange *w* of the cistern B, in the manner and for the purpose substantially as described.

300,000. CORN-HARVESTER. SOLOMON F. MOUCK, Empire, Colo. Filed Apr. 27, 1883. (No model.)

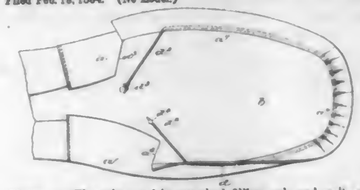
Claim.—1. The rocking arch H, provided with the arms *g''* and *d'* and journals *g g*.

2. The combination of the lifting-tongs *h h*, the latch *f'*, the catch *f''*, the hinged spring *f³*, the spring-bar *a'*, the bolt *a*, and the spring *i²*.

3. The combination, in a corn-harvester, of the rocking arch H, having arms *g''* and *d'*, and the lifting-tongs *h h*, secured thereto by means of the bolt *a*.

4. In a corn-harvester, the combination of the rocking arch H, having arm *g''*, the crank-wheel *h''*, the pin *h'*, the shaft I', the band I, and the band-pulleys *i i*.

5. The combination, in a corn-harvester, of the lifting-tongs *h h*, the rollers *f f*, and arch F, as specified.



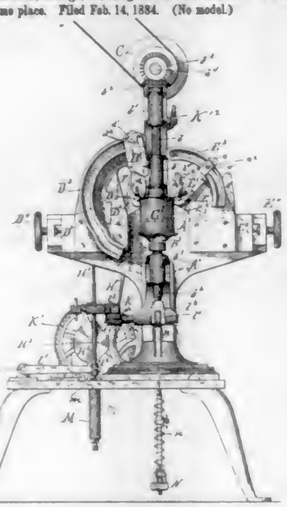
6. In a corn-harvester, the combination of the rollers C C, the bearings *c c*, the brackets C' C', the hangers D D, the cog-wheels *d d*, the bevel-gear wheels E E', and the shaft *e*, all operating as described.

7. In a corn-harvester, the combination of the side rail, A', frames N N', elevator K, roller *l²*, shaft *m''*, bevel-gearing *m'*, brackets *l' l'*, shafts *m*, arms *n'*, knives *l*, cross-board *k²*, and slide-board *n⁴*, as described.

8. In a corn-harvester, the combination of the frames N N', elevator K', drive-shaft *p*, bevel-gear O, hangers *n''*, shaft *n²*, arms *n'*, knives *n*, and board *k²*, as described.

9. In a corn-harvester, the combination, with the elevators for conveying the ears, of the knives for cutting off the ends of the ears.

300,001. BOOT OR SHOE. LAWRENCE F. NORMAN, Boston, Mass. Filed Feb. 18, 1884. (No model.)



Claim.—1. The sole *s* and its attached filling-sole and welt, separated by a slit, *m'*, for the reception of the upper, substantially as described.

2. The upper having its edge at its fore part turned outward, and the inner sole, combined with the backing *d*, extended about the outturned upper between its edge and the edge of the inner sole, to hold the upper about the inner sole, substantially as described.

3. The herein-described method of confining the outturned upper in place upon the inner sole, which consists in applying a flexible backing to the said upper between its edge and the edge of the inner sole, substantially as described.

300,002. DOUBLE-SEAMING MACHINE. EDWIN NORTON and JOHN GEORGE HODGSON, Chicago, Ill., assignors to said Norton and Oliver W. Norton, same place. Filed Feb. 14, 1884. (No model.)

Claim.—1. In a can-seaming machine, the combination of a seaming-tool, F F', mounted on a rocking and radially-reciprocating arm, *d*, with tool G, mounted on a rocking and radially-reciprocating arm, *e*, substantially as specified.

2. The combination of a compound seaming-tool, F F', sliding tool-arm *d*, tool-holder D', rock-shaft D, adjustable sliding head D^2, and grooved cam D^3, for reciprocating said tool-arm as the tool-holder D' is rocked, substantially as specified.

3. The combination of compound seaming-tool F F', sliding tool-arm *d*, tool-holder D', rock-shaft D, adjustable sliding head D^2, grooved cam D^3, rock-shaft E, seaming-tool G, sliding arm *e*, tool-holder E', adjustable sliding head E^2, grooved cam E^3, and arm A^3, rod A^2, rock-shaft A^4, bar A^5, and arm A^6, for operating said rock-shaft E from the rock-shaft D, substantially as specified.

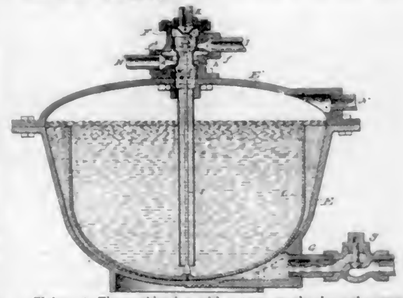
4. The combination of the revolving chuck for the can, with rock-shafts E and D, tool-holders secured to said rock-shafts, seaming-tools journaled on sliding arms mounted on said tool-holders, cams for actuating said sliding arms, a cam and mechanism connecting said cam with rock-shaft E, to operate the same, and mechanism for actuating the movable disk of the chuck, substantially as specified.

5. The combination of the rocking tool-holders E' and D' with mechanism for operating the same, substantially as specified.

6. The combination of the rocking tool-holders E' and D' with sliding tool-arms mounted on said holders, and cams for actuating said sliding arms, substantially as specified.

7. The combination, with the rock-shafts, tool-holders, and seaming-tools mounted thereon, of the pitman-rod H', cam-wheel H^2, shaft H^3, gear K', fitting loosely thereon, provided with a clutch-surface, clutch K^2, spring K^3, and collar K^4, secured to said shaft H^3, and pivoted arm K^5, provided with cam-surface K^6, and pin K^7, secured to said clutch K^2, substantially as specified.

8. The combination of can-chuck disk B' and shaft b^4, to which it is secured, with crank-shaft L, provided with arms *l* and *l'*, cam H^2, rod I^2, and crank-shaft I^3, provided with arms I^5 and I^6, substantially as specified.



9. The combination, with the revolving chuck for the can, of the tool-holder secured to a rock-shaft, and provided with radial grooves or guides, a sliding tool-arm mounted in said grooves or guides, and a seaming-tool adapted to fold the horizontal flange of the can-head over the vertical wall of the can-body and mounted on said tool-arm, and a cam for operating said tool-arm as the tool-holder is rocked, substantially as specified.

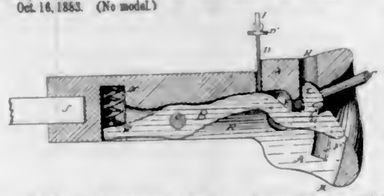
10. The combination, with the revolving chuck for the can, the upper disk of said chuck fitting within the countersunk head of the can, so as to support the same, of the tool-holder secured to a rock-shaft and provided with radial grooves or guides, a sliding tool-arm mounted in said grooves or guides, and a seaming-tool adapted to fold the horizontal flange of the can-head over the vertical wall of the can-body and mounted on said tool-arm, and a cam for operating said tool-arm as the tool-holder is rocked, substantially as specified.

11. The combination of stationary revolving disk B, movable revolving disk B', shaft b^4, crank-shaft L, provided with arms *l l'*, cam H^2, rod I^2, crank-shaft I^3, provided with arms I^5 and I^6, and pivoted block I^7, provided with rubber cushion I^8 and plate I^9, substantially as specified.

12. The combination of the movable revolving disk B' and its shaft b^4, of the cam H^2 and suitable connecting mechanism for operating said shaft b^4 from the cam H^2, said connecting mechanism being provided with an elastic cushion to compensate for irregularities in the can-body, substantially as specified.

300,003. STEAM-TRAP. EUGENE F. OSBORNE, St. Paul, Minn. Filed Mar. 2, 1883. (No model.)

Claim.—1. The combination, with a steam-supply pipe and a source or means of water-supply, of a closed chamber constructed to receive water by gravity, and provided with an exit therefor, automatic means constructed to alternately admit steam from said supply-pipe to said chamber and cut it off therefrom, and automatic means constructed to close said water-exit simultaneously with the cutting off of the supply of steam to the chamber, whereby water is alternately allowed to flow into the said chamber and forced therefrom by steam-pressure, substantially as described.



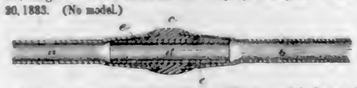
2. The combination, with a steam-supply pipe and a pipe communicating with a source or means of water-supply, of a closed chamber having a water-inlet provided with an inwardly-opening check-valve, a water-exit and a steam-exit, automatic means for alternately admitting steam from said supply-pipe to said chamber and cutting it off therefrom, and automatic means for closing said water-exit and opening said steam-exit during the time that communication between the steam-supply pipe and the chamber is interrupted, substantially as described.

3. The combination, with a steam-supply pipe and a pipe communicating with a source or means of water-supply, of a closed chamber having a water-inlet passage provided with an inwardly-opening check-valve, a water-exit and a steam-exit, valves for controlling the admission of steam from the supply-pipe to said chamber and for controlling the said water and steam exits, and a float connected with said valves and operating to alternately admit steam from said pipe to said chamber and to exclude it therefrom, and to close said water-exit and open said steam-exit during the time that the steam-inlet is closed, substantially as described.

4. The combination, with a tank containing water under steam-pressure and a steam-supply pipe which is independent of said tank, of a chamber constructed and arranged to receive water from the tank by gravity, and provided with a suitable automatic valve in the inlet-pipe for preventing the backward flow of water therein, and with a water-exit, automatic means for alternately admitting steam from said supply-pipe to said chamber and cutting it off therefrom, automatic means for closing the said water-exit, and automatic means for equalizing the pressure between the said tank and the said chamber during the time that the communication between said supply-pipe and said chamber is closed, substantially as described.

5. The combination, with the closed receptacle E, having a water-inlet provided with a check-valve, of the float L, the valve-casing F, communicating with the top of the receptacle, and provided with passages *k*, *f'*, *k'*, and *f*, the tube *e*, the valve M, and the rod *l*, secured to said float and provided with the valve *k'*, substantially as and for the purposer set forth.

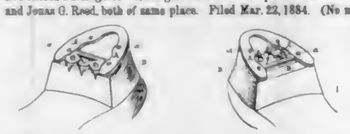
300,004. CAR-COUPLING. WM. PARSONS, Cleveland, Ohio. Filed Oct. 16, 1883. (No model.)



Claim.—1. In a car-coupler, the lugs L L, in combination with the annular recess E, the point P, and latch B, as and for the purposes set forth and described.

2. The combination of the head A, latch B, link T, pin D, and lever I, substantially as set forth, and for the purposes described.

3. In a car-coupler, the combination, with a link and draw-head, of a latch, B, having tapering lugs L L, operated substantially in the manner and for the purposes set forth and described.

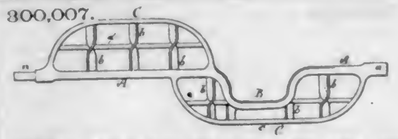


300,005. JOINT FOR LEAD PIPES. WM. R. PATTERSON, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Feb. 20, 1883. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, with the sections of pipe, of a strengthening of lead, forming with the ends of the sections on each side the wipe-joint a double thickness of metal, the whole being firmly united by the solder which joins the two ends of the sections of pipe, substantially as and for the purpose specified.

2. The combination, with the wipe-joint of the lead pipe of a telegraph-cable, of the strengthening-piece *d*, extending beyond the solder on both sides the joint, said solder being united to said strengthening-piece and to the ends of the sections, substantially as and for the purpose specified.

300,006. COMBINED ICE-CREEPER AND HEEL-PLATE. EDWD. N. PORTER, Burlington, Vt., assignor of two-thirds to Lorenzo G. Burnham and Jonas G. Reed, both of same place. Filed Mar. 22, 1884. (No model.)

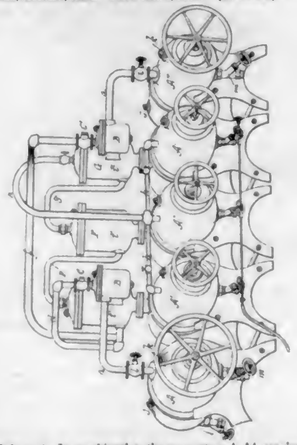


Claim.—1. In combination with the heel-plate A, the slotted cross-bar B, spring *e*, and creeper C, substantially as described, and for the purpose set forth.

2. The ice-creeper C, pivoted in recesses *g* in the heel-plate A, and firmly supported by the ends *b b* and spring *e* of the cross-bar B, and designed, when in use, to be folded back within the sides of the heel-plate and expose two or more projecting points, and when not used to be folded forward, so that its points shall rest tightly against the front edge of the heel, substantially as described.

300,007. AGITATOR FOR GENERATORS AND RECEIVERS FOR SODA OR OTHER AERATED WATERS. ALVIN D. PUFFER, Medford, Mass. Filed Oct. 10, 1883. (No model.)

Claim.—1. An agitator or dasher for aerated liquids, consisting of

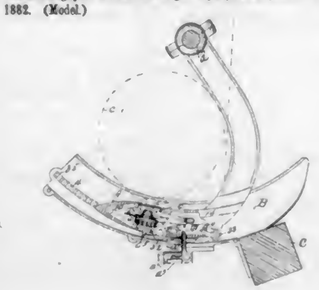


300,007.

a shaft, wings C, attached to said shaft on opposite sides, vanes *b*, which extend laterally from the shaft to the wings, as shown, and longitudinal bars *d*, which are connected to the middle parts of said vanes, and also to said wings, substantially as set forth.

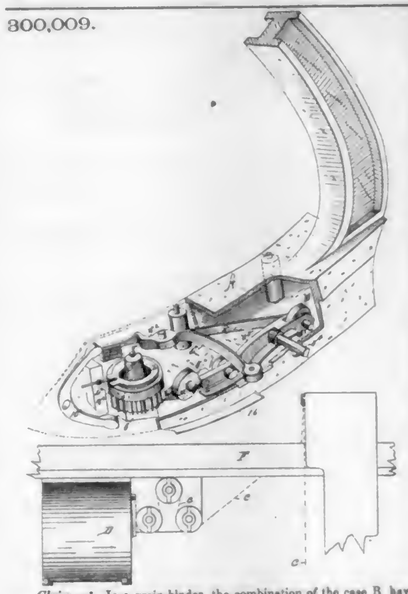
2. A dasher containing, in combination with the shaft and wings, the offset in the shaft, the vanes with reverse slopes, and the bar longitudinally intersecting the vanes, all as explained.

300,008. CARBONIC-ACID-GAS GENERATOR. LUTHER WINTHROP PUFFER, Medford, Mass. Filed Jan. 4, 1884. (No model.)



Claim.—1. In combination, the generators A A^4, receivers A' A^4 A', dry purifiers B B, with their sediment-traps *c c*, and purifiers D F G, with their connecting-pipes and the automatic valves C C', substantially as and for the purposes herein described.

2. The combination of the generators A A^4, pipes *a a*, with their valves, and the sediment-traps and dry purifiers, with the pipes *d* and *f*, connecting with the purifier D, as described, and the purifiers F G, with the receivers A' A^4 A', substantially as described.



3. In a carbonic-acid-gas-generating apparatus, a generator provided both front and back with filling-bungs and discharging-valves *j k l m*, as and for purposes herein set forth.

4. A purifier having an air-inlet pipe in its side, an outlet-pipe in its top, and a diaphragm extending down from its top between said pipes, to compel the air entering by the former pipe to descend to the bottom of the purifier before ascending to the outlet.

300,009. KNOT-TYING MECHANISM FOR GRAIN-BINDERS. CHARLES M. RICHARDSON and JACOB S. GIBBS, Bridgeport, Conn., assignors to the Bridgeport Twine Binding Company, same place. Filed Mar. 11, 1882. (Model.)

300,009.

Claim.—1. In a grain-binder, the combination of the case B, having two twine-clamping jaws pivoted thereto, a spring to shut said jaws, and the elbow-lever a^4, with the head A, adapted to move through said case, and provided with means for opening said jaws, substantially as described.

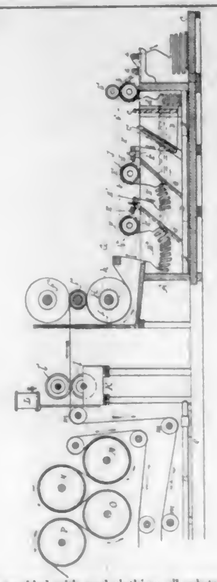
2. The combination, with the case B, having the rack, of the head A, having the twine-slot 20, the conical-ended knotter-post *o*, fixed in said head, the looping-pinion *i*, having the collar *z* thereon, and the transverse groove v^2 across its periphery, and the tension-spring i^2, substantially as set forth.

3. In combination with the case B, having the rack 4 thereon, the head A, adapted to move through said case, and carrying the conical-ended knotter-post *o*, fixed in the head, a knotting-hook pivoted in the post *o*, having an arm to swing against and from the knotter-post, and mechanism within said head, substantially as described, for looping the twine around the conical end of the post *o*, and for oscillating the knotting-hook on its pivot within the knotter-post, substantially as set forth.

4. The combination, with the looping-pinion *i*, having the collar *z* thereon, of the tension-spring i^2, secured to the head A, and encircling that part of said pinion between the collar *z* and the main part of the pinion, substantially as and for the purpose set forth.

5. In combination with the head A, having the knotter-post *o*, the looping-pinion *i*, revolving thereon, the knotting-hook *o*, pivoted in said post, the rod o^3, connected to said hook, the levers o^3 o^4, connected with rod o^3, spring o^5, and the case B, having suitable cams thereon for contact with the arm o^4 on the lever o^3, substantially as set forth.

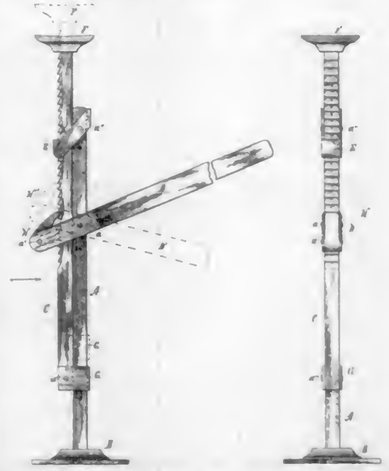
6. The pivoted clamp-jaws a a^3, having the bevel-edged points 40 on the lower end thereof, substantially as set forth.



300,010. APPARATUS FOR SEPARATING VEGETABLE FIBER FROM WOOLEN FABRICS. JOSEPH HACKING RILEY, Bury, County of Lancaster, England. Filed Jan. 11, 1884. (No model.) Patented in England Apr. 16, 1881, No. 1,678.

Claim.—1. In a machine for destroying vegetable matter from woven fabrics, the combination of vats or tanks provided with fixed divisions *e e'* and sliding compartments *c c'*, and the grids or grates D D, with the tension-bars and feed-rolls, actuated by mechanism, as herein described, for feeding the cloth continuously through the various divisions of the main vat A, substantially as stated.

2. In a machine for destroying vegetable matter from woven fabrics, the combination, with the vat A and its operative parts, of the device herein shown for saving the selvages of the fabric undergoing treatment, consisting of the tank or tanks K, adapted to contain the neutralizing-liquor and the pairs of rollers *l l'*, &c., and reservoir L, substantially as described.



3. In a machine for destroying vegetable matter from woven fabrics, the general combination of the vat A with its operative parts, the device for preventing the destruction of the lists or selvages of the cloth in process of treatment, and the series of steam-pipes and drums with the pair

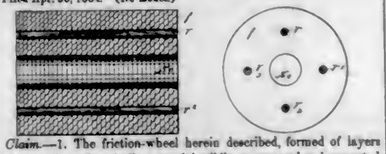
300,010.

or pairs of rolls provided with card clothing, all substantially as and for the purposes set forth.

300,011. LIFTING-JACK. JOHN RITCHIE and FRIEDRICH LUCKERMANN, Freeport, Ill. Filed Feb. 23, 1884. (No model.)

Claim.—1. In a wagon-jack, the combination of two bars—one plain, the other provided with ratchet-teeth—lying in contact and sliding longitudinally one upon the other, a loop attached rigidly to the lower end of the ratchet-bar and passing around the plain bar, a loop pivoted to the plain bar and passing around the ratchet-bar, and forming a gravity-pawl adapted to engage the teeth thereof, and means for raising said ratchet-bar, substantially as shown and described

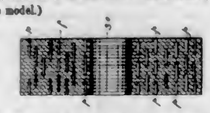
2. The combination of the plain bar A, ratchet-bar C, loop G, attached to the bar C and inclosing the bar A, loop E, pivoted to the bar A, and inclosing the bar C and engaging the successive teeth of said bar, the lever D, pivoted to the bar A, and the pawl H, pivoted to the lever D, and engaging the ratchet-teeth of the bar C, substantially as shown and described, and for the purpose set forth.



300,012. PAPER PULLEY. WILLIAM E. ROCKWOOD, Indianapolis, Ind., assignor of one-half to Horatio C. Newcomb, same place. Filed Apr. 30, 1884. (No model.)

Claim.—1. A pulley whose web is composed of successive layers of paper or other suitable material cemented and compressed solidly together, the web extended so as to form the central portion of the rim, the other portion formed by the addition of narrower rings or strips of a similar material laid on each side of the web parallel to the layers of the web, and cemented to each other and to the sides of the web, and the whole made solid by pressure, and further united by wooden pins passing through such rim layers and the web, substantially as shown and described.

2. The process of forming a pulley-wheel of paper or other similar material herein described, which consists of forming the web by the cementing together of successive layers of paper or other material and subjecting the same to pressure, and of forming the rim by cementing narrow rings or strips of similar material around and upon each side of the web at and extending below the edge, subjecting these also, with the web, to suitable pressure to unify them, and further securing the layers of the rim on each side of the web together and to the web by wooden pins passing through the several rim layers and through the web, substantially as and for the purpose described.

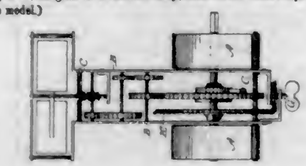


300,013. PAPER FRICTION-WHEEL. WILLIAM E. ROCKWOOD, Indianapolis, Ind., assignor of one-half to Horatio C. Newcomb, same place. Filed Apr. 30, 1884. (No model.)

Claim.—1. The friction-wheel herein described, formed of layers of paper-board or other similar material solidly compressed and cemented together, and provided with the wooden pins running through the wheel substantially parallel with its axis, as and for the purposes set forth.

2. The combination of the solid paper friction-wheel *f* and the wooden pins r r' r^2 r^3, substantially as described.

300,014. PAPER WHEEL. WILLIAM E. ROCKWOOD, Indianapolis, Ind., assignor of one-half to Horatio C. Newcomb, same place. Filed Apr. 30, 1884. (No model.)

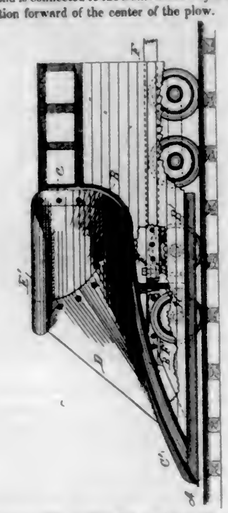


Claim.—1. The wheel *f*, composed of layers of paper or similar material compressed and cemented together to form a solid wheel, and the parts further secured by wooden pegs *p*, each peg passing transversely through only a portion of the layers of which the wheel is made up.

2. A wheel composed of layers of paper or similar material cemented and compressed together, and further secured by wooden pegs, each passing transversely through two or more layers of paper, and the outside layers further held together by means of screws, all combined substantially as described.

3. A wheel composed of layers of paper or similar material cemented and compressed together, the layers further secured by means of screws, each screw passing transversely through two or more layers of paper, substantially as described.

300,015. CLOCK-WORK MECHANISM. WILLIAM H. ROGERS, Brooklyn, N. Y., assignor to S. Elwood May, New York. Filed Apr. 10, 1884. (No model.)

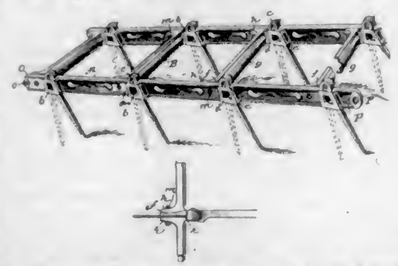


Claim.—1. One or more springs, A A, secured on the ends of the axle D, outside of the frames B B, containing the clock-work mechanism for propelling the same, for the purpose set forth.

2. The winding apparatus consisting of the key G, in combination with the bevel-pinion F and the bevel-wheel E, substantially as and for the purpose set forth.

300,016. SNOW-PLOW. JAMES HENRY RUSSELL, St. John, New Brunswick, Canada. Filed Mar. 27, 1884. (No model.)

Brief.—Curved sponsings are applied under and to support the projecting sheathing at the sides of the structure. The coupling-bar projects far forward, and is connected to the frame-timber by a semicircular socket-joint connection forward of the center of the plow.

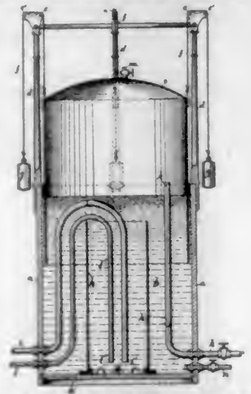


Claim.—1. The combination, with the sides of the plow, of the curved sponsings B, applied thereon, and the sheathing C, supported thereby at its margin, to cut wider than the plow itself, substantially as described.

2. In a snow-plow, the long coupling-bar F, projected far forward and connected to the frame-timber F' at a point forward of the center of the plow, substantially as described.

3. The combination of the coupling-bar F and the frame-timber F', united by the semicircular socket-joint connection G G', substantially as specified, for the purpose set forth.

300,017. HARROW. HANS H. SAYER, Dubuque, Iowa. Filed Feb. 6, 1884. (No model.)



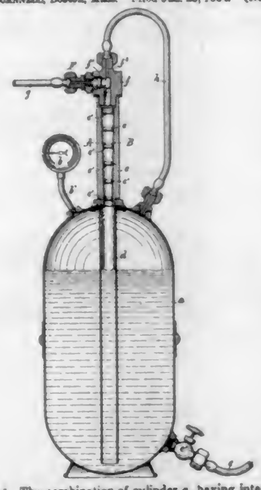
Claim.—1. In a harrow, pockets or closed sockets for the teeth, having a vertical and an inclined bearing-surface, said pockets being formed integral with the side bars, substantially as described.

2. In a harrow, pockets or closed sockets formed integral with the side bars, and having a vertical and an inclined bearing-surface, teeth pivoted in the upper part of such pockets, and adapted to operate substantially as described.

3. The combination of the double-flanged side bars having pockets and projections *f*, formed integral therewith, the cross-bars, and securing-bolts, substantially as described.

300,018. GASOMETER FOR WASHING CARBONIC-ACID GAS. ROGER F. SCANNELL, Boston, Mass. Filed Jan. 23, 1884. (No model.)

Claim.—1. A gasometer having the stationary tub *a* and vertically-adjustable bell *c*, in combination with the interior shell or cylinder, *h*, and gas-delivery pipe *i*, as and for the purpose set forth.

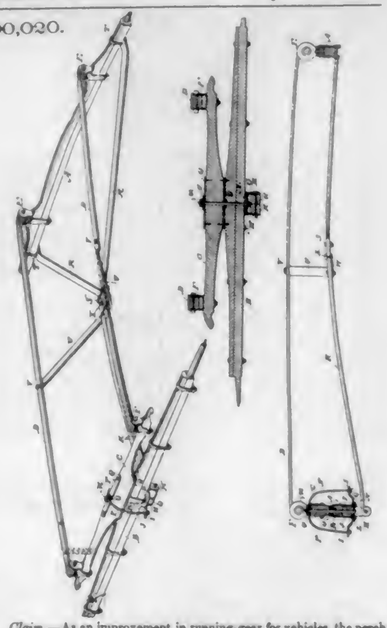


2. The combination of tub *a*, having shell *h*, and gas-inlet pipe *i*, terminating near the bottom of said shell, with bell *c* as and for the purpose set forth.

3. The combination of tub *a*, having shell *h*, and inlet-pipe *l*, terminating near the bottom of said shell, with bell *c*, as and for the purpose set forth.

4. The combination of tub *a*, having shell *h*, and inlet-pipes *i l*, terminating near the bottom of said shell, as and for the purpose set forth.

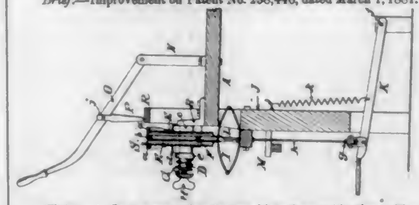
5. The combination of tub *a*, having shell *h*, and gas-inlet pipe *i*, terminating near the bottom of said shell, with bell *c* and gas-discharge pipe *k*, as and for the purpose set forth.



300,019. AGITATOR DEVICE FOR CARBONIZING LIQUIDS. ROGER F. SCANNELL, Boston, Mass. Filed Jan. 23, 1884. (No model.)

Claim.—1. The combination of cylinder *a*, having internal siphon-pipe, *d*, with pipe *e*, having a series of perforated disks, *d' d' d'*, and the gas and liquid inlet pipe *g*, as and for the purpose set forth.

2. The combination of cylinder *a*, having internal siphon-pipe, *d*, with pipe *e*, having a series of perforated disks, *d' d' d'*, the gas and liquid inlet pipe *g*, and return-pipe *h*, as and for the purpose set forth.



300,020. VEHICLE-SPRING. HENRY J. SCHILD, Stanton, Mich. Filed Nov. 6, 1883. (No model.)

Claim.—As an improvement in running-gear for vehicles, the perch or reach comprising two flat springs, R, secured side by side and extending rearwardly for about two-thirds of their length, an encircling-clip, S, securing them together at this point, then diverging immediately in rear of said clip to near the outer ends of the rear axle, to the under face of which they are secured, in combination with the axle and bolster, the side springs connecting the rear axle and bolster, the double-inclined brace U, secured at its center to the reach and at its ends to the side springs, and a plate, G, secured to the front axle, and having downwardly-extending arms H, between which the leaves of the perch or reach are secured, as set forth.

300,021. MACHINE FOR FORMING CRUPPERS. JOSEPH SHAFFER, Dayton, Ohio, assignor of one-half to Edward F. Cooper, same place. Filed Feb. 23, 1884. (No model.)

Brief.—Improvement on Patent No. 238,446, dated March 1, 1881.

Claim.—1. In a crupper-forming machine, the combination, with a swaging-block, of a three-part die, the outer portions of which can be spread apart, and the inner portion of which can be depressed, substantially as described.

2. In a crupper-forming machine, the combination, with the forming-die, of a pedal and automatic gripping-tongs united to said treadle by a cord or equivalent device, as and for the purpose set forth.

3. The combination, with the lever O, carrying the bed-plate supporting the three-part die E E F, washers *c d*, spindle D, follower *e*, spring G, and thumb-screw H, of the spring I, tongs L, cord A, and treadle K, substantially as and for the purpose described.

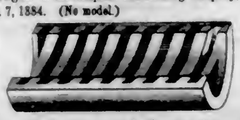
300,022. HEEL-STIFFENER. EDWARD SHAW and ROMEO A. OWINGS, Mattoon, Ill. Filed Feb. 28, 1884. (No model.)

Claim.—As an improved article of manufacture, a heel-stiffener or counter for boots and shoes, having a cast or molded rubber body provided around its bottom with an inwardly-projecting flange integral with the body, for receiving the nails or pegs by which the counter is attached

300,022.

to the inner sole or heel, and an interposed piece of cloth, canvas, or other fibrous material molded or cast into the body and projecting beyond the edges of the same, to receive the stitches by which the counter is attached to the upper, substantially as shown and described.

300,023. ANTI-FRICTION COMPOSITION. WILLIAM W. SMALLEY, Boundbrook, N. J., (Administrator of John Smalley, deceased,) assignor to the Graphite Lubricating Company, Jersey City, N. J. Filed Mar. 6, 1884. (No specimens.)



Claim.—1. A composition for anti-friction bearings, consisting of graphite, shellac, and gum-copal, combined substantially as herein set forth.

2. In the manufacture of lubricating compositions, subjecting gum-copal to the action of turpentine, and then dissolving in alcohol, combining with graphite, drying, and pulverizing, to form an anti-friction powder.

3. The improvement in making anti-friction compositions, consisting in combining graphite with a solution of shellac, and drying and powdering the mixture, and combining the powder with another made by mixing graphite with a solution of gum-copal, and drying and pulverizing the same, substantially as set forth.

300,024. MANUFACTURE OF ANTI-FRICTION BEARINGS. WILLIAM W. SMALLEY, Boundbrook, N. J., (Administrator of John Smalley, deceased,) assignor to the Graphite Lubricating Company, Jersey City, N. J. Filed Mar. 7, 1884. (No model.)

Claim.—1. The improvement in the manufacture of anti-friction bearings, consisting in subjecting the composition containing anti-friction material and gum to the action of heat, as and for the purpose set forth.

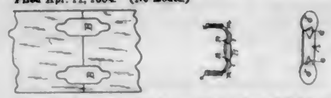
2. The improvement in making anti-friction bearings, consisting in making a composition containing anti-friction material and gum, forming the same under heat and pressure, and then subjecting the same to the action of heat, as and for the purpose set forth.

3. An anti-friction bearing consisting of anti-friction material combined with a gum and baked, substantially as described.

300,025. MANUFACTURE OF ANTI-FRICTION BEARINGS. WILLIAM W. SMALLEY, Boundbrook, N. J., (Administrator of John Smalley, deceased,) assignor to the Graphite Lubricating Company, Jersey City, N. J. Filed Mar. 7, 1884. (No model.)

Claim.—1. The improvement in the manufacture of anti-friction bearings, consisting in filling the receptacles in the bearing-blocks with anti-friction composition and packing the same therein under heat and pressure, substantially as described.

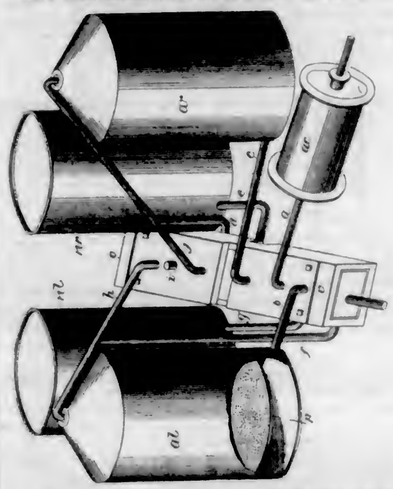
2. The mode described of making anti-friction bearings, the same consisting in heating the recessed or channeled bearing or bushing and introducing into the channels thereof an anti-friction composition, and in packing the same in the channels under pressure while thus heated, substantially as described.



3. The combination, in a machine for packing anti-friction bearings, of a heated receptacle for the channeled or grooved bearings or bushings, and pressure appliances, whereby the composition is forced under pressure into the channels or grooves, substantially as described.

4. The combination of the steam-heated casing D, plungers I and N, and screw J, arranged opposite a chamber in the casing, substantially as described.

5. The combination of the steam-heated casing, screw J, and counter-screw L, substantially as and for the purpose set forth.



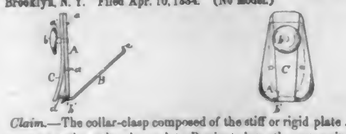
6. The combination of the heater containing a chamber, *y*, compressing devices, and holder B, adapted to said chamber and to receive the bearing, substantially as described.

300,026. BELT-FASTENER. WILLIAM SMITH, Eaton Rapids, Mich. Filed Apr. 11, 1884. (No model.)

Claim.—A metallic belt-fastener consisting of the clasp B, having the slanting or circular corners *m m*, the annular ribs *s s*, and the points *n n*, in combination with the covering A, provided with the brads *e e*, all substantially as described, and for the purposes set forth.

300,027. APPARATUS FOR PREPARING OXYGENATED AIR. ANTON STAHL, Leadville, Colo. Filed Apr. 18, 1883. (No model.)

Claim.—1. In an apparatus for preparing oxygenated air, the combination, with an air-compressor, of two strong closed tanks, (called "water-tanks,") which are filled with such liquids that absorb oxygen in comparatively larger proportion than nitrogen, preferably with water having a layer of oil or glycerine on top, the two tanks having each one or more horizontal perforated diaphragms, *p*, and being connected with the valve *v'*—one by the pipe *b* and the other by the pipe *c*—all substantially as described, and for the purpose specified.



2. In an apparatus for preparing oxygenated air, the combination, with an air-compressor and two air-tight water-tanks, of two strong hermetically-closed air-tanks (called "nitrogen-tanks") for the temporary storing of the nitrogenated air, these two air-tanks being so connected with the water-tanks through the pipes *g* and *f* and *e* and *d* and by the valves v^2 and v^3 that while the first water-tank, *al*, is being filled with compressed atmospheric air the nitrogenated air can pass out at the top of the said water-tank into the first nitrogen-tank, *nl*, and while the second water-tank, *ar*, is being filled with compressed air the non-absorbed (nitrogenated) portion of air can escape by the top of this second water-tank into the second nitrogen-tank, *nr*, all substantially as described, and for the purpose specified.

3. In an apparatus for preparing oxygenated air, the combination, with an air-compressor, two water-tanks, and two nitrogen-tanks, of four valves, which may be of various shapes—such as slide-valves, piston-valves, rotary valves, &c.—and which may be either separate, so that each valve is in a chest by itself, or may be combined into one, two, or three compound valves having one, two, or three valve-chests and valve-rods, but which must be so constructed and connected that their movements are always simultaneous, and that in one of their principal positions of rest—as, for example, in their forward position—the communication is open between the pipes *a* and *b* through the port *m* or some other equivalent means, between the pipes *f* and *g* through the port *o*, between the pipes *j* and *i* through the port *n*, and between the pipe *e* and the exit-opening *k* through the port *r*, while at the same time the valve ends of the pipes *c*, *d*, and *h* are closed by the valves v', v^2, and v^4,

and the communication between the pipe *g* and the exit-opening *k* is closed by the valve v^3, and that when the valves are in their other backward position the communication is open between the pipes *a* and *c* through the port *m* or its equivalent, between the pipes *d* and *e* through the port *r*, between the pipes *h* and *i* through the port *n*, and between the pipe *g* and the exit-opening *k* through the port *o*, while at the same time the valve ends of the pipes *b*, *f*, and *j* are closed by the valves v', v^2, and v^4, and the communication between the pipe *e* and the exit-opening *k* is closed by the valve v^3, all substantially as described, and for the purpose specified.

4. In an apparatus for preparing oxygenated air, the combination, with the air-compressor, two water-tanks, two nitrogen-tanks, and four valves, of the pipe *a*, connecting the air-compressor with the valve v', the pipe *b*, connecting the valve v' with the water-tank *al*, the pipe *c*, connecting the valve v' with the water-tank *ar*, the pipe *f*, connecting the top of the tank *al* with the valve v^2, the pipe *g*, connecting the valve v^2 with the nitrogen-tank *nl*, the pipe *d*, connecting the top of the tank *ar* with the valve v^3, the pipe *e*, connecting the valve v^3 with the nitrogen-tank *nr*, the pipe *h*, connecting the top of the water-tank *al* with the valve v^4, the pipe *j*, connecting the top of the water-tank *ar* with the valve v^4, and, lastly, the exit-pipe *i*, leading to a place where the oxygenated air (resulting from the working of the apparatus) is either stored or used, all substantially as described in the foregoing specification, and for the purpose named.

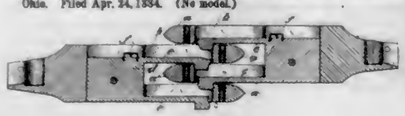
300,028. NECKTIE AND COLLAR CLASP. CLINTON STEPHENS, Brooklyn, N. Y. Filed Apr. 10, 1884. (No model.)

Claim.—The collar-clasp composed of the stiff or rigid plate A, having spurs or studs *a*, the claw-plate B, pivoted to the extremity of the said plate A, and the button *b*, having a shank, *a'*, and a spring, C, the said button-shank and spring being attached to that side of the plate A opposite to that at which is placed the claw-plate B, the parts being arranged in relation with each other as described, and for the purpose specified.

300,029. OILING-PAD FOR JOURNAL-BOXES. JOHN STEPHENSON, New York, N. Y. Filed May 2, 1884. (No model.)

Claim.—1. An oiling-pad having in its contacting surface strips or pieces of lead or other material secured in the felt, with the surface in the same plane as that of the felt, substantially as and for the purpose described.

2. An oiling-pad having metallic facing-pieces and resting upon a spring-support, whereby it is maintained with its face in contact with that of the journal, substantially as set forth.



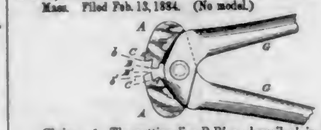
3. An oiling-pad consisting of felt and inserted pieces of soft metal, substantially as and for the purpose set forth.

4. An oiling-pad consisting of a soft porous pad carrying inserted pieces of soft metal, and a spring supporting the pad in contact with the journal, substantially as described.

5. The combination of the curved cradle supported by a spring and pad of porous material, and metallic pieces secured to the pad, substantially as described.

6. An oiling-pad having embedded in its surface strips of soft metal extending lengthwise of the pad, or approximately thereto, substantially as described.

300,030. CAR-COUPLING. HERBERT M. STURGIS, South Charleston, Ohio. Filed Apr. 24, 1884. (No model.)



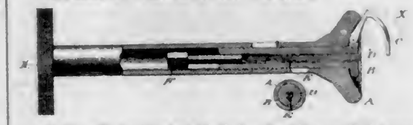
Claim.—1. In a car-coupling, the combination, with a draw-head having an opening to receive a portion of the opposite draw-head, of a coupling hook or latch pivoted therein, and consisting of a body portion having an arm or arms provided with a hook or hooks, substantially as set forth.

2. In a car-coupling, the combination, with a draw-head divided into an upper and lower portion, as shown, and having a longitudinal opening, as shown, of a coupling-hook pivoted in said opening, said coupling-hook consisting of a body portion having two forwardly-extending arms provided with hooks, substantially as set forth.

3. The combination, with a draw-head divided into an upper and lower portion, as shown, having their forward ends beveled on their upper and lower sides, and having a longitudinal opening, as shown, of a coupling-hook pivoted in said opening, said coupling-hook consisting of a body portion having two forwardly-extending arms provided with hooks, substantially as set forth.

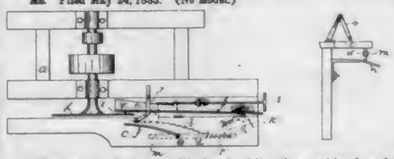
4. The combination, with a draw-head divided into an upper and lower portion, as shown, having their forward ends beveled on their upper and lower sides, and having a longitudinal opening, of a coupling-hook pivoted in said opening, said coupling-hook consisting of a body portion having two forwardly-extending arms provided with hooks, and a double lever pivotally secured to said hook, substantially as set forth.

300,031. SHEAR-CUTTING NIPPERS. STEPHEN TAFT, Millbury, Mass. Filed Feb. 13, 1884. (No model.)



Claim.—1. The cutting-lips B B', as described, in combination with the supplemental or holding lips *c c'*, substantially as described.

2. The cutting-lips B B' and the holding-lips *c c'*, forming a solid bearing together, substantially as and for the purposes set forth.



3. The cutting-lips B B', in combination with lips or shoulders connected to them by the curves or lines C C', forming free spaces for their edges when closed, substantially as described.

300,032. CHUCK FOR WATCH-MAKERS' LATHES. CAL THOMAS, Terre Haute, Ind. Filed Dec. 26, 1883. (No model.)

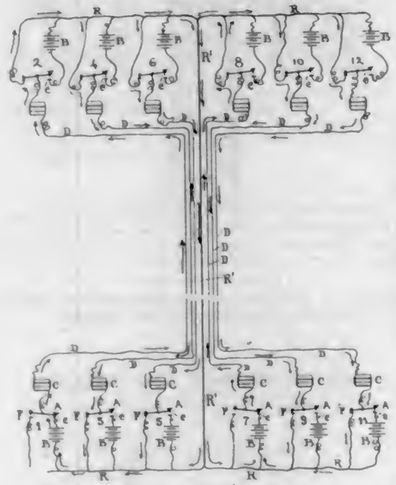
Claim.—The combination of the hollow draw-in screw H, the sleeve A, countersunk at its outer end, the hollow spindle B, having hinged to its outer end the clamping-jaws C, and threaded at its inner end, the pump-center D, the adjusting-screw F, and guide-pin E, substantially as described.

300,033. STAVE-JOINTING MACHINE. JOSHUA TREAT, Hampden, Me. Filed May 24, 1883. (No model.)

Claim.—1. In a stave-jointing machine, the combination of the hinged table *c*, pivoted arm *f*, adapted to be oscillated by the stave, the inclined plane *n*, secured to a fixed support, and the knob *m*, connected and oscillating with the arm *f*, and situated between said inclined plane and the hinged table, substantially as set forth.

2. In a stave-jointing machine, the combination of the hinged table *c*, pivoted arm *f*, adapted to be oscillated by the stave, the inclined plane *n*, adjustable toward and from the table on a fixed support, and the knob *m*, connected and oscillating with the arm *f*, and situated between said inclined plane and the hinged table, substantially as set forth.

3. In a stave-jointing machine, the combination of the hinged table *c*, pivoted arm *f*, adapted to be oscillated by the stave, the inclined plane *n*, attached to a fixed support, the lever *d*, connected and oscillating with the arm *f*, and adapted through the construction and connections shown to operate the spring-guide *k*, and the knob *m*, attached to said lever *d*, and situated between the hinged table and the inclined plane, substantially as set forth.



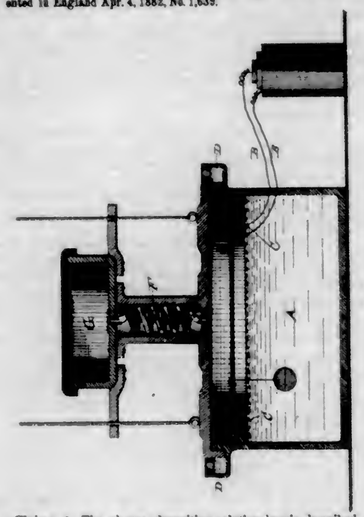
4. In a stave-jointing machine, the combination of the hinged table *c*, for supporting the work, means for automatically raising said table to change the inclination of the work to the saw, and a presser adapted to hold the work against the table, and to insure the return of the latter when released by the raising devices, substantially as set forth.

5. In a stave-jointing machine, the combination of the hinged table *c*, for supporting the work, means for automatically raising said table to change the inclination of the work to the saw, and the spring *o*, attached to a fixed support, and adapted to hold the work against the table, and to insure the return of the latter when released by the raising devices, substantially as set forth.

6. In a stave-jointing machine, the combination of the main frame having a surface inclined to the plane of the saw, the wedge *q*, bearing against said surface and held in sliding contact therewith, the guide *k*, attached to said wedge in a position substantially parallel to the plane of the saw, and means for longitudinally adjusting said wedge to change the distance between the guide and the saw, substantially as set forth.

7. In a stave-jointing machine, the combination of the main frame having a surface inclined to the plane of the saw, the wedge *q*, bearing against said surface and held in sliding contact therewith, the guide *k*, attached to said wedge in a position substantially parallel to the plane of the saw, and a rod, *s*, extending to the end of the frame next to the operator for longitudinally adjusting said wedge, substantially as set forth.

300,034. COMPOUND TELEGRAPH-CABLE. PETER H. VANDER WEYDE, Brooklyn, assignor to the Vander Weyde Electric Company, New York, N. Y. Filed Apr. 14, 1882. (No model.)

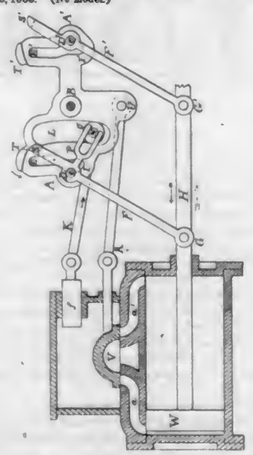


Claim.—1. The combination, in an electric telegraph or telephone system, with two or more main parallel conducting-wires severally adapted for transmitting direct electric currents, of an auxiliary parallel wire and suitable commutators and conductors adapted to establish from either main wire which may be transmitting a direct current a return-circuit through said auxiliary wire independent of any ground-connection, substantially in the manner and for the purpose herein set forth.

2. The combination, in an electric telegraph or telephone system, with two or more main parallel conducting-wires severally adapted for transmitting direct electric currents, of an auxiliary parallel wire and suitable commutators and conductors adapted to establish from either main wire which may be transmitting a direct current a return-circuit to battery conjointly through said auxiliary wire and the main wires not otherwise in use independently of any ground-connection, substantially in the manner and for the purpose herein set forth.

3. The combination, with an electric telegraph cable or system of parallel line-wires, and with the sounders and batteries for each line in said cable or system, of telegraph-keys, each having its anvil connected electrically with one pole of its appropriate battery and its bar connected in like manner directly with one end of its appropriate line-wire, and each of which is fitted with a back contact adapted to close, when the key is up and the connection with its battery thereby broken, an electrical connection between its bar and the opposite pole of each and every battery, and the back contact of each and every other key at its end of the cable or system, substantially in the manner and for the purpose herein set forth.

300,035. PROCESS OF AND APPARATUS FOR ELECTRO-DEPOSITING COPPER, BRASS, &c. WILLIAM HENRY WALENN, Islington, County of Middlesex, England. Filed Nov. 8, 1883. (No model.) Patented in England Apr. 4, 1882, No. 1,639.



Claim.—1. The electro-depositing solution herein described, consisting of cyanide of potassium and neutral tartrate of ammonium in the proportion of thirty-two ounces of the former and one ounce of the latter, charged by electrolysis with the metal or alloy to be deposited, and perfected by the addition of cupric ammonide, substantially in the proportions and for the purpose described.

2. The herein-described process of electro-depositing metals and alloys by subjecting them to the action of an electro-depositing solution in a closed vessel under a pressure exceeding that of the atmosphere at a temperature of from 190° Fahrenheit up to the boiling-point of the solution, substantially as and for the purpose set forth.

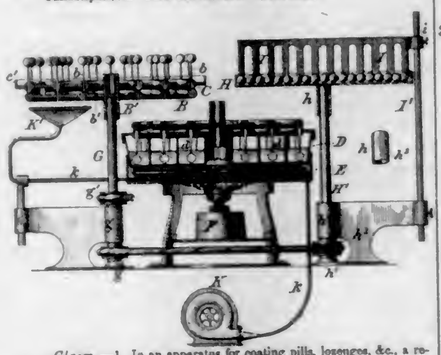
3. The depositing-tank A, having cathode-supporting shelves provided with slabs of non-conducting material and dipping into a water-seal, a counterbalanced cover having an upwardly-extending tube, a condensing box or vessel at the upper end of said tube, and a condensing-worm forming a connection between said condensing-box and the tank A, substantially as and for the purpose set forth.

300,036. VALVE-GEAR. LEWIS WINDHURST, Springfield, Ohio. Filed Oct. 6, 1883. (No model.)

Claim.—1. The combination of the rocking lever A A′, the links F F′, slots or grooves E D E′ D′, the time-locking contrivance T S T′ S′, with an automatic device for operating the lever A A′, and means for applying the action of said device to either side of the rocking center B, substantially as described.

2. In a valve-gear, the combination of a double-armed rocking lever provided with a slot or groove at each arm, and the links F F′, provided with the pins *e e′*, with means for operating these links, the slots being so constructed and arranged that each link will actuate the rocking lever only when moved by the piston-rod in a certain direction, as shown and described.

3. In a valve-gear, the combination of a double-armed rocking lever with two links, F F′, one end of which links is operated by the piston-rod, the respective opposite end of said links being connected to an arm of the rocking lever in such a manner that only one link can actuate said lever during the outstroke of the piston, and the opposite link only during the instroke of the piston, all substantially and for the purpose as set forth.



4. In a valve-gear having an extra moving power acting on a rocking lever, A A′, and of which the described steam-plunger is an example, the combination of mechanical means of transferring that power alternately to one side or the other of the rocking center B, (in conformity to the motion of the piston-rod H,) with a time-lock represented by the parts T S T′ S′, so contrived as to restrain and limit the action of said extra power to the dead-points of the slide-valve, substantially as set forth.

5. In a valve-gear, the combination of a steam-plunger with a rocking lever and means for transferring the lever-connections of the steam-plunger or the spring to either side of the rocking center of the lever, substantially as described.

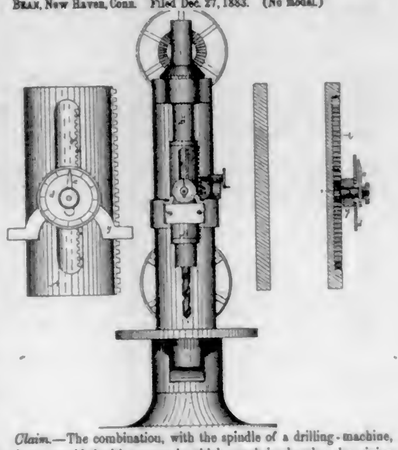
6. In a valve-gear, the combination of links F F′, provided with projections S S′, with the lever A A′, provided with projections T T′, the piston-rod H, and means independent of the links for actuating the lever A A′, whereby the independent means for actuating the lever A A′ is restrained until the piston has arrived at the end of a stroke, substantially as described.

7. The combination of the rocking lever A A′, the links F F′, slits or grooves E D E′ D′, and the time-lock contrivance T S T′ S′, with the extra moving power applied at N, and with means of transferring the same to either side of the rock-center B, substantially and for the purpose as described.

300,037. COATING PILLS, LOZENGES, &c. WALTER T. BAKER, Philadelphia, Pa. Filed Dec. 29, 1883. (No model.)

Claim.—1. In an apparatus for coating pills, lozenges, &c., a receptacle having a central shaft adapted to center a lifting device, and a series of seats or recesses located around said shaft, each of said seats being adapted to receive and support a pill or analogous article in a plane perpendicular to the shaft, substantially as set forth.

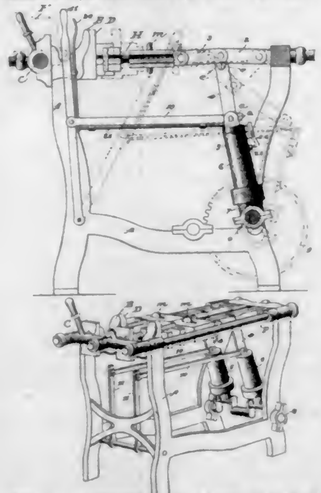
2. In an apparatus for coating pills, lozenges, &c., a coating dish or bath divided into two or more separate sections, substantially as set forth.



3. In an apparatus for coating pills, lozenges, &c., the combination of a lifter and holder having a series of rings or frames, each provided with projections adapted to engage a pill or analogous article, and a remover formed of a corresponding series of perforated rings or frames and connected to said lifter and holder, with the capacity of movement thereon when required to disengage the pills from the projections, substantially as set forth.

4. In an apparatus for coating pills, lozenges, &c., the combination of a recessed receptacle having a central shaft, a lifter and holder having central sockets on each side thereof, and a rotating drier-shaft, the socket on one side of the lifter and holder being adapted to fit on the shaft of the recess-receptacle and the opposite socket to fit on the drier-shaft, substantially as set forth.

5. In an apparatus for coating pills, lozenges, &c., the combination of a recessed receptacle, a lifter and holder, a remover, a coating-bath, a drier-shaft, a polishing-dish, and a polishing-shaft, substantially as set forth.



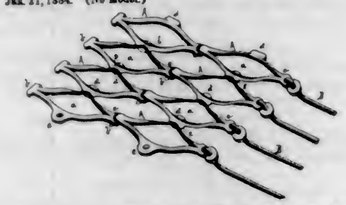
6. In an apparatus for coating pills, lozenges, &c., the combination of a lifter and holder, a drier-shaft, a fan or blower, a supply-pipe leading therefrom and discharging adjacent to the lifter and holder, and a heater connected with said supply-pipe between the blower and the discharge, substantially as set forth.

300,038. INDEX-GAGE FOR DRILLING-MACHINES. ALBERT B. BEAN, New Haven, Conn. Filed Dec. 27, 1883. (No model.)

Claim.—The combination, with the spindle of a drilling-machine, of a sleeve provided with a recess in which a rack is placed, and a pinion lying in said recess and meshing into said rack, said pinion being carried upon a shaft to which a pointer or other indicator is attached, as set forth.

300,039. BOOT AND SHOE SOLE SHAPING MACHINE. MAURICE V. BRENNAHAN, Lynn, Mass. Filed Apr. 5, 1884. (No model.)

Claim.—1. In combination with the mold D, the form B, said form being mounted on a movable support, C, and adapted to operate in connection with the mold, substantially as and for the purposes described.



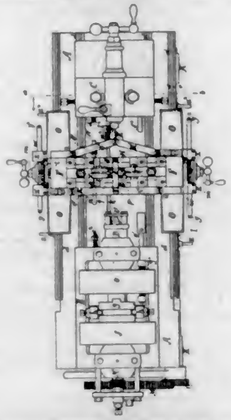
2. In combination with the mold D, the block B, and toggle-arms 2 3, and the parts 4 5 6, arranged substantially as described, and a suitable driving mechanism, substantially as set forth.

3. In a sole-shaping machine of substantially the construction described, the combination of lever 4, sleeve 5, plunger 6, and pin 23, said parts being combined and adapted to operate substantially as and for the purposes above set forth.

4. In a sole-shaping machine of substantially the construction described, the combination of lever 4, sleeve 5, plunger 6, arranged to operate as set forth, and a clamping or interlocking mechanism adapted to interlock the sleeve 5 and plunger 6, substantially as and for the purposes described.

5. The combination of the lever 11, rod 10, lever 4, sleeve 5, plunger 6, and pin 23, all adapted to operate substantially as set forth, and means, substantially as shown, to operate the pin 23, said means being extended upward along the lever 11, as and for the purposes set forth.

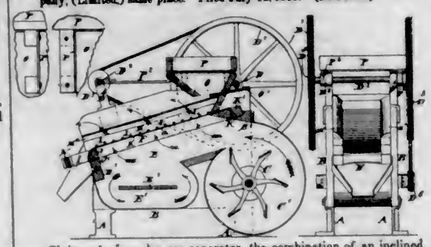
300,040. FLY-NET FOR HORSES. RALPH BROWNSON, St. Paul, Minn., assignor of one-half to Peter R. L. Hardenbergh, same place. Filed Jan. 21, 1884. (No model.)



Claim.—1. As an improved article of manufacture, a web or net for horses, constructed of separate interlocked links of leather, of the form substantially as hereinbefore shown and described.

2. The link A, having the slit *a*, T-heads *b d*, and perforations *e e*, substantially as and for the purpose set forth.

3. A web or net constructed of separate links A, having T-heads *b d* and perforations *e e*, in combination with strings B, substantially as and for the purpose specified.

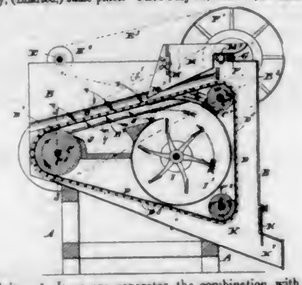


300,041. MACHINE FOR THREADING SCREW-TAPS. SIMON WHIPPLE CARD, Mansfield, Mass. Filed Dec. 18, 1883. (No model.)

Claim.—1. The combination, substantially as described, composed of the following elements, adapted and arranged essentially as set forth, viz: first, the lathe-bed A and the head and tail stocks B and C, with the arbor D and center E; second, the two cutter-carriages F, provided with cutter-holding devices or clamps *r*; third, the carriages G G, H, and O; fourth, the mechanism for reciprocating the carriage O, it consisting of the screw I, gears L, M, and N, pulleys *e* and *f*, clutch *g*, lever A, rod *k*, collars *l* and *l²*, springs *m* and *m²*, and the ears *n* and *n²*; fifth, the mechanism for advancing the cutter-carriages alternately to the blank, such consisting of two pairs of toggles, R and S, R′ and S′, the slide-rod *n′*, (having two collars, *o*,) the studs *c²* and *d′*, the slide-rods *e′* and *f″*, and the two springs *g′*; sixth, the mechanism for feeding forward the two cutter-carriages F in the required order, each of such mechanisms consisting of the carriage G, the screw *i*, ratchet-wheel *u* or *u′*, pawl *v*, slide *w* or *w′*, studs *y y²*, stops *z z²*, friction-disk *l′*, and spring *k′*, all as set forth.

2. The combination, substantially as described, for advancing each cutter-carriage to the blank, such combination consisting of the two pairs of toggles R and S, R′ and S′, slide-rod *n′*, shoulders *o′*, studs *c²* and *d′*, slide-rods *e′* and *f″*, and the two springs *g′*, arranged and adapted essentially as set forth.

300,042. DRY ORE SEPARATOR. WILLIAM L. CARD and JOSEPH C. DANE, La Crosse, Wis., assignors to the Card-Dane Dry Gold Sluice Company, (Limited,) same place. Filed July 12, 1883. (No model.)



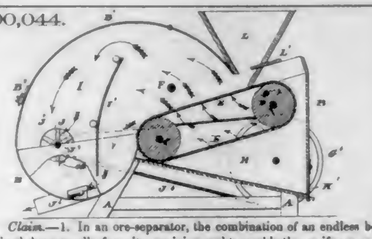
Claim.—1. In a dry ore separator, the combination of an inclined ore-bed composed of a suitable frame, fine-meshed wire-cloth, cotton, or other textile fabric superimposed on the wire-cloth, and transversely-arranged round riffles in close contact throughout their length with the upper surface of the cotton or textile fabric, an air-chamber, and a fan to deliver an even, steady, and continuous upward flow of air through the ore-bed and ore, substantially as herein shown and described.

2. In an ore-separator, the combination of an ore-bed, inclined downwardly from its receiving end toward its discharge end to enable the auriferous material to flow down it, an air-chamber beneath the bed, an extension beneath the air-chamber, having horizontal partition, and means to create a current of air through the air-chamber and around the partition and upward through the bed in a rearwardly direction, as set forth.

3. In an ore-separator, the bed consisting of side pieces, inner end pieces, outer and lower end pieces, wire-cloth, and superimposed textile cloth supported on the side and inner end pieces, and secured by the outer and lower end pieces, and suitable fastenings, the riffles, and upper side pieces and fastenings to secure the riffles in place, as set forth.

300,043. DRY ORE SEPARATOR. WILLIAM L. CARD and JOSEPH C. DANE, La Crosse, Wis., assignors to the Card-Dane Dry Gold Sluice Company, (Limited,) same place. Filed July 12, 1883. (No model.)

Claim.—1. In an ore-separator, the combination, with an endless traveling ore-bed, of a laterally-shaking hopper having blunt tapering teeth, between which the smaller particles first drop, and means to cause a current of air to pass upwardly through the ore-bed, as set forth.



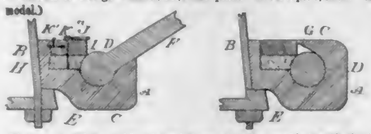
2. In an ore-separator, the combination, with an endless traveling ore-bed inclined from the receiving end downward toward the discharge end, and having riffles, of a laterally-shaking hopper having blunt tapering teeth to feed the finer material beneath the coarser, as set forth.

3. In an ore-separator, the combination of a casing, three rollers arranged in triangular form, a fan-chamber between the rollers, a fan, an air-chamber between the fan-chamber and the rear roller, and a chamber beneath the belt to receive the precious metal, as set forth.

4. In an ore-separator, a belt consisting of textile and wire cloths, the textile cloth superimposed on the wire-cloth, riffles, blocks between the ends of the riffles, strips for binding the edges of the belt, and rivets to secure the parts together, as set forth.

300,044. DRY ORE SEPARATOR. WILLIAM L. CARD and JOSEPH C. DANE, La Crosse, Wis., assignors to the Card-Dane Dry Gold Sluice Company, (Limited,) same place. Filed July 12, 1883. (No model.)

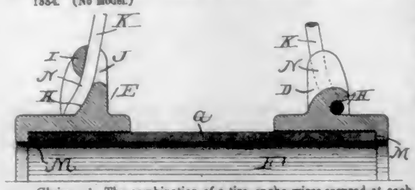
300,044.



Claim.—1. In an ore-separator, the combination of an endless belt inclined downwardly from its receiving end to enable the auriferous material to flow down it, a suction device to draw air through the belt upwardly and rearwardly, and a partition to deflect the lighter coarse matter toward the discharge, as set forth.

2. In an ore-separator, the combination of an endless belt whose bed portion is inclined downwardly from the receiving end to permit the material to flow down it, a casing having at its rear an opening at each side, a partition transverse of the casing, a deflector to divide and direct the lighter coarse matter to the side openings, and a suction device to draw a current of air through the belt in an upward and rearward direction, as set forth.

3. In an ore-separator, the combination of an endless belt whose bed portion is inclined downwardly from the receiving end, and having riffles of sufficient height to arrest the heavier precious metal, a casing having at its rear an opening at each side, a partition transverse of the casing, a deflector to divide and direct the lighter coarse matter to the side openings, and a suction-fan and chamber at each side of the machine, having a discharge at bottom to receive the matter passing through the side openings and compel it to pass out, the fan-chambers being in communication with the main chamber of the casing at the rear of the partition, as set forth.



300,045. THILL-COUPLING. JOHN W. CARNS, Pierce, Ohio, assignor of one-half to George Walker, Jr., same place. Filed Apr. 8, 1884. (No model.)

Claim.—1. The combination of the socket A, provided with the inclined openings G, the shoulder E, the head D, the rubber block H, rigidly attached to the metallic cap I, the eye or handle J, and the clip B, all arranged substantially as shown, and for the purpose specified.

2. The metallic cap I, provided with the spring-catch K, in combination with the socket A, provided with the recess K′, substantially as and for the purpose specified.

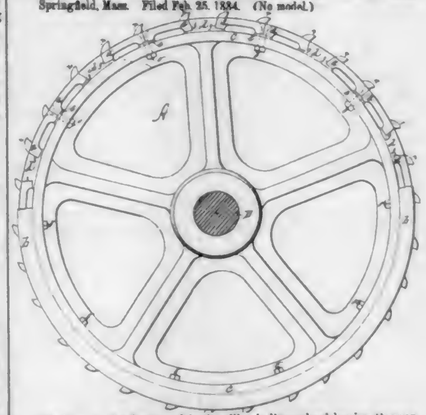
300,046. WHEEL. ROBERT S. CARR, Hamilton, Ohio. Filed Feb. 4, 1884. (No model.)

Claim.—1. The combination of a tire, spoke-wires secured at each end to the tire, and each forming two spokes joined by a central bend, with its convexity toward the center of the wheel, and hub-spiders provided with a circumferential series of segmental lips arranged with their extremities contiguous, so as to form a space for the reception of two spokes, and having front bars closing the front of the segmental lips at their points of approach, substantially as and for the purpose set forth.

2. The combination of a tire, hub-spiders provided with a circumferential series of segmental lips, and with front bars at the contiguous extremities of the lips, and spoke-wires having a central bend to enable them to enter and leave the spider, and having also a side bend within the hub-spider, substantially as and for the purpose set forth.

3. The combination of a tire, a series of wire spokes, a hub-tube, and a pair of spoke-receiving spiders fitted upon the ends of the hub-tube and engaging against the ends of the tube, substantially as and for the purpose set forth.

300,047. CAPSULE FOR BOTTLES, &c. CHARLES CHESWRIGHT, London, England. Filed Mar. 3, 1884. (No model.) Patented in France Apr. 24, 1883, No. 155,090, and in England Apr. 27, 1883, No. 2,131.



Claim.—1. A capsule for bottles and similar receptacles, made from thin metal and comprising a cap to rest on the cork, a body or sleeve, and narrow ties formed from the same piece as the cap, and strengthened by folds of the metal, substantially as herein set forth.

2. A capsule for bottles and similar receptacles, made from thin metal and comprising a cap to rest on the cork, and a sleeve made separate from and independent of the cap, to embrace the neck of the receptacle and the lower edge of the cap, substantially as set forth.

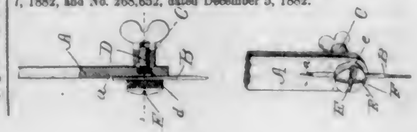
3. In a sheet-metal capsule for bottles and similar receptacles, the combination, with the cap and the sleeve, of the band *e*, arranged to cover the joint where the sleeve laps over the base of the cap, substantially as set forth.

4. In a sheet-metal capsule for bottles and similar receptacles, the combination of the cap, the ties *c*, strengthened by folds *c′*, of metal, as shown, the separate sleeve *b′*, and the band *e*, all constructed and arranged substantially as set forth.

300,048. GRINDING-WHEEL FOR BARK-MILLS. LLOYD R. CLARK, Springfield, Mass. Filed Feb. 25, 1884. (No model.)

Claim.—1. An improved bark-mill grinding-wheel having thereon a series of abutment-strips whose sides are grooved to receive the edges of the tooth-plates, and a series of bearing-strips located between the abutment-strips, tooth-plates having separated teeth, substantially as described, to fit between the latter and bear thereupon and on the bearing-strips, and bolts, substantially as described, for securing said plates to the wheel, substantially as set forth.

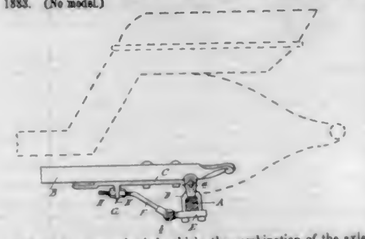
2. An improved tooth-plate for bark-mill grinding-wheels, consisting of the plate *a*, having separated teeth thereon integral therewith and hardened, and having bearing-surfaces beneath its opposite edges, substantially as set forth.



3. The wheel A, having the bands *b* applied thereto, and the strips *d* and *e* extending from end to end thereof, the tooth-plates *a*, and the bolts *o*, substantially as set forth.

300,049. PROCESS OF ENGRAVING MARBLE AND GRANITE. FREDERICK W. COONS, St. Louis, Mo. Filed Mar. 3, 1884. (No specimens.)

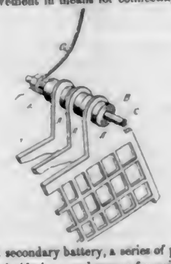
Claim.—The described process of engraving marble and granite by the use of varnish, lead-foil, and nitric acid, as set forth.



300,050. NEEDLE-CLAMP FOR SEWING-MACHINES. JASPER W. COREY, Chicago, Ill., assignor to the Sigwalt Sewing Machine Company, same place. Filed June 7, 1883. (No model.)

Brief.—Specific improvement on Patents No. 254,603, dated March 7, 1882, and No. 268,652, dated December 5, 1882.

Claim.—In a needle-clamp for sewing-machines, the combination of a needle-bar having groove *a* and hole *a′*, bolt D, having grooves E, *e*, and E′, and hole *d′*, formed in the head *d*, nut C, and an angular pin formed in one piece passing through holes *d′* and *a′* and extending into groove *e*, substantially as described.



300,051. TWO-WHEELED VEHICLE. ALBERT DAVIS, Mason, Mich., assignor to the Mason Road Cart Company, same place. Filed Dec. 26, 1883. (No model.)

Claim.—In a two-wheeled vehicle, the combination of the axle A, shafts B, clip D, provided with the ears *a*, strap-iron C, having lug G and an eye to engage with the ears *a*, tie-bar E, provided with the eye *b*, rod F, pivoted at one end to the axle, and the other end adapted to pass through and be supported by said lug, and the nuts H, whereby the shaft B and its adjusting-rod are pivotally secured to the axle, substantially as and for the purposes described.

300,052. SECONDARY BATTERY. AUGUSTUS G. DAVIS, Baltimore, Md. Filed Jan. 14, 1884. (No model.)

Brief.—Improvement in means for connecting the plates of secondary batteries.

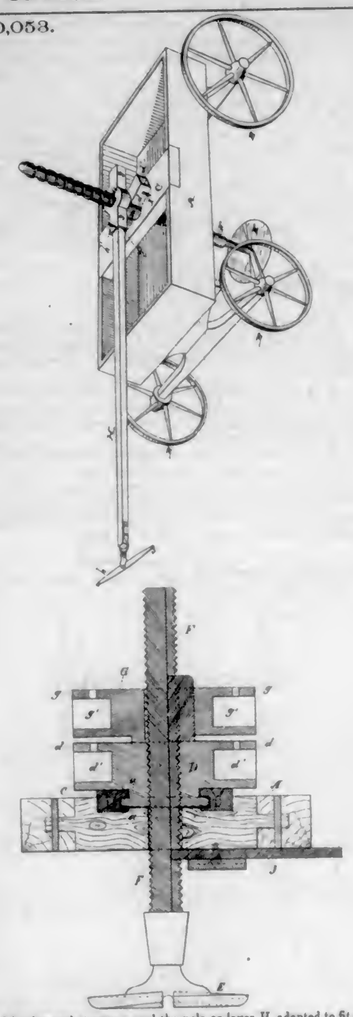
Claim.—1. In a secondary battery, a series of plates provided with upward extensions and side lugs, and means for uniting the series, substantially as described.

2. In a secondary battery, the combination, with a series of plates provided with upward projections and side lugs, of a central rod screw-threaded at its ends and provided with tightening-nuts, substantially as described.

3. In a secondary battery, the combination, with a series of plates provided with goose-neck projections having side lugs and extending beyond the sides of the cell, of means for uniting the series, substantially as described.

4. A secondary-battery plate provided with upward projections and side lugs, substantially as described.

5. A secondary-battery plate provided with goose-necked upward projections and side lugs, substantially as described.



300,053. EARTH-BORING AUGER. CAMILLE DE MEZERVILLE, Santa Clara, Cal. Filed Sept. 17, 1883. (No model.)

Brief.—Through a bearing-plate on a vehicle passes the grooved screw-shaft of an auger, which is rotated to dig by a feathered washer, provided with socketed arms to receive a sweep-pole. The feed is by a nut similarly provided and held from rotation by a pin. The auger is raised by rotation of the nut, the shaft being then held from rotation by a slide-piece engaging the groove.
